VDR	Voyage Data Recorder
VEC	Vapor Emission Control

RULES FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS 2019

PART I CLASSIFICATION AND SURVEY

CONTENTS

Chapter 1

Classification of Steel Ship

1.1 General

1.1.1 Steel ship built and surveyed in accordance with the Rules for Construction and Classification of Steel Ships (hereinafter referred to as the Rules) published by the CR Classification Society (hereinafter referred to as the Society) or alternatives found to represent an overall safety standard equivalent to that of the Rules (See 1.1.6 of this Part) will be assigned a class in the Register of Ships (hereinafter referred to as the Register) and will continue to be classed so long as they are found, upon examination at the prescribed surveys, to be maintained in a fit and efficient condition and in accordance with the requirements of the Rules.

1.1.2 Classification will be conditional upon compliance with the Rules in respect of both hull and machinery (i.e., main and auxiliary engines, boilers, essential appliances, pumping arrangements and electrical equipment). The products including the equipment, components, systems and materials intended for classed ships or ships to be classed are to comply with the requirments in "Guidelines for Survey of Product for Marine Use".

1.1.3 The Rules are framed on the understanding that ships will be properly loaded and handled; they do not, unless stated in the class notation, provide for special distributions or concentrations of loading. The Society may also require additional strengthening to be fitted in any ship which, in their opinion, may be subjected to severe stresses due to particular features in her design, or when it is desired to make provisions for exceptionally loaded or ballasted conditions. In these cases particulars are to be submitted for consideration.

1.1.4 The stability of the ship is to be sufficient and in compliance with the requirements of governmental authority or International conventions and codes.

1.1.5 The Rules do not cover certain technical characteristics, such as trim, hull vibration, etc., but the Society is willing to advise on such matters although it cannot assume responsibility for them.

1.1.6 Alternatives are to be accepted, provided that they are considered by the Society to be equivalent to the Rules.

1.1.7 Ships the construction of which involves novel features of design in respect of hull, machinery or equipment and to which the provisions of the Rules are not directly applicable may be classed, when approved by the Society on the basis that the Rules insofar as applicable have been complied with and that special consideration based on the best information available at the time has been given to the novel features. The Rules are framed on the understanding that ships are not to be operated in environmental conditions more than those agreed for the design basis and approval, without the prior agreement of the Society.

1.1.8 Register

Steel ships with their class approved by the Society are to be recorded in the Register. The Register is to be published on the CR website and is to contain the names of ships and other useful items of information such as flag, port of registry, gross tonnage, class notations, owners, shipbuilders, dimensions, machinery particulars, the date of build, etc.

1.1.9 Date of build

(a) The date of build is normally to be the date of completion of the classification initial survey during construction of ships built under the inspection.

(b) If the period between launching and completion or putting a ship to use is unduly made longer than usual, the date of launching may be additionally indicated in the Register.

(c) If a ship is not immediately put into service after completion, but is laid up for a period, the ship is to be drydocked for examination by the Surveyor of the Society (hereinafter referred to as the Surveyor) before proceeding to sea, and the subsequent special survey is based on the date of such an examination provided that the result of such survey is satisfactory in all respects.

1.1.10 Loading conditions and any other preparations required to permit a ship with a notation specifying some service limitation to undertake a sea-going voyage, either from port of loading to service area or from one service area to another, are to be in accordance with arrangement agreed by the Society prior to the voyage.

1.1.11 Damage, repairs and alternations

Any damage, defect, breakdown or grounding, which could invalidate the conditions for which a class has been assigned, is to be reported to the Society without delay.

1.1.12 For ships, the arrangements and equipment of which are required to comply with the requirements of the International Convention Regulations and applicable Protocols and Amendments relating thereto, such compliance is to be demonstrated by possession of applicable Convention Certificates issued by the Government of the State whose flag the ship is flying (hereinafter refer to as the Administration) or by any organization authorized by the Administration.

1.1.13 Where an on-board computer system having either a longitudinal strength or a stability computation capability or both, is provided on new ships, or newly installed on existing ships, then the system is to be certified for such use in accordance with the Society's procedure for approval of on-board computer systems for stability calculation (Refer to Appendix 1).

1.1.14 When longitudinal strength calculations have been required, loading guidance information is supplied to the Master by means of a Loading Manual and in addition, when required, by means of loading instrument.

1.1.15 For all ships, new installation of materials which contain asbestos is to be prohibited.

1.1.16 Ships of length less than 24 meters may be designed and constructed in accordance with other recognized standards, e.g. ISO standards provided the agreement is issued by the Society.

1.1.17 In general, while references are made to IACS URs (Unified Requirements), the latest version of the documents are to be used.

1.2 Application

1.2.1 Except in the case of a special directive by the Society, no new Regulation or alteration to any existing Regulation relating to classification character or to class notation is to be applied to existing ships.

1.2.2 Except in the case of a special directive by the Society, no new Rule or alteration to any existing Rule materially affecting classification is to be applied compulsorily within six months of its adoption, nor after the approval of the original midship section or equivalent structural plans. Where it is desired to use existing previously approved plans for a new contract, written application is to be made to the Society.

1.2.3 The Rules may be used in High Speed Crafts, Aluminum Vessels and FRP ships, if applicable.

1.3 Classification Characters

1.3.1 All ships, when classed, will be assigned following classification characters as applicable.

1.3.2 Classification symbols

(a) **CR100** —This class is to be assigned to the ship's hull which in all their parts complies with the Rules for the draught required.

(b) **CMS** —This class is to be assigned to the machinery including propelling and essential auxiliary machinery and all other equipment covered by the classification which complies with the Rules.

(c) **RMS** —This class is to be assigned to the refrigerating machinery including hold insulation and working condition which complies with the Rules.

(d) The symbol **CMS** and/or **RMS** will be added concurrently to a ship assigned with **CR100**.

1.3.3 Surveying symbols

(a) ✠ This symbol when affixed to classification symbols means the plans of ship have been approved by the Society in accordance with the Rules, and ship has been built to the satisfaction of the Surveyor to the Society.

(b) ✠ This symbol is to be assigned to the ship has not been built under the survey of the Society but has been constructed under the survey of a recognized society. In addition, the whole of hull and machinery will be required to have been installed and tested to the satisfaction of the Surveyor to the Society in accordance with the Rules of the Society.

(c) No surveying symbol are to be assigned to the hull and machinery of any ship not having been surveyed during construction by either the Society or any other recognized party but the existing installation and arrangement has been examined and tested and found to be acceptable to the Society.

1.3.4 Equipment symbols

The letter **E** which is affixed to surveying symbols of hull means the equipment including anchors, chain cables and hawsers of new or existing ships is supplied and maintained in accordance with the full requirements of the Rules, or partial requirements under special approval. In the case of a ship classed for a special or restricted service, if approved by the Society that requirements of the Rules are not necessary to apply, no equipment symbol is to be affixed.

1.3.5 Automation symbols

A symbols, which is to be round-bracketed and be affixed next to the classification symbol **CMS**, indicating that an automatic or remote control and monitoring system for propulsion machinery, propulsion machinery spaces, etc. is provided and relevant requirements of the Rules are complied with. See Table I 1-1.

1.3.6 Positioning Mooring symbols

(a) Position Mooring Equipment

When requested by the Owner, the symbol **POME** may be placed after the classification symbol, thus: **CR 100 ✠ POME** which will signify that the mooring equipment, anchors, chain or wire rope which have been specified by the Owner for position mooring have been tested in accordance with the specifications of the Owner and in the presence of a Surveyor.

Fabrication tests of the position mooring equipment, such as anchors, chains, wires, shackles, etc. are to at least satisfy the requirements of Part XI and Part XII of the Rules for the respective sizes of equipment.

(b) Position Mooring Systems

When requested by the Owner, the Society is prepared to certify the position mooring capability of the unit. A unit so certified for position mooring will be designated by the symbol **POMS** placed after the classification symbol, thus: **CR 100 ✠ POMS**.

1.4 Class Notations

1.4.1 General

(a) When considered necessary by the Committee, or when requested by an Owner and agreed by the Committee, a class notation will be appended to classification character assigned to the ship. This class notation will consist of one of, or a combination of, the notations listed in 1.4.2 to 1.4.5. The classification characters and class notations assigned to a ship are indicated on the Certificate of Classification as well as in the Register of Ships published by the Society.

(b) The notations for type of ship, service restriction, feature, cargo, equipment, additional survey, etc. are added after the classification symbol **CR100**. The automation symbol and notations for navigation safety system, special equipment of machinery, machinery survey, etc. are added after the classification symbol **CMS**.

(c) Where a class notation assigned to a specific ship together with classification characters is required by the Rules to which the ship is subject, such notation is a necessary one for this ship, otherwise an optional one.

(d) Where multiple class notations for type of vessel are assigned, such individual notations are to be separated by a slash "/", e.g.:

CR100 ✠ E Oil/Chemical Tanker

(e) Any suffix to a class notation is to be curly-bracketed and every two suffixes are to be separated by a semicolon ";", e.g.:

CR100 ✠ E Bulk Carrier, BC-A{No MP; Holds 2, 4 and 6 may be empty}, ……

(f) Every two sets of class notations are to be separated by a comma ",", e.g.:

CR100 ✠ E Oil Tanker, CSR, ESP, ……

CMS(CAU)✠ PCM, NAV……

Unless specially stated otherwise, class notations are generally given in the following sequence.

1.4.2 Hull structural material notation

A notation indicating that the ship uses materials other than steel as the structural materials for the main hull, e.g. **FRP Hull, Aluminum Alloy Hull** etc.

1.4.3 Ship type notation, special duty notation, additional service notation and hull construction notation

(a) Ship type notation

A notation indicating that the ship has been arranged and constructed in compliance with particular usage intended to apply to that type of ship. See Table I 1-2 of this Chapter.

(b) Special duties notation

A notation indicating that the ship has been designed, modified or arranged for special duties other than those implied by the type and cargo notation, e.g. **Research Vessel**. Ships with special duties notations are not thereby prevented from performing any other duties for which they may be suitable.

(c) Additional service notation

A type notation and/or a special duty notation may be completed by one or more additional service notations. The specific rule requirements applicable to each service notation are to be complied with. See Table I 1-3 of this Chapter.

(d) Hull construction notation

For ships with hull construction other than monohull, such as catamaran, trimaran, small waterplane area twin hull (SWATH) and etc., the hull construction of ship is in compliance with relevant requirements of the Rules or the requirements agreed by the Society, the hull construction notation of **Catamaran**, **Trimaran**, or **SWATH** will be affixed after the ship type notation.

1.4.4 Service restriction notation

A notation indicating that the ship has been classed on the understanding that it will be operated only in suitable areas or conditions which have been agreed by the Committee. See Table I 1-4.

1.4.5 Additional Class Notation

A notation expressing the classification of equipment or specific arrangement, which has been requested by the Owner.

(a) Special features notation.

A notation indicating that the ship incorporates special features which significantly affect the design, e.g. **Movable Decks**.

(b) Cargo notation

A notation indicating that the ship has been designed, modified or arranged to carry one or more particular cargoes, e.g. **Sulphuric Acid**. Ships with one or more cargo notation are not thereby prevented from carrying other cargoes for which they are suitable.

(c) Additional survey notation.

A notation indicating that one or more special surveys are adopted and relevant requirements of the Rules are complied with. See Table I 1-5.

(d) Special equipment notation.

A notation indicating that one or more special equipments are provided and relevant requirements of the Rules are complied with. See Table I 1-6.

(e) Ice notation.

A notation indicating that the ship has been strengthened for navigation in ice in accordance with relevant requirements of the Rules. See Table I 1-7.

(f) Navigation safety notation.

A notation indicating that a navigational safety system is provided and relevant requirements of the Rules are complied with. See Table I 1-8.

(g) Refrigerated cargo installation notation.

A notation indicating that a refrigerated cargo installation is provided and relevant requirements of the Rules are complied with. See Table I 1-9.

(h) Environmental protection notation.

A notation indicating that one or more environmental protection features are adopted and relevant requirements of the Rules are complied with. See Table I 1-10.

1.5 Application for Classification and Surveys

1.5.1 An application for the classification of ships is to be submitted in writing by the builder for a ship to be built under the Society's survey or by the owner for a ship not built under the Society's survey.

1.5.2 An application for surveys for maintenance of class is to be submitted in writing or typing by e-mail or fax by the owner or owner's representative.

1.6 Surveys of Steel Ships

1.6.1 General

(a) All ships classed with the Society are subjected to the following periodical surveys:

(i) Annual surveys.

(ii) Bottom surveys.

(iii) Intermediate surveys.

(iv) Special surveys.

(v) Boiler surveys and thermal oil heater surveys.

(vi) Propeller shaft and tube shaft surveys.

(b) The contents of surveys by the Society are detailed in the "Survey Requirements of Steel Ships" in Chapter 2 of this Part.

(c) Special consideration may be given to any unusual circumstances justifying a modification of either survey requirements or the interval of surveys. This Society may make special requirements including intervals of periodical surveys to coincide with the regulations of the flag state of ships if owner requests.

(d) Statutory survey will be acted by this Society, when authorized on behalf of Governments, in respect of National and International statutory safety and other requirements for passenger and cargo ships.

(e) Survey planning meeting(Kick- off meeting) is to be held prior to the commencement of the intermediate survey and special survey.

1.6.2 Classification initial survey during construction

(a) New ships are to be built in accordance with the Rules. The constructional plans and particulars of the hull, equipment and machinery, together with their drawing list, are to be submitted for approval of the Society before the work is commenced. In case these plans need to be modified or altered, a re-approval is indispensable.

(b) The new machinery including boilers, pressure vessels and electrical equipment for ships classed or intended to be classed is to be manufactured under and surveyed according to the Rules.

(c) From the commencement of the work until the completion of the ship and final test of the machinery under working condition, the Surveyors are to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the Rules or the approved plans, or any material, workmanship or arrangement found to be unsatisfactory, it is to be rectified.

(d) The materials used in the construction of hulls and machinery intended for classification are to be of good quality and free defects and are to be tested in accordance with the requirements of Part XI. The steel is to be manufactured by an approved process at works recognized by the Society. Alternatively, tests to the satisfaction of the Society will be required to demonstrate the suitability of the steel.

(e) Copies of finish plans (showing the ship as built), essential Certificates and records, required loading and other instruction manuals are to be readily available for use when required by the Surveyor, and may be required to be kept on board.

(f) Hull Survey for New Construction

(i) Qualification and Monitoring of Personnel

Exclusive surveyors of this Society are to confirm through patrol, review and witness that the ships are built using approved plans in accordance with the relevant rules and statutory requirements. The surveyors are to be qualified to be able to carry out the tasks and procedures are to be in place to ensure that their activities are monitored through the QM of this Society.

(ii) Survey of the hull structure

IACS UR Z23 Table 1 provides a list of surveyable items for the hull structure and coating and is applicable to this Society including:

(1) Description of the shipbuilding functions;

(2) Classification and statutory survey requirements;

(3) Survey method required for classification;

(4) Relevant IACS and statutory requirement references;

(5) Documentation to be available for the classification surveyor during construction.

- The shipbuilder is to provide the classification surveyors access to documentation required by classification, this includes documentation retained by the shipbuilder or other third parties.

- The list of documents approved or reviewed by this Society for the specific new construction are as follows:

  plans and supporting documents
  examination and testing plans
  NDE plans
  welding consumable details
  welding procedure specifications
  welding plan or details
  welder's qualification records
  NDE operator's qualification records

(6) Documents to be inserted into the ship construction file.

(7) A list of specific activities which are relevant to the shipbuilding functions. This list is not exhaustive and can be modified to reflect the construction facilities or specific ship type.

(8) Evidence is also to be made available, as required, by the shipbuilder, to the surveyor whilst the construction process proceeds to prove that the material and equipment supplied to the ship has been built or manufactured under survey relevant to the classification rules and statutory requirements.

(iii) Newbuilding survey planning

Prior to commencement of surveys for any newbuilding project, a kick off meeting shall be carried out.

A record of the meeting is to be made. The records are to take note of specific published Administration requirements and interpretations of statutory requirements. The shipyard shall be requested to advise of any changes to the activities agreed at the kick off meeting and these are to be documented. Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kick-off meeting. Structural fabrication is to be carried out in accordance with IACS Recommendation 47, "Shipbuilding and Repair Quality Standard", or a recognized fabrication standard which has been accepted by this Society prior to the commencement of fabrication/construction. The work is to be carried out in accordance with the Rules and under survey of this Society. In the event of series ship production consideration may be given to waiving the requirement for a kick off meeting for the second and subsequent ships.

(iv) Examination and test plan for newbuilding activities. The shipbuilder is to provide plans of the items which are intended to be examined and tested. These plans need not be submitted for approval and examination at the time of the kick off meeting, but the plans and any modifications to them are to be submitted to the surveyors in sufficient time to allow review before the relevant survey activity commences. They are to include:

(1) Proposals for the examination of completed steelwork - generally referred to as the block plan and are to include details of joining blocks together at the pre-erection and erection stages or at other relevant stages;

(2) Proposals for fit up examinations where necessary;

(3) Proposals for testing of the structure (leak and hydrostatic) as well as for all watertight and weathertight closing appliances;

(4) Proposals for non-destructive examination;

(5) Any other proposals specific to the ship type or to the statutory requirements.

(v) Ship Construction File

(1) The shipbuilder is to deliver documents for the Ship Construction File. In the event that items have been provided by another party such as the shipowner and where separate arrangements have been made for document delivery which excludes the shipbuilder, that party has the responsibility. The Ship Construction File shall be reviewed for content.

(2) Ship Construction File on board the ship, is to facilitate inspection (survey) and repair and maintenance, shall include in addition to documents listed in IACS Z23 Table 1, but not be limited to:

- As-built structural drawings including scantling details, material details, and, as applicable, wastage allowances, location of butts and seams, cross section details and locations of all partial and full penetration welds, areas identified for close attention and rudders (IACS Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5);

- Manuals required for classification and statutory requirements, e.g. loading and stability, bow doors and inner doors and side shell doors and stern doors – operations and maintenance manuals (IACS S8 and S9);
- Ship structure access manual, as applicable;
- Copies of certificates of forgings and castings welded into the hull (IACS W7 and W8);
- Details of equipment forming part of the watertight and weathertight integrity of the ship;
- Tank testing plan including details of the test requirements (IACS S14);
- Corrosion protection specifications (IACS Z8 and Z9);
- Details for the in-water survey, if applicable, information for divers, clearances measurements instructions etc., tank and compartment boundaries;
- Docking plan and details of all penetrations normally examined at drydocking;
- Coating Technical File, for ships subject to compliance with the IMO Performance Standard for Protective Coatings (PSPC) as a class requirement under the IACS Common Structural Rules.

(vi) Review of the construction facility

The Society is to familiarize themselves with the yard's production facilities, management processes, and safety for consideration in complying with the requirements of Table 1 of IACS UR Z23 prior to any steelwork or construction taking place in the following circumstances:

(1) where the Society has none or no recent experience of the construction facilities – typically after a one year lapse - or when significant new infrastructure has been added;

(2) where there has been a significant management or personnel re-structuring having an impact on the ship construction process;

(3) or where the shipbuilder contracts to construct a vessel of a different type or substantially different in design.

1.6.3 Classification survey of ships not built under survey

Ships which have not been built under survey to the Society, but which are submitted for classification, are to be subjected to a classification survey of ships not built under survey (See 2.16 of this Part). Survey planning meeting(Kick- off meeting) is to be held prior to the commencement of the survey.

1.6.4 Special survey

(a) Survey intervals

The special survey is to be subjected to surveys at the fixed intervals not exceeding five years. Special surveys are normally to be effected in the sequences of :

No.1 - for ships up to 5 years old.

No.2 - for ships between 5-10 years old.

No.3 - for ships between 10-15 years old.

No.4 & subsequent - for ships age > 15 years old.

(b) Commencement of special survey

(i) The special survey may be commenced at the 4th annual survey and be progressed with a view to completion by the 5th anniversary date.

(ii) As part of the preparation for the special survey, the thickness measurement held and survey plan (see 2.1.5(a) of this Part) are to be dealt with in advance of the special survey. However, the thickness measurement held before the 4th annual survey cannot be credited as a part of special survey.

(c) Premature of special survey

(i) If a special survey is completed prematurely but within three months prior to the due date, the due date of the next special survey is based upon a date not exceeding five years from the due date of the existing special survey. If a special survey is completed more than three months prior to the due date, the due date of the next special survey is based upon a date not exceeding five years from the date of completing of the special survey.

(ii) Where a special survey is commenced more than 15 months prior to the due date, the entire survey is normally to be completed within fifteen months, if such work is to be credited to the special survey. Survey is based upon a date not exceeding 5 years from the date of completion of the special survey.

(d) Extension of special surveys

(i) If a ship at the time when the special survey is due but not in a port in which it is to be surveyed, the Society may upon the Owner's written request in advance in each case extend a period not exceeding three months. Such extension is, however, only to be granted for allowing the ship to complete its voyage to the port in which it is to be surveyed, and only in cases where it is considered proper and reasonable to do so.

(ii) If a special survey is completed after the due date, the due date of the next special survey is based upon a date not exceeding five years from the due date of the existing special survey.

(iii) A maximum three months extension of special survey beyond the due date may be granted provided an occasional survey has been carried out satisfactorily based on a scope of annual survey and the additional items considered by the Head Office of the Society.

(e) If a special survey has been completed and a new final certificate can't be issued or placed on board the ship before the expiry date of the existing certificate, the attending Surveyor authorized by the Society may endorse the existing certificate and such a certificate is to be accepted as valid for a further period which is not to exceed six months from the expiry date.

(f) Continuous survey

(i) At the request of the owner, and upon approval of the proposed arrangement, a system of continuous surveys for hull, machinery and cargo refrigerating machinery appliances, may be undertaken, except for hull surveys of tankers, bulk carriers and similar types of ships, where-by the special survey requirements are carried out in regular cycle to complete all the requirements of the particular special survey within a five-year period. If the continuous survey is completed beyond the five-year period, the completion date is to be recorded to agree with the original due date of the cycle. If the continuous survey is completed prematurely but within three months prior to the due date, the special survey is to be credited to agree with the effective due date. The continuous survey can, also be adopted respectively for the hull, the machinery including the electrical equipment and the refrigerated cargo installations.

(ii) Where some items of the machinery are opened up and examined by the recognized chief engineer as normal routine for maintenance at ports where the Surveyor is not available or at sea, the open-up inspection of the items, at the request of Owner, under certain conditions, may be dispensed with at the discretion of the Surveyor subject to a confirmatory survey at the convenient port of call where the Surveyor is available. The confirmatory survey is to be carried out within five months from the date of the item of the machinery which was opened up and inspected by the recognized chief engineer. If deemed necessary by the Surveyor, the individual item may be inspected again.

(iii) All items stipulated in 2.7.1, 2.7.2 and 2.7.3 except thickness measurement are covered by a system of continuous survey for hull. The thickness measurement for the vessel which adopts a system of continuous survey for hull conducted before the 4th annual survey cannot be credited for the special survey.

(g) Planned machinery maintenance scheme(PMS)

An approved PMS is considered as an alternative to continuous survey for machinery specified in (f).

(i) Application

The PMS, in principle, apply to those items of machinery and equipment installed on the following ships which are to comply with International Safety Management Code adopted by IMO.

(1) The ships are to be less than fifteen years old.

(2) The ships operated by Owners/ship management companies have the maintenance system fixed satisfactorily.

(ii) Survey for PMS

(1) Initial survey for PMS
The initial survey is to be carried out by the Surveyor within one year from the date of approval of PMS, and it is to be verified that the planned machinery maintenance is carried out in accordance with the approved scheme.

(2) Annual survey for PMS
The annual survey is to be carried out at each class periodical survey and it is to be verified that the planned machinery maintenance is carried out by the recognized chief engineer in accordance with the approved machinery maintenance scheme and survey schedule table and recorded correctly and that the machinery is in good order.

(3) Open-up survey
The following machinery is, in principle, to be opened and examined in attendance of the Surveyor in accordance with the survey schedule table.

- Crankpins and bearings, crank-journals and bearings for main diesel engines.
- Rotors, blades, casings, main bearings, couplings between turbine and reduction gear, nozzle valves and maneuvering valves for main steam turbine.
- Aux. steam turbine for main generator.
- Thrust shaft and bearings for main propulsion.
- Reduction gear for main propulsion.
- Flexible coupling for main propulsion.
- Other items deemed necessary by the Society.

(4) Occasional survey
Where serious damage is found on the important components/machinery, occasional survey is to be carried out by the Surveyor.

(iii) For engine with bore 300 mm or under of the non-ocean going vessels, special consideration may be given to modify the above PMS requirements based on the manufacturer's recommendation of maintenance manual.

1.6.5 Annual survey

(a) Annual survey are to be carried out within three months either way of each anniversary date after the date of build or the assigned date of a previous special survey.

(b) The anniversary date is to be changed if the annual survey is completed before the period specified in (a) of this subparagraph.

(i) The new anniversary date is to be amended by endorsement to a date which is not three months later than the date on which the survey was completed.

(ii) The subsequent annual survey is to be completed at the intervals prescribed as above using the new anniversary date.

(iii) The expiry date for a special survey may remain unchanged provided one or more annual surveys, as appropriate, are carried out so that the maximum intervals between the surveys prescribed are not exceed.

1.6.6 Intermediate surveys

Intermediate surveys are to be carried out at the second or third annual survey after the classification initial survey during construction or a special survey. Annual surveys are not required to be carried out when an intermediate survey is carried out. Parts of the intermediate surveys which are additional to the requirements of the annual survey may be surveyed either at or between the second or third annual survey.

1.6.7 Bottom survey

(a) Survey intervals

(i) At least two bottom surveys are to be carried out during five year special survey period. In all cases, taking account of extension of special survey, the maximum interval between two bottom survey is not to exceed 36 months and one of the two bottom surveys required in each five year special survey period is to be coincided with the special survey. For vessels operating solely in fresh water, the maximum interval is not to exceed five years.

(ii) A maximum three months extension of bottom survey beyond the due date may be granted provided an occasional survey has been carried out satisfactorily with the survey items required by the Head Office of the Society.

(iii) For ESP ships exceeding fifteen years of age, bottom surveys are to be carried out in dry dock.

(b) In-water survey in lieu of bottom survey in dry dock

(i) An approved in-water survey equivalent to a docking survey may be considered as an alternative to a docking survey.

(ii) An in-water survey not credited as a bottom survey of the special survey may be carried out with the ship afloat. Special consideration is to be given to ships of fifteen years of age or over before being permitted to have such inspection.

(c) Bottom survey at special survey

A bottom survey in dry dock is to be a part of the special survey

(d) For passenger ships, the bottom surveys are to be carried out at each annual survey and special survey, at least two bottom surveys to be carried out in dry dock within each five years period of the classification special survey and the maximum interval between the two bottom survey in dry dock is not to exceed 36 months. The in-water surveys may be carried out and credited as the other bottom survey.

1.6.8 Propeller shaft and tube shaft survey

(a) Survey intervals

(i) Water-lubrication bearings

The normal survey interval of the following propeller shaft is five years:

(1) For propeller shaft fitted with approved keyway and approved propeller hub, which are designed for avoiding excessive stress concentration, and protected by a continuous liner or by an approved equivalent arrangement, to prevent seawater from contacting the steel shaft effectively, or which has shafts of corrosion resistance material.

(2) For the propeller shaft lubricated with fresh water exclusively in bearing.

(3) For multiple screw propeller shaft.

(ii) Oil-lubrication bearings

Normal survey interval is five years.

(iii) Tube shaft survey:

Tube shaft, if fitted, is to be examined at the same interval as propeller shaft.

(iv) Controllable pitch propellers for main propulsion purposes are to be surveyed at the same intervals as the propeller shaft.

(v) Directional propellers for main propulsion purposes are to be surveyed at intervals not exceeding five years.

(vi) Water jet units for main propulsion purposes are to be surveyed at intervals not exceeding five years provided the impeller shafts are made of approved corrosion resistant material or have approved equivalent arrangements.

(vii) All other shafts not covered above, their normal survey interval is three years.

(b) Extensions of normal survey for propeller shaft and tube shaft

(i) Extension up to one year

(1) Water-lubricated bearings

An extension up to one year may be considered, when requested by the Owner, provided a survey is carried out in accordance with 2.3.7(a)(i) of this Part.

(2) Oil-lubricated bearings
Up to two separate extensions of approximately one year may be considered when requested by the Owner, provided a survey is carried out in accordance with 2.3.7(a)(ii) of this Part.

(ii) Extension up to five years
In lieu of (b)(i)(2) above, up to two(2) separate extensions may be granted by the Society, when requested by the Owner, provided a survey is carried out at the fifth year and at the fifth year after the first extension in accordance with 2.3.7(b) of this Part.

1.6.9 Boiler surveys and thermal oil heater surveys

(a) Survey intervals for boiler

(i) For ship fitted with more than one water tube boiler for propulsion, the interval between two consecutive surveys of each boiler is not to exceed 2.5 years. For ships fitted with only one water tube boiler for propulsion, the interval between 2 consecutive surveys of the boiler is not to exceed 2.5 years until the boiler is 7.5 years old; thenceforth the boiler is to be surveyed annually. For ships fitted with fire tube boilers for propulsion, the boiler are to be surveyed when four years and six years old; thenceforth the boiler is to be surveyed annually.

(ii) Auxiliary boilers or thermal oil heaters, waste heat steam generators/economizers having a working pressure exceeding 0.35 MPa and heating surface exceeding 4.5 m^2 are to be surveyed twice in every 5 year special survey period and one of the two boilers or thermal oil heaters, etc. surveys is to be coincided with the special survey. The period between surveys will not exceed three years.

(b) Extension of boiler surveys
When requested by Owners, subject to a survey for extension, an extension for a boiler survey may be granted by the Surveyor after a satisfactory external examination of the boiler and review of boiler operation and feed water records.

1.6.10 Occasional surveys
Occasional surveys are to be carried out when ships have sustained damage, undergone major repairs or alternations, or lay-up and re-commissioning.

(a) Damage, major repair or alternations

(i) The Society is to be immediately informed about any deficiencies and damages to hull and machinery or other equipment classed, where these may be of relevance to the ship's class. An occasional survey is to be arranged for a date not later than that ship's arrival at the next port. A ship may be temporarily repaired and retained her class if the Surveyor deems so and reports to the Society that the ship has been repaired to such a degree as being considered in a technical fitness condition for the intended voyage. In such cases a permanent repair and survey are to be duly carried out. If the survey reveals that a ship's class has been affected, the class is to be maintained only on condition that the repairs or modifications demanded by the Society are to be carried out within the period specified by the Surveyor. Until full settlement of recommendations the class is to be restricted.

(ii) In the case of alternations, plans are to be approved before the work is commenced.

(iii) If any part of the main or auxiliary machinery including boilers, or insulation or fittings, is removed for repair or alternation, the exposed part of the structure normally not accessible is to be specially examined.

(iv) In exceptional cases, the inspection of hull and machinery, and the performance of the repairs required for maintenance of the original class may be dispensed with, if the Owner agree to the class and/or the range of service being restricted, or possibly a higher freeboard being assigned.

(b) Lay-up and re-commissioning

(i) The Society is to be notified by the Owner that a ship has been laid up. Ships intended to be laid up are to comply with the requirements of "Guidelines for Lay-up of Ships" of the Society. This status is to be noted in the Register, and surveys falling due during lay-up may then be held in abeyance until the ship re-commissions. Lay-up procedures and arrangements for maintenance of conditions during lay-up may be submitted to the Society for review and verified on board by the Surveyor.

(ii) In the case of ships which have been laid up for an extended period (i.e. six months or more) the requirements for surveys on re-commissioning are to be specially considered in each case, due regard being given to the status of surveys at the time of the commencement of the lay-up period, the length of the period and the conditions under which the ship has been maintained during that period.

(iii) Where the lay-up preparations and procedures have been submitted to the Society for review and verified by annual lay-up surveys, consideration may be given to deducting part of or all of the time in lay-up from the progression of survey intervals.

(iv) For ships returning to active service regardless of whether the Society has been informed previously that the ship has been laid up, a re-commissioning survey is required.

1.6.11 Miscellaneous items

(a) If the recommendations of the Surveyor are considered in any case to be unnecessary or unreasonable, appeal may be made to the Society, who may direct a special examination to be held.

(b) It is the responsibility of the Owner to ensure that all surveys necessary for the maintenance of class are carried out at the proper time under the supervision of the Surveyor. It is, however, the normal practice of the Society to give timely notice to Owners when surveys become due, but the non-receipt of such notice, or of notice regarding other surveys, does not absolve Owners from their responsibility.

(c) Period of class

The ship's hull and machinery are always assigned the same period of validity of class (duration of one class period). The class continues to be valid, provided that the hull and machinery are subjected to all surveys stipulated and that any repairs required are carried out to the satisfaction of the Society.

(d) If the hull and/or the machinery are not subjected to the prescribed surveys on their due dates, a ship's class is to be suspended for both hull and machinery. If special shipboard equipment classed is not subject to the prescribed surveys on their due dates, the class of the special equipment only is to be suspended (i.e. Aux. boiler, CAS, CAB or CAU, or RMS).

1.7 Approval

1.7.1 Survey reports

Upon completion of a survey of a classed ship, the Surveyor is to send one original and one copy of his reports with his recommendations, if set up, to the applicant, and at the same time, one copy to the Society. The Society reserves the right for final decision on the Surveyor's recommendations.

1.7.2 Decision of classification

Any member of the Committee or the staff of the Society having either direct or indirect interest in a ship to be classed, is not permitted to be present at or to participate in the meeting for the decision of the classification.

1.8 Certificates of Classification

1.8.1 Final certificate of classification

When the required reports and interim certificates on completion of the classification initial survey during construction of new ships, or the classification survey of ships not built under survey have been submitted for classification and approved by the Classification Committee, final Certificates of Classification signed by the Chairman, the President and the Chief Surveyor will be issued to the builders or owners.

1.8.2 Interim certificates of classification

(a) Upon completion of a classification entry survey, when the ship in the Surveyor's opinion, is considered to be in a fit and efficient condition and eligible to be classed, the Surveyor is permitted to issued an Interim Certificate of Classification stating that he has recommended to the Classification Committee that the ship is in a fit and efficient condition and eligible to be classed.

(b) The validity of Interim Certificates is limited to six months.

1.9 Notice of Surveys

1.9.1 It is the responsibility of the Owners to ensure that all surveys necessary for the maintenance of class are carried out at the proper time and in accordance with the instruction of the Society.

1.9.2 The Society will give timely notice to an Owner about forthcoming surveys by means of a letter or e-mail. The omission of such notice, however, does not absolve the Owner from his responsibility to comply with CR's survey requirements for maintenance of class.

1.10 Suspension and Withdrawal of Class

1.10.1 In any of the following cases, the class of a ship is liable to be withheld or if already granted, may be withdrawn or expunged from the Register:

(a) The wording, symbols or marks on the certificate is altered, defaced or obliterated.

(b) Any damage or casualty is done to the hull or machinery to such an extent as affecting her class in the Register and the damage so sustained has been un-repaired or not been repaired to the satisfaction of the Society.

(c) The structure or arrangement of the hull, equipment and machinery have been altered without approval of the Society.

(d) The loading of the ship exceeds the load line assigned by the Society or the freeboard marks have been placed higher on the ship's sides than the positions assigned by the Society.

(e) The applicant fails to pay any survey fees or expenses.

(f) The applicant fails to fulfill the Society's requirements.

(g) The Owner so request.

(h) If the annual survey or intermediate survey is not complete within three months of the due date of the survey.

1.10.2 Class suspension and cancellation

(a) Class will be suspended automatically in the following condition.
   (i) If a class periodical survey , MCS survey or HCS survey is over-due.
   (ii) If any outstanding recommendation is over-due.
   (iii) If other required survey in the Rules is over-due. However, over-due of required survey of environmental protection notation as listed in Table I 1-10 will not cause the suspension of class. Class will be reinstated automatically from the date of satisfactory completion of the over-due surveys or the over-due recommendations.

(b) If the Owners failed to apply for a survey on any casualty, damage, operational failure or any repair upon the first opportunity, class may be suspended until the date before the repair survey is completed satisfactorily.

(c) Class Maintenance Certificate is not to be issued during the period of class suspension and before the required survey is completed satisfactorily.

(d) Class suspended for over 3 months may result in cancellation of class.

1.10.3 Change of periodicity, postponement or advance of surveys.

(a) The Society reserves the right, after due consideration, to change the periodicity, postponement or advance of surveys, taking into account particular circumstances.

(b) When a survey becomes overdue during a voyage, the following applies:

(i) In the case of a class special survey becomes overdue during a voyage, the Society may grant an extension to allow for completion of the class special survey, provided there is documented agreement to such an extension prior to the expiry date of the Certificate of Classification, adequate arrangements have been made for attendance of the surveyor at the first port of call and the society is satisfied that there is technical justification for such an extension. Such an extension will be granted only until arrival at the first port of call after the expiry date of the Certificate of Classification.

However if owing to "exceptional circumstances" as defined below, the class special survey cannot be completed at the first port of call, the Society may grant an extension according to 1.6.4(d) of this Chapter, but the total period of extension shall in no case be longer than three months after the original due date of the class special survey.

"Exceptional circumstances" means:

(1) unavailability of dry-docking facilities, or

(2) unavailability of repair facilities, or

(3) unavailability of essential materials, equipment or spare parts, or

(4) delays incurred by action taken to avoid severe weather conditions.

(ii) In the case of annual and intermediate surveys, no postponement is granted. Such surveys are to be completed within their prescribed windows;

(iii) In the case of all other periodical surveys and recommendations, extension of class may be granted until the arrival of the ship at the first port of call.

1.11 Reclassification

1.11.1 When reclassification is desired for a ship for which the class previously assigned has been withdrawn, the Society is to direct a reclassification survey, appropriate to the age of the ship and the circumstances of the case, to be carried out by the Surveyor. If at such a survey, the ship is found or placed in a good and efficient condition in accordance with the requirements of the Rules, the Society is prepared to reinstate her original class as may be deemed necessary. The date of reclassification is to be recorded in the Register.

1.12 Survey Fees and Expenses

1.12.1 Survey fees are to be chargeable and expenses to be reimbursed if incurred according to the "Scale of Survey Fees" of the Society. All fees and expenses are to be promptly paid by the Owner or the applicant or their representatives after completion of each survey. In default of such payment, the Society may withhold the issuance of the certificates or reports. If the class is already granted, the same may be withdrawn or expunged from the Register.

1.13 International Conventions and Codes

Where authorized by the government of the country in which a ship is registered or intended to be registered and upon request by builders or owners of the ship, the Society is to survey a new or existing ship for compliance with the provisions of International Conventions and Codes.

1.14 Governmental Regulations

Where authorized by a government agency and upon request of the Owners of the ships, the Society will survey and certify a new or existing ships for compliance with particular regulations of that government.

1.15 Sea Trials

1.15.1 In the classification survey of all ships, sea trials specified in following (a) to (j) are to be carried out in full load condition, in the calmest possible sea and weather condition and at the deep unrestricted water. However, where sea trials cannot be carried out in full load condition, sea trials may be carried out in an appropriate loaded condition. The noise measurements specified in (k) are to be carried out at either the full load condition or the ballast condition.

(a) Speed test.

(b) Astern test.

(c) Steering test and the change-over test from the main to auxiliary steering gear.

(d) Turning test.

(e) Confirmation of no abnormality for the operating condition of machinery and behaviors of the ship during the trials.

(f) Performance test of windlass.

(g) Performance test of automatic and remote control systems for main propulsion machinery or the controllable pitch propellers, boilers and electric generating sets.

(h) The accumulation test of boilers.

(i) Measurement of the torsional vibration for the shafting systems. (refer to Chapter 6 of Part IV)
Where it is deemed appropriate by the Society, the measurement of the torsional vibration for the shafting systems during the sea trials may be dispensed with, provided that sufficient analysis data (e.g. torsional vibration analysis) which ensure there is no critical vibration within the service speed range.

(j) Measurement of the sound pressure levels of fixed fire detection and fire alarm systems.

(k) Noise measurements. (Refer to Chapter 34 of Part II, as applicable)

(l) Other tests where deemed necessary by the Society.
Some sea trial tests of an individual ship may be dispensed with provided that the available data can be obtained from those of a sister ship or other adequate means and a special approval in given by the Society.

1.15.2 The results of the tests are to be submitted to the Society as sea trial record.

1.15.3 In the case of classification survey of the ships not built under the Society's survey, the above tests may be dispensed with, provided that sufficient data on the previous tests are available and no alteration affecting the tests specified above have been made after the previous tests.

1.16 Stability Experiment

1.16.1 In the classification survey, stability experiment by inclining test of a ship are to be carried out upon completion of the ship (See Appendix 2). A stability information booklet, which is to be prepared on the basis of the particulars of stability determined by the results of stability experimental and to be approved by the Society, is to be provided on board. The intact stability criteria in Part A of 2008 IS Code (MSC.267(85)) shall be as a minimum requirement.

1.16.2 Inclining test may be dispensed with, provided that:

(a) The ship's basic stability data is available from inclining test of a sister ship, if a weight survey is carried out upon completion, and in comparison with the data derived from the sister ship, the deviation from the lightship displacement is not exceeding 1% for ship of 160 m or more in length, and 2% for ship of 50 m or less in length and as determined by linear interpolation for intermediate lengths, and a deviation from lightship LCG not exceeding 0.5 % of subdivision length (Ls); or

(b) The ship is especially designed for the carriage of liquid or ore in bulk, when reference to existing data for similar ships clearly indicates that due to the ship's proportions and arrangements, more sufficient GM will be available in all probable loading cases.

1.16.3 Where any alteration are made to a ship so as to materially affect the stability information, amended and approved stability information shall be provided. The ship shall be re-inclined if anticipated deviations exceed one of the values specified in next paragraph.

1.16.4 At periodical intervals not exceeding five years, a lightweight survey shall be carried out on all passenger ships to verify any changes in lightweight displacement and LCG. The ship shall be re-inclined whenever, in comparison with the approved stability information, a deviation from the lightship displacement exceeding 2% or a deviation of LCG exceeding 1% of Ls is found or anticipated.

1.17 Liability and Compensation

1.17.1 Article 1

(a) CR CLASSIFICATION SOCIETY is a Society (the "Society") whose purpose is the classification (« Classification ») of any ship or vessel or structure of any type or part of it or system therein collectively hereinafter referred to as a "Unit" whether linked to shore, river bed or sea bed or not, whether operated or located at sea or in inland waters or partly on land, including submarines, hovercrafts, drilling rigs, offshore installations of any type and of any purpose, their related and ancillary equipment, subsea or not, such as well head and pipelines, mooring legs and mooring points or otherwise as decided by the Society.

The Society:

(i) prepares and publishes Rules for classification, Guidance Notes and other documents (« Rules »);

(ii) issues Certificates, Attestations and Reports following its interventions (« Certificates »);

(iii) publishes Registers.

(b) The Society also participates in the application of National and International Regulations or Standards, in particular by delegation from different Governments. Those activities are hereafter collectively referred to as « Certification ».

(c) The Society can also provide services related to Classification and Certification such as ship and company safety management certification; ship and port security certification, training activities; all activities and duties incidental thereto such as documentation on any supporting means, software, instrumentation, measurements, tests and trials on board.

(d) The Society can also provide services in independent surveys, such as independent survey of a ship, materials and equipment, or other equipment carried out according to the Purchase Agreement or specified rules; or appraisal before purchase of a non-CR class ship or verification of seaworthiness of a ship conducted at the request of the owner; or damage survey of a non-CR class ship as required by an insurance company.

(e) The interventions mentioned in (a), (b) and (c) are referred to as « Services ». The party and/or its representative requesting the services is hereinafter referred to as the « Client ». The Services are prepared and carried out on the assumption that the Clients are aware of the International Maritime and/or Offshore Industry (the "Industry") practices.

(f) The Society is neither and may not be considered as an Underwriter, Broker in ship's sale or chartering, Expert in Unit's valuation, Consulting Engineer, Controller, Naval Architect, Manufacturer, Shipbuilder, Repair yard, Charterer or Shipowner, who are not relieved of any of their expressed or implied obligations by the interventions of the Society.

1.17.2 Article 2

(a) Classification is the appraisement given by the Society for its Client, at a certain date, following surveys by its surveyors along the lines specified in 1.17.3 and 1.17.4 hereafter on the level of compliance of a Unit to its Rules or part of them. This appraisement is represented by a class entered on the Certificates and periodically transcribed in the Society's Register.

(b) Certification is carried out by the Society along the same lines as set out in 1.17.3 and 1.17.4 hereafter and with reference to the applicable National and International Regulations or Standards.

(c) It is incumbent upon the Client to maintain the condition of the Unit after surveys, to present the Unit for surveys and to inform the Society without delay of circumstances which may affect the given appraisement or cause to modify its scope.

(d) The Client is to give to the Society all access and information necessary for the performance of the requested services.

1.17.3 Article 3

(a) The Rules, procedures and instructions of the Society take into account, at the date of their preparation, the state of currently available and proven technical knowledge of the Industry. They are not a code of construction neither a guide for maintenance or a safety handbook. Committees consisting of personalities from the Industry contribute to the development of those documents.

(b) The Society only is qualified to apply its Rules and to interpret them. Any reference to them has no effect unless it involves the Society's intervention.

(c) The Services of the Society are carried out by professional Surveyors according to the Code of Ethics of CR CLASSIFICATION SOCIETY.

(d) The operations of the Society in providing its Services are exclusively conducted by way of random inspections and do not in any circumstances involve monitoring or exhaustive verification.

1.17.4 Article 4

The Society, acting by reference to its Rules:

(a) Reviews the construction arrangements of the Units as shown on the documents presented by the Client;

(b) Conducts surveys at the place of their construction;

(c) Classes Units and enters their class in its Register;

(d) Surveys periodically the Units in service to note that the requirements for the maintenance of class are met. The Client is to inform the Society without delay of circumstances which may cause the date or the extent of the surveys to be changed.

1.17.5 Article 5

(a) The Society acts as a provider of services. This cannot be construed as an obligation bearing on the Society to obtain a result or as a warranty.

(b) The certificates issued by the Society pursuant to 1.17.5(a) here above are a statement on the level of compliance of the Unit to its Rules or to the documents of reference for the Services provided for. In particular, the Society does not engage in any work relating to the design, building, production or repair checks, neither in the operation of the Units or in their trade, neither in any advisory services, and cannot be held liable on those accounts. Its certificates cannot be construed as an implied or express warranty of safety, fitness for the purpose, seaworthiness of the Unit or of its value for sale, insurance or chartering.

(c) The Society does not declare the acceptance or commissioning of a Unit, nor of its construction in conformity with its design, that being the exclusive responsibility of its owner or builder, respectively.

(d) The Services of the Society cannot create any obligation bearing on the Society or constitute any warranty of proper operation, beyond any representation set forth in the Rules, of any Unit, equipment or machinery, computer software of any sort or other comparable concepts that has been subject to any survey by the Society.

1.17.6 Article 6

(a) The Society accepts no responsibility for the use of information related to its Services which was not provided for the purpose by the Society or with its assistance.

(b) If the Services of the Society cause the Client a damage which is proved to be the direct and reasonably foreseeable consequence of an error or omission of the Society, its liability towards the Client is limited to two times the amount of fee paid for the Service having caused the damage, but no greater than ten million (NT$10,000,000) New Taiwan dollars. The Society bears no liability for indirect or consequential loss such as e.g. loss of revenue, loss of profit, loss of production, loss relative to other contracts and indemnities for termination of other agreements.

(c) All claims are to be presented to the Society in writing within three months of the date when the Services were supplied or (if later) the date when the events which are relied on of were first known to the Client, and any claim which is not so presented shall be deemed waived and absolutely barred.

1.17.7 Article 7

(a) Requests for Services are to be in writing.

(b) Either the Client or the Society has rights to terminate the requested Services after giving the other party thirty days' written notice, for convenience, and without prejudice to the provisions in 1.17.8 hereunder.

(c) The class granted to the concerned Units and the previously issued certificates remain valid until the date of effect of the notice issued according to 1.17.7(b) hereabove subject to compliance with 1.17.2(c) hereabove and 1.17.8 hereunder.

1.17.8 Article 8

(a) The Services of the Society, whether completed or not, involve the payment of fee upon receipt of the invoice and the reimbursement of the expenses incurred.

(b) Overdue amounts are increased as of right by interest in accordance with the applicable legislation.

(c) The class of a Unit may be suspended in the event of non-payment of fee after a first unfruitful notification to pay.

1.17.9 Article 9

The documents and data provided to or prepared by the Society for its Services, and the information available to the Society, are treated as confidential. However:

(a) Clients have access to the data they have provided to the Society and, during the period of classification of the Unit for them, to the classification file consisting of survey reports and certificates which have been prepared at any time by the Society for the classification of the Unit;

(b) Copy of the documents made available for the classification of the Unit and of available survey reports can be handed over to another Classification Society in case of the Unit's transfer of class;

(c) The certificates, documents and information relative to the Units classed with the Society may be reviewed and disclosed upon order of the concerned governmental or inter-governmental authorities or of a Court having jurisdiction. The documents and data are subject to a file management plan.

1.17.10 Article 10

Any delay or shortcoming in the performance of its Services by the Society arising from an event not reasonably foreseeable by or beyond the control of the Society shall be deemed not to be a breach of contract.

1.17.11 Article 11

(a) In case of diverging opinions during surveys between the Client and the Society's surveyor, the Society may designate another of its surveyors at the request of the Client.

(b) Disagreements of a technical nature between the Client and the Society can be submitted by the Society to the advice of its Head Office.

1.17.12 Article 12

(a) Disputes over the Services carried out by delegation of Governments are assessed within the framework of the applicable agreements with the States, international Conventions and national rules.

(b) Disputes arising out of the payment of the Society's invoices by the Client are submitted to Taiwan Taipei District Court.

(c) Other disputes over the present Article 1.17 or over the Services of the Society are exclusively submitted to arbitration, by three arbitrators, in Taipei according to the Arbitration Act or any statutory modification or re-enactment thereof. The contract between the Society and the Client shall be governed by the Republic of China (Taiwan) law.

1.17.13 Article 13

(a) The Article 1.17 constitutes the sole contractual obligations binding together the Society and the Client, to the exclusion of all other representation, statements, terms, conditions whether express or implied. They may be varied in writing by mutual agreement.

(b) The invalidity of one or more stipulations of the present Article 1.17 does not affect the validity of the remaining provisions.

(c) The definitions herein take precedence over any definitions serving the same purpose which may appear in other documents issued by the Society.

Table I 1-1
List of Automation Symbol affixed to CMS

Symbol	Description	Reference
CAS	This symbol will be assigned when a ship's machinery installation complies with the requirements for automatic or remote control and monitoring system.	Part VIII Chapter 4
CAU	This symbol will be assigned when a ship's machinery installation complies with the requirements for automatic or remote control and monitoring system with unattended machinery spaces.	Part VIII Chapter 5
CAB	This symbol will be assigned when a ship is capable of operating as **CAU** but because of their compact propulsion machinery space design are not fitted with the means to control the propulsion and its associated machinery from a centralized location within the propulsion machinery space.	Part VIII Chapter 6

Table I 1-2
List of Ship Type Notation

Notation	Description	Reference
Barge	Non-self-propelled barges intended to be towed or pushed	Part II and Part III Chapter 9
Bulk Carrier	For ships intended primarily to carry dry cargo in bulk, generally having single deck, topside tanks, hopper side tanks and double bottom in cargo spaces, cargo holds bounded by single or double side skin.	Part III Chapter 1 and 1A
Chemical Carrier	For ships which are constructed generally with integral tanks and intended primarily to carry chemicals in bulk.	Part III Chapter 5
Container Carrier	For ships which are built for the carriage of containers in holds or on decks.	Part III Chapter 3
Fire-fighting Ship N	Ships intended for fire-fighting operation are to be assigned this class notation, with N being **1**, **2** or **3**.	Part III Chapter 12
Fishing Vessel	For ships which are built for the purpose of fishing.	Part III Chapter 7
Floating Dock	For floating docks which comply with the applicable requirements in Chapter 8 of Part III.	Part III Chapter 8
General Dry Cargo Ship	For ships which are defined in Part I Chapter 2.	Rules for the construction and classification of steel ships
General Dry Cargo Ship with Double Hull	For ships which are defined in I/2.1.2(k)(x).	Rules for the construction and classification of steel ships
Liquefied Gas Carrier	For ships which are built for the carriage of liquefied gas in bulk.	Part III Chapter 4
Ore Carrier	For ships which are constructed generally with single deck, two(2) longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the center holds only.	Part III Chapter 1
Oil Tanker	For ships which are constructed generally with integral tanks and intended primarily to carry oil in bulk., having flash point at or below 60°C (closed cup test). When carry oil product with a flash point exceeding 60°C such as asphalt, additional service notation "**Flash Point > 60°C**" should be added.	Part III Chapter 2 and 2A
Ore/Oil Carrier	For ships which are constructed generally with single deck, two(2) longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the center holds or oil cargoes in center holds and wing tanks.	Part III Chapter 2 and 2A

Notation	Description	Reference
Ore/Bulk/Oil Carrier	For ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in the cargo length area, and intended primarily to carry oil or dry cargoes, including ore, in bulk.	Part III Chapter 2 and 2A
Passenger Ship	For ships which carry more than 12 passengers.	Rules for the Construction and Classification of Steel Ships
Refrigerated Cargo Ship	For ships which are specially designed and constructed for the carriage of refrigerated cargoes.	Part X
RO/RO Cargo Ship	For ships which are specially designed and constructed for the carriage of vehicles, and cargoes in pallet form or in containers and loaded/unloaded by wheeled vehicles.	Part III Chapter 6
Tug	For ships which are built for the purpose of towing or pushing other vessels.	Part III Chapter 11
Escort Tug (F_S, t, v)	An escort tug is a tug intended for escort operation. The escort rating number (**F_S, t, v**) shall be determined by approved full scale trials.	Part III Chapter 11A
Offshore Service Unit	For Ships built for the purpose of ocean service	Part III Chapter 13
HLA	This notation (**H**eavy **L**ift **A**ppliance) will be assigned to ships equipped with heavy lift appliance.	Rules for the Construction and Survey of Cargo Gears
Self-Propelled Unit	This notation will be assigned to units designed with means of propulsion capable of propelling the unit during long distance ocean transits without external assistance.	Part III Chapter 13
Non Self-Propelled Unit	This notation will be assigned to units that are not a self-propelled unit.	Part III Chapter 13
Self-Elevating Unit	This notation will be assigned to units with movable legs capable of raising its hull above the surface of the sea and lowering it back into the sea.	Part III Chapter 13
SUBMARINE	This notation will be assigned to submarines complying with the requirements of chapter 1 to chapter 3 of the Rules for the Construction and Classification of Submarines (hereinafter referred to as the Rules for Submarines).	Chapter 1 to Chapter 3 of the Rules for Submarines
OSV	This notation will be assigned to **O**ffshore **S**ervice **V**essel which is intended for supporting offshore installations. If the vessel complies with the additional requirements for specific operations or design condition, the corresponding qualifiers specified in Chapter 16 of Part III will be affixed to this notation.	Part III Chapter 16
Standby Vessel	This notation will be assigned to the vessel designed to carry out standby and rescue services to offshore installations. If the vessel complies with the additional requirements for specific operations or design condition, the corresponding qualifiers specified in Chapter 16 of Part III will be affixed to this notation.	Part III Chapter 16

Note:

(1) For ships deemed necessary by the Society, an appropriate notation except specified above may be affixed to classification characters.

Table I 1-3
List of Additional Service Notation

Notation	Description	Reference
CSR	This notation will be assigned to bulk carriers or oil tankers which fully comply with the IACS's **C**ommon **S**tructural **R**ules.	IACS's **C**ommon **S**tructural **R**ules
BC-A	This notation will be assigned to bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to **BC-B** conditions.	Part III/1.2
BC-B	This notation will be assigned to bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to **BC-C** conditions.	Part III/1.2
BC-C	This notation will be assigned to bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.	Part III/1.2
{Maximum cargo density (t/m^3)}	This service feature will be indicated within the annotation for notations **BC-A** and **BC-B** if the maximum cargo density is less than 3.0 t/m^3.	Part III/1.2
{No MP}	This service feature will be indicated within the annotation for notation **BC-A, BC-B** and **BC-C** if the ship has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in 1.2.5(c) of Part III.	Part III/1.2
{Holds a, b,…… may be empty}	This service feature will be indicated within the annotation for notation **BC-A,** for the combination of specified empty holds.	Part III/1.2
GRAB [X]	This notation will be assigned to ships, of which the holds are to be designed for loading/unloading by grabs having a maximum specific weight **X** equal to or greater than 20 tons.	Part III/1.2
GRAB	This notation will be assigned to ships strengthened for loading/unloading cargoes by means of grabs or buckets deemed as appropriate by the Society.	Rules for the Construction and Classification of Steel Ships
Flash Point > 60°C	For oil tankers intended to carry oil having flash point above 60°C (closed cup test).	Part III Chapter 2 and 2A
ESP	This notation (**E**nhanced **S**urvey **P**lan) will be assigned to oil tankers, combination carriers, bulk carriers, ore carriers and chemical tankers, as defined in 2.1.2 of Part I which are subject to an enhanced survey plan.	Part I Chapter 2
PSPC	This notation (**P**erformance **S**tandard for **P**rotective **C**oating) will be assigned to any ship where the applicable requirements in 23.1.4 of Part II are complied with.	Part II/23.1.4
HSC-N	This notation, with **N** being **PA**, **PB** or **C**, will be assigned to ships which fully comply with the Rules for the Construction and Classification of High-Speed Craft.	Rules for the Construction and Classification of High-Speed Craft
LSC	This notation (**L**ight **S**tructure **C**raft) will be assigned to ships which comply with the requirements of structure, fire safety, escape measures and life-saving appliances and arrangements for high-speed craft, as appropriate, and are capable of maximum speed $3.7\nabla^{0.1667}$ (m/s) (∇ = displacement in m^3 corresponding to the load line) and not to proceed in the course of their voyage more than the time as specified in 1.3.4 of the Rules for the Construction and Classification of High-Speed Craft.	Chapter 3, 4, 7 and 8 in Rules for the Construction and Classification of High-Speed Craft
PMA	This notation (**P**ermanent **M**eans of **A**ccess) will be assigned to ships where the applicable requirements in Chapter 28 of Part II are complied with.	Part II Chapter 28
GBS	This notation will be assigned to GBS ships which fully comply with the requirements of Part XIV	Part XIV

BP[X]	This notation will be assigned to ships which have a maximum bollard pull load **X** in tons.	Part III/11.9
NR	This notation (the comfort **R**ating of **N**oise) will be assigned to ships where the applicable requirements in Chapter 34 of Part II are complied with.	Part II Chapter 34
BC-XII	This notation will be assigned to ships where the applicable requirements in Chapter 14 of Part III are complied with.	Part III Chapter 14
SPS	This notation will be assigned to ships that comply with the IMO Code of Safety for Special Purpose Ships (SPS Code).	SPS Code

Table I 1-4
List of Service Restriction Notation

Notation	Description	Reference
Coastal Service	Service along a coast, the geographical limits of which will be indicated in the Register, and for a distance out to sea generally not exceeding 30 nautical miles, unless some other distance is specified for 'Coastal Service' by the Administration with which the ship is registered, or by the Administration of the coast off which it is operating, as applicable.	
Greater Coastal Service	Service along a coast, the geographical limits of which will be indicated in the Register, and for a distance out to sea generally farther than the area of **Coastal Service** in domestic voyage.	
Protected Waters Service	Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered waters between islands.	
Specified Operating Area Service	Service within one or more geographical area(s) which will be indicated in the Register.	
Specified Route Service	Service between two or more ports or other geographical features which will be indicated in the Register.	

Table I 1-5
List of Additional Survey Notation

Notation	Description	Reference
IWS	This notation (**I**n **W**ater **S**urvey) will be assigned to ships which are suitable for in-water survey in lieu of bottom survey in dry dock.	Part I/1.6.7(b) & 2.2.2 of the Rules
PCM(1)	This notation (**P**ropeller shaft **C**ondition **M**onitoring) will be assigned when oil lubricated propeller shaft arrangements with approved oil glands are fitted and the requirements of 2.3.4 of Part I of the Rules are complied with.	Part I/2.3.4 of the Rules
PMS(1)	This notation (**P**lanned **M**aintenance **S**cheme for machinery) will be assigned to ships for which an approved planned maintenance scheme for machinery is adopted as an alternative to continuous survey for machinery.	Part I/1.6.4(g) of the Rules

Note:

(1) Means notation, when assigned, to be added after the classification symbol **CMS**.

Table I 1-6
List of Special Equipment Notation

Notation	Description	Reference
CCB	This notation (**C**entralized System for **C**argo and **B**allast Water Handling) will be assigned to ships provided with centralized system for cargo and ballast water handling.	Part VIII/7.10
DPS-N	This notation (**D**ynamic **P**ositioning **S**ystem), with N being **I**, **II** or **III**, will be assigned to ships provided with dynamic positioning system.	Part IV Chapter 10
ETA	This notation (**E**mergency **T**owing **A**rrangement) will be assigned to tankers provided with emergency towing arrangements.	Part II/25.7
Helideck-N	This notation(**Heli**copter **deck**), with N being **I**, **II, III** or **IV**, will be assigned to ships provided with helicopter facilities in accordance with related requirements of the Rules.	Part II Chapter 12A
HHA	This notation (**H**igh **H**olding **A**nchor) will be assigned to ships receiving the equipment symbol **E,** with a specially considered anchor of approved superior holding ability for which the mass of the anchor may be reduced up to a maximum of 25% from the mass specified in Table II 25-1.	Part II/25.3
IGS[(1)]	This notation (**I**nert **G**as **S**ystem) will be assigned when a ship intended for the carriage of oil in bulk, or for the carriage of liquid chemicals in bulk, fitted with an approved system for producing gas for inert the cargo tanks.	Part VI/5.8
LCS	This notation (**L**oading **C**omputer **S**ystem) will be assigned where an approved loading computer system has been installed as a classification requirement in 1.1.13 of Part I.	Part I/1.1.13 & Appendix 1 & Part II/3.5
VEC	This notation (**V**apor **E**mission **C**ontrol) will be assigned to ships equipped with cargo vapor emission control system in compliance with the requirements in 3.16 of Part VI. The notation **–T** is added to the notation where, in addition, the ship is fitted with specific arrangements for transferring cargo vapors to another ship.	Part VI/3.16
AIP[(1)]	This notation (**A**ir **I**ndependent **P**ropulsion System) will be assigned if submarines provided with an Air Independent Propulsion system which complying with the requirements of section 4.4 of the Rules for Submarines.	Section 4.4 of the Rules for Submarines
CSS	This notation (**C**ontainer **S**ecuring **S**ystems) will be assigned to ships which have a certified container securing system for unrestricted service.	Guidelines for Certification of Container Securing Systems
CSP	This notation (**C**ontainer **S**ecuring **P**rogram) will be assigned to ships which have certified container securing program provided onboard.	Guidelines for Certification of Container Securing Systems
CSP-RSS	This notation (**C**ontainer **S**ecuring **P**rogram**)** with suffix **(R**oute **S**pecific **S**ervice) will be assigned to ships which signify the certification of the container securing program's capability to address both unrestricted service and route specific service.	Guidelines for Certification of Container Securing Systems
Elev	The notation (**Elev**ator) may be assigned to ships under owner's request where the applicable requirements in the Guidelines are complied with.	Guidelines for Elevators
AccGui Elev	The notation (**Acc**essible and **Gui**de **Elev**ator) will be assigned to ships which have accessible and guide facilities for disabled passengers under owner's request where the applicable requirements in the Guidelines are complied with.	Guidelines for Elevators
FC Energy[(1)]	This notation (**F**uel **C**ell **Energy**) will be assigned to ships where the fuel cell energy source is used for essential, important or emergency services.	Guidelines for Fuel Cell Installations

Notation	Description	Reference
FC Installation[1]	This notation (**F**uel **C**ell **Installation**) will be assigned to ships complying with the safety and environmental requirements where the fuel cell energy source is not used for essential, important or emergency services.	Guidelines for Fuel Cell Installations
Gas Fuel[1]	This notation (**Gas Fuel**) will be assigned to ships where only the gas fuel is used for main propulsion engines.	Guidelines for Natural Gas-Fuelled Engine Installations
Dual Fuel[1]	This notation will be assigned to ships where the gas fuel and oil fuel are used for main propulsion engines.	Guidelines for Natural Gas-Fuelled Engine Installations

Note:

(1) It means that the notation, when assigned, is to be added after the classification symbol **CMS**.

Table I 1-7
List of Ice Class Notation

Notation	Description	Reference
Ice Class N	This notation, with N being **IAS**, **IA**, **IB** or **IC**, will be assigned to ships where the requirements in Chapter 10 of Part III of the Rules are complied with. If ships intend to navigate in polar waters and comply with the requirements in Chapter 10A of Part III of the Rules, this notation, with N being **PC1, PC2**… or **PC7**, will also be assigned to ships.	Part III Chapter 10 and Chapter 10A

Table I 1-8
List of Navigation Safety Notation

Notation	Description	Reference
NAV[1]	This notation will be assigned to ships when the requirements of navigation safety system in Chapters 2 and 3 of Part XIII of the Rules are complied with.	Part XIII Chapters 2 and 3
NAV0[1]	This notation will be assigned to ships when the requirements of navigation safety system in Chapters 2, 3, 4, 5, 6, 7, 9 and 10 of Part XIII of the Rules are complied with.	Part XIII Chapters 2, 3, 4, 5, 6, 7, 9 and 10
NAV1[1]	This notation will be assigned to ships when the requirements of navigation safety system in Chapters 2 to 10 of Part XIII of the Rules are complied with.	Part XIII Chapters 2 to 10

Note:

(1) Means notation, when assigned, to be added after the classification symbol **CMS**.

Table I 1-9
List of Refrigerated Cargo Installation Notation

Notation	Description	Reference
CA	This notation (**C**ontrolled **A**tmosphere) will be assigned together with applicable descriptive note when a refrigerated cargo ship is provided with a CA system to extend the life of fresh products and cargoes which will achieve and maintain specified ranges of oxygen and carbon dioxide levels or specified relative humidity in the cargo holds, and which are approved, installed and tested in accordance with the requirements in Chapter 6 of Part X of the Rules. It is a prerequisite that the refrigeration installation on board be assigned an **RMS** class.	Part X Chapter 6
CRC	This notation (**C**arriage of **R**efrigerated **C**ontainers) will be assigned together with applicable descriptive note when a container ship has the ability to carry refrigerated containers stowed on deck as well as in a hold space, and is provided with the ventilation system and the electrical power supply which are approved, installed and tested in accordance with the requirements in Chapter 8 of Part X of the Rules. The classification symbol **RMS** is not necessarily required when **CRC** notation assigned.	Part X Chapter 8

Table I 1-10
List of Environmental Protection Notation

Notation	Description	Reference
POT	This notation (**P**rotection of Fuel and Lubricating **O**il **T**anks) will be assigned to ships having an aggregate fuel oil capacity of 600 m^3 and above with fuel oil and lubricating oil tanks arranged in accordance with the requirement specified in 6.5.3 of Part VI.	Part VI/6.5.3
PP	This notation (**P**ollution **P**revention) will be assigned to ships where the applicable requirements in Chapter 32 of Part II are complied with.	Part II Chapter 32
BWM	This notation (**B**allast **W**ater **M**anagement) will be assigned to ships where the applicable requirements in Chapter 32 of Part II are complied with.	Part II Chapter 32
EEDI	This notation (**E**nergy **E**fficiency **D**esign **I**ndex) will be assigned to ships where the applicable requirements in Chapter 32 of Part II are complied with.	Part II Chapter 32
SEEMP	This notation (**S**hip **E**nergy **E**fficiency **M**anagement **P**lan) will be assigned to ships where the applicable requirements in Chapter 32 of Part II are complied with.	Part II Chapter 32
SRE	This notation (**S**hip **Re**cycling) will be assigned to ships where the applicable requirements in Chapter 31 of Part II are complied with.	Part II Chapter 31
SRE-EU	This notation **SRE-EU** will be assigned to ships where the applicable requirements in Chapter 31 of Part II are complied with.	Part II Chapter 31
SCR(1)	This notation will be assigned to ships where the applicable requirements in the Guidelines for **S**elective **C**atalytic **R**eduction Systems are complied with.	Part IV/ 3.7.3(i)
SO_X Scrubber(1)	This notation will be assigned to ships where the applicable requirements in the Guidelines for **SOx Scrubber** Systems are complied with.	Part IV/ 3.7.3(i)
SO_X Scrubber Ready-N(1)	This notation, with **N** being **I**, **II** or **III**, will be assigned to ships where the applicable requirements in the Guidelines for SO_X Scrubber Systems are complied with.	Guidelines for SO_X Scrubber Systems
EGR(1)	This notation will be assigned to ships where the applicable requirements in the Guidelines for **E**xhaust **G**as **R**ecirculation Systems are complied with.	Part IV/ 3.7.3(i)

Notes:

(1) It means notation, when assigned, to be added after the classification symbol **CMS**.

Chapter 2

Survey Requirements of Steel Ship

2.1 General

2.1.1 General

(a) The Surveyor is to have free access at any time in order to examine a classed ship and to make sure of her good condition.

(b) When a survey becomes due or any damage or alterations which may affect the technical fitness or the class to the hull or machinery of the ship occurred, the owner or his representative is to apply in time for a survey to be made without waiting for notice from the Society. (See 1.6.10(a) and 1.6.11(b))

(c) In the case of any disagreement or dispute between the owner and the Surveyor or other officers regarding the inspection, examination and survey work, an appeal in writing for re-survey or explanation may be made to the Society.

(d) Though the survey of a certain part of the ship being surveyed is not included in this Chapter, the Surveyor may, if deemed necessary, make an additional survey of such a part. The Head Office of the Society also reserve the rights to perform an occasional survey whenever reasonable necessity exists.

(e) Modification of requirements

(i) At the periodical surveys, the Surveyor may modify the requirements for periodical surveys specified in this Chapter having regard to the size, service engaged, age, construction, results of last surveys and actual condition of the ship.

(ii) For spaces where effective coatings are found to be in a Good condition, the extent of internal examination or gauging requirements specified in this Chapter may be specially considered at the discretion of the Surveyor.

(f) Additional requirements to prevent from the detention by Port State Control and to ensure the safety for bulk carriers, general dry cargo ships and tankers over 15 years old and for non general dry cargo ships over 20 years old when carry out the periodical survey:

(i) For spaces where coatings are found to be in a POOR condition, the spaces are to be de-rusted/de-scaled, thickness measured and examined. If the measured areas were found in substantial corrosion condition, the areas are to be cropped and renewed before the periodical survey was completed. Otherwise, the spaces are to be de-rusted/de-scaled, thickness measured and examined annually. If the measured spaces were not in substantial corrosion condition, the spaces are to be re-coated to be at least in FAIR condition before the periodical survey was completed. Otherwise, the spaces are to be de-rusted/de-scaled, thickness measured and examined annually.

(ii) For spaces where the substantial areas are found, although the coatings are in a FAIR or GOOD condition, the substantial corrosion areas are to be cropped and renewed before the periodical survey was completed. Otherwise, the substantial corrosion areas are to be de-rusted/de-scaled, thickness measured and examined annually.

2.1.2 Definitions

(a) Air Pipe Head

Air pipe heads installed on the exposed decks are those extending above the freeboard deck or superstructure decks.

(b) Ballast Tank

(i) A ballast tank for all vessels is a tank which is used primarily for the carriage of salt water ballast.

(ii) A ballast tank for ESP tankers is a tank which is used solely for the carriage of salt water ballast.

(iii) A ballast tank for ESP bulk carriers is a tank which is used solely for the carriage of salt water ballast, or where applicable, a space which is used for both cargo and salt water ballast will be treated as a ballast tank when substantial corrosion has been found in that space. A double side tank is to be considered as a separate tank even if it is in connection to either the topside tank or the hopper tank.

(c) Bay

Bay is the area between adjacent transverse frames from longitudinal bulkhead to longitudinal bulkhead (or side shell).

(d) Bulk Carrier

(i) A bulk carrier is a ship which is constructed generally with hopper side tanks and topside tanks in cargo spaces and intended primarily to carry dry cargo in bulk. It includes a vessel of such type as ore carrier or combination carrier.

(ii) A double skin bulk carrier is a ship which is constructed generally with single deck, hopper side tanks and topside tanks in cargo spaces and intended primarily to carry dry cargo in bulk. It includes a vessel of such type as ore carrier or combination carrier, in which all cargo holds are bounded by a double-side skin (regardless of the width of the wing space).

(e) Cargo Area or Cargo Length Area

Cargo Area or Cargo Length Area is that part of the ship that contains cargo holds and cargo / slop tanks and adjacent areas including ballast tanks, fuel tanks, cofferdams, void spaces and also including deck areas throughout the entire length and breadth of the part of the ship over the mentioned spaces.

(f) Close-up Survey

A close-up survey is a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within the reach of hand.

(g) Coating Condition

Coating condition of hard coatings is defined as follows:

(i) GOOD is a condition with only minor spot rusting.

(ii) FAIR is a condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20% or more of areas under consideration, but less than as defined for Poor condition.

(iii) POOR is a condition with general breakdown of coating over 20% or more of areas or hard scale at 10% or more of areas under consideration.

(h) Combined Cargo/ Ballast Tank – Oil Tanker and Chemical Tanker

A combined cargo/ ballast tank is a tank which is used for the carriage of cargo or ballast water as a routine part of the vessel's operation and will be treated as a ballast tank. Cargo tank in which water ballast might be carried only in exceptional cases as per MARPOL I/18(3) are to be treated as cargo tank.

(i) Corrosion Prevention System

A corrosion prevention system is normally considered as a full hard coating. Protective coating is usually to be epoxy coatings or equivalent. Other coating systems, which are neither soft nor semi-hard coating, may be considered acceptable as alternatives, provided that they are applied in compliance with the manufacturers' specification.

Where soft or semi-hard coating has been applied, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals and safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures, which may include spot removal of the coating. When safe access cannot be provided the soft coating or semi-hard is to be removed.

(j) Critical Structural Areas

Critical structural areas are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or from similar or sister ships to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

(k) General Dry Cargo Ships

"General dry cargo ships" are ships carrying solid cargoes other than:

(i) bulk carriers (including single and double skin);

(ii) dedicated container carriers;

(iii) dedicated forest product carriers (not timber or log carriers);

(iv) ro-ro cargo ships;

(v) refrigerated cargo ships;

(vi) dedicated wood chip carriers;

(vii) dedicated cement carriers;

(viii) livestock carriers;

(ix) deck cargo ship which is designed to carry cargo exclusively above deck without any access for cargo below deck; and

(x) general dry cargo ships of double side-skin construction , with double side-skin extending for the entire length of the cargo area, and for the entire height of the cargo hold to the upper deck

(l) Oil

Oil is petroleum in any form including crude oil, fuel oil, sludge, oil refuse, and refined products others than petrochemicals which are subject to the provisions of Annex II of the MARPOL 73/78.

(m) Overall Survey

An overall survey is a survey intended to report on the overall condition of the hull structure and determine the extent of additional close-up surveys.

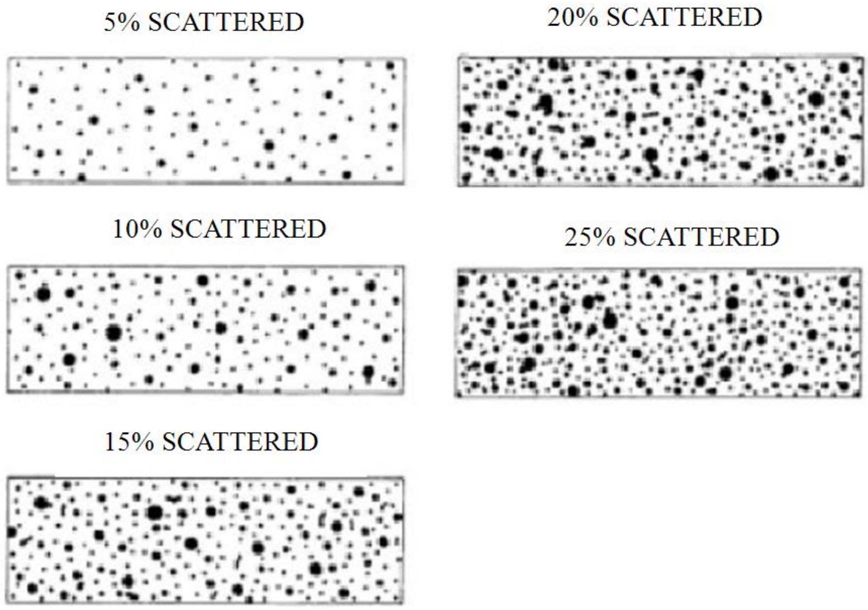
(n) Panel

Panel is the area between adjacent transverse frames from longitudinal stiffener to longitudinal stiffener.

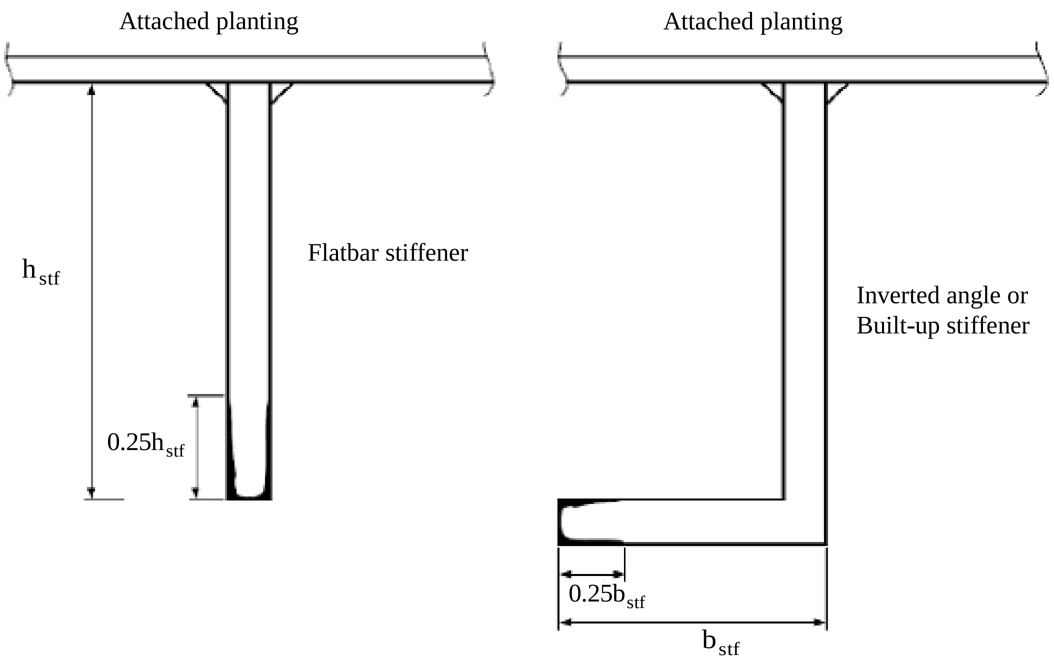
(o) Pitting Corrosion , Edge corrosion and Grooving corrosion

Pitting corrosion is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area.

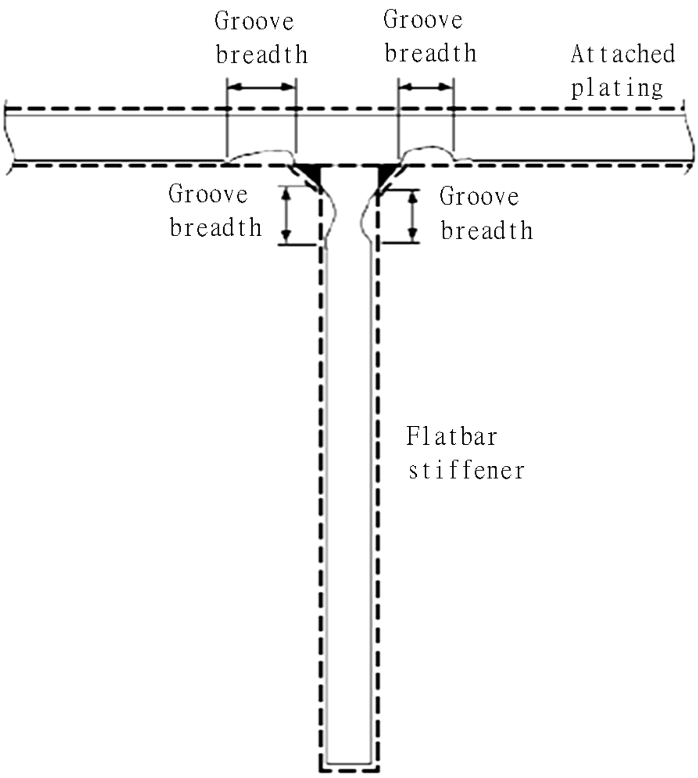
Pitting intensity is defined as shown below:



Edge corrosion is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings as shown below



Grooving corrosion is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams as shown below



(p) Prompt and Thorough Repair

A prompt and thorough repair is defined as a permanent repair completed at the time of the survey to the satisfaction of the Surveyor.

(q) Representative Tanks/Spaces

Representative tanks/spaces are those which are expected to reflect the condition of other tanks/spaces of similar type and service and with similar corrosion prevention systems. When selecting representative tanks/spaces account is to be taken of the service and repair history on board and identifiable critical and/or Suspect Areas.

(r) Spaces

Spaces are separate compartments including holds, tanks, cofferdams, and void spaces bounding cargo holds, decks, and the outer hulls.

(s) Special Consideration

Special consideration or special considered (in connection with close-up surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

(t) Substantial Corrosion

Substantial corrosion is such an extent of corrosion that assessment of corrosion pattern indicates a wastage in excess of 75% of allowable margins, but within acceptable limits. For ships built under the IACS Common Structural Rules, substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged (or measured) thickness between t_{net} + 0.5 mm and t_{net}.

(u) Suspect Areas

Suspect areas are locations showing substantial corrosion and/or are considered by the Surveyor to be prone to rapid wastage.

(v) Tanker

A tanker is a ship which is constructed primarily to carry liquid cargo in bulk. Oil Tankers, Chemical Tankers and Liquid Gas Carriers are included in this category.

(i) Oil Tanker

An oil tanker is a ship, which is constructed primarily to carry oil in bulk and includes ship types such as combination carriers (ore/oil and ore/bulk/oil ships, etc).

(ii) Double Hull Oil Tanker

A double hull oil tanker is a ship which is constructed primarily for the carriage of oil in bulk, which has the cargo tanks protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or void spaces.

(iii) Chemical Tanker

A Chemical Tanker is a ship constructed or adapted and used for the carriage in bulk of any liquid product listed in Chapter 17 of the IBC Code.

(w) Thickness Measurements for Close-up Survey

Thickness measurements of structures in areas where close-up surveys are required, are to be carried out simultaneously with close-up surveys. In annual survey, thickness measurements for close-up survey may be waived if the coating condition is in FAIR or GOOD condition and no substantial corrosion is found.

(x) Transverse Section

A transverse section includes all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom and hopper side plating, longitudinal bulkhead and bottom plating in top wing tanks. For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections.

(y) Wind and Water Strakes

Wind and water strakes are the strakes of a ship's side shell plating between the ballast and deepest load waterline.

2.1.3 Procedures for class related services

(a) Thickness measurements - hull structures

(i) Thickness measurement is to be carried out by a qualified company certified by the Society. The certification of firms engaged in thickness measurement of hull structures is to be referred to the "Procedures for certification of firms engaged in thickness measurement of hull structures" described in Appendix 3.

(ii) Thickness measurement is normally to be carried out under the supervision of the Surveyor. However, the Surveyor may accept thickness measurement not carried out under his supervision, in which case provisions is to be made for the Surveyor to recheck the measurements as deemed necessary to ensure acceptable accuracy.

(iii) A thickness measurement report is to be prepared by the approved firm carrying out the thickness measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when the measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator and the Surveyor.

(iv) The thickness measurement report is to be verified by the Surveyor.

(v) Additional ESP requirements for bulk carriers and oil Tankers, including combinations carriers.

(1) The required thickness measurements, if not carried out by the Surveyor, are to be witnessed by the Surveyor. The Surveyor is to be on board to the extent necessary to control the process.

(2) The thickness measurement firm is to be part of the survey planning meeting to be held prior to commencing the survey.

(3) In all cases the extent of the thickness measurements is to be sufficient as to represent the actual average condition.

(b) In-water surveys

(i) In-water survey operations are to be carried out by the company approved by the Society.

(ii) The Society's approval is to be granted to the companies whose organization and management structure are satisfactorily established, which employ the divers for the in-water survey work with sufficient knowledge and experience of the maintenance and repair work of ships as well as with the capability of operating in-water television and in-water cameras, and which have sufficient equipment proved suitable for the work undertaken.

(iii) The continued approval of the company is to depend on its original standards and ability being maintained. Any changes in the information originally supplied are to be reported to the Society; however, the approval is to be renewed after a period not exceeding 5 years.

2.1.4 Provision for surveys

(a) Conditions for survey

(i) The owner is to provide the necessary facilities for a safe execution of the survey.

(ii) Tanks and spaces are to be safe for access, i.e. gas freed, ventilated, and illuminated.

(iii) Tanks and spaces are to be sufficiently clean and free from water, scale, dirt, oil residues, etc. to reveal corrosion, deformation, fractures, damages or other structural deterioration. In particular, this applies to areas which are subject to thickness measurement.

(iv) Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration.

(b) Access to structures

(i) For overall survey, means are to be provided to enable the Surveyor to examine the structure in a safe and practical way.

(ii) For close-up survey, one or more of the following means for access, acceptable to the Surveyor, is to be provided.

(1) Permanent staging and passages through structures.

(2) Temporary staging and passages through structures ladders.

(3) Lifts and moveable platforms.

(4) Boats or rafts.

(5) Other equivalent means.

(c) Equipment for survey

(i) Thickness measurement is normally to be carried out by means of ultrasonic test equipment. The accuracy of the equipment is to be proven to the Surveyor as required.

(ii) One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:

(1) Radiographic equipment.

(2) Ultrasonic equipment.

(3) Magnetic particle equipment.

(4) Dye penetrate.

(d) Surveys at sea or at anchorage

(i) Surveys at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance from the personnel on board.

(ii) A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system is also to include the personnel in charge of ballast pump handling if boats or rafts are used.

(iii) Explosimeter, oxygen-meter, breathing apparatus, life-line and whistles are to be at hand during the survey. When boats or rafts are used appropriate life jackets are to be available for all participants. Boats or rafts are to have satisfactory residual buoyancy and stability even if one chamber is ruptured. A safety check-list is to be provided.

(iv) Surveys of tanks by means of boats or rafts may only be undertaken with the agreement of the Surveyor, who should take into account the safety arrangements provided, including weather forecasting and ship response in reasonable sea condition.

2.1.5 Preparation for the enhanced plan of survey for ESP ships

(a) Survey plan

(i) A specific survey plan must be worked out in advance of:

(1) the special survey

(2) the intermediate survey for vessels over 10 years of age by the Owner in cooperation with the Society. The survey plan is to be written to format. Reference can be made to IMO 2011 ESP CODE and as amended.

(ii) A survey plan is intended to identify critical structural areas and to stipulate the minimum extent, locations and means for close-up survey and thickness measurements with respect to sections and internal structures as well as to nominate Suspect Areas.

(iii) In developing the survey plan, the following documentation is to be collected and consulted with a view to selecting tanks, holds, areas, and structural elements to be examined.

(1) Survey status and basic ship information;

(2) Documentation on-board as described in (b) and (c);

(3) Main structural plans (scantlings drawings), including information regarding use of high tensile steels(HTS);

(4) Relevant previous survey and inspection reports from both Society and Owner;

(5) Information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data;

(6) Information regarding corrosion protection level on the newbuilding; and

(7) Information regarding the relevant maintenance level during operation.

(iv) The survey plan is to account for and comply, as a minimum, with the requirements for close-up survey, thickness measurement and tank testing, respectively, and is to include relevant information including at least:

(1) Basic ship information and particulars;

(2) Main structure plans (scantling drawings), including information regarding use of high tensile steels (HTS);

(3) Plan of holds/tanks;

(4) List of holds/tanks with information on use, protection and condition of coating;

(5) Conditions for survey (e.g., information regarding hold/tank cleaning, gas freeing, ventilation, lighting, etc.);

(6) Provisions and methods for access to structures;

(7) Equipment for surveys;

(8) Corrosion risk nomination of tanks;

(9) Design risk nomination of structure;

(10) Nomination of holds and tanks and areas for close-up survey;

(11) Nominations of sections and structures for thickness measurement;

(12) List of acceptable corrosion allowance of different structures;

(13) Nomination of tanks for tank testing (special survey only); and

(14) Damage experience related to the ship in question.

(v) The Society will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

(b) Survey planning meeting

Prior to commencement of any part of the Special and Intermediate survey, a survey planning meeting should be held between the attending Surveyor(s), the owner's representative in attendance, the thickness measurement company operator (as applicable) and the master of the ship or an appropriately qualified representative appointed by the master or company for the purpose to ascertain that all the arrangements envisaged in the survey program are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

(c) Documentation on board

(i) General

(1) The Owner is to supply and maintain onboard documentation as specified in (ii) and (iii) of this subparagraph, which are to be readily available for the Surveyor.

(2) The documentation is to be kept on board for the lifetime of the ship.

(ii) Survey report file

(1) A survey report file is to be a part of the documentation on board consisting of:

– report of structural surveys.
– condition evaluation report.
– thickness measurement report.

(2) The survey report file is to be available also in the Owner's and the Society's offices.

(iii) Supporting documents

The following additional documentation is to be available on board:

(1) Main structural plans of cargo tanks/holds and ballast tanks.

(2) Previous repair history.

(3) Cargo and ballast history.

(4) Extent of use of inert gas plant and tank cleaning procedures (for tankers only).

(5) Inspections by ship's personnel with reference to:

– Structural deterioration in general;
– Leakage in bulkheads and piping;
– Condition of coating or corrosion prevention system, if any.
– A guidance for reporting;
– Any other information that will help identify Suspect Areas requiring inspection,
– Any other information that would help to identify critical structural areas and/or Suspect Areas requiring inspection.

(iv) Review of documentation on board

Prior to inspection, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

(d) Reporting of evaluation of survey

(i) Evaluation of survey report

(1) The data and information on the structural condition of the ship collected during the survey are to be evaluated for acceptability and continued structural integrity of the ship.

(2) The analysis of data is to be carried out and endorsed by the Society and the conclusions of the analysis are to form a part of the condition evaluation report.

(ii) Reporting

A condition evaluation report of the survey and results is to be issued to the Owner and placed on board the ship for reference at future surveys. The condition evaluation report is to be endorsed by the Society.

(e) Technical assessment in conjunction with the planning of enhanced surveys for oil tankers

(i) As with other aspects of survey planning, the technical assessments described below are to be completed out by the Owner or operator in co-operation with the Society well in advance of the commencement of the special survey, i.e., prior to commencing the survey and normally at least 12 to 15 months before the survey's completion due date.

(ii) Technical assessments of the relative risks of susceptibility to damage or deterioration of various structural elements and areas are to be judged and decided. Technical assessments, which may include quantitative or qualitative evaluation of relative risks of possible deterioration, of the following aspects of a particular ship may be used as a basis for the nomination of tanks and areas for survey:

(1) design features such as stress levels on various structural elements, design details and extent of use of high tensile steel;

(2) former history with respect to corrosion, cracking, buckling, indents and repairs for the particular ship as well as similar vessels, where available; and

(3) information with respect to types of cargo carried, use of different tanks for cargo/ballast, protection of tanks and condition of coating, if any.

(iii) There are three basic types of possible failure which may be the subject of technical assessment in connection with planning of surveys; corrosion, cracks and buckling. Contact damages are not normally covered by the survey plan since indents are usually noted in memoranda and assumed to be dealt with as a normal routine by surveyors. Technical assessments performed in conjunction with the survey planning process are, in principle to be as shown schematically in Fig. I 2-1. The approach is basically an evaluation of the risk based on the knowledge and experience related to design and corrosion. The design is to be considered with respect to structural details which may be susceptible to buckling or cracking as a result of vibration, high stress levels or fatigue. Corrosion is related to the ageing process, and is closely connected with the quality of corrosion protection at newbuilding, and subsequent maintenance during the service life. Corrosion may also lead to cracking and/or buckling.

(iv) Damage experience related to the ship in question and similar ships, where available, is the main source of information to be used in the process of planning. In addition, a selection of structural details from the design drawings is to be included. Typical damage experience to be considered will consist of:

(1) number, extent, location and frequency of cracks; and

(2) location of buckles.

This information may be found in the survey reports and/or the Owner's files, including the results of the Owner's own inspections. The defects are to be analyzed, noted and marked on sketches. The review of the main structural drawings, is to include checking for typical design details where cracking has been experienced. The factors contributing to damage are to be carefully considered. The use of high tensile steel (HTS) is an important factor. Details showing good service experience where ordinary, mild steel has been used may be more susceptible to damage when HTS, and its higher associated stresses, are utilized. There is extensive and, in general, good experience, with the use of HTS for longitudinal material in deck and bottom structures. Experience in other locations, where the dynamic stresses may be higher, is less favorable, e.g. side structures. In this respect, stress calculations of typical and important components and details, in accordance with relevant methods, may prove useful and are to be considered. The selected areas of the structure identified during this process are to be recorded and marked on the structural drawings to be included in the survey plan.

(v) In order to evaluate relative corrosion risks, the following information is generally to be considered:

(1) Usage of tanks and spaces;

(2) Condition of coatings;

(3) Condition of anodes;

(4) Cleaning procedures;

(5) Previous corrosion damage;

(6) Ballast use and time for cargo tanks;

(7) Corrosion risk scheme; and

(8) Location of heated tanks.

The evaluation of corrosion risks is to be based on the age of the ship and relevant information on the anticipated condition as derived from the information collected in order to prepare the survey plan. The various tanks and spaces are to be listed with the corrosion risks nominated accordingly.

(vi) On the basis of the table of corrosion risks and the evaluation of design experience, the locations of initial close-up survey and thickness measurement (sections) may be nominated. The sections subject to thickness measurement one normally to be nominated in tanks and spaces where corrosion risk is judged to be the highest. The nomination of tanks and spaces for close-up survey initially, to be based on highest corrosion risk, and is always to include ballast tanks. The principle for the selection is to be that the extent is increased by age or where information is insufficient or unreliable.

(f) Evaluation of longitudinal strength of hull girder for oil tankers of 130 m in length and upwards and of over 10 years of age for survey report

The longitudinal strength of the ship's hull girder and the transverse sectional areas of deck flange (deck plating and deck longitudinals) and bottom flange (bottom shell plating and bottom longitudinals) of the ship's hull girder is to be evaluated within 0.4L amidships for the extent of the hull girder length that contains tanks therein and within 0.5L amidships for adjacent tanks which may extend beyond 0.4L amidships where tanks means ballast tanks and cargo tanks, and to be evaluated on the basis of the thickness measured, renewed or reinforced, as appropriate, during the special survey as below:

(i) If the diminution of sectional areas of either deck or bottom flange exceeds 10% of their respective as-built area (i.e. original sectional area when the ship was built), the ship is to be taken to renew or reinforce the deck or bottom flanges so that the actual sectional area is not less then 90% of the as-built area; or to calculate the actual section moduli (Z_{act}) of transverse section of the ship's hull girder by applying the calculation method specified in 3.2.5 of Part II.

(ii) for ships constructed on or after 1 July 2002, the actual section moduli (Z_{act}) is to be not less than the diminution limits determined by the Society, or

(iii) for ships constructed before 1 July 2002, the actual section moduli (Z_{act}) is to meet the criteria for minimum section modulus for ships in service required by the Society, provided that in no case Z_{act} is to be less than the diminution limit of the minimum section modulus (Z_{mc}) as specified below:

(1) The diminution limit of the minimum section modulus (Z_{mc}) of oil tankers in service is given by the following formula:

$$Z_{mc} = cL^2B\,(C_b + 0.7)\,k \quad \text{cm}^3$$

where

L = Length of ships. L is the distance, in meters, on the summer load waterline from the fore side of stem to the after side of the rudder post, or the centre of the rudder stock if there is no rudder post. L is not to be less than 96%, and need not be greater than 97%, of the extreme length on the summer load waterline. In ships with unusual stern and bow arrangement the length L may be specially considered.

B = Greatest moulded breadth in metres.

C_b = Moulded block coefficient at draught d, corresponding to summer load waterline, based on L and B. C_b is not to be taken less than 0.60, and

c = 0.9 C_n

C_n = $10.75 - \left(\frac{300 - L}{100}\right)^{1.5}$ for 130 m ≤ L ≤ 300 m

= 10.75 for 300 m < L < 350 m

= $10.75 - \left(\frac{L - 350}{150}\right)^{1.5}$ for 350 m ≤ L ≤ 500 m

k = Material factor, e.g.

k = 1.0 for mild steel with yield stress of 235 N/mm^2 and over,

k = 0.78 for high tensile steel with yield stress of 315 N/mm^2 and over,

k = 0.72 for high tensile steel with yield stress of 355 N/mm^2 and over.

(2) Scantlings of all continuous longitudinal members of the ship's hull girder based on the section modulus requirement in (1) above are to be maintained within 0.4L amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the end of 0.4L part, bearing in mind the desire not to inhibit the ship's loading flexibility.

(3) However, the above standard may not be applicable to ships of unusual type or design, e.g. for ships of unusual main proportions and /or weight distributions.

(g) For CSR bulk carriers, the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey no. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship’s hull girder for CSR bulk carriers specified in Part 1, Ch 13 of CSR.

2.2 Bottom Surveys

2.2.1 Bottom surveys in dry dock

At each bottom survey in dry dock the following requirements are to be complied with:

(a) Normally the ship is to be placed on blocks of sufficient height in a dry dock or on a slipway and cleaned, and proper staging is to be erected as may be necessary for examination. A docking survey covers an examination of the bottom and side plating, stern frame and rudder, as well as steering fins, shaft brackets, propeller(s) and other stern appendages, if fitted. Attention is to be given to parts of the structure particularly liable to excessive corrosion or to deterioration from causes such as chafing and lying on the ground and to any undue unfairness of the plating of the bottom.

(b) Sea inlets and overboard discharges below the water line are to be examined, and valves, cocks together with their fastenings to the hull are to be examined. Dismantling of them may be dispensed with at the discretion of the Surveyor if the interval of the overhauling inspection does not exceed 5 years.

(c) The clearance in the rudder bearing is to be ascertained and recorded. Visible parts of rudder, rudder pintles, gudgeons, etc. are to be examined. Where applicable, watertight pressure test of the rudder may be required as deemed necessary by the surveyor. The lifting or removal of the rudder may be dispensed with provided the Surveyor is satisfied with the bearing condition of the rudder by a measurement of the clearance.

(d) Survey in place for the propeller shaft and stern tube shaft is to be carried out as per requirement of 2.3.5.

(e) Visible parts of side thrusters are to be examined. Other propulsion systems which also have manoeuvring characteristics (such as directional propellers, vertical axis propellers, water jet units) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangement of propeller blades, propeller shaft and steering column shall be verified.

(f) Anchor and anchor chains are to be arranged and examined. Chain lockers are to be internally examined. The diameter of anchor chain cables is to be measured at special survey No. 2 and subsequent special survey.

2.2.2 In-water survey

(a) General requirements

(i) The underwater body is to be protected against corrosion by a full hard coating system and strongly recommended to be also protected by an impress current cathodic protection system.

(ii) The information obtained from the in-water survey is to be as reliable as that obtained from the docking survey.

(iii) Proposals for an in-water survey are to be submitted in advance of the survey being required by the Society.

(iv) Application for the subsequent in-water survey is also to be submitted to the Society for acceptance.

(v) The in-water survey may not be applicable if there are outstanding recommendations for repairs to the propeller, rudder, stern frame, underwater hull structure, or sea valves.

(b) Plans and documents

When ships are intended to be subjected to an in-water survey, the following plans and documents are to be submitted to the Society:

(i) Plans of the shell plating below waterline showing the details of the location and sizes of shell opening, location of bottom plugs, location of water and oil tight bulkheads;

(ii) Detailed information or drawings of constructions and arrangement indicated in the item (c) below together with their colour photographs and detailed instruction for inspection of such constructions and arrangements; and

(iii) Other data, if deemed necessary.

(c) Constructions and arrangement

The constructions and arrangements of ships which are intended to be subjected to an in-water survey are to comply with the following:

(i) Anodes are to be attached in such a manner as to be easily replaced where necessary.

(ii) Rudder is to be provided with the means of facilitating the measurement of clearances in way of each pintle. Liners on rudder stock and pintles are to be marked in such a way so that any relative movements can be checked.

(iii) Rope guard ring plates are to be of such constructions as to facilitate the inspection of shafts between propeller hubs and stern frame boss.

(iv) In case of water lubricating type stern-tube bearings, the devices which may indicate the clearance of propeller shaft strut and stern bearings are to be provided.

(v) In case of oil lubricating type stern-tube bearings, suitable means of ascertaining the performances of stern-tube bearings including oil sealing devices are to be provided.

(vi) Suitable means of ascertaining the position and identifying each blade of propellers from inboard are to be provided.

(vii) Sea connections are to be provided with the means of blanking their openings to the sea from outboard so that the sea connections may be opened up from inboard for examination and repairs. Grating of sea suctions are to be of hinged type as far as practicable.

(viii) To the hull below load water line, provision is to be made for ready identification of the position of bulkheads and transverses (including indication of the number of transverses). To bottom shell plating, provision is to be made for ready identification of the flat bottom and of ship's lengthwise (fore and aft) and athwartship (port side or starboard side) direction.

(d) Performance of in-water survey

(i) The in-water survey is to be carried out in sufficiently clear and calm waters. The ship is to be as light as possible. The shell sides below the waterline and the bottom are to be sufficiently clean.

(ii) The in-water survey is to be carried out in the presence of the Surveyor, and there is to be satisfactory two-way communication between the Surveyor and the diver.

(iii) The underwater pictures on the surface monitor screen are to offer reliable technical information such as to enable the Surveyor to judge the parts surveyed.

(iv) The in-water survey is to provide the information normally obtained from a bottom survey in dry dock. It at least covers an examination of the bottom and side plates of the shell plating, including any attachments and the rudder, an external examination of propellers as well as propeller shafts, and the cleaning condition of sea chests.

(v) If the in-water survey reveals damage or deterioration that requires early attention, the Surveyor may require that the ship be dry-docked in order that a further survey can be undertaken and the necessary work carried out.

(e) Firms engaged in In-Water Survey of ships are to comply with the requirements of "Guidelines for Approval of Service Suppliers."

2.3 Propeller Shaft and Tube Shaft Surveys

2.3.1 Tapered Shafts

The following survey details, apply to a shafting arrangement where the propeller is taper fitted to the shaft.

(a) Water-lubricated bearings

The survey is to consist of removing the propeller and drawing in and examining the entire shaft. During each survey, the shaft is to be examined by a surface crack-detection method (such as magnetic particle or dye penetration) all around the shaft from the after edge of the liner for one-third of the length of the taper, including forward end of keyway (if fitted).

(b) Oil-lubricated bearings

The survey may be carried out as described in (a) above. Alternatively, on the basis of satisfactory service record, lubricating oil analysis, bearing weardown and the condition of the inboard and outboard seal assemblies, the survey may consist of removing the propeller to expose the forward end of the taper and performing a nondestructive examination by a surface crack- detection method (such as magnetic particle or dye penetration) all around the shaft in way of the forward portion of the taper section, including the end of key-way (if fitted).

2.3.2 Flanged propeller shafts

The surveys detailed below are applicable where the propeller is fitted to the shaft by means of a coupling flange.

(a) Water-lubricated bearings

The survey is to consist of withdrawing the shaft in its entirety.

(b) Oil-lubricated bearings

The survey may be carried out as described above. Alternatively, the survey may consist of the verification of a satisfactory service record, lubricating oil analysis, stern bearing wear down, shaft seal effectiveness, and for controllable pitch propellers, a blade seal leak and function test.

(c) Coupling bolts and flange radius

Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul or repairs, the coupling bolts and flange radius are to be examined by means of a surface crack detection method.

2.3.3 Miscellaneous propellers

(a) Controllable pitch propellers where fitted are to be opened up and the working parts examined, together with the control gear.

(b) Directional propeller units are to be examined as the following requirements.

(i) Lubrication oil samples are to be taken and sent to a recognised laboratory for analysis at regular intervals, not exceeding 3 months. Records of lubrication oil analysis are to include trends of previous analysis, and be available onboard at all times. A representative oil sample is to be taken before the filters and with the unit in its normal running condition. Oil analysis is to detect iron (Fe) and other solid contamination in addition to possible water content. Acceptance criteria for wear particles and water content are set by the relevant thruster maker (in case thruster maker criteria are not available due to e.g. bankruptcy of gear thruster maker, the water content due to condensation is normally not to exceed 0.5%). The oil analysis is to cover all of the following areas, if applicable:

(1) lubrication oil for gears, bearings;

(2) sealing boxes;

(3) steering gear; and

(4) propeller.

If the propeller shafts seal oil systems do not allow for sampling unless the vessel is in dry dock, a representative oil analysis is to be taken in connection with the bottom survey in dry-dock.

(ii) The thrusters are to be subjected to complete survey every 5 years. The complete survey is to include:

(1) evaluation of oil analysis of gear lubrication oil, propeller hydraulic system oil and sealing system oil as specified in 2.3.3(b)(i) above.

(2) opening up of protection covers.

(3) inspection of power transmission gear, bearings, visible parts of shafts and general condition of housing internally. Gear clearance and axial play of bearings shall be measured.

(4) examination of controllable pitch mechanism oil transmission system and feedback system.

(5) full stroke ahead and astern are to be verified and correct blade position feed-back and indication verified.

(6) examination of steering column and related sealing and bearing.

(7) running test at MCR (max continuous rating).

(iii) Inboard parts of the thruster accessible from the inside, such as drive motors, shafting system, gear transmissions, pumps and piping systems, alarm, safety and control systems are covered by the class surveys of machinery. This will be applicable for e.g. Voith-Schneider and pump type thrusters.

(iv) Outboard parts of the thruster, accessible from the outside, are to be externally examined during by the bottom surveys.

(v) If the thruster is overhauled at the time of the complete survey, NDT for TIFF (tooth interior fatigue fracture) shall be carried out according to maker's requirements and acceptance criteria. If the thruster is overhauled during the interval between two scheduled surveys, satisfactory documentation for NDT (TIFF) performed according to maker's requirements and acceptance criteria is to be submitted to the attending surveyor at the next survey. Mounting of the thruster on board is to be verified and function tested.

(c) Water jet units are to be dismantled for examination of the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlet channels, steering nozzle, reversing arrangements and control gear.

2.3.4 Propeller shaft condition monitoring

(a) Where oil lubricated shaft with approved oil glands are fitted, a class notation **PCM** may be assigned, if its monitoring manuals or maintenance manuals of preventive maintenance system together with relative diagrams, are submitted and approved by the Society. The management systems are to comply with the following:

(i) Lubricating oil analysis is to be carried out regularly at intervals not exceeding six months. The lubricating oil analysis documentation is to be available on board. Each analysis is to include the following minimum parameters:

(1) Water content;

(2) Chloride content;

(3) Bearing material and metal particles content; and

(4) Oil ageing(resistance to oxidation).

Oil samples are to be taken under service conditions and representative of the oil within the stern-tube.

(ii) Oil consumption is to be recorded monthly.

(iii) Bearing temperatures are to be recorded daily, (two temperature sensors with alarm or other approved arrangements are to be provided).

(iv) Facilities are to be provided for measurement of bearing wear down.

(v) Oil glands are to be capable of being replaced without withdrawal of the propeller shaft or removal of the propeller.

(b) For maintenance of the **PCM** notation, annual survey is to be carried out as follows:

(i) Satisfactory operating conditions of the propeller shaft are to be confirmed, including the verification of the records of lubricating oil analysis, lubricating oil consumption, bearing temperatures and wear down readings.

(c) Where the notation **PCM** has been assigned, the propeller shaft need not be withdrawn at surveys as required by 1.6.8 provided all condition monitoring data is found to be within permissible limits and all exposed areas of the shaft are examined by a magnetic particle crack detection method. Where the Surveyor considers that the data presented is not entirely to his satisfaction the shaft will be required to be withdrawn in accordance with 1.6.8.

(d) For vessels with **PCM** notation, the propeller shaft survey interval required by 1.6.8(a)(ii) of this Part will be extended up to 15 years provided:

(i) Annual surveys are carried out to the satisfaction of the attending Surveyors, and

(ii) The followings are carried out at each propeller shaft survey due date required by 1.6.8(a)(ii)

(1) Bearing weardown measurement.

(2) Verification that the propeller is free of damage which may cause the propeller to be out of balance.

(3) Verification of effective inboard seal.

(4) Renewal of outboard seal in accordance with manufacturer's recommendation.

(5) For keyed propellers, the fore part of the shaft taper and shaft keyway are to be examined by an appropriate surface crack detection method(such as magnetic particle or dye-penetration), for which dismantling of the propeller and removal of the key will be required.

(e) Initial survey for existing vessels obtaining **PCM** notation

(i) All systems required by 2.3.4(a) of this Part are to be examined and tested in accordance with the approval plans, and

(ii) Propeller shaft survey as per 2.3 of this Part will be required if the last propeller shaft survey was carried out more than 5 years prior to the initial survey, or

(iii) The propeller shaft survey may be waived subject to satisfactory review of the following records:

(1) Six-monthly records of stern bearing oil analysis for water and metal contents, covering the last 5 years.

(2) Monthly records of stern bearing oil consumption, covering the last 5 years.

(3) Monthly records of stern bearing temperature monitoring, covering the last 5 years.

(4) Propeller shaft, stern bearing assembly and propeller operation and repair records, if available.

(5) Records of stern bearing clearance and weardown measurement from new building and last dry docking.

2.3.5 Survey in place

The scope of a survey of propeller shafts and tube shafts in place consists of:

(a) Checking of the clearances of the stern tube shafts,

(b) Checking of the tightness of the oil sealing glands,

(c) Examination of propeller,

(d) Where a controllable pitch propeller is fitted, it is to be ascertained that the pitch control device is in good working order, and if considered necessary, the device is to be opened up for further examination.

2.3.6 Wear-down Limits

(a) The maximum allowable wear-down limit of aft lignum-vitae bush is to be as follows:

(i) For machinery placed amidships:

C = 5+D/100 when D ≤ 400 mm
C = 9 when D > 400 mm
where:
D = Diameter of propeller shaft, in mm.
C = Max. allowable wear-down limit, in mm.

(ii) For machinery placed aft, the clearance is to be 1.5 mm less than the above values.

(b) Water lubricated rubber bearing are to be rebushed when any water groove is half of the original depth, or whenever the clearance exceeds the limits as given above for water-lubricated bearings other than rubber, whichever occurs first.

(c) Oil-lubricated bearings are to be rebushed when the wear down exceeds manufacturer's recommendations.

2.3.7 Extensions of propeller shaft survey

(a) Up to approximately one year

(i) Water-lubricated bearings

Satisfactory service record and an external examination of the inboard and outboard propeller shaft assemblies, together with the bearing wear down check at the end of the normal survey period.

(ii) Oil-lubricated bearings

(1) Verification of satisfactory service and oil loss records.

(2) An external examination of the inboard and outboard seal assemblies.

(3) An examination of oil sample at the time of granting each requested extension. (The sample oil analysis is to be done in accordance with the applicable requirements in 2.3.4(a)(i))

(4) Confirmation at the fifth year that the bearing wear down is within allowable limits.

(b) Not exceeding five years

(i) Verification of satisfactory service including oil loss records.

(ii) Oil sample examination and test. (The sample oil analysis is to be done in accordance with the applicable requirements in 2.3.4(a)(i))

(iii) Confirmation of no any repairs by grinding or welding without approval of the Society.

(iv) Bearing weardown measurement.

(v) Verification that the propeller is free of damages which may cause the propeller to be out of balance.

(vi) Bearing inboard seal assemblies are to be externally examined and to be found or placed in a satisfactory condition.

(vii) Bearing outboard seals are to be renewed and the seal liner found to be or placed in a satisfactory condition.

(viii) For keyed propellers, the fore part of the shaft taper and shaft keyway are to be examined by an appropriate surface crack detection method(such as magnetic particle or dye-penetration), for which dismantling of the propeller and removal of the key will be required.

2.4 Boiler Survey and Thermal Oil Heater Surveys

2.4.1 Boiler surveys

(a) At each survey, boilers and economizers are to be examined internally and externally in cleaned condition, including seat buffers and stays, if provided.

(b) Mountings including safety valves are to be examined and opened up for further examination if deemed necessary by the Surveyor. Safety valves are to be set as the requirements in Part V. All studs fastening directly to boiler shells or heads, if provided, are to be examined.

(c) In case the dimensions of boiler plates, tubes and stays are required to be ascertained, an efficient non-destructive examination is to be carried out. The allowable working pressure may be required to reduce from its designed working pressure if the dimension is found to be undersized due to corrosion or waste.

(d) The oil fuel burning system together with its safety appliances, valves, control gears, oil discharge pipes between pumps and burners are to be examined under working condition.

(e) Automatic combustion control devices, if provided, are to be tested under working condition.

(f) In case an important repair carried out or if deemed necessary by the Surveyor, the hydraulic test may be required.

Note: Hydraulic test pressures are as follows:

Boiler's age	Test pressure	Remarks
Age < 12 years	$P = 1.25\ P_o$	$P_o \leq 4$ MPa
	$P = 1.2\ P_o + 0.2$	$P_o > 4$ MPa
Age ≥ 12 years	$P = 1.15\ P_o$	

P_o is the working pressure.

(g) In fired boilers employing forced circulation, the pumps used for this service are to be opened and examined at each boiler survey.

(h) At each annual survey, general examination is to be carried out.

2.4.2 Thermal oil heater surveys

(a) Thermal oil plants are to be subjected to functional tests, while in operation.

(b) The following items are to be examined:

(i) The entire thermal oil plant for leakage.

(ii) The condition of the insulation.

(iii) The functioning of the indication, control and safety equipment.

(iv) Remote controls for the shut-off and discharge valves.

(v) Leakage monitors for heaters (for exhausting gas heating).

(vi) The testing of safety devices.

(c) Heating surfaces and, where appropriate, the combustion chamber, are to be examined for contamination, corrosion, deformations and leakage.

(d) As a rule, tightness tests are to be carried out to the admissible working pressure.

2.5 Annual Surveys

2.5.1 Annual surveys - hull

At each annual survey the general condition of hull and equipment is to be examined so far as can be seen and placed in satisfactory condition as necessary, attention being paid to the following items:

(a) Hull and deck plating and its closing appliances and watertight penetrations.

(b) Hatch covers and coaming

- (i) It is to be confirmed that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.
- (ii) Where mechanically operated steel covers are fitted, checking the satisfactory condition:
  - (1) Hatch covers;
  - (2) Tightness devices of longitudinal, transverse and intermediate cross junctions (gaskets, gasket lips, compression bars, drainage channels);
  - (3) Clamping devices, retaining bars, cleating;
  - (4) Chain or rope pulleys;
  - (5) Guides;
  - (6) Guide rails and track wheels;
  - (7) Stoppers, etc;
  - (8) Wires, chains, gypsies, tensioning devices;
  - (9) Hydraulic system essential to close and securing;
  - (10) Safety locks and retaining devices.
- (iii) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition:
  - (1) Wooden covers and portable beams, and their securing devices;
  - (2) Steel pontoons;
  - (3) Tarpaulins;
  - (4) Cleats, battens, wedges;
  - (5) Hatch securing bars and their securing devices;
  - (6) Loading pads/bars and the side plate edge;
  - (7) Guide plates and chocks;
  - (8) Compression bars, drainage channels and drain pipes (if any).
- (iv) If considered necessary by the Surveyor, the effectiveness of sealing arrangement of all hatch covers is to be confirmed.
- (v) Checking the condition of hatch coaming plating and their stiffeners. Where significant wastage of hatch covers is noted, thickness measurement is to be carried out and renewal made as necessary.
- (vi) Proper operating and functioning of hatch cover and securing arrangements are to be confirmed.

(c) Protection of other openings

- (i) Hatchways, manholes, and scuttles in freeboard and superstructure decks.
- (ii) Machinery casings, fiddley covers, companion- ways and deckhouses protecting openings in freeboard or enclosed superstructure decks.
- (iii) Portlights together with deadcovers, cargo ports, bow or stern access, chutes and similar openings in ship's sides or ends below the freeboard deck or in way of enclosed superstructures.
- (iv) Ventilators, air pipes together with flame screens, scuppers and discharges serving spaces on or below the freeboard deck.
- (v) Watertight bulkheads, bulkhead penetrations and wall of enclosed superstructure.
- (vi) Weather-tight and watertight doors and closing appliances for all of the above including proper operation of such doors.

(d) Freeing ports together with bars, shutters and hinges.

(e) Protection of the crew

Guard rails, lifelines, gangways, accommodation ladders with accessory wires, winches and gears and deck houses accommodating crew.

(f) Verification of loading guidance and stability data

- (i) For ship provided with the loading manual continuous such means in ready use.

(ii) For ship provided with the loading computer, confirmed that a loading computer installed on board have the performance and functions as deemed appropriate by the Society.

(iii) Confirmed that an approved stability booklet is kept on board for ready use.

(g) Verification that no alternations have been made to the hull or superstructures which would affect the calculation determining the position of load lines. The load line marks (see Appendix 4) are to be sighted, found plainly visible, and recut and/or painted as required. Surveys carried out by the National Authorities of the countries in which the ships are registered may be accepted as meeting these requirements.

(h) Anchoring and mooring equipment including the working test of windlass.

(i) Bow doors, inner doors, side shell doors and stern doors are to be surveyed as per IACS UR Z24 "4. Annual Survey".

(j) Fire protection and fire fighting arrangements including operation tests as far as practicable

Confirmation as far as practicable, that no significant changes have been made to the arrangement of structural fire protection is also to be carried out. Surveys carried out by the National Authorities of the countries in which the ships are registered may be accepted as meeting these requirements.

(k) Ballast tanks for vessels of age over 5 years

(i) Ballast tanks, excluding double bottoms, of which protective coating was not applied from the time of construction, the spaces in question are to be internally examined and gauged as necessary.

(ii) Ballast tanks which were required as a consequence of the outstanding notes set up at the intermediate or special survey due to no protective coating, soft or semi-hard coating or Poor condition without dealing with are to be internally examined. When extensive corrosion is found, thickness measurement is to be carried out.

(l) Additional ESP requirements for oil tankers

(i) General

The survey is to consist of an examination for the purpose of ensuring, as far as practical, that the hull and piping are maintained in a satisfactory condition and is to take into account the service history condition.

(ii) Weather decks

(1) Cargo tank opening including gaskets, covers, coamings and flame screens.

(2) Examination of cargo tank venting arrangements including secondary means of venting, or over/under pressure alarms where fitted, with associated pressure/vacuum valves and screens.

(3) Flame screens on vents to all bunker, oily ballast and oily slop tanks.

(4) Cargo, crude oil washing, bunker and vent piping systems, including vent masts and headers.

(iii) Cargo pump rooms and pipe tunnels

(1) All bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of bulkheads.

(2) The condition of all piping systems.

(iv) Ballast tanks

(1) Examination of ballast tanks is to be carried out when required as a consequence of the results of the Special Survey and Intermediate Survey. When considered necessary by the Surveyor, thickness measurement is to be carried out.

(2) Where Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements in Table I 2-4B.

(3) For oil tankers exceeding 15 years of age, all ballast tanks adjacent to (i.e. with a common plane boundary) a cargo tank with any means of heating are to be examined internally. When considered necessary by the surveyor, thickness measurements are to be carried out and if the results of these thickness measurements indicate that Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Table I

2-4B of this Chapter. Tanks or areas where coating was found to be in Good condition at the previous intermediate or special survey may be specially considered by the Society.

(v) Verification that at least one portable detector for measuring flammable vapour concentrations is available, together with a sufficient set of spares and a suitable means of calibration.

(m) Additional ESP requirements for bulk carriers

(i) General

The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, coamings and piping are maintained in a satisfactory condition.

(ii) Close-up survey of hatch covers and coamings.

(iii) Examination of ballast tanks when required as a consequence of the results of the special survey

When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with Table I 2-4C.

(iv) Examination of cargo holds

(1) Bulk carrier over 10 years and up to 15 years of age

– Overall survey of all cargo holds. Where the protective coating in cargo holds is found to be in Good condition, the extent of close-up surveys and thickness measurement may be specially considered.

– Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as close-up survey of sufficient extent of all remaining cargo holds.

– When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, the extent of thickness measurement shell be increased in accordance with the Table I 2-4C.

– All piping and penetration in cargo holds, including overboard piping, is to be examined.

(2) Bulk Carrier over 15 years of age

– Overall survey of all cargo holds. Where the protective coating in cargo holds is found to be in Good condition, the extent of close-up surveys and thickness measurement may be specially considered.

– Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold and one other selected cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as close-up survey of sufficient extent of all remaining cargo holds.

– When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, the extent of thickness measurement is to be increased in accordance with the Table I 2-4C.

– All piping and penetration in cargo holds, including overboard piping, is to be examined.

(3) The following examination of the foremost cargo hold is to be carried out for ships of 150 m in length and upwards of single side skin construction, carrying solid bulk cargoes having a density of 1,780 kg/m^3 and above, constructed before 1 July 1999, and constructed with an insufficient number of transverse watertight bulkheads to enable them to withstand flooding of

the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium as specified in regulation XII/4.4 of the SOLAS.

(A) For bulk carriers of 5 $<$ age $\leq$ 15:

– An overall survey of the foremost cargo hold, including close-up survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the condition of shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads; and areas found to be Suspect Areas at the previous special survey.

– Where considered necessary by the surveyor as a result of overall and close-up survey as described above, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of the cargo hold.

(B) For bulk carriers of age $>$ 15:

– An overall survey of the foremost cargo hold, including close-up survey is to be carried out to establish the condition of all shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads, and areas found to be Suspect Areas at the previous special survey.

(C) Extent of thickness measurement

– Thickness measurement is to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey, as described in (1) and (2) above. The minimum requirement for thickness measurements are areas found to be Suspect Areas at the previous special survey. Where Substantial Corrosion is found, the extent of thickness measurements is to be increased with the requirements of Table I 2-4C.

– The thickness measurement may be dispensed with provided the Surveyor is satisfied by the close-up survey, there is no structural diminution and the protective coating, where applied, remains effective.

– The gauging of the vertically corrugated transverse watertight bulkhead between holds No. 1 and No. 2, including each corrugation flange, web, shedder plate and gusset plate, is to be carried out at the levels as described below:

Level (a) and (b) (see Fig. I 2-2 and Fig. I 2-3):

The mid-breadth of each corrugation flanges and webs at approximately 200 mm above the top of shedder plates and top of hopper plates;

The middle of gusset plates between corrugation flanges, if fitted;

The middle of the shedder plates;

The mid-breadth of each corrugation flanges and webs at approximately 200 mm and where as deemed necessary by the Surveyor below upper stool, if fitted.

Level (c) (see Fig. I 2-2 and I 2-3):

For ships with or without lower stool

Locations:

The mid-breadth of the corrugation flanges and webs at about the mid-height of the corrugation.

- Where the thickness changes within the horizontal levels, the thinner plate is to be gauged.

(n) Where ships have timber load lines, metal sockets or equivalent means for securing upright and eye plates for lashing are to be examined.

(o) Additional requirements for navigational arrangements for periodical one man watch, and where applicable integrated bridge system. Annual Surveys are to be carried out to ascertain that the equipment and arrangements required for the applicable class notation are being maintained in good working order. At the time of the survey relevant statutory certificates may be accepted as evidence of satisfactory operation.

(p) Helicopter deck

Where areas of the ship are designated for helicopter operations, the helicopter deck, deck supporting structure, deck surface, deck drainage, tie downs, markings, lighting, wind indicator, securing arrangements where fitted and safety netting or equivalent are to be examined.

(q) Ships constructed of reinforced plastic

In addition to the applicable requirements of the annual survey - hull is also to include the following:

(i) All accessible parts particularly liable to rapid deterioration.

(ii) The deck to hull connection, and superstructure and deckhouse connections to the deck.

(r) Barges

In addition to the applicable requirements of 2.5.1, the annual survey is also to include the following:

(i) For barges engaged in the dry bulk cargo trade, at each annual survey after special survey No. 3, holds, with particular attention being paid to tank tops, underside of main deck and side shell plating, framing and attachments. Thickness measurements may be required and access is to be provided for inaccessible areas as considered necessary by the attending Surveyor.

(ii) For manned barges annual survey is to include the following:

(1) Fire safety measures.

(2) Fire extinguishers.

(3) Power supply including emergency source of power.

(4) Lifesaving appliances and equipment.

(5) Radio communication installation.

(6) Windlass, anchors and chains.

(7) Fire mains are to be pressurized to the working pressure and surveyed over their full length where accessible.

(s) High speed craft – hull for high speed craft of FRP construction

In addition to the applicable requirements of the annual survey - hull is also to include the following:

(i) The craft is to be placed in dry dock or slipway and all applicable items of the annual survey - hull are to be examined.

(ii) The deck-to-hull connection, and superstructure and deckhouse connections are to be examined.

(iii) The ship is to be thoroughly checked and sounded for any apparent delaminations. Where it is thought a delamination is found, a 50 mm diameter plug is to be removed from the area and examined for core to skin adhesion and water permeation.

2.5.2 Annual survey – machinery

At each annual survey, the following requirements are to be complied with:

(a) At each annual survey, a general examination of the propelling machinery and essential auxiliaries, is to be made. The Surveyor may in addition, require such further items to be opened up as considered necessary to ascertain that they are in good working condition.

(b) Machinery and boiler spaces with particular attention to the fire and explosion hazards, and also emergency escape routes are to be generally examined.

(c) All main and auxiliary steering gears including their associated and control systems are to be examined and tested in operation.

(d) All the means of communication between the navigation bridge and the machinery control position, as well as the bridge and the alternative steering position, if fitted, are to be tested.

(e) Bilge pumping systems and bilge wells including operation of pumps, remote reach-rods and level alarms, where fitted, are to be examined as far as practical.

(f) Boilers, thermal oil heaters heated by flame or combustion gas, pressure vessels and their mountings including safety devices, foundations, controls, releasing gear, high pressure and steam escape piping, insulation and gauges are to be externally examined. Confirmation of the safety devices of the boilers and the thermal oil heaters may be required as considered necessary by the Surveyor.

(g) Electrical machinery, emergency sources of electrical power switchgear and other electrical equipment are to be generally examined and also to be tested in operation as far as practicable.

(h) Confirmation as far as practicable of the operation of all emergency sources of power is to be made. If they are automatic, also in the automatic mode.

(i) Where automatic and/or remote controls are fitted for essential machinery, they are to be tested to demonstrate that they are in good working condition.

(j) Parts which are opened up for maintenance at Owner's option are to be examined as necessary.

(k) For hydraulic power units, hoses, piping for any damage, corrosion or leakages, and hydraulic oil cooling system condition and operation are to be checked. Operational test of all emergency stops, controls and remote controls are also to be checked.

(l) Additional requirements for oil tankers and ships carrying dangerous chemicals in bulk

At each annual survey, the following are to be examined and placed in good order:

(i) All electrical equipment and cables in dangerous zones on weather decks and cargo pump rooms.

(ii) Cargo, bilge, ballast and stripping pumps including pump foundation in cargo pump rooms as far as practicable.

(iii) Electrical and mechanical remote operating and shutdown devices including operation tests in cargo pump rooms.

2.5.3 Annual survey – **CAS**, **CAU** and **CAB**

The following performances are to be made and placed in order. Where appropriate records of daily checks and periodical maintenance have been kept, some of the tests may be dispensed with at the Surveyor's discretion.

(a) Safety devices for main propulsion machinery or controllable pitch propellers, and emergency stopping devices for main propulsion machinery fitted in the remote control station for the main propulsion machinery or controllable pitch propellers.

(b) Safety devices for boilers.

(c) Safety devices for electric generating sets.

(d) Communication system specified in 2.9 in Part VIII.

2.5.4 Annual survey - marine oil pollution prevention installations

Marine oil pollution prevention installations including operation tests as far as practicable are to be surveyed according to the IMO Resolution A.1053(27) - Guidelines for Surveys under Annex I of MARPOL 73/78 with its amendments. Surveys carried out by the National Authorities of the countries in which the ships are registered may be accepted as meeting these requirements.

2.5.5 Annual survey - refrigerated cargo installations

See 2.8.1.

2.5.6 Annual survey - inert gas system

See 2.9.1.

2.5.7 Annual survey - liquefied gas carriers

See 2.10.1.

2.5.8 Annual survey - chemical carriers
See 2.11.1.

2.5.9 Annual survey – general dry cargo ship
See 2.12.1.

2.5.10 Annual survey – double hull oil tankers
See 2.13.1.

2.5.11 Annual survey – passenger ships
See 2.14.1

2.5.12 Annual survey – double skin bulk carriers
See 2.15.1

2.6 Intermediate Surveys

2.6.1 At each intermediate survey for hull, in addition to all the requirements for annual survey in 2.5, the following additional applicable requirements in 2.6.2~2.6.4, 2.6.7~2.6.14 are also to be complied with depending on the type of ship.

2.6.2 Additional hull requirements for ships other than tankers, combination carriers and bulk carriers

(a) Ships of age over 5 years and up to 10 years: An internal general examination of representative sea water ballast tanks which include at least one peak tank and one deep/wing tank in way of cargo length area, excluding double bottom tanks, is to be carried out as follows:

(i) If such inspections reveal no visible structural defects, the examination may be limited to a verification that the coatings remain efficient.

(ii) Where no protective coating, soft or semi-hard coating or Poor coating condition without dealing with is found, the examination is to be extended to other ballast spaces of the same type.

(iii) In ballast tanks, where no protective coating, soft or semi-hard coating or Poor coating condition without dealing with is found, maintenance of class is to be made subject to the tanks in question being internally examined and gauged as necessary at annual intervals.

(b) Ships over 10 years of age

An internal general examination of all sea water ballast tanks is to be carried out as follows:

(i) If such inspection reveals no visible structural defects, the examination may be limited to a verification that the coatings remain efficient.

(ii) In ballast spaces other than double bottom tanks, where no protective coating, soft or semi-hard coating or Poor coating condition without dealing with is found, maintenance of class is to be made subject to the tanks in question being internally examined and gauged as necessary at annual intervals.

(iii) Also in case of double bottom tanks, annual surveys may have to carry out.

(c) In addition to the requirements in (a) and (b) above, the following requirements are also to be complied with for ships excluding oil tankers and bulk carriers over 15 years of age.

An internal examination of at least one forward and one after cargo holds is to be carried out. For the ship which has only two cargo holds, either one cargo hold is to be examined.

2.6.3 Additional ESP hull requirements for oil tankers including combination carriers

(a) For weather decks, an examination as far as applicable of cargo, crude oil washing, bunker, ballast, steam and vent piping systems on weather decks as well as vent masts and headers is to be carried out. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested or thickness measured or both.

(b) Oil tankers of 5 < age ≤ 10

(i) For tanks used for salt water ballast, an overall survey of representative tanks selected by the surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the protective coating remains effective.

(ii) Where Poor coating condition, corrosion or other defects are found in salt water ballast tanks or where a protective coating has not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

(iii) In salt water ballast tanks where a protective coating is found in Poor condition, it is not renewed, or where soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the tanks in question is to be examined and thickness measurements carried out as considered necessary at annual intervals.

(c) Oil tankers of 10 < age ≤ 15

(i) The requirements of the intermediate enhanced survey are to be to the same extent as the previous special survey required in 2.7.5 and 2.1.5(a). However, pressure testing of tanks and cargo holds used for ballast is not required unless deemed necessary by the attending Surveyor.

(ii) In application of 2.6.3(c)(i) above the intermediate enhanced survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey.

(d) Oil tankers exceeding 15 years of age

(i) The requirements of the intermediate enhanced survey are to be to the same extent as the previous special survey required in 2.7.5 and 2.1.5(a). However, pressure testing of tanks and cargo holds used for ballast is not required unless deemed necessary by the attending Surveyor.

(ii) In application of (i) above the intermediate enhanced survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey.

(e) Survey planning

For ships age > 10 years, survey planning is to be carried out in accordance with 2.1.5 (a).

(f) Drydocking requirements

For ships age > 15 years, the ship is to be placed in a dry dock or upon a slipway and all items of 2.2.1 (a) through (f) are to be examined. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and water ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Survey, if not already surveyed.

2.6.4 Additional ESP hull requirements for bulk carriers

(a) For bulk carriers of 5 < Age ≤ 10

(i) Ballast tanks

(1) For spaces used for salt water ballast, an overall survey of representative spaces selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the coating remains effective.

(2) Where Poor coating condition, corrosion or other defects are found in salt water ballast spaces or where protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

(3) In salt water ballast spaces other than double bottom tanks, where a protective coating is found in Poor condition and it is not renewed, where soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurement carried out as considered necessary at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

(4) In addition to the requirements in (1) to (3) above, areas found to be Suspect Areas at the previous special survey are to be overall and close-up surveyed.

(ii) Cargo holds

(1) An overall survey of all cargo holds, including close-up survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the condition of shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads in the forward cargo hold and one other selected cargo hold; and areas found to be Suspect Areas at the previous special survey.

(2) Where considered necessary by the Surveyor as a result of the overall and close-up survey, as described in (1) above, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.

(iii) Extent of thickness measurements

(1) Thickness measurements is to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey, as described in 2.6.4(a)(i) and 2.6.4(a)(ii). The minimum requirements for thickness measurements at the intermediate enhanced survey are areas found to be Suspect Areas at the previous special survey.

(2) Where Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Table I 2-4C.

(3) The thickness measurement may be dispensed with provided the Surveyor is satisfied with the close-up survey, that there is no structural diminution and the protective coating, where applied, remains effective.

(4) Where the protective coating in cargo holds is found to be in Good condition, the extent of close-up surveys and thickness measurements may be specially considered.

(b) For bulk carriers 10 < age ≤ 15

(i) The requirements of the intermediate enhanced survey are to be to the same extent as the previous special survey required in 2.7.5 and 2.1.5(a). However, pressure testing of tanks and cargo holds used for ballast is not required unless deemed necessary by the attending Surveyor.

(ii) In application of 2.6.4(b)(i) above the intermediate enhanced survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey.

(c) For bulk carriers of age > 15

(i) The requirements of the intermediate enhanced survey are to be to the same extent as the previous special survey required in 2.7.5 and 2.1.5(a). However, pressure testing of tanks and cargo holds used for ballast is not required unless deemed necessary by the attending Surveyor.

(ii) In application of 2.6.4(c)(i) above the intermediate enhanced survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey.

(d) Survey planning

For ships age > 10 years, survey planning is to be carried out in accordance with 2.1.5(a).

(e) Drydocking requirements

For ships age > 15 years, the ship is to be placed in a dry dock or upon a slipway and all items of Section 2.2.1 (a) through to (f) are to be examined.

The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and water ballast tanks are to be carried out in accordance with the applicable requirements for Intermediate Survey, if not already surveyed.

(f) Bulk carriers subject to IACS UR S31

Side shell frames of cargo holds bounded by a single side shell are to be assessed for compliance with the requirements of IACS UR S31 with revisions and steel renewal, reinforcement or coating, where required in accordance with IACS UR S31 with revisions is to be carried out.

2.6.5 Intermediate survey – machinery

(a) At each intermediate survey, all the requirements for annual survey are to be complied with.

(b) For tankers, in addition to the above, insulation resistance of electrical circuits in dangerous spaces is to be measured. Consideration may be given to accept the recent readings by the crew.

2.6.6 Intermediate survey – marine oil pollution prevention installations

Marine oil pollution prevention installations including operation tests as far as practicable are to be surveyed according to the IMO Resolution A.1053(27) – Guidelines for Surveys under Annex 1 of MARPOL 73/78 with its amendments. Surveys carried out by the National Authorities of the countries in which the ships are registered may be accepted as meeting these requirements.

2.6.7 Intermediate survey – liquefied gas carrier

See 2.10.2.

2.6.8 Intermediate survey – chemical carrier

See 2.11.2.

2.6.9 Intermediate survey – general dry cargo ships

See 2.12.2.

2.6.10 Intermediate survey – double hull oil tankers

See 2.13.2.

2.6.11 Intermediate survey – passenger ships

See 2.14.2.

2.6.12 Intermediate survey – double skin bulk carriers

See 2.15.2.

2.6.13 Barges - hull

In addition to the applicable requirements of 2.6.1, the intermediate survey is also to include the following:

(a) Salt water ballast spaces

In lieu of 2.6.1, an overall survey of three representative salt water ballast spaces including one rake tank and one upper wing tank, if applicable, and one additional space selected by the Surveyor.

(b) Deck cargo barges

At each intermediate survey after special survey No.3 – hull, in addition to the required salt water ballast spaces, at least two void spaces are to be examined internally, as considered necessary by the attending Surveyor.

(c) Dry cargo barges

At each intermediate survey after special survey No.3 – hull, in addition to the required salt water ballast spaces, at least two cargo holds are to be examined and dealt with, as deemed necessary by the attending Surveyor. Where extensive corrosion or structural damage is found, the remaining holds may also be required to be examined and dealt with.

(d) Oil/fuel oil tank barges and chemical tank barges - hull

At each intermediate survey after special survey No.2 – hull, in addition to the required salt water ballast spaces, at least three cargo tanks: one center tank, one port wing tank and one starboard wing tank, are to be examined internally and dealt with, as deemed necessary by the attending Surveyor. Thickness gauging and means of access to the upper part of the tanks may be required. Where extensive corrosion or structural damage is found, the remainder of the cargo tanks may be required to be examined.

2.6.14 Fishing ships - hull

In addition to the applicable requirements of 2.6.1, at each intermediate survey after special survey No.3 – Hull, an overall survey of at least two of the fish holds.

2.7 Special Surveys

2.7.1 Special survey No.1 - hull

All annual survey requirements together with the following are to be complied with:

(a) The examinations of the hull are to be supplemented by thickness measurements and testing as deemed necessary, to ensure that the structural integrity remains effective and are to be sufficient to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration. The close ceiling in holds of single bottom ships is to be lifted to such an extent that at least two strakes on each side (one strake being at the bilge) and all portable hatches in holds and flooring plates in machinery and boiler spaces are to be removed for examination of the structure below. Where a double bottom is fitted, a sufficient ceiling is to be lifted from the inner bottom to enable the Surveyors to satisfy themselves as to the condition of the tank top plating, and if necessary, all ceiling is to be removed for ascertaining the condition. The cement or other composition on the inner space of the bottom plating is to be carefully examined. The removal of this covering may be dispensed with provided that it is tested by beating or chipping, and found sound and adhering satisfactorily to the steel plating.

(b) Internal examinations of spaces and tanks

(i) At special surveys, paying due attention to (1) through (8) below, examinations of structures and fittings such as piping, etc. in tanks and spaces are to be carried out carefully.

(1) Structural members, piping, hatch covers, etc. sensitive to corrosion in the cargo holds where high-corrosive cargoes to steel such as logs, salt, coal, sulfide ore, etc. have been loaded.

(2) Portions sensitive to wearing down by heat such as plating under boilers.

(3) Structurally discontinuous portions such as corners of hatchway openings on deck, openings including side scuttles, cargo port, etc. on shell.

(4) Condition of coating and corrosion prevention system if applied.

(5) Condition of striking plates under sounding pipes.

(6) Condition of cement or deck composition, if fitted.

(7) Locations on which defects such as cracking, buckling, corrosion, etc. have been found in similar ships or similar structures.

(8) Critical structural areas which may effect the strength and structural are to be examined.

(ii) At special surveys, paying attention to (i) above, internal examinations of tanks or spaces listed in Table I 2-1A are to be carried out. In case where postponement of the special survey, a kind of the special survey to be applied to the ship is to be determined based on the original expiry date of the Certificate of Classification of the ship.

(iii) At special surveys for tankers, in addition to (i) and (ii) above, an internal examination of tanks and spaces listed in Table I 2-1B is to be carried out.

(iv) At special surveys for bulk carriers, in addition to (i) and (ii) above, an internal examination of tanks and spaces listed in Table I 2-1C is to be carried out.

(c) Pressure Test

(i) At special surveys, a pressure test of tanks is to be carried out according to (1) through (3) below.

(1) A pressure test is to be carried out under the pressure as specified below:

- For tanks: the pressure corresponding to the maximum head that can be experienced in service.
- For piping: the working pressure.

(2) A pressure test of tanks may be carried out when the ship is afloat, provided that an internal examination of bottom of the tank is also carried out afloat.

(3) At special surveys for ships having many water tanks and oil tanks, some water tanks or oil tanks may be exempted from a pressure test where deemed appropriate by the Surveyor taking account of present ship's condition, ship's age and an interval from the previous testing.

(ii) At special surveys for cargo ships, a pressure test is to be carried out according to (i) above for tanks listed in Table I 2-2A (Requirements of Pressure Tests at Special Survey for Cargo Ships) and Table I 2-2B (Minimum Requirements of Pressure Test at Special Survey of Oil Tankers, Ore/Oil Carriers and etc.), and Table I 2-2C (Requirements of Pressure Tests at Special Survey of Bulk Carriers).

(d) Decks, casings and superstructures are to be examined, especially the corners of openings and other discontinuities in way of strength decks and top sides. Wood decks or sheathings are to be examined and sections to be removed to ascertain the condition of the plating if found not adhering closely to the plating.

(e) The requirements for thickness measurement are given in Table I 2-3A and the structural members in any locations proved to be rapidly wasted or showing excessive corrosion are to be measured in accordance with the requirements of Table I 2-4A which is to be carried out by an appropriate ultrasonic equipment or other approved means.

(f) The equipment required by the Rules is to be verified. The anchors and chain cables are to be ranged, examined and the required complement and condition verified. The chain locker holdfasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

(g) All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

(h) When spaces are insulated in connection with refrigeration, hatches and limbers are to be removed and the condition of the structural members examined.

(i) Hatch covers and coamings are to be examined as follows:

(i) A thorough inspection of the items listed in 2.5.1(b) is to be carried out.

(ii) Random checking of the satisfactory operation of mechanically operated hatch covers is to be made, including:

(1) Storage and securing in open condition;

(2) Proper fit and efficiency of sealing in closed condition;

(3) Operational testing of hydraulic and power components, wires, chains, and link drives;

(iii) The effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent is to be checked.

(j) Engine room structure is to be examined. Particular attention is to be given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops, and engine room bulkheads in way of tank top and bilge wells. Where wastage is evident or suspect, thickness measurements are to be carried out, and renewals or repairs made when wastage exceeds allowable limits.

(k) A bottom survey in dry dock in accordance with the requirements of 2.2.1 of this Part is to be carried out as part of the special survey.

(l) For all ships except for passenger ships, automatic air pipe heads are to be completely examined (both externally and internally) as indicated in Table I 2-28. For designs where the inner parts cannot be properly inspected from outside, this is to include removal of the head from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanized steel.

(m) Survey planning

Survey planning is to be carried out for ESP ships in accordance with 2.1.5(a).

(n) Gangways, accommodation ladders with accessory wires, winches and gears are to be load tested and operationally tested with maximum operational load.

(o) Bow doors, inner doors, side shell doors and stern doors are to be surveyed as per IACS UR Z24 "3. Special Survey."

2.7.2 Special survey No.2 – hull

All items specified in 2.7.1 together with the following are to be complied with:

(a) A sufficient amount of ceiling in the holds is to be lifted from bilges and satisfy themselves as to the condition of the structure in bilge, the inner bottom plating, the pillar feet, the lower end plating of bulkheads and the tunnel side. In ships having a single bottom, the close ceiling in holds is to be lifted to such an extent that at least 3 strakes on each side (one strake being at the bilge) and all portable hatches in holds and flooring plates in machinery and boiler spaces are to be removed for examination of the structure below. But in either case the whole of the ceiling may be lifted for examination of the structure below when considered necessary by the Surveyor.

(b) The requirements with regard to internal examination, thickness measurement and tank pressure testing same as those stated in 2.7.1(b), (c) and (e) are to be complied with.

(c) Chain cables are to be ranged out and examined, and chain lockers examined internally. When any length of a chain cable is so worn that its mean diameter is 12% below the requirement, it is to be renewed.

2.7.3 Special survey No.3 – hull

All items specified in 2.7.2 together with the following are to be complied with:

(a) A sufficient amount of ceiling and lining in the holds and flooring plates in the machinery spaces are to be removed as required by the Surveyor. The ship is to be made free from rust inside and outside in order to expose for examination of the framing and plating together with discharges, scuppers, air and sounding pipes, and the structure is to be examined.

(b) Wood sheathing and deck composition on steel decks are to be removed as required by the Surveyor and plating below examined. Cement chocks on the ship's sides at bilges and decks are to be examined, and portions of them removed so that the condition of the shell plating and adjacent steel work can be ascertained.

(c) The lining in way of side scuttles is to be removed as required by the Surveyor, and the shell plating examined.

(d) The requirements with regard to internal examination, thickness measurement and tank pressure testing same as those stated in 2.7.1(b), (c) and (e) are to be complied with.

2.7.4 Special survey No.4 and subsequent – hull

In addition to all items specified in 2.7.3 the requirements with regard to internal examination, thickness measurement and tank pressure testing same as those stated in 2.7.1(b), (c) and (e) are to be complied with.

2.7.5 Special survey – additional ESP hull requirements for oil tankers (combination carrier included)/bulk carrier

(a) General

(i) All cargo tanks/holds, ballast tanks, pump rooms (for tankers), pipe tunnels, cofferdams and void spaces bounding cargo tanks/holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as deemed necessary, to ensure that the structural integrity remains effective. The examination is to be sufficient to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration.

(ii) For both bulk carriers and oil tankers, all piping systems on weather deck and in the above tanks and spaces and only for oil tankers, cargo piping on deck, including crude oil washing (COW) piping, are to be examined and operationally tested under working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. When considered necessary by the Surveyor pressure tests and gauging for pipings are to be carried out and results of the gauging are to be reported. For oil tanker, special attention is to be given to any ballast piping in cargo tanks and any cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

(iii) The survey extent of combined ballast/cargo oil tanks or combined ballast cargo holds is to be evaluated based on the records of ballast history and the condition of the corrosion prevention system provided and extent of corrosion found.

(iv) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.

(b) Tank corrosion prevention system

Where provided, the condition of coating or corrosion prevention system of ballast tanks and cargo tanks is to be examined. For salt water ballast tanks, excluding double bottom tanks of bulk carriers, where a protective coating is found in Poor condition and it is not renewed, where soft or semi-hard coating has been applied or where a protective coating was not applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurement is to be carried out as considered necessary.

When such breakdown of coating is found in salt water ballast double bottom tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a coating was not applied from the time of construction the tanks in question are to be examined at annual intervals. Thickness measurement is to be carried out as deemed necessary by the Surveyor.

(c) Extent of overall and close-up surveys

(i) An overall survey of all tanks and spaces except fresh water, fuel oil, diesel oil and lubricating oil tanks is to be carried out. Fresh water, fuel oil, diesel oil and lubricating oil tanks are to be dealt with according to the requirements of

Table I 2-1A (Minimum Requirements for Internal Examination at Hull Special Surveys),
Table I 2-1B (Additional Requirements of Internal Examinations for Oil Tankers), and
Table I 2-1C (Additional Requirements of Internal Examinations for Bulk Carrier).

(ii) For the purpose of establishing the condition of internal members in cargo tanks/holds and ballast tanks, the requirements for the close-up survey are given in

Table I 2-5A (Minimum Requirements for Close-up Surveys at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc.) and
Table I 2-5B (Minimum Requirements for Close-up Surveys at Hull Special Survey of Bulk Carriers).

(iii) For oil tankers, the Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

(1) in particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to an available information;

(2) in tanks which have structures with reduced scantlings in association with a corrosion prevention system approved by the Society.

(iv) For areas in spaces where coatings are found to be in a Good condition, the extent of close-up surveys according to Table I 2-5A and Table I 2-5B may be specially considered by the Surveyor.

(d) Extent of thickness measurement

(i) The requirements for thickness measurements are given in Table I 2-3B (Minimum Requirements for Thickness Measurements at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc.), and Table I 2-3C (Minimum Requirement for Thickness Measurement at Hull Special Surveys of Bulk Carriers).

(ii) For bulk carriers, representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and ballast tanks is to be carried out. Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The thickness measurement may be dispensed with provided the Surveyor is satisfied with the close-up examination, that there is no structural diminution, and the protection coating where applied remains efficient.

(iii) The Surveyor may extend the thickness measurement as deemed necessary. Where Substantial Corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of

Table I 2-4B (Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc. within the Cargo Tank Length) and Table I 2-4C (Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Bulk Carriers within the Cargo Area.), and may be additionally specified in planning document as described in 2.1.5(a).

(iv) For areas in spaces where coatings are found to be in a Good condition, the extent of thickness measurements according to Table I 2-3B and I 2-3C may be specially considered by the Surveyor.

(v) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(vi) For oil tankers,

(1) Transverse sections are to be chosen such that thickness measurements can be taken for as many different tanks in corrosive environments as possible, e.g. ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils, other ballast tanks, cargo tanks permitted to be filled with sea water and other cargo tanks, and are to be clear of areas which have been locally renewed or reinforced;

(2) In cases where two or three sections are to be measured, at least one includes a ballast tank within 0.5L amidships;

(3) However, ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils and cargo tanks permitted to be filled with sea water are to be selected where present;

(4) The thickness of each component is to be determined by averaging all of the measurements taken in way of the transverse section on each component;

(5) Where one or more of the transverse sections are found to be deficient in respect of the longitudinal strength, the number of transverse sections for thickness measurement is to be increased such that each tank within the 0.5L amidships region has been sampled. Tank spaces that are partially within, but extend beyond the 0.5L region, are to be sampled; and

(6) Additional thickness measurements are also to be performed on one transverse section forward and one aft of each repaired area.

(e) Extent of tank pressure testing

(i) The requirements for tank pressure testing are given in Table I 2-2B of this Chapter.

Cargo tank testing of oil tankers carried out by the vessel's crew under the direction of the Master may be accepted by the surveyor provided the following conditions are complied with:

(1) A tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, has been submitted by the owner and reviewed by this Society prior to the testing being carried out;

(2) There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

(3) The tank testing has been satisfactorily carried out within special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed;

(4) The satisfactory results of the testing is recorded in the vessel's logbook;

(5) The internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

(ii) The Surveyor may extend the tank pressure testing as deemed necessary.

(iii) Tanks are to be tested with a head of liquid to the top of hatches for cargo holds, ballast/cargo holds or top of air pipes for ballast tanks or oil tanks, if this gives a higher pressure.

2.7.6 Special survey–machinery

(a) Pumps and the pumping system including valves, cocks, pipes and strainers are to be examined. For hydraulic power units, records of hydraulic oil replacement are to be checked. Oil samples for analysis may be required at the discretion of the Society. Other systems are to be tested if considered necessary.

(b) All shafts (except propeller and stern tube shafts which are detailed in propeller shaft survey), thrust blocks, line shaft bearings are to be opened up for examination. The lower halves of bearings need not be exposed if alignment and wear are found acceptable.

(c) Steering machinery including auxiliary arrangement is to be examined and operation tested. The machinery may be opened up for examination if deemed necessary by the Surveyor.

(d) Holding down bolts and chocks of main and auxiliary engines and shafting bearing blocks are to be examined.

(e) All air vessels for essential services, together with their mountings, valves and safety devices, are to be cleaned internally, and examined internally and externally. If internal examination of the air vessels is not practicable, they are to be tested hydraulically to at 1.25 times the working pressure. Safety valves setting are to be checked.

(f) Fuel tanks which do not form part of ship's structure together with their fittings are to be examined and, if deemed necessary by the Surveyor, they are to be tested as specified for new tanks.

(g) The reduction gears are to be examined, and opened up if deemed necessary by the Surveyor, in order to confirm the condition of the gears, pinions, gear teeth, spiders, shafts, bearings and lubrication system. Alternative means of accertaining the condition of epicyclic gearing will be specially considered.

(h) The machinery and heat exchangers which are not included in the boiler survey requirements are to be examined and opened up for further examination if deemed necessary by the Surveyor.

(i) The windlass and mooring winches are to be examined including operation test. They are to be opened up for examination if deemed necessary by the Surveyor.

(j) The bilge system including valves, cocks, strainers and bilge injections are to be opened up for examination if deemed necessary by the Surveyor. The system is to be tested in working condition.

(k) Air compressor of essential services is to be opened up for examination. Safety valve setting is to be checked.

(l) Evaporators are to be opened up and examined. Safety valve settings are to be checked.

(m) Main and auxiliary engines are to be tested in working condition if deemed necessary by the Surveyor.

(n) Engine room remote control quick closing valves are to be opened up, examined and tested in working condition.

(o) Feed pumps, burning pumps and boiler water circulating pumps for boilers are to be opened up and examined.

(p) Steam turbines

In addition to the foregoing items (a) to (o), steam turbines used as main and auxiliary engines are to be examined as follows:

(i) Steam turbine blades, rotors, stop valves, shafts glands, thrust and adjusting bearings together with oil drains and sealing pipes are to be examined.

(ii) Exhaust steam turbines, gears, clutches, and electric motors are to be opened up and examined; coned ends of internal driving shafts are to be examined.

(iii) For main steam pipes, a selected section is to be removed and examined when they are 12 years old and thenceforth at each special survey. Sufficient lagging is to be removed for examination and hydraulically tested to twice the working pressure. When deemed necessary by the Surveyor the thickness of pipes is to be ascertained to determine the future working pressure.

(iv) Condensers are to be examined and tested if repaired.

(v) Safety devices are to be examined and tested.

(q) Diesel engine

(i) In addition to the foregoing items (a) to (o), diesel engines used as main and auxiliary engines are to be examined as follows:

Cylinders, covers, valves and valve gears, pistons, piston rod, crossheads, guides, connecting rods, crankshafts and all bearings, crankcases, bed-plates, entablatures, crankcase door fastenings and explosion relief devices, scavenge pumps, scavenge blowers, superchargers and their associated coolers, air compressors and their intercoolers, filters and/or separators and safety devices, fuel injection pumps and fittings, camshaft drives and balancer units, torsional vibration dampers or de-tuners, flexible couplings, clutches, reverse gears, attached pumps and cooling arrangements are to be examined.

Special consideration as to the requirements for Special Surveys may be given for diesel engines with bores 300 mm or under, provided the engine is maintained under a manufacturer's scheduled maintenance program.

(1) The records of the program, including lubrication servicing, are to be made available to the Surveyor. Periodical overhauls, required by the manufacturer's scheduled maintenance program, are to be witnessed by the Surveyor.

(2) For ships not engaged in international voyages, the survey may be carried out by reviewing the records of the program and other effective means, such as the verification runs specified in (s) below, to confirm that engines are in good order. Periodical overhauls, required by the manufacturer's scheduled maintenance program, are to be witnessed by the Surveyor.

(ii) Tie rods are to be re-tensioned, as necessary. Engine entablature bolting is to be checked for tightness, and crankshaft deflections of medium-speed and low-speed type engines are to be measured and placed in good order.

(r) Electrical installations.

(i) The survey is to comprise examination of the electrical installation with regard to fire and explosion hazards and injury from accidental touching. The survey is also to include testing of correct functioning of equipment covered by the requirements of the Rules.

(ii) As far as practicable, the following equipment is to be examined for satisfactory condition:

(1) Main and emergency switchboards.

(2) Generators.

(3) Distribution boards.

(4) Motor starters.

(5) Electrical motors.

(6) Converters (e.g. transformers, rectifiers, chargers).

(7) Cable installations.

(8) Enclosures for electrical equipment.

(9) Lighting equipment.

(10) Heating equipment.

(11) Battery installation.

(iii) The following are to be tested to the extent deemed necessary by the Surveyor to ascertain the proper functioning of the equipment:

(1) Generator load test.

(2) Generator parallel operation.

(3) Generator protection relays.

(4) Generator remote speed control.

(5) Generator synchronizing equipment.

(6) Power plant interlocking systems.

(7) Insulation resistance indicating device.

(8) Emergency generator including switchboard.

(9) Battery chargers.

(10) Mechanical ventilation of battery rooms /lockers.

(11) Navigation lights, with controllers including alarms.

(iv) Measurements of insulation resistance on main and emergency switchboards, generators, exciters, propulsion motors if the ship is of electrical propulsion and all electrical installations and their wiring are to be performed as follows:

Part to be tested	Insulation resistance	
Switchboard with all out-going circuit breakers and switches opened, and control and measuring instrument disconnected	Between each busbar, and busbar to hull	1 megohm
Generator and motor	Each generator or motor to hull	1,000 times the rated voltage of the machine in ohms
All wiring measured from switchboard with circuit breakers and protective devices closed, except those of the generator	Between each conductor and conductor to hull	100,000 ohms

(v) Tests of emergency stopping means of all oil transfer systems, and boiler and engine room ventilations are to be performed.

(vi) For the main electric propelling machinery, windings, commutators and slip-rings, all air ducts in stator coil and ventilating holes in rotors are to be examined.

(s) Machinery verification runs for ships not engaged in international voyages

As part of the Special Survey of Machinery, a dock trial in the presence of the Surveyor is to be carried out in order to confirm satisfactory operation of main and auxiliary machinery. A sea trial may be carried out if deemed necessary by the Surveyor.

If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration should be given to a sea trial to the satisfaction of the Surveyor.

2.7.7 Special survey – **CAS**

The following are to be performance tested and placed in order:

(a) Main propulsion machinery and controllable pitch propellers

(i) Change-over devices of control positions between main control station and local control station.

(ii) Safety devices.

(b) Boilers

(i) Automatic and remote control systems.

(ii) Safety devices.

(c) Electric generating sets

(i) Automatic and remote control systems.

(ii) Safety devices.

(d) Automatic change-over devices (or remote start/stop devices) of essential pumps and automatic starting devices (or remote start/stop devices) of air compressors.

(e) Alarm systems

(i) Function of alarm systems and indicator devices.

(ii) Confirmations of setting points of alarms.

(f) Remote control and monitoring systems

2.7.8 Special survey – **CAU**, **CAB**

The following are to be performance tested and placed in order:

(a) Main propulsion machinery and controllable pitch propellers

(i) Change-over devices of control positions between navigation bridge and main control station and between main control station and local control station, or between main monitoring and control station on bridge and local station or sub-control station.

(ii) Safety devices.

(b) Boilers

(i) Automatic and remote control systems.

(ii) Safety devices.

(c) Electric generating sets

(i) Automatic and remote control systems.

(ii) Safety devices.

(iii) Automatic start of stand-by power supply unit after black-out, where applicable.

(d) Automatic change-over devices of essential pumps and automatic starting devices (or remote start/stop devices) of air compressors.

(e) Communication systems specified in 2.9 of Part VIII.

(f) Alarm systems

(i) Function of alarm systems and indicator devices.

(ii) Confirmations of setting points of alarms.

(g) Remote control and monitoring systems

Where considered necessary by the Surveyor, sea trials may be required upon completion of the above mentioned tests.

2.7.9 Special survey – marine oil pollution prevention installations

Marine oil pollution prevention installations including operation tests as far as practicable are to be surveyed according to the IMO resolution A.1053(27) – Guidelines for Surveys under Annex I of MARPOL 73/78 with its amendments. Surveys carried out by the National Authorities of the countries in which the ships are registered may be accepted as meeting these requirements.

2.7.10 Special survey – cargo refrigerating machinery appliances

See 2.8.2.

2.7.11 Special survey – inert gas system

See 2.9.2.

2.7.12 Special survey – liquefied gas carrier
See 2.10.3.

2.7.13 Special survey – chemical carrier
See 2.11.3, 2.11.4, and 2.11.5.

2.7.14 Special survey – general dry cargo ships
See 2.12.3.

2.7.15 Special survey – double hull oil tankers
See 2.13.3.

2.7.16 Special survey – passenger ships
See 2.14.2.

2.7.17 Special survey – double skin bulk carriers
See 2.15.3.

2.7.18 High speed craft – hull
In addition to the applicable requirements of 2.7.1, 2.7.2, 2.7.3 and 2.7.4, the special survey is also to include the following requirements for craft of FRP construction:

(a) Engine foundations and their attachments to the hull are to be examined.

(b) A minimum of five plugs, each 50 mm in diameter, are to be removed from the hull bottom and topsides from locations deemed appropriate from the attending Surveyor and examined for core to skin adhesion and water permeation.

2.8 Surveys of Refrigerated Cargo Installations

2.8.1 Annual surveys

(a) Where practicable, the entire refrigerating machinery is to be examined under working condition on the ship's arrival at the port of discharge before the refrigerated cargo is unloaded. Log books or other records are to be examined and any breakdown or malfunctions of the refrigerating plant in the past are to be noted and reported to the Surveyor.

(b) Cargo chambers are to be examined throughout to check that insulation linings, fastenings as well as sheathings on decks, tank tops and tunnel tops are free from damages, and airtight. Where the insulation deficiency is known or suspected, the removal or boring of the insulation may be required by the Surveyor in order to determine fullness and dryness; test holes are to be properly closed thereafter.

(c) Air trunks and casing for air ducts and coolers, and fastenings and supports for ducts, grids and meat rails, etc. are to be examined as far as practicable for damage or deterioration.

(d) Hatch covers and seals, doors and frames of cargo or cooler spaces, covers of bilges and manholes, air refreshing ducts and their closing appliances as well as thermometer tubes with their connections and fastenings are to be examined to see that they are in good condition and airtight.

(e) Bilges are to be cleaned and suction pipes, suction rose boxes, sounding pipes as well as liquid sealed traps and non-return valves for chamber drainage examined to ascertain that all sounding and drainage devices are in efficient working condition.

(f) Cooling grids, air cooler coils and air cooler drip pans with drainage are to be examined to ascertain that they are clean and in good working order.

(g) Brine coils and grids and brine return tanks, together with valves and fittings are to be examined under working condition.

(h) Primary refrigerant cooler coils and cooling grids together with valves and fittings are to be examined under working condition.

(i) Shells of shell-and-tube and double-pipe type condensers and evaporators, separators, receivers, filters, driers, coil terminals of coil-in-casing type condensers and evaporators and other pressure vessels as well as primary refrigerant gas and liquid piping, headers, condenser cooling water piping and valves are to be examined externally as far as practicable.

(j) Thermometers concerned are to be examined. The Surveyor may request one or more thermometers to be calibrated by a competent person.

(k) A general examination is to be made of refrigerant compressors, condenser cooling water pumps, brine and primary refrigerant circulating pumps, air circulating fans together with their motors, control gears and cables and the insulation resistance measured. The acceptable insulation resistance measured is to be shown in 2.7.6(r) of this Part. The results of insulation resistance measuring carried out by a competent person may be acceptable at the discretion of the Surveyor.

(l) The generating plant supplying electric power to the refrigerating machinery is to be examined generally with a view to ascertaining that the plant is being efficiently maintained.

2.8.2 Special survey

(a) Special survey No.1

In addition to the requirements of annual surveys as detailed in 2.8.1 above the following are to be complied with:

(i) All refrigerant compressors together with their prime movers are to be opened up for examination. Relief devices, suction filters and lubricating arrangements are also to be examined.

(ii) Water end covers of shell-and-tube and double-pipe type condensers are to be removed for examination of tubes, tube plates and covers.

(iii) Condenser cooling water pumps, including the reserve pump which may be used for other services, as well as brine and primary refrigerant circulating pumps are to be examined under working condition and if deemed necessary by the Surveyor, these pumps may be opened up for examination.

(iv) Brine coils and grids are to be hydraulically tested for tightness to a pressure of 1.5 times the working pressure or 0.4 MPa, whichever is the greater.

(v) Primary refrigerant cooler coils and cooling grids together with valves and fittings, gas condensers, evaporators and receivers are to be leak tested for tightness when under the refrigerant pressure prevailing the system with the refrigerating machinery at rest and the regulating valves opened sufficiently to obtain an approximate balance of pressure throughout the system.

(vi) The Surveyor is to satisfy himself that all pressure relief valves and safety discs throughout the refrigerating machinery and appliances are in good order.

(vii) At exposed places a sufficient amount of the insulation of refrigerant and brine pipes is to be removed and pipes examined, if deemed necessary by the Surveyor.

(b) Subsequent special surveys

In addition to the requirements for special surveys No.1 as defined in 2.8.2(a) above, the following are to be complied with:

(i) Coils of coil-in-casing condensers and evaporators are to be removed for examination and pressure tested to a pressure as specified in 4.17 of Part X or their relief valve setting pressure, whichever is the smaller, to prove tight. Where it is impracticable to remove the coils they may be examined from inspection holes and pressure tested in place.

(ii) Shell-and-tube condensers and evaporators are to have end covers removed and to be pressure tested under the same pressure as that required in (i) above.

(iii) Where brine or water is used for sub-cooling the primary refrigerating liquid in heat exchangers of the shell-and-tube type, the heat exchangers are to be examined and pressure tested in the same manner as that required for condensers in (ii) above. Double-pipe type heat exchangers are to be examined as far as practicable with the refrigerant gas piping under the same pressure as that required for condensers in (ii) above. Other types of heat exchangers using brine or water are to be examined and pressure tested at the discretion of the Surveyor according to the design of such equipment.

(iv) Primary refrigerant cooling grids or air cooler coils in the refrigerated chamber are to be pressure tested in place under a pressure as specified in 4.17 of Part X.

2.8.3 Loading port surveys

(a) When a loading port certificate is required by the owner or his representative, a survey as detailed in (d) hereunder is to be carried out at the loading port.

(b) In the case of ships engaged on voyages of less than 2 months duration, a Loading Port Certificate is to be considered valid for 2 months, provided cargoes carried are such a nature as not to damage the insulation or appliances in refrigerated chambers, nor to affect by taint or mould refrigerated cargoes loaded during that period.

(c) If the ship loads at more than one port, one survey only at the first loading port is to be required, provided it includes the examination of all refrigerated chambers which are to be used for refrigerated cargo during the voyage and general cargo is not subsequently carried in any of the chambers prior to loading the refrigerated cargo.

(d) Requirements of loading port survey are to be as follows:

(i) Refrigerated chambers are to be examined in any empty state to ascertain that they are cleaned and free of odour which may adversely affect the cargo to be loaded.

(ii) Brine or other refrigerant pipe grids, cooler coils and connections are to be examined to ascertain that they are free from leakage.

(iii) Wood sheathings and cargo battens are to be examined to ascertain that they are well fitted in position.

(iv) Insulation and linings are to be examined to ascertain that no damage has been sustained prior to the loading of the refrigerated cargo.

(v) Scuppers and bilge suctions draining refrigerated chambers are to be examined to ascertain that they are in good working order, and that liquid sealed traps are primed.

(vi) The refrigerating machinery is to be examined under working condition, and temperatures in the refrigerated chambers are to be noted.

(e) Where any repair is deemed necessary by the Surveyor, it is to be carried out immediately to his satisfaction before the new cargo is loaded. Any indication of defective insulation not considered to warrant immediate attention is to be noted and specially reported.

2.9 Surveys of Inert Gas Systems

2.9.1 Annual Surveys

At each Annual Survey the inert gas system is to be generally examined so far as can be seen and placed in satisfactory condition. The survey is to include the following items:

(a) External examination of all components and piping including scrubbers, fans, cooling water pumps, compressors, washing equipment, valves, stand pipes and screens.

(b) Confirmation of proper operation of inert gas blowers.

(c) Observation of the operation of the scrubber room ventilation system.

(d) Deck seal or double block and bleed assemblies, and non-return valves are to be examined externally and proven in operation. Automatic filling and draining of deck seals, operation of non-return valves and double block and bleed assemblies, and the water carryover are to be checked.

(e) Verification of the operation of all remotely operated or automatically controlled valves and, in particular, flue gas isolating valves.

(f) Verification of the operation of the inter-locking feature of soot blowers.

(g) Verification of the automatic operation of gas pressure regulating valves.

(h) On completion of general repair work, a tightness test and a functional test are to be performed.

(i) Verification of the operation of the following alarms and safety devices using simulated conditions where necessary.

(i) Flue gas systems

(1) Low water pressure or low water flow rate to the flue gas scrubber.

(2) High water level in the flue gas scrubber.

(3) High gas temperature at inert gas blower discharge.

(4) Failure of inert gas blowers.

(5) Oxygen content in excess of 8% by volume.

(6) Failure of the power supply to the automatic control system for the gas regulating valve and to the oxygen content and gas pressure indicating devices.

(7) Low water level in the water seal.

(8) Gas pressure less than 100 mm water gauge.

(9) High gas pressure.

(10) Accuracy of fixed and portable oxygen measuring equipment by means of a calibration gas.

(ii) Gas generating systems

(1) Low water pressure or low water flow rate to the flue gas scrubber.

(2) High gas pressure.

(3) High gas temperature at inert gas blower discharge.

(4) Oxygen content in excess of 8% by volume.

(5) Insufficient fuel oil supply.

(6) Failure of the power supply to the generator.

(7) Failure of the power supply to the automatic control system for the generator.

(8) Accuracy of fixed and portable oxygen measuring equipment by means of a calibration gas.

(j) The Surveyor is to examine the permanent records to check the operation and maintenance of the system. Consideration may be given by the Surveyor for the crediting of certain items that have been properly documented and recorded.

(k) Additional requirements for separate inert gas generator

(i) Automatic combustion control system is to be examined and tested.

(ii) Combustion chamber and mountings are to be examined internally and externally.

(iii) Forced draft fans are to be examined.

(iv) Fuel oil service pumps are to be examined.

(l) Additional requirements for inert gas stored in bottles

(i) Bottles are to be examined internally and externally. If they can not be examined internally they are to be gauged. When considered necessary by the Surveyor, they are to be hydrostatically tested to at least 1.2 times the working pressure. Relief valves are to be proven operable.

(ii) Where an alkali (or other) scrubber is fitted in the system the scrubber, circulating pump, valves and piping are to be examined internally and externally.

2.9.2 Special survey of inert gas system

At each special survey of inert gas system in addition to the requirements for the annual surveys in 2.9.1, the following are to be complied with:

(a) All valves, including valves at boiler uptakes, air seal valves at uptakes, scrubber isolating valves, fan inlet and outlet isolating valves, main isolating valves, re-circulating valves (if fitted), pressure/vacuum breakers and cargo tank isolating valves are to be examined.

(b) Scrubbers are to be examined.

(c) Fans (blowers) including casing drain valves are to be examined.

(d) Fan (blower) drives, either electric motor or steam turbine, are to be examined.

(e) Bellows expansion pieces are to be examined.

(f) Sea water pumps, valves and strainers for scrubbers and water seals together with piping connections at scrubbers, water seals, shell plating and the remainder of the sea water piping are to be examined.

(g) Stand pipes, where fitted, for purging in each cargo tank are to be examined.

(h) Deck seals or double block and bleed assemblies, and non-return valves are to be examined externally and internally.

(i) The special survey may be commenced at 4th annual survey and be progressed during the succeeding year with a view to completion by the 5th anniversary date. The flue gas system is to be presented for survey within 3 months before the due date of the special survey. The requirements for survey to qualify for the commencement of the special survey are to be no less than those of an annual survey as outlined in paragraph 2.9.1.

2.10 Surveys of Liquefied Gas Carriers

2.10.1 Annual Surveys

In addition to the surveys as per applicable requirements of 2.5, the components, equipment and outfit as listed below are to be examined as to whether they are in unobjectionable maintenance condition.

(a) Cargo handling systems are to be examined as follows:

(i) The cargo and process piping, expansion joints, cargo hoses and machinery, such as heat exchangers, vapourizers, pumps, compressors are to be externally examined.

(ii) The availability of the required spool pieces for piping separation is to be verified.

(iii) The log books are to be examined with regard to correct functioning of the cargo containment and cargo handling systems. The running hours per day of the re-liquefaction plants or the boil-off rate and the inert gas consumption are to be considered.

(iv) It is to be ensured that the relevant instructions and information material such as cargo handling plants, cargo tank loading limit information, cooling down procedures etc. are on board.

(b) Cargo containment venting systems are to be examined as follows:

(i) Venting system for cargo tanks, inter barrier spaces (in case of Type A tanks, cargo holds) are to be visually examined. It is to be verified that the cargo tank relief valves are sealed and that the certificate containing details on opening/closing pressure of the relief valves is kept on board.

(ii) Protection screens and flame arresters, if fitted, are to be examined for corrosion and cleanliness.

(c) Instrumentation and safety systems are to be examined as follows:

(i) The monitoring and control equipment for pressure, temperature and liquid levels is to be verified as to its good working order, by one or several of the following methods:

(1) Visual external examination.

(2) Comparison of read-outs of different indicators.

(3) Comparison of read-outs with the data of the cargo actually handled.

(4) Examination of repair and maintenance records with reference to the cargo plant repair.

(ii) Emergency shut-down valves at shore connections and tanks are to be tested without flow in the pipe lines. It is to be verified that operation of the emergency shut-down system is to cause the cargo pumps and compressors to stop.

(iii) The fixed and portable gas detection equipment, including indicators and alarms, is to be tested for correct functioning.

(d) In gas-dangerous spaces and zones the electrical equipment including cables and their supports, is to be visually examined, particularly regarding explosion protection.

(e) Ventilation systems for all spaces in the cargo area, including cargo pump rooms, cargo compressor rooms, electrical motor rooms, cargo control rooms, and other spaces used for cargo handling operations are to be examined as to their satisfactory operating condition.

(f) Inert gas/dry air systems, including the means for prevention of backflow of cargo vapour to gas-safe spaces are to be checked as to their satisfactory operating condition. See also 2.9.1.

(g) All fire fighting systems in the cargo area, including the compressor room, are to be checked visually. See also 2.5.1(j).

(h) The following items of equipment are to be inspected for their condition and correct functioning:

(i) Means for ensuring gas-tightness of wheelhouse windows and doors, windows in end bulkheads of superstructures and deck house facing the cargo area or stern loading/unloading arrangements, and closing devices of all air intakes and openings into accommodation, service and control stations.

(ii) Sealing arrangements for tanks or tank domes penetrating decks or tank covers.

(iii) Drip trays or insulation for deck protection against cargo leakage.

(iv) Arrangements for heating of hull structural elements, if any. Access to the heated cofferdams etc. is normally not required.

(v) Electric bonding of cargo piping systems.

(vi) Arrangements for the use of boil-off gas as fuel, including alarm and safety systems.

2.10.2 Intermediate Surveys

In addition to the surveys as per 2.10.1 the checks mentioned below are to be carried out. The intermediate survey supplements the preceding annual survey by testing of cargo handling installations, with pertinent automatic controls, alarm and safety systems, for their correct functioning.

(a) Cargo systems and tanks are to be examined as follows:

(i) The piping system in cargo tanks is to be examined. Bonding of tanks and pipes is to be controlled.

(ii) It is to be checked whether the ship's cargo hoses are approved and in satisfactory condition. At intervals of not more than 2.5 years, the cargo hoses are to be subjected to a pressure and conductivity test.

(iii) Weather deck: Piping systems essential for operation of the ship, e.g. cargo transfer, bunkering and ballast lines, are to be examined.

(iv) For ships between 5 and 10 years of age, an overall survey of representative ballast tanks is to be carried out.

(v) For ships over 10 years of age, an overall survey of all ballast tanks is to be carried out.

(vi) Close-up survey as required in Table I 2-29A.

(b) Cargo containment venting systems are to be examined as follows:

(i) The drainage arrangements of venting systems are to be examined.

(ii) If cargo tanks are equipped with relief valves with non-metallic membranes in main or pilot valves, such membranes are to be replaced by new ones and the valves are to be adjusted, function tested and sealed. These measures need not be taken simultaneously with the intermediate survey, provided that the non-metallic membranes are renewed at intervals not exceeding 3 years.

(c) Instrumentation and safety systems are to be examined as follows:

(i) The alarm, control and safety systems of the cargo installation are to be visually examined and tested by varying pressures, temperatures and liquid levels, as far as practicable, and comparisons are to be drawn, using test instruments. Simulated testing may be accepted for sensors which are not accessible or for sensors located within cargo tanks or inertised cargo holds. This test is to include testing of alarm and safety functions.

(ii) The gas detection equipment, including indicators and alarms, is to be tested for correct functioning. The piping of the gas detection system is to be visually inspected for corrosion and damages. The tightness and integrity of suction lines between suction points and analyzing units are to be verified as far as possible.

(iii) On ships having arrangements for the use of boil-off gases as fuel, safety, control, alarm and shut-down systems are to be checked. The extent of the checks is to be determined from case to case.

(d) Electrical installations are to be examined as follows:

Electrical equipment in gas-dangerous spaces and zones is to be examined in respect of the following:

(i) Protective earthing (spot check).

(ii) Integrity of certified safe-type equipment.

(iii) Damage to outer sheath of cables.

(iv) Function testing of pressurized equipment, and of associated alarms.

(v) Testing of systems for de-energizing noncertified safe electrical equipment located in spaces protected by air-locks, such as electric motor rooms, cargo control rooms, etc.

(vi) Checking of insulation resistance of circuits. Relevant measurements are only to be made when the ship is in gas free or inertised condition. If proper test reports are available on board, readings made by the crew may be accepted.

(vii) When the ship is in gas free condition, it is to be verified that the cargo tanks are electrically bonded to the hull.

2.10.3 Special Survey

Where applicable, in addition to the surveys as per applicable requirements in 2.7 and 2.10.2, the examinations and tests as mentioned below are to be carried out:

(a) The cargo containment systems is to be examined as follows:

(i) All cargo tanks are to be examined internally.

(ii) As far as practicable, the outer surface of un-insulated cargo tanks or the outer surface of cargo tanks insulations, including vapour or protective cover if any, is to be examined, as are areas in way of supports, keys and anti-flotation chocks. Partial removal of insulation may be required in order to verify the condition of the tank or the insulation itself, if found necessary by the Surveyor. Where, e.g. in the case of membrane type cargo tanks, the insulation arrangement is such that it cannot be examined, the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be examined for cold spots when cargo tanks are in cold condition. This examination may be dispensed with if the log book, together monitoring instruments gives sufficient evidence of the integrity of the insulation system.

(iii) Thickness measurements of cargo tanks may be required if deemed necessary by the Surveyor.

(iv) Non-destructive examination of main structural members, tank shells and highly stressed parts, including welded connections is to supplement cargo tank inspections as far as deemed necessary by the Surveyor. The following items are inter alia considered as highly stressed parts:

(1) Cargo tank supports and longitudinal and transverse securing devices.

(2) Y-connections between tank shells and longitudinal bulkheads of slop tanks.

(3) Web frames or stiffening rings.

(4) Swash bulkheads and their fixations.

(5) Dome and sump connection to tank shells.

(6) Foundations for pumps, towers, ladders, etc.

(7) Pipe connections.

(v) For independent Type B tanks, the extent of non-destructive examination is defined in a plan specially prepared for the particular cargo tank design.

(vi) The tightness of all cargo tanks is to be verified by an appropriate procedure provided that the effectiveness of the ship gas detection equipment has been confirmed, it is to be acceptable to utilize this equipment for the tightness test of independent tanks below deck during the first process of filling of the cargo tanks subsequent to the special survey.

(vii) Where the findings of checks according to (i) to (vi) of this subparagraph or an examination of the log book raise doubts as to the structural integrity of a cargo tank, a hydrostatic or hydro-pneumatic test is to be carried out. For integral tanks and for independent Type A and B tanks, the test pressure at the top of tank is to correspond to the MARVS (maximum allowable relief valve setting) of the tank. For independent Type C tanks, the test pressure at the top of the tank is not to less than 1.25 times the MARVS.

(viii) Extended tests

On the occasion of special surveys No.2, 4, 5, etc., all independent type C tanks are to be either

(1) Hydrostatically or hydro-pneumatically tested to a pressure at the upper edge of the tanks of 1.25 times MARVS and thereafter, non-destructively, in accordance with (iv)/(v) of this subparagraph, or

(2) Subjected to a thorough, systematically planned nondestructive examination procedure. These tests are to be carried out in accordance with a plan specially prepared for the particular tank design. If a special plan dose not exist, the following applies with regard to nondestructive testing:
Testing is to be concentrated on the detection of surface cracks in welded connections in highly stressed areas, as listed in (iv) of this subparagraph. At least 10% of the length of the welded connections in each of the above mentioned areas are to be tested. This testing is to be carried out internally and externally, as far as practicable. Insulation is to be removed as necessary for the required nondestructive examination.

(b) Tank supporting structures and insulation are to be examined as follows:

(i) As far as practicable, all hold spaces and hull insulation (if provided), secondary barriers and tank supporting structures are to be visually examined. The secondary barrier of all tanks is to be checked for its effectiveness by means of a pressure/vacuum test, a visual examination or some other acceptable methods.

(ii) For membrane and semi-membrane tank systems, the inspection and testing as per (i) of this subparagraph are to be carried out in accordance with a plan and an approved method specially prepared for the actual tank system.

(c) Pressure and vacuum relief valves are to be examined as follows:

(i) The pressure relief valves for cargo tanks are to be opened up for examination, adjusted, function tested and sealed. The requirements of 2.10.2(b)(ii) regarding replacement of nonmetallic membrane apply. The following tolerances apply regarding the set pressures of cargo tank pressure relief valves:

Set pressure P		Tolerance
	P ≤ 0.15 MPa	± 10 %
0.15 MPa<	P ≤ 0.3 MPa	± 6 %
0.3 MPa<	P	± 3 %

(ii) Pressure/vacuum relief valves, rupture discs and other pressure relief devices for inter-barrier spaces and hold spaces are to be examined, opened and tested if necessary, depending on their design.

(d) It is to be verified that cargo tanks are to be electrically bonded to the hull.

(e) Piping systems are to be examined as follows:

(i) Cargo, liquid nitrogen and process piping systems, including their valves and actuators, compensators etc., are to be opened up for examination as deemed necessary by the Surveyor. Insulation is to be removed as deemed necessary to ascertain the external condition of pipes. At the Surveyor's discretion welded seams at branches and bends are to be subjected to non-destructive random crack tests. If the visual examination raises doubts as to the integrity of pipelines, they are to be pressure tested to 1.25 times MARVS. After reassembly the complete piping system is to be tested for leaks.

(ii) The pressure relief valves in piping systems are to be function tested. A random selection of valves is to be opened up for examination and adjusted.

(iii) Cargo pumps, booster pumps and gas compressors are to be inspected and tested.

(f) The re-liquefaction installation is to be examined as follows:

(i) The parts of compressors subject to wear, such as cylinders, pistons, connecting rods, glands, bearings, auxiliary components, such as shafts, rotors and diffusers of centrifugal pumps, etc., are to be examined.

(ii) The drives of compressors, including those components which are required for operation of the drives, are to be inspected.

(iii) All the covers of heat exchangers are to be dismounted for inspection of pipe plates, if necessary, pressure and tightness tests are to be connected. If only a few pipes have been exchanged, a tightness test may be sufficient.

(iv) The safety equipment (pressure relief valves, rupture discs) is to be checked.

(g) At special surveys Nos. 2, 4, 5 etc. all process pressure vessels are to be tested pneumatically at a pressure equal to 1.1 times the working pressure, unless the result of the survey requires a hydraulic pressure test to 1.5 times the working pressure.

(h) The equipment connected with fuel gas evaporated from the LNG cargo is to be examined as follows:

(i) The gas conditioning plant is to be inspected externally.

(ii) The pipe or duct enclosing the fuel gas line is to be inspected for leaks. The ventilation system of that pipe or duct as well as the inertising equipment of a double wall piping system is to be checked for their operability. Heat exchangers are to be visually examined internally.

(iii) Safety devices: See 2.10.2(c).

(i) In addition to the visual examinations and tests as per 2.10.2(d) the protection devices of electric motors are to be tested.

(j) Miscellaneous items are to be examined as follows:

(i) Drainage systems for removal of water or cargo inter-barrier spaces and hold spaces are to be examined and tested where necessary.

(ii) All gas tight bulkheads are to be inspected. The effectiveness of gas tight shaft sealings is to be verified.

(iii) It is to be checked whether the spare parts stipulated in the GC code or IGC code are kept on board.

(iv) Any installations for heating of hull structures are to be examined for correct functioning.

(k) Close-up survey as required in Table I 2-29B.

(l) Ballast tanks, including double bottom tanks, pump rooms, compressor rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined. All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction.

(m) Thickness measurement as required in Table I 2-29C.

(n) Tank testing as required in Table I 2-2B. Cargo tank testing carried out by the vessel's crew under the direction of the Master may be accepted by the surveyor provided the following conditions are complied with:
- (i) A tank testing procedure has been submitted by the owner and reviewed by this Society prior to the testing being carried out;
- (ii) There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;
- (iii) The tank testing has been satisfactorily carried out within special survey window not more than 3 months prior to the date of the survey on which the overall or close up survey is completed;
- (iv) The satisfactory results of the testing is recorded in the vessel's logbook;
- (v) The internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

2.11 Surveys of Chemical Carriers

2.11.1 Annual Surveys

In addition to the surveys as per applicable requirements in 2.5, the following installations, items of equipment and outfit listed are to be checked as to their perfect maintenance condition:

(a) On weather deck within the cargo area the following equipment, if fitted, is to be surveyed:
- (i) Cargo tank hatches, including sealings and covers.
- (ii) The gauging devices, level alarms and overflow control with automatic closing valves.
- (iii) Pressure/vacuum relief valves and flame arresters of cargo tank venting arrangements as well as devices for measuring the cargo tank vapour pressure.
- (iv) Sampling devices of cargo cooling or heating installation as well as temperature measuring devices and temperature alarm systems.
- (v) Pump discharge pressure gauges and the distinctive marking of pumps, valves and cargo piping.
- (vi) Wheelhouse doors and wheelhouse windows, deckhouse and superstructure windows facing the cargo area (closed condition).

(b) Cargo handling installations (including spool pieces of loading and unloading system, spray shields and drip trays, cargo hoses, etc.) arranged on the weather deck, possibly in the fore or aft area, are to be visually examined.

(c) In cargo pump room and other enclosed spaces entered during cargo handling operations the following are to be surveyed:
- (i) Remote operation of bilge system.
- (ii) Rescue arrangements.
- (iii) Ventilation systems.
- (iv) For fire extinguishing systems, see (e).

(d) In gas dangerous spaces and zones, the electrical equipment, including cables and their supports, is to be visually examined, particularly regarding explosion protection.

(e) The survey of fire extinguishing systems covers:

(i) External inspections of all systems for the cargo tank area and pump rooms.

(ii) Checking of the foam fire extinguishing and/or water spray system on deck.

(f) The following items, if fitted, are to be checked:

(i) Special arrangements related to damage control (e.g. sliding bulkhead doors) in accordance with the approved damage control plan (also for tanker of less than 100 m in length).

(ii) Cargo sample storage spaces.

(iii) Gas detection instruments.

(iv) Cargo information and safety instructions.

2.11.2 Intermediate Surveys

In addition to the surveys as stipulated in 2.11.1 above, the checks listed below are to be performed. If deemed necessary by the Surveyor, a functional test is to be carried out in addition to the survey.

(a) In the case of chemical tankers aged 10 years or over, at least two selected cargo tanks are to be internally inspected for corrosion and possible damages to their coatings, and structural equipment, such as piping, valves and fittings, instrumentation, etc. is to be inspected.

(b) Sea water ballast tanks.

See 2.6.2(a) and (b).

(c) All important piping systems in the cargo area are to be examined, e.g.:

(i) Cargo, tank cleaning, bunkering, ballast and steam pipings.

(ii) Provisions for drainage of cargo tank vent lines.

(iii) Bonding devices of all piping systems and independent cargo tanks.

(iv) Cargo cooling systems.

(v) Cargo hoses.

(vi) Tank heating systems.

(vii) Spare parts for mechanical ventilation systems.

(d) The electrical equipment in gas dangerous spaces and zones is to be surveyed with respect to the following:

(i) Protective earthing (spot checks).

(ii) Integrity of certified safe type equipment.

(iii) Damage to the outer sheet of cables.

(iv) Function testing of pressurized equipment, and of associated alarms.

(v) Testing of insulation resistance of circuits, only when the ship is in gas free or inertised condition. If proper test reports are available on board, the readings made by the crew may be accepted.

2.11.3 Special survey – hull

In addition to the applicable requirements in 2.7, the following items are to be surveyed:

(a) The internal examination including close-up survey and pressure testing of all tanks and spaces are to be carried out according to Table I 2-1B, Table I 2-6A, Table I 2-6B and Table I 2-9. Cargo tank testing carried out by the vessel's crew under the direction of the Master may be accepted by the surveyor provided the following conditions are complied with:

(i) A tank testing procedure has been submitted by the owner and reviewed by this Society prior to the testing being carried out;

(ii) There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

(iii) The tank testing has been satisfactorily carried out within special survey window not more than 3 months prior to the date of the survey on which the overall or close up survey is completed;

(iv) The satisfactory results of the testing is recorded in the vessel's logbook;

(v) The internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

(b) The minimum requirements for thickness measurements are given in Table I 2-7. The extent of thickness measurements at those areas of substantial corrosion in cargo area length is given in Table I 2-8.

2.11.4 Special survey - cargo area equipment

In addition to the requirements of the cargo system and pertinent safety devices stipulated in 2.11.2, the following items are to be examined:

(a) Cargo and ballast piping systems including valves and fittings, are to be inspected for corrosion, as deemed necessary by the Surveyor. Subsequently a pressure test is to be carried out.

(b) Cargo stripping and ballast pumps are to be examined. Pressure relief valves of pumps are to be function tested.

(c) Pressure/vacuum valves of cargo tanks are to be function tested and are to be opened up and adjusted, if deemed necessary by the Surveyor.

(d) Tank venting systems are to be examined. Flame arresters are to be opened up as far as necessary, and cleaned.

(e) Cargo tank heating systems are to be examined and pressure tested to 1.5 times the operating pressure.

(f) The bilge systems of pump rooms are to be examined and tested.

(g) All ventilation systems in cargo areas, including portable fans, are to be examined and function tested.

(h) The following equipment is to be function tested:
  (i) Level indicators of cargo tanks.
  (ii) Liquid level alarms.
  (iii) Overflow controls.
  (iv) Pressure and temperature alarms.
  (v) Remote control systems of cargo pumps.
  (vi) Sampling arrangements for cargo tanks, if fitted.
  (vii) Inert gas systems, see 2.9.2.

2.11.5 Special survey – machinery

In addition to the special surveys of the ship's machinery as required in 2.7.6 and the inspections and testing as per 2.11.2(d), the protection devices of electric motors in gas dangerous spaces and zones are to be tested.

2.12 Surveys of General Dry Cargo Ships - Hull

These requirements apply to general dry cargo ships of 500 gross tonnage and above.

2.12.1 Annual Survey

(a) General
  (i) The due range of Annual Survey is to be in accordance with the applicable requirements of 2.5.
  (ii) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, coamings and piping are maintained in a satisfactory condition.

(b) Examination of the hull
  (i) Examination of the hull plating and its closing appliances as far as can be seen.

(ii) Examination of watertight penetrations as far as practicable.

(c) Hatch covers and coamings

(i) Checking that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.

(ii) Where mechanically operated steel covers are fitted, checking the satisfactory condition of:

(1) Hatch covers; including Close-up Survey of hatch cover plating;

(2) Tightness devices (gaskets, gaskets lips, compression bars, drainage channels);

(3) Clamping devices, retaining bars, cleating, chain or rope pulleys;

(4) Guides, guide rails, track wheels and stoppers, etc.;

(5) Wires, chains, gypsies, tensioning devices;

(6) Hydraulic system essential to closing and securing; and

(7) Safety locks and retaining devices.

(iii) Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition of:

(1) Wooden covers and portable beams, carriers or sockets for the portable beams, and their securing devices;

(2) Steel pontoons, including close-up survey of hatch cover plating;

(3) Tarpaulins;

(4) Cleats, battens and wedges;

(5) Hatch securing bars and their securing devices;

(6) Loading pads/bars and the side plate edge;

(7) Guide plates and chocks; and

(8) Compression bars, drainage channels and drain pipes (if any).

(iv) Checking the satisfactory condition of hatch coaming plating and their stiffeners including close-up survey.

(v) Random checking of the satisfactory operating of mechanically operated hatch covers is to be made including:

(1) Stowage and securing in open condition;

(2) Proper fit and efficiency of sealing in closed condition; and

(3) Operational testing of hydraulic and power components, wires, chains and link drives.

(d) Suspect Areas identified at previous special or intermediate surveys are to be overall and close-up surveyed. Thickness measurements are to be taken of the area of Substantial Corrosion and the number of thickness measurement is to be increased to determine the extent of Substantial Corrosion as deemed necessary by the surveyor.

(e) Examination of cargo holds

Examination of cargo holds for annual survey of general dry cargo ships is to be carried out as given in Table I 2-10.

(f) Examination of ballast tanks

Examination of ballast tanks is required as a consequence of the results of the special survey and intermediate survey. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, then the number of thickness measurements is to be increased to determine the extent of Substantial Corrosion as deemed necessary by the surveyor.

(g) When thickness measurements as stated in (d), (e) and (f) above, indicate Substantial Corrosion, the number of thickness measurements is to be increased to determine the extent of Substantial Corrosion. Table I 2-16 may be used as guidance for additional thickness measurements.

(h) Randomly examine and test the water level detectors and their alarms for single hold dry cargo ships.

2.12.2 Intermediate survey

(a) General

(i) Due range of intermediate survey is to be in accordance with the applicable requirements of 2.6.

(ii) At each intermediate survey, in addition to the requirements of the annual survey, the following items are to be surveyed.

(iii) For general dry cargo ships exceeding 15 years of age, the requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.12.3. However, an under water survey may be considered as equivalent in lieu of the requirements of 2.12.3(a)(vii) and pressure testing of ballast tanks and cargo holds used for ballast water, as applicable, is not required unless deemed necessary by the attending Surveyor.

(b) Examination of ballast tanks

Examination of ballast tanks for intermediate survey of general dry cargo ships is to be carried out as given in Table I 2-11.

(c) Examination of cargo holds

Examination of cargo holds for intermediate survey of general dry cargo ships is to be carried out as given in Table I 2-12.

2.12.3 Special survey

(a) General

(i) The due range of special survey is to be in accordance with the applicable requirements of 2.7.

(ii) A survey planning meeting is to be held prior to the commencement of the survey.

(iii) The special survey is to include, in addition to the requirements of the annual survey, examination, tests and checks of sufficient extent to ensure that the hull and related piping is in a satisfactory condition.

(iv) All cargo holds, salt water ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined as given in Table I 2-13. This examination is to be supplemented by thickness measurement and testing as deemed necessary, to ensure that the structural integrity remains effective. The examination is to be sufficient to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration.

(v) All piping systems within the above spaces are to be examined and tested under working conditions to ensure that the condition remain satisfactory.

(vi) The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.

(vii) A survey in dry dock is to be a part of the special survey.

(b) Tank protection

(i) Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For tanks used for salt water ballast, excluding double bottom tanks, where a protective coating is found in Poor condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a protection coating was not applied from the time of construction, the tank in question is to be examined at annual intervals.

(ii) When such breakdown of coating is found in salt water ballast double bottom tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the tank in question is to be examined at annual intervals. When deemed necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

(iii) Where the protective coating in spaces is found to be in Good condition, the extent of close-up surveys and thickness measurements may be specially considered.

(c) Hatch covers and coamings

In addition to the requirements of the annual survey, the following items are to be surveyed.

(i) Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

(1) Stowage and securing in open condition;

(2) Proper fit and efficiency of sealing in closed condition; and

(3) Operational testing of hydraulic and power components, wires, chains and link drives.

(ii) Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

(iii) Thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out as given in Table I 2-14, and the the thickness measurement of hatch cover and coaming plating in way of Substantial Corrosion is to be carried out as given in Table I 2-16.

(d) Extent of overall and close-up survey

(i) An overall survey of all tanks and spaces, excluding fuel oil, lube oil and fresh water tanks, is to be carried out at each special survey.

(ii) Each special survey is to include a close-up survey of sufficient extent to establish the condition of the shell frames and their end attachments in all cargo holds and salt water ballast tanks as indicated in Table I 2-14.

(e) Extent of thickness measurement

(i) The minimum requirements for thickness measurements at special survey are given in Table I 2-15 and Table I 2-16.

(ii) Thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and salt water ballast tanks is to be carried out. Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The thickness measurements may be dispensed with provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution, and the protective coating where applied remains efficient.

(iii) The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate Substantial Corrosion, the number of thickness measurements is to be increased to determine the extent of Substantial Corrosion as deemed necessary by the Surveyor.

(iv) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(f) Extent of tank testing

(i) All boundaries of salt water ballast tanks and deep tanks used for salt water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, only representative tanks are to be pressure tested.

(ii) The Surveyor may extend the tank testing as deemed necessary.

(iii) Tanks are to be tested with a head of liquid to the top of the air pipes for ballast tanks and deep tanks or the pressure corresponding to the maximum head that can be experienced in service for oil tanks.

2.13 Surveys of Double Hull Oil Tankers – Hull

These requirements apply to surveys of hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks for the double hull oil tankers with ESP notation.

2.13.1 Annual survey

(a) General

(i) The due range of annual survey is to be in accordance with the applicable requirements of 2.5.

(ii) The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

(b) Examination of the hull

(i) Examination of the hull plating and its closing appliances as far as can be seen.

(ii) Examination of watertight penetrations as far as practicable.

(c) Examination of weather decks

(i) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.

(ii) Examination of cargo tanks pressure/vacuum valves and flame screens.

(iii) Examination of flame screens on vents to all bunker, oily ballast and oily slop tanks.

(iv) Examination of cargo, crude oil washing, bunker and vent piping systems, including vent masts and headers.

(d) Examination of cargo pump rooms and pipe tunnels

(i) Examination of all pump room bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.

(ii) Examination of the condition of all piping systems.

(e) Examination of ballast tanks

(i) Examination of ballast tanks when required as a consequence of the results of the special survey and intermediate survey. When considered necessary by the Surveyor, thickness measurement is to be carried out and if the results of these thickness measurements indicate that Substantial Corrosion is found, additional thickness measurements are to be carried out as deemed necessary by the Surveyor.

(ii) Double hull oil tankers exceeding 15 years of age, all ballast tanks adjacent to (i.e. with a common plan boundary) a cargo tank with any means of heating are to be examined internally. Ballast tanks which were found, at the previous Intermediate or special survey, to have no Substantial Corrosion within the tank and which were found in compliance with either of the following conditions may be specially considered by the Society:

(1) coating in Good condition; or

(2) coating of the common boundary, including adjacent structures, in Good condition and the coating of the remaining parts of the tank in Fair condition.

2.13.2 Intermediate survey

(a) General

(i) The due range of intermediate survey is to be in accordance with the applicable requirements of 2.6.

(ii) At each intermediate survey, in addition to the requirements of the annual surveys, the following items are to be surveyed.

(iii) For double hull oil tankers exceeding 15 years of age, the requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.1.5(a) and 2.13.3. However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by attending Surveyor.

(iv) In application of (iii) above, a survey in dry dock is to be part of the intermediate survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and water ballast tanks are to be surveyed in accordance with the applicable requirements for the intermediate surveys, if not already surveyed.

(v) For ships over 20 years of age after launching date, the applicable requirements specified in 2.6 are to be applied at the intermediate survey carried out within 3 months before or after the anniversary date from the previous special survey.

(b) For weather decks, an examination as far as applicable of:

(i) Cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out.

(ii) If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.

(c) Extent of overall survey and close-up survey

The extent of overall survey and close-up survey for intermediate survey is to be in accordance with the requirements of Table I 2-17.

(d) Extent of Thickness Measurements

(i) The extent of thickness measurements is also given in Table I 2-17.

(ii) The minimum requirements for thickness measurements at the intermediate survey are areas found to be Suspect Areas at the previous special survey.

(iii) Where Substantial Corrosion is found, the extent of the thickness measurements according to Table I 2-17 is to be increased in accordance with the requirements of Table I 2-20. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect Areas identified at previous special surveys are to be examined.

(iv) Areas of Substantial Corrosion identified at previous special or intermediate survey are to have thickness measurements taken.

(e) Double hull oil Tankers exceeding 15 years of age

(i) The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.13.3 and 2.1.5. However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.

(ii) A survey in dry dock is to be part of the intermediate survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and water ballast tanks are to be surveyed in accordance with the applicable requirements for intermediate surveys, if not already surveyed.

2.13.3 Special survey

(a) General

(i) The due range of Special Survey is to be in accordance with the applicable requirements of 2.7.

(ii) The special survey is to include, in addition to the requirements of the intermediate survey, examination, tests and checks of sufficient extent to ensure that the hull and related piping is in a satisfactory condition.

(iii) All cargo tanks, all salt water ballast tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined. This examination is to be supplemented by thickness measurement and pressure testing as deemed necessary, to ensure that the structural integrity remains effective. The examination is to be sufficient to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration.

(iv) Cargo piping on deck, including crude oil washing (COW) piping, and all piping systems within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Where provided, special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are opened during repair periods and can be examined internally.

(v) A survey in dry dock is to be a part of the special survey.

(b) Tank protection

(i) Where provided, the condition of corrosion prevention of cargo tanks is to be examined.

(ii) For tanks used for salt water ballast, where a protective coating is found in Poor condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the tank in question is to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

(c) Extent of overall and close-up survey

(i) An overall survey of all tanks and spaces, excluding fuel oil, lube oil and fresh water tanks, is to be carried out at each special survey.

(ii) The minimum requirements for close-up surveys at special survey are given in Table I 2-18.

(iii) The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

(1) In particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information.

(2) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

(iv) For areas in tanks where coatings are found in Good condition, the extent of close-up surveys according to Table I 2-18 may be specially considered.

(d) Extent of thickness measurement

(i) The minimum requirements for thickness measurements at special survey are given in Table I 2-19.

(ii) Provisions for extended measurements for areas with Substantial Corrosion are given in Table I 2-20, and as may be additionally specified in the survey plan as required in 2.1.5. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect Areas identified at previous Special Surveys are to be examined. Areas of Substantial Corrosion identified at previous special or intermediate survey are to have thickness measurements taken.

(iii) The Surveyor may further extend the thickness measurements as deemed necessary.

(iv) For areas in tanks where coating are found to be in a Good condition, the extent of thickness measurements according to Table I 2-19 may be specially considered.

(v) Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

(vi) In cases where two or three sections are to be measured, at least one is to include a ballast tank within 0.5L amidships.

(e) Extent of tank testing

(i) The minimum requirements for tank testing at special survey are given in Table I 2-21.

(ii) The Surveyor may extend the tank testing as deemed necessary.

(iii) Tanks are to be tested with a head of liquid to the top of access hatches for cargo tanks, or top of air pipes for ballast tanks, if this gives a higher pressure.

2.14 Surveys of Passenger Ships

These requirements apply to ships carrying more than 12 passengers. Passenger ships are subjected to the following periodical surveys:

(a) Annual Survey

(b) Intermediate Survey

(c) Bottom Survey

(d) Special Survey

(e) Boiler Survey

(f) Propeller Shaft Survey

2.14.1 Annual Survey:

In addition to the requirements of intermediate surveys of non general dry cargo ships in 2.6, following items are also to be carried out:

(a) Hull:

(i) Bottom survey in dry dock or in water.

(ii) Inspection of the piping and valves of cross flooding system and operation tests of its remote control system. Main valves for the system are to be overhauled and inspected.

(iii) Inspection and operation test of door indicators and water leakage detectors of shell doors.

(iv) Inspection of discharge pipes and valves on shells below bulkhead deck. These valves are to be overhauled and inspected, but may be dispensed with when the bottom survey was carried out in water.

(v) Inspection and tightness test of the fixed parts of fin-stabilizers.

(vi) Inspection of all shell connections below bulkhead deck.

(vii) Inspection of gangways, all shell ports (cargo ports included), ash and rubbish chutes below the bulkhead deck.

(viii) Inspection of portlights including deadlights and securing arrangements below the bulkhead deck.

(ix) Inspection of all openings and their closures in watertight bulkheads below the bulkhead deck including watertight doors and operation of same.

(x) The escapes and any cross-flooding arrangement are to be checked.

(b) Machinery:

(i) Sea trials are to be carried out, if deemed necessary.

(ii) The ability of the propulsion machinery to reverse the direction of the thrust of propellers and the ability to stop the ship are to be tested and verified.

(iii) Inspection of main and emergency electric power, and emergency lighting system.

(iv) Inspection of flooding detection system and/or water ingress alarm system for each watertight spaces below the bulkhead deck.

(c) Fire Protection and Fire Extinguishing System:

(i) Inspection of the general alarm system, fire alarm system, fire detection system, public addressing system, fire doors, fire dampers, draft stops and fire divisions.

(ii) Inspection and operation test of water sprinkler system including it's piping , valves, alarm system and automatic starting of fire pumps. Pressure tanks, if any, are to be pressure tested.

2.14.2 Intermediate and Special Survey

In addition to the requirements of special surveys of non general dry cargo ships in 2.7 and 2.14.1, following items are also to be complied with.

(a) Hull:

(i) Check the light weight of the ship.

The light weight of the ship is to be checked during special survey. If the major conversion is found during annual survey or intermediate survey, the light weight of the ship is to be checked by the attending Surveyor.

Inclining experiments are to be carried out whenever the light weight is different from record by 2% or more or the longitudinal center of gravity is different from record by 1% of ship's length or more.

(b) Bottom survey in dry dock is to be a part of intermediate or special survey.

While the thickness measurements is carried out, if substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Table I 2-4A. Tanks or areas where coating was found to be in GOOD condition at the previous intermediate or periodical survey may be specially considered by the Society.

(c) For intermediate survey - machinery, the requirements of 2.7.6 may be dispensed with at the discretion of the Society or the attending Surveyor.

2.15 Surveys of Double Skin Bulk Carriers - Hull

2.15.1 Annual Survey

(a) In addition to the requirements of annual surveys of non general dry cargo ships in 2.5, following items are also to be carried out:

(i) A thorough survey of all cargo hatch covers and coamings including opening and closing operation of hatch covers.

(ii) Examination of all piping and penetrations in cargo holds, including overboard piping.

(iii) Examination and test, at random, of water ingress detection systems.

(iv) Examination and test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

(v) Double Skin Bulk Carriers 10 < age ≤ 15

(1) Overall survey of two selected cargo holds.

(2) When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If substantial corrosion is found, the extent of thickness measurements is to be increased.

(vi) Double Skin Bulk Carriers 15 < age

(1) Overall survey of all cargo holds.

(2) When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If substantial corrosion is found, the extent of thickness measurements is to be increased.

2.15.2 Intermediate Survey

(a) In addition to the requirements of annual surveys in 2.15.1, following items are also to be carried out:

(i) Double Skin Bulk Carriers 5 < age ≤ 10

(1) For tanks used for water ballast, an overall survey of representative tanks selected by the surveyor is to be carried out. The selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. If such overall survey reveals no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains efficient. Where POOR coating condition, corrosion or other defects are found in water ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type. In ballast tanks other than double bottom tanks, where a hard protective coating is found in POOR condition, and it is not renewed, or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual intervals. When such breakdown of hard protective coating is found in ballast double bottom tanks, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied, the tanks in question may be examined at annual intervals. When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. Suspect areas identified at previous surveys are to be overall and close-up surveyed.

(2) An overall survey of all cargo holds is to be carried out.
Where considered necessary by the surveyor as a result of the overall survey, the survey is to be extended to include a close-up survey of those areas of structure in the cargo holds selected by the surveyor.

(ii) Double Skin Bulk Carriers 10 < age ≤ 15

The requirements of the intermediate survey are to the same extent as the previous special survey. However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

(iii) Double Skin Bulk Carriers 15 < age

(1) The requirements of the intermediate survey are to the same extent as the previous special survey. However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

(2) A survey in dry dock is to be part of the intermediate survey.

(iv) Minimum requirements of overall and Close-up survey and thickness measurements at intermediate survey are to be surveyed as Table I 2-26 for double skin bulk carriers.

2.15.3 Special Survey

(a) In addition to the requirements of annual surveys in 2.15.1, following items are also to be carried out:

(i) All cargo holds, ballast tanks, including double bottom and double side tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined.

(ii) All piping systems within the above spaces are to be examined and operationally tested to working pressure.

(iii) Bottom survey in dry dock is to be part of the special survey.

(iv) An overall survey of all tanks and spaces is to be carried out. Fuel oil tanks in cargo length area are to be surveyed as Table I 2-22.

(v) Minimum Close-up survey is to be surveyed as Table I 2-23 for double skin bulk carriers, excluding ore carriers and as Table I 2-24 for ore carriers, respectively.

(vi) Minimum thickness measurements are to be carried out as Table I 2-25.

(vii) All boundaries of water ballast tanks, deep tanks and cargo holds used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, only representative tanks are to be pressure tested.

2.15.4 Extended thickness measurements is to be increased in accordance with Table I 2-27 when considered necessary by the surveyor, or where substantial corrosion exists in each survey.

2.16 Classification Survey of Ships not Built under Survey

2.16.1 The following drawings and documents, necessary for classification purpose, are to be submitted as far as practicable together with the application for classification:

(a) Hull

(i) General arrangement.

(ii) Mid-ship section.

(iii) Scantling profile and deck plans.

(iv) Shell expansion.

(v) Capacity plan.

(vi) Piping and pumping diagrams.

(vii) Rudder and stern frames.

(viii) Data of chain cable and anchor.

(ix) Lines and hydrostatic curves (if freeboard assignment is required).

(x) Lumber storage plan (if timber freeboard assignment is required).

(xi) Loading and stability information (i.e. loading manual).

(xii) Outfitting arrangement of ship's side fittings.

(xiii) Inert gas system (if required to be installed).

(xiv) COW system (if required to be installed).

(b) Machinery
- (i) Engine room arrangement.
- (ii) Piping system in engine room.
- (iii) Detail and arrangement of propulsion shafting.
- (iv) Machinery particulars.
- (v) General arrangement of electric equipment.
- (vi) Electric wiring diagram of power, lighting and interior communication system.
- (vii) Electric equipment particulars.
- (viii) Main switchboard.

(c) **CAS/CAU/CAB**
- (i) Machinery arrangement plans showing location of control stations in relation to controlled units.
- (ii) Arrangements and details of control consoles including front view, installation arrangements together with schematic diagrams for all power, control and monitoring systems including their functions.
- (iii) Kinds and sizes of all electrical cables and wiring associated with control systems including voltage rating, service voltage and currents together with overload and short circuit protection.
- (iv) Schematic plans of hydraulic and pneumatic control systems together with all interconnections, piping sizes and materials including working pressures and relief valve settings.
- (v) Description of all alarms and emergency tripping arrangements, functional sketches or description of all special valves, actuators, sensors and relays.
- (vi) Schematic plans and supporting data of fire protection and extinguishing systems, including fire detection and alarm system, bilge high water level alarms.

(d) Cargo refrigerating machinery and installations
- (i) General arrangement of the insulated chamber in elevation and plan.
- (ii) Drainage arrangement and detail of non-return trap.
- (iii) Arrangement of air ducts, fan coolers and thermometers.
- (iv) General arrangement of the refrigerating machinery.
- (v) Piping diagram of primary and secondary refrigerant systems including full particulars of safety devices, valves and pipes.
- (vi) Electric wiring diagram.
- (vii) The log book of the refrigerating machinery for the preceding years is to be submitted for investigation.
- (viii) Weights and descriptions of cargoes required to be cooled down in each chamber.
- (ix) Proposed time required for cooling down.
- (x) Initial temperature at which the cargo is to be loaded.
- (xi) Carrying temperature of the cargo in refrigerated chamber.
- (xii) Proposed air circulation and fresh air quantity required to cool down refrigerated chamber.

2.16.2 Ships without classification

For the ships which have not been classed with any other Classification Society, all surveys to the extent as specified in the Rules, are to be carried out by the Surveyor who is to take into account the age, the standard of construction, the past maintenance, and the present status of the ships concerned.

2.16.3 Ships with classification

If the ship keeps the Class of another recognized Classification Society with sufficient status, in general, a survey to the extent of an intermediate survey is to be conducted except the ship being within 3 months of the due date of special survey. Some intermediate survey items may be omitted by the Surveyor in view of the ship's condition. In such case, the period of class is to remain as assigned by the previous Classification Society.

2.16.4 Subsequent surveys

Subsequent surveys are to be carried out as in the case of ships built under survey.

Table I 2-1A
Minimum Requirements for Internal Examination at Hull Special Surveys

Spaces and Tanks (1),(2),(3)	SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
Fuel oil bunker tanks				
- Engine room	None	None	One	One
- Cargo area	None	One	Two(4)	Half, minimum 2(4)
Lube oil	None	None	None	One
Fresh water	None	One	All	All

Other spaces:

1. All spaces including holds and their 'tween decks where fitted; double bottom, deep, ballast, peak and cargo tanks; pump rooms, pipe tunnels, duct keels, machinery spaces, dry spaces, cofferdams and voids are to be internally examined including the plating and framing, bilges and drain wells, sounding, venting, pumping and drainage arrangements.
2. Internal examination of fuel oil, lube oil and fresh water tanks is to be carried out in accordance with this Table above.
3. Engine room structure is to be examined. Particular attention is to be given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops, and engine room bulkheads in way of tank top and bilge wells. Particular attention is to be given to the sea suctions, sea water cooling pipes and overboard discharge valves and their connections to the shell plating. Where wastage is evident or suspect, thickness measurements are to be carried out, and renewals or repairs made when wastage exceeds allowable limits.
4. For spaces used for salt water ballast, excluding double bottom tanks, if there is no protective coating, soft or semi-hard coating, or Poor protective coating condition and it is not renewed, maintenance of class is to be subject to the spaces in question being internally examined at annual intervals. Waiver of internal examination at annual intervals for tanks of 12 m^3 or less in size, with soft or semi-hard coating, may be considered.
5. When such conditions are found in salt water ballast double bottom tanks, maintenance of class may be subject to the spaces in question being internally examined at annual intervals.
6. Hatch covers and coamings are to be examined to verify that no unapproved changes have been made, that hatch covers are structurally sound and weathertight, and where mechanically operated steel covers are fitted, satisfactory operation is to be verified.

Notes:

(1) Tanks of integral (structural) type.

(2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

(3) Peak tanks (all uses) are subject to internal examination at each special survey.

(4) One deep tank is to be included, if fitted.

Table I 2-1B
Additional Requirements of Internal Examinations for Oil Tankers

Special Survey	Tanks and Spaces subject to an Examination	Note
All special survey	1. All cargo tank	• For oil tankers, combined cargo/ballast tanks, if any, are to be examined carefully taking account of ballast history and the extent of the corrosion prevention system provided. • For oil tankers, condition of the inner surface of the bottom plating of the tank is to be examined in order to ascertain that the there is no excessive pitting of the plating. • For oil tankers, bell mouths of the cargo suction pipes are to be removed to enable examination of the bottom plating of the tank and bulkheads in that vicinity as considered necessary by the Surveyor.
	2. All tanks and spaces adjacent to cargo tanks (ballast tanks, pump rooms, pipe tunnels, cofferdams and void spaces)	• For oil tankers and ships carrying dangerous chemicals in bulk, an internal examination of ballast tanks is to be carried out at annual intervals, where a protective coating is found in Poor condition, and it is not renewed or where a protective coating has not been applied to the tanks. • An internal examination of pump room is to be carried out carefully paying attention to the sealing arrangements of all penetrations of bulkheads, ventilating arrangements, foundations and gland seals of pumps.

Table I 2-1C
Additional Requirements of Internal Examinations for Bulk Carrier

Special Survey	Tanks and Spaces subject to an Examination	Note
All special surveys	1. All cargo holds	• Combined cargo/ballast tanks, if any, are to be examined taking account of ballast history and the extent of the corrosion prevention system provided.
	2. All tanks and spaces adjacent to cargo holds (ballast tanks, pipe tunnels, cofferdams and void spaces)	• For ballast tanks where a protective coating is found in Poor condition, and it is not renewed or where a protective coating has not been applied, an internal examination is to be carried out at annual intervals. • Ballast tanks converted to void spaces are to be examined applying the provisions for ballast tanks correspondingly.

Table I 2-2A
Requirements of Pressure Tests for Cargo Ships

Special Survey (SS)	Tanks subject to Pressure Test
SS No.1 (Age ≤ 5)	1. All water tanks including cargo holds used for ballast and all cargo tanks Special consideration may be, however, given to limit testing of fresh water tanks to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks. 2. All fuel oil tanks Special consideration is to be given to limit testing of fuel oil tanks to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks. 3. All lubrication oil tanks Special consideration may be, however, given to limit testing of lubrication oil tanks to representative tanks provided that, after an external examination of the tanks, the Surveyor is satisfied with the condition of the tanks.
SS No.2 (5 < Age ≤ 10)	1. Same requirements as special survey No.1
SS No.3 (10 < Age ≤ 15)	1. All water tanks including cargo holds used for ballast and all cargo tanks 2. All fuel oil tanks Special consideration is to be given to limit testing of double bottom tanks to representative tanks including one forward and one aft tank and of deep tanks to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks. 3. All lubrication oil tanks Special consideration is to be given to limit testing of lubrication oil tanks to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks.
SS No.4 (Age > 15)	1. All water tanks including cargo holds used for ballast, all cargo tanks, all fuel oil tanks and all lubrication oil tanks

Table I 2-2B
Minimum Requirements to Tank Testing at Special Survey of Oil Tankers, Ore/Oil Ships and etc.

SS No. 1 (Age ≤ 5)	SS ≥ No. 2 (5 < Age ≤ 10)
1. All ballast tank boundaries	1. All ballast tank boundaries
2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump-rooms or cofferdams	2. All cargo tank bulkheads

Table I 2-2C
Requirements of Pressure Tests at Special Survey of Bulk Carriers

Special Survey (SS)	Tanks subject to Pressure Test
SS No.1 (Age ≤ 5)	1. All boundaries of ballast tanks, deep tanks and cargo holds used for ballast within the cargo length area 2. Representative tanks for fresh water, fuel oil and lubrication oil within the cargo length area 3. All water tanks Special consideration may be, however, given to limit testing of fresh water tanks other than tanks specified in 1. and 2. above to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks. 4. All fuel oil tanks Special consideration may be, however, given to limit testing of fuel oil tanks other than tanks specified in 2. above to representative tanks provided that, after an internal or external examination of the tanks, the Surveyor is satisfied with the condition of the tanks. 5. All lubrication oil tanks Special consideration may be, given to limit testing of lubrication oil tanks other than tanks specified in 2. above to representative tanks provided that, after an external examination of tanks, the Surveyor is satisfied with the condition of the tanks.
SS No.2 (5 <Age ≤ 10)	1. As special survey No.1
SS No.3 (10 <Age ≤ 15)	1. All water tanks including cargo holds used for ballast 2. All fuel oil tanks Special consideration may be, however, given to limit testing of double bottom tanks to representative tanks including one forward and one aft tank and of deep tanks to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks. 3. All lubrication oil tanks Special consideration may be, however, given to limit testing of lubrication oil tanks to representative tanks provided that, after an internal and external examination of the tanks, the Surveyor is satisfied with the condition of the tanks.
SS No.4 (Age > 15)	1. All water tanks including cargo holds used for ballast, all fuel oil tanks and all lubrication oil tanks

Table I 2-3A
Minimum Requirements for Thickness Measurements at Hull Special Surveys

SS No. 1 (Age ≤ 5)	SS No. 2 (5<Age≤10)	SS No. 3 (10 < Age ≤ 15)	SS No ≥ 4 (Age > 15)
1. Suspect Areas throughout the vessel	1. Suspect Areas throughout the vessel	1. Suspect Areas throughout the vessel	1. Suspect Areas throughout the vessel
	2. One transverse section of deck plating abreast a cargo space within the amidships 0.5L(5)	2. Two transverse sections within the amidships 0.5L abreast of two different cargo spaces(5)	2. A minimum of three transverse sections in way of cargo spaces within the amidships 0.5L(5)
		3. Internals in forepeak tank and after peak tank	3. Internals in forepeak and after peak tanks
		4. All cargo hold hatch covers and coamings (plating and stiffeners)	4. All cargo hold hatch covers and coamings (plating and stiffeners)
			5. All exposed main deck plating full length
			6. Representative exposed superstructure deck plating (poop, bridge, and forecastle deck)
			7. Lowest strake and strakes in way of 'tween decks of all transverse bulkheads in cargo spaces together with internals in way(5)
			8. All wind- and water strakes, port and starboard, full length
			9. All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
			10. Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

Notes:

(1) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.

(2) Thickness measurements of internals may be modified at the discretion of the Surveyor if the protective coating is in Good condition.

(3) For vessels less than 100 meters in length, the number of transverse sections required at Special Survey No. 3 may be reduced to one, and the number of transverse sections required at Subsequent Special Surveys may be reduced to two.

(4) For vessels more than 100 meters in length, at Special Survey No. 3, thickness measurements of exposed deck plating within amidship 0.5 L may be required.

(5) For vessels without defined cargo spaces, thickness measurements are to be taken at the appropriate, most onerous locations selected to provide the best representative sampling of areas likely to be exposed to corrosion the most.

Table I 2-3B
Minimum Requirements for Thickness Measurements
at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc.

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
1. One section of deck plating for the full beam of the ship within the cargo area (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast)	1. Within the cargo area: a. Each deck plate b. One Transverse section	1. Within the cargo area: a. Each deck plate b. Two Transverse sections	1. Within the cargo area: a. Each deck plate b. Three Transverse sections c. Each bottom plate
2. Measurements of structural members subject to close-up survey according to Table I 2-5A, for general assessment and recording of corrosion pattern	2. Measurements of structural members subject to close-up survey according to Table I 2-5A, for general assessment and recording of corrosion pattern	2. Measurements of structural members subject to close-up survey according to Table I 2-5A, for general assessment and recording of corrosion pattern	2. Measurements of structural members subject to close-up survey according to Table I 2-5A, for general assessment and recording of corrosion pattern
3. Suspect Areas	3. Suspect Areas	3. Suspect Areas	3. Suspect Areas
	4. Selected wind and water strakes outside the cargo area	4. Selected wind and water strakes outside the cargo area	4. All wind and water strakes outside the cargo area
		5. All wind and water strakes within the cargo area	5. All wind and water strakes within the cargo area
		6. Internals in peak tanks	6. Internals in peak tanks
			7. Exposed superstructure deck plating
			8. Exposed main deck plating full length
			9. The transverse bulkhead (lowest strake in cargo spaces and their internals)
			10. Sea chest plating

Table I 2-3C
Minimum Requirement for Thickness Measurement
at Hull Special Surveys of Bulk Carriers

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
1. Suspect Areas	1. Suspect Areas	1. Suspect Areas	1. Suspect Areas
	2. Within the cargo length: a. Two transverse section of deck plating outside line of cargo opening	2. Within the cargo length: a. Each deck plate outside line of cargo hatch openings b. 2 Transverse Sections, one in the amidship area, outside line of cargo hatch opening	2. Within the cargo length: a. Each deck plate outside line of cargo hatch openings b. 3 transverse sections, one in the amidship area, outside line of cargo hatch opening. c. Each bottom plate
	3. Measurement for, general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table I 2-5B	3. Measurement for, general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table I 2-5B	3. Measurement for, general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table I 2-5B
	4. Wind and water strakes in way of the transverse sections considered under point 2 above	4. All wind and water strakes within the cargo length area	4. All wind and water strakes within the cargo length area
		5. Selected wind and water strakes outside the cargo length area	5. All wind and water strakes outside the cargo length area
		6. Vertically corrugated transverse watertight bulkhead between cargo hold Nos. 1 and 2 in accordance with requirements of IACS URs S19 and S23 if applied	6. Vertically corrugated transverse watertight bulkhead between cargo hold Nos. 1 and 2 in accordance with requirements of IACS URs S19 and S23 if applied
		7. Side shell frames and brackets in accordance with requirements of IACS UR S31 if applied	7. Side shell frames and brackets in accordance with requirements of IACS UR S31 if applied
		8. Cargo hatch covers and coaming (plate & stiffener)	8. Cargo hatch covers and coaming (plate & stiffener)
		9. Internals in peak tanks	9. Internals in peak tanks
			10. Exposed superstructure deck plating
			11. Exposed main deck plating full length
			12. The transverse bulkhead (lowest strake in cargo spaces and their internals)
			13. Sea chest plating

Table 1 2-4A
Requirements of Additional Thickness Measurements
for Cargo Ships in way of Substantial Corrosion

Structural Member	Extent of Measurement	Pattern of Measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

Table I 2-4B
Requirements for Extent of Thickness Measurement in way of Substantial Corrosion
at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc. within the Cargo Tank Length (1/2)

Structural member	Extent of measurement	Pattern of measurement
Bottom Structure		
1. Bottom plating	Minimum of 3 bays across tank including aft bay Measurements around and under all bell mouths	5 point pattern for each panel between longitudinals and webs
2. Bottom Longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertically web
3. Bottom girders and brackets	At fore and aft transverse bulkhead bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements Two measurements across face flat 5 point pattern on girder/bhd brackets
4. Bottom transverse webs	3 webs in bays where bottom plating measured, with measurements at both ends and middle	5 points pattern over 2 square metre area Single measurements on face flat
5. Panel stiffening	Where provided	Single measurements
Deck Structure		
1. Deck plating	Two bands across tank	Minimum of three measurements per plate per band
2. Deck longitudinals	Minimum of 3 longitudinals each of two bays	3 measurements in line vertically on webs, and 2 measurements on flange (if fitted)
3. Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements Two measurements across face flat 5-point pattern on girder/bulkhead brackets
4. Deck transverse webs	Minimum of two webs, with measurements at middle and both ends of span	5-point pattern over about 2 square metre areas Single measurements on face flat
5. Panel stiffening	Where provided	Single measurements

Table I 2-4B
Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc. within the Cargo Tank Length (2/2)

Structural member	Extent of measurement	Pattern of measurement
Side Shell and Longitudinal Bulkheads		
1. Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2. All other strakes	Plating between every third pair of longitudinals in same 3 bays	Single measurement
3. Longitudinals on deckhead and bottom strakes	Each longitudinal in same three bays	3 measurements across web and 1 measurement on flange
4. Longitudinals - all others	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
5. Longitudinals - brackets	Minimum of three at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
6. Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5-point pattern over about 2 square metre area, plus single measurements on web frame and cross ties face flats
Transverse Bulkheads and Swash Bulkheads		
1. Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between pair of stiffeners at three locations : approx. 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over 1 metre length
2. All other strakes	Plating between pair of stiffeners at middle location	Single measurement
3. Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about 1 square metre of plating
4. Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span) For flange, single measurements at each bracket toe and at centre of span
5. Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over areas of bracket
6. Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 square metre 3 measurements across face flat.
7. Stringer platforms	All stringers with measurements at both ends and middle	5-point pattern over 1 square metre of area plus single measurements near bracket toes and on face flats

Table I 2-4C
Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Bulk Carriers within the Cargo Area (1/2)

Structural member	Extent of measurement	Pattern of measurement
Shell structures		
1. Bottom and side shell plating	a. Suspect plate, plus four adjacent plates b. See other tables for particulars on gauging in way of tanks and cargo holds	a. 5 point pattern for each panel between longitudinals
2. Bottom / Side shell longitudinals	Minimum of three longitudinals in way of Suspect Areas	3 measurements in line across web 3 measurements on flange
Transverse bulkheads in cargo holds		
1. Lower stool	a. Transverse band within 25 mm of welded connection to inner bottom b. Transverse band within 25 mm of welded connection to shelf plate	a. 5 point between stiffeners over 1 m length b. Ditto
2. Transverse bulkhead	a. Transverse band at approximately mid height b. Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	a. 5 point pattern over 1 m^2 of plating b. 5 point pattern over 1 m^2 of plating
Deck structure including cross strips, main cargo hatchways, hatch covers, coamings and topside tanks		
1. Cross deck strip plating	Suspect cross deck strip plating	a. 5 point pattern between underdeck stiffeners over 1 m length
2. Underdeck stiffeners	a. Transverse members b. Longitudinal member	a. 5 point pattern at each end and mid span b. 5 point pattern on both web and flange
3. Hatch covers	a. Side and end skirts, each 3 locations b. 3 longitudinal bands, outboard strakes (2) and centerline strake (1)	a. 5 point pattern at each location b. 5 point measurement each band end or side coaming
4. Hatch coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5 point measurement each band i.e. end or side coaming
5. Topside water ballast tanks	a. Watertight transverse bulkheads i. lower 1/3 of bulkhead ii. upper 2/3 of bulkhead iii. stiffeners	 i. 5 point pattern over 1 m^2 of plating ii. 5 point pattern over 1 m^2 of plating iii. 5 point pattern over 1 m length
	b. 2 representative swash transverse bulkheads i. lower 1/3 of bulkhead ii. upper 2/3 of bulkhead iii. stiffeners	 i. 5 point pattern over 1 m^2 of plating ii. 5 point pattern over 1 m^2 of plating iii. 5 point pattern over 1 m length
	c. 3 representative bays of slope plating i. lower 1/3 of tank ii. upper 2/3 of tank	 i. 5 point pattern over 1 m^2 of plating ii. 5 point pattern over 1 m^2 of plating
	d. Longitudinals, suspect and adjacent	5 point pattern both web and flange over 1 metre length
6. Main deck plating	Suspect plates and adjacent in item 4	5 point pattern over 1 m^2 of plating
7. Main deck longitudinals	Minimum of 3 longitudinals where plating measured	5 point pattern on both web and flange over 1 metre length
8. Web frames / Transverses	Suspect plates	5 point pattern over 1 m^2

Table I 2-4C
Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Bulk Carriers within the Cargo Area (2/2)

Structural member	Extent of measurement	Pattern of measurement
Double bottom and hopper structure		
1. Inner / Double bottom plating	Suspect plate plus all adjacent plates	5 point pattern for each panel between longitudinals over 1 metre length
2. Inner / Double bottom longitudinals	Three longitudinals where plates measured	3 measurements in line across web and 3 measurements on flange
3. Longitudinal Girders or Transverse floors	Suspect plates	5 point pattern over about 1 m^2
4. Watertight Bulkheads (WT Floors)	a. lower 1/3 of tank b. upper 2/3 of tank	a. 5 point pattern over 1 m^2 of plating b. 5 point pattern alternate plates over 1 m^2 of plating
5. Web Frames	Suspect plate	5 point pattern over 1 m^2 of plating
6. Bottom / side shell longitudinals	Minimum of three longitudinals in way of Suspect Areas	3 measurements in line across web 3 measurements on flange
Cargo holds		
1. Side Shell frames	Suspect frame and each adjacent	a. At each end and mid span: 5 point pattern of both web and flange b. 5 point pattern within 25 mm of welded attachment to both shell and lower slope plate

Table I 2-5A
Minimum Requirements for Close-up Surveys at Hull Special Survey of Oil Tankers, Ore/Oil Carriers and etc.

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
1. One web frame ring(1) - in a ballast wing tank, if any, or a cargo wing tank used primarily for water ballast 2. One deck transverse(2) - in a cargo oil tank 3. One transverse bulkhead(4) - a. in a ballast tank c. in a cargo oil wing tank d. in a cargo oil centre tank	1. All web frame rings(1)- in a ballast wing tank, if any, or a cargo wing tank used primarily for water ballast 2. One deck transverse(2) - a. in each of the remaining ballast tanks, if any b. in a cargo wing tank c. in two cargo centre tanks 3. Both transverse bulkheads(3) – in a wing ballast tank, if any, or a cargo wing tank used primarily for water ballast 4. One transverse bulkhead(4) – a. in each remaining ballast tank b. in a cargo oil wing tank c. in two cargo centre tanks	1. All web frame rings(1) - a. in all ballast tanks b. in a cargo wing tank 2. A minimum of 30%(1), (7) of all web frame rings in each remaining cargo wing tank 3. All transverse bulkheads(3) in all cargo and ballast tanks 4. A minimum of 30% of deck and bottom transverses(5) including adjacent structural members in each cargo centre tank 5. As considered necessary by the surveyor(6)	1. As special survey No. 3 2. Additional transverses included as deemed necessary by the Surveyor

Notes:
(1) Complete transverse web frame ring including adjacent structural members
(2) Deck transverse including adjacent deck structural members
(3) Transverse bulkhead complete - including girder system and adjacent members
(4) Transverse bulkhead lower part - including girder system and adjacent structural members
(5) Deck and bottom transverse including adjacent structural members
(6) Additional complete transverse web frame ring
(7) The 30% is to be rounded up to the next whole integer

Table I 2-5B
Minimum Requirement for Close-up Survey at Hull Special Surveys of Bulk Carriers

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No.≥4 (Age > 15)
1. Shell frame[1]- a. 25% of shell frames in the forward cargo hold at representative positions b. selected frames in remaining cargo holds 2. One transverse web[2] with associated plating and longitudinals in two representative water ballast tanks of each type (i.e. topside, hopper side or side tank) 3. Two selected cargo hold transverse bulkheads[3], including internal structure of upper and lower stools, where fitted 4. All cargo hold hatch covers and coamings[4] (plating and stiffeners)	1. All shell frames[1] in the forward cargo hold and 25% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating. For Bulk Carriers 100,000 DWT and above, all shell frames in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating. 2. Transverse web[2] or bulkhead[2] in ballast tank– a. one transverse web with associated plating and longitudinals in each water ballast tank (i.e topside, hopper side or side tank) b. forward and aft transverse bulkhead in one side ballast tank, including stiffening system 3. All cargo hold transverse bulkheads[3] including internal structure of upper and lower stools, where fitted 4. All cargo hold hatch covers and coamings[4] (plating and stiffeners) 5. All deck plating and under deck structure[5] inside line of hatch openings between all cargo hold hatches	1. All shell frames[1] in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating 2. Transverse web[2] or bulkhead[2] in ballast tank – a. All transverse webs with associated plating and longitudinals in each water ballast tank (i.e. topside, hopper side or side tank) b. All transverse bulkheads in ballast tanks, including stiffening system 3. All cargo hold transverse bulkheads[3] including internal structure of upper and lower stools, where fitted 4. All cargo hold hatch covers and coamings[4] (plating and stiffeners) 5. All deck plating and under deck structure[5] inside line of hatch openings between all cargo hold hatches	1. All shell frames[1] in all cargo holds including upper and lower end attachments and adjacent shell plating 2. Transverse web[2] or bulkhead[2] in ballast tank – a. All transverse webs with associated plating and longitudinals in each water ballast tank (i.e. topside, hopper side or side tank) b. All transverse bulkheads in ballast tanks, including stiffening system 3. All cargo hold transverse bulkheads[3] including internal structure of upper and lower stools, where fitted 4. All cargo hold hatch covers and coamings[4] (plating and stiffeners) 5.All deck plating and under deck structure[5] inside line of hatch openings between all cargo hold hatches

Notes:
(1) Cargo hold transverse frames
(2) Transverse web frame or watertight transverse bulkhead in water ballast tanks
(3) Cargo hold transverse bulkheads plating, stiffeners and girders
(4) Cargo hold hatch covers and coamings. For cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/ thickness measurement shall be done of accessible parts of hatch covers' structures.
(5) Deck plating inside line of hatch openings between cargo hold hatches

Note: Close-up survey of transverse bulkheads to be carried out at four levels:
Level (a): Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool
Level (b): Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates
Level (c): About mid-height of the bulkhead
Level (d): Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks

Table I 2-6A
Minimum Requirements for Close-up Survey at Special Survey of Single Skin Chemical Tankers

SS No. 1 Age ≤ 5	SS No. 2 5 < Age ≤ 10	SS No. 3 10 < Age ≤ 15	SS No. 4 Age > 15
1. One web frame ring in a ballast tank	1. All web frame rings in a ballast wing tank or double bottom ballast tank (1)	1. All web frame rings a. In all ballast tanks b. In a cargo wing tank	1. As special survey No.3
2. One deck transverse in a cargo tank or on deck	2. One deck transverse a. in each remaining ballast tank or on deck b. in a cargo wing tank or on deck	2. One web frame ring a. in each remaining cargo tank	2. Additional transverse areas as deemed necessary
3. One transverse bulkhead a. Lower part in a ballast tank b. Lower part in a cargo wing tank c. Lower part in a cargo centre tank (2)	3. Both transverse bulkheads in a ballast wing tank	3. All transverse bulkheads a. In all cargo tanks b. In all ballast tanks	
	4.One transverse bulkhead a. Lower part in each remaining ballast tank b. Lower part in two cargo centre tanks (2) c. Lower part in a cargo wing tank		

Notes:

(1) Ballast double hull tank: means double tank plus double side tank plus double deck tank, as Applicable, even if these tanks are separate.

(2) Where no centre cargo tanks are fitted (as in case of centre longitudinal bulkhead), transverse Bulkheads in wing tanks are to be surveyed.

A-D: Are areas to be subjected to close-up surveys and thickness measurements.

A) Complete transverse web frame ring including adjacent structural members.

B) Deck transverse including adjacent deck structural members.

C) Transverse bulkhead complete – including girder system and adjacent structural members.

D) Transverse bulkhead lower part – including girder system and adjacent structural members.

Table I 2-6B
Minimum Requirements for Close-up Survey
at Special Survey of Double Skin Chemical Tankers

SS No. 1 Age ≤ 5	SS No. 2 5 < Age ≤ 10	SS No. 3 10 < Age ≤ 15	SS No. 4 Age > 15
1. One web frame ring in a ballast double hull tank(1)	1. All web frame rings in a ballast wing tank or ballast double hull tank(1)	1. All web frame rings a. In all ballast tanks b. In a cargo wing tank	1. As special survey No.3
2. One deck transverse in a cargo tank or on deck	2. The knuckle area and the upper part (3 meters approx) of one web frame in each remaining ballast tank	2. One web frame ring in each remaining cargo tank	2. Additional transverse areas as deemed necessary
3. One transverse bulkhead in a ballast tank(1)	3. One deck transverse in Two cargo tanks	3. All transverse bulkheads a. In all cargo tanks b. In all ballast tanks	
4. One transverse bulkhead in a cargo wing tank	4. One transverse bulkhead a. in each ballast tank(1) b. in two cargo centre tanks(2) c. in a cargo wing tank		
5. One transverse bulkhead in a cargo centre tank(2)			

Notes:

(1) Ballast double hull tank: means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

(2) Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

1.~7. are areas to be subjected to close-up surveys and thickness measurements.

1. Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.
2. Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable).
3. Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.
4. Transverse bulkhead complete in ballast tanks, including girder system and adjacent structure members, such as longitudinal bulkheads, girder in double bottom tanks, inner bottom plating, hopper, connecting brackets.
5. Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.
6. The knuckle area and the upper part (3 meters approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 metres from the corners both on the bulkhead and the double bottom.
7. Web frame in a cargo tank means deck transverse, longitudinal bulkhead vertical girder and cross ties, where fitted, including adjacent structural members.

Table I 2-7
Minimum Requirements for Thickness Measurements
at Hull Special Survey of Chemical Carriers

SS No. 1 Age ≤ 5	SS No. 2 5 < Age ≤ 10	SS No. 3 10 < Age ≤ 15	SS No. ≥ 4 Age > 15
1. Suspect Areas	1. Suspect Areas	1. Suspect Areas	1. Suspect Areas
2. One section of deck plating for the full beam of the ship within the cargo area (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast)	2. Within the cargo area: a. Each deck plate b. One transverse section	2. Within the cargo area: a. Each deck plate b. Two Transverse sections(1) c. All wind and water strakes	2. Within the cargo area: a. Each deck plate b. Three transverse sections (1) c. Each bottom plate
	3. Selected wind and water strakes outside the cargo area	3. Selected wind and water strakes outside the cargo area	3. All wind and water strakes, full length
4. Measurements of structural members subject to close-up survey according to Table I 2-6, for general assessment and recording of corrosion pattern	4. Measurements of structural members subject to close-up survey according to Table I 2-6, for general assessment and recording of corrosion pattern	4. Measurements of structural members subject to close-up survey according to Table I 2-6, for general assessment and recording of corrosion pattern	4. Measurements of structural members subject to close-up survey according to Table I 2-6, for general assessment and recording of corrosion pattern

Note:
(1) At least one section is to include a ballast tank within 0.5L amidships.

Table I 2-8
Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Chemical Carriers within the Cargo Tank Length (1/2)

Structural member	Extent of measurement	Pattern of measurement
Double bottom and hopper structure		
1. Inner bottom and bottom plating	Suspect plate plus adjacent plates Measurements around and under all bell mouths and pump wells	5-point pattern for each panel between longitudinals over 1 metre length
2. Inner bottom and bottom longitudinals	Three longitudinals where plates measured	3 measurements in line across flange and 3 measurements on vertical web
3. Longitudinal girders or transverse floors	Suspect plates	5 point pattern over about 1 m^2
4. Watertight bulkheads (WT floors)	a. lower 1/3 of tank b. upper 2/3 of tank	a. 5 point pattern over about 1 m^2 b. 5 point pattern alternate plates over 1 m^2 of plating
5. Web frames	Suspect plate	5 point pattern
Deck structure		
1. Deck plating	Two bands across tank	Minimum of three measurements per plate per band
2. Deck longitudinals	Minimum of 3 longitudinals in each of two bays	3 measurements in line vertically on webs, and 2 measurements on flange (if fitted)
3. Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements Two measurements across face flat 5 point pattern on girder/bhd brackets
4. Deck transverse webs	Minimum of two webs with measurements at middle and both ends of span	5 points pattern over about 2 m^2 areas. Single measurements on face flat
5. Panel stiffening	Where provided	Single measurements
NOTE: For tanks where Substantial Corrosion covers more than 20% of the deck surface, the whole deck structure including longitudinal and web frames above the tank is to be thickness measured in accordance with above		
Deck structure side shell and longitudinal bulkheads		
1. Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2. All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
3. Longitudinals-deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4. Longitudinals - all others	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
5. Longitudinals - bracket	Minimum of three at top middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
6. Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5 point pattern over about 2 m^2 area, plus single measurements on web frame and cross tie face flats

Table I 2-8
Requirements for Extent of Thickness Measurement in way of Substantial Corrosion at Hull Special Survey of Chemical Carriers within the Cargo Tank Length (2/2)

Structural member	Extent of measurement	Pattern of measurement
Transverse bulkheads and swash bulkheads		
1. Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between pair of stiffeners at three locations – approx. 1/4, 1/2 and 3/4 width of tank	5 points pattern between stiffeners over 1 meter length
2. All other strakes	Plating between pair of stiffeners at middle location	Single measurement
3. Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange or fabricated connection	5 point pattern over about 1 m^2 of plating
4. Stiffeners	Minimum of three typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection, and one at center of span). For flange, single measurements at each bracket toe and at centre of span
5. Bracket	Minimum of three at top, middle and bottom of tank	5 point pattern over areas of bracket
6. Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 m^2 3 measurements across face flat
7. Stringer platforms	All stringers with measurements at both ends and middle	5 point pattern over 1 m^2 of area plus single measurements near bracket toes and on face flats

Table I 2-9
Minimum Requirements to Tank Testing at Hull Special Survey of Chemical Carriers

SS No. 1 Age ≤ 5	SS No. 2 and subsequent Age > 5
1. All ballast tank boundaries	1. All ballast tank boundaries
2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump-rooms or cofferdams	2. All cargo tank bulkheads

Table I 2-10
Examination of Cargo Holds for Hull Annual Survey of General Dry Cargo Ships

	10 < Age ≤ 15(3)	Age > 15(1), (2), (3)
Overall Survey	1. One forward cargo hold (and their associated tween deck spaces, where fitted) 2. One after cargo hold (and their associated tween deck spaces, where fitted)	All cargo hold (and their associated tween deck spaces, where fitted)
Close-up Survey		1. Cargo holds: - one forward lower cargo hold - one other lower cargo hold 2. Extent: - Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating
Others		All piping and penetrations in cargo holds, including over-board piping, are to be examined

Notes:

(1) Where the protective coating in cargo holds, as applicable, is found to be in Good condition, the extent of close-up surveys may be specially considered by the Society

(2) Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of those cargo holds and associated tween deck spaces (as applicable) as well as a close-up survey of sufficient extent of all remaining cargo holds and tween deck spaces (as applicable)

(3) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, then the number of thickness measurements is to be increased to determine the extent of Substantial Corrosion

Table I 2-11
Examination of Ballast Tanks for Hull Intermediate Survey of General Dry Cargo Ships

	5 < Age ≤ 10	10 < Age≤ 15	Age > 15
Overall Survey	1. Representative salt ballast spaces(1), (2), (3) 2. Suspect area found at the previous special survey	1. All salt water ballast tanks (1), (3) 2. Suspect area found at the previous special survey	Same extent as the previous special survey
Closed-up Survey	Suspect area found at the previous special survey	Suspect area found at the previous special survey	Same extent as the previous special survey

Notes:

(1) If such inspections reveal no visible structural defects, the examination may be limited to a verification that the protective coating remains efficient.

(2) Where Poor coating condition, corrosion or other defects are found in salt water ballast spaces or where a protective coating was not applied from the time of construction, the examination is to be extended to other ballast spaces of the same type.

(3) In salt water ballast spaces where a protective coating is found in Poor condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the tank in question is to be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

Table I 2-12
Examination of Cargo Holds for Hull Intermediate Survey of General Dry Cargo Ships

	5 < Age ≤ 10	10 < Age ≤ 15	Age > 15
Overall Survey	1.One forward cargo hold (and their associated tween deck spaces, where fitted) 2.One after cargo hold (and their associated tween deck spaces, where fitted) 3.Suspect area found at the previous special survey	1.All cargo hold (and their associated tween deck spaces, where fitted) 2.Suspect area found at the previous special survey	Same extent as the previous special survey
Closed-up Survey	Suspect area found at the previous special survey	Suspect area found at the previous special survey	Same extent as the previous special survey

Note: When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, then the number of thickness measurements is to be increased to determine the extent of Substantial Corrosion.

Table I 2-13
Requirements of Internal Examinations in addition to the Requirements of Table I 2-1A for Hull Special Survey of General Dry Cargo Ships

Special Survey	Tanks and Spaces Subject to an Examination	Note
All special surveys	1. All cargo holds	-
	2. All tanks and spaces adjacent to cargo holds (ballast tanks, pipe tunnels, cofferdams and void spaces)	• For ballast tanks where a protective coating is found in Poor condition, and it is not renewed or where a protective coating has not been applied, excluding double bottom tanks, an internal examination is to be carried out at annual intervals. For double bottom ballast tanks with the condition as specified, where considered necessary by the Surveyor, an internal examination is to be carried out at annual intervals. • Ballast tanks converted to void spaces are to be examined applying the provisions for ballast tanks correspondingly.

Table I 2-14
Minimum Requirements for Close-up Survey at Hull Special Surveys of General Dry Cargo Ships

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3, (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
1. Selected shell frames(1) in one forward and one aft cargo hold and associated tween deck spaces	1. Selected shell frames(1) in all cargo holds and tween deck spaces	1. All shell frames(1) in the forward lower cargo hold and 25% frames in each of the remaining cargo holds and tween deck spaces including upper and lower end attachments and adjacent shell plating	1. All shell frames in all cargo holds and tween deck spaces including upper and lower end attachments and adjacent shell plating 2. Areas of items 2 through 7 as for Special Survey No. 3
2. One selected cargo hold transverse bulkhead(2)	2. One transverse bulkhead(2) in each cargo hold 3. Forward and aft transverse bulkhead(2) in one side ballast tank, including stiffening system.	2. All cargo hold transverse bulkheads(2) 3. All transverse bulkheads(2) in ballast tanks, including stiffening system	
3. All cargo hold hatch covers and coamings(4) (plating and stiffeners)	4. One transverse web(3) with associated plating and framing in two representative water ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank)	4. All transverse webs(3) with associated plating and framing in each water ballast tank (i.e. topside, hopper side, side tank or double bottom tank)	
	5. All cargo hold hatch covers and coamings(4) (plating and stiffeners)	5. All cargo hold hatch covers and coamings(4) (plating and stiffeners)	
	6. Selected areas of all deck plating(5) inside line of hatch openings between cargo hold hatches	6. All deck plating(5) inside line of hatch openings between cargo hold hatches	
	7. Selected areas of inner bottom plating(6)	7. All areas of inner bottom plating(6)	

Notes:

(1) Cargo hold transverse frames

(2) Cargo hold transverse bulkhead plating, stiffeners and girders

(3) Transverse web frame or watertight transverse bulkhead in water ballast tanks

(4) Cargo hold hatch covers and coamings

(5) Deck plating inside line of hatch openings between cargo hold hatches

(6) Inner bottom plating

Note: Close-up survey of cargo hold transverse bulkheads to carried out at the following levels:

a. Immediately above the inner bottom and immediately above the tween decks, as applicable

b. Mid-height of the bulkheads for holds without tween decks

c. Immediately below the main deck plating and tween deck plating

Table I 2-15
Minimum Requirements for the Thickness Measurement at Hull Special Surveys of General Dry Cargo Ships

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3, (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
1. Suspect Areas.	1. Suspect Areas. 2. One transverse section of deck plating abreast a cargo space within the amidships 0.5L. 3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table I 2-14.	1. Suspect Areas. 2. Two transverse sections within the amidships 0.5L abreast of two different cargo spaces. 3. Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table I 2-14. 4. Within the cargo length, each deck plate outside line of cargo hatch openings. 5. All wind and water strakes within the cargo length area. 6. Selected wind and water strakes outside the cargo length area.	1. Suspect Areas. 2. Within the cargo length: a. A minimum of three transverse sections within the amidships 0.5L. b. Each deck plate outside line of cargo hatch openings. c. Each bottom plate, including lower turn of bilge. d. Duct keel or pipe tunnel plating and internals. 3. All wind and water strakes full length port and starboard 4. Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table I 2-14.

Notes:

(1) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.

(2) For ships less than 100 m in length, the number of transverse sections required at special survey No. 3 may be reduced to one and the number of transverse sections at special survey No. 4 and subsequent special surveys may be reduced to two.

Table I 2-16
Guidance for Additional Thickness Measurements in way of Substantial Corrosion at Hull Special Survey of General Dry Cargo Ships

Structural Member	Extent of Measurement	Pattern of Measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 m^2
Stiffeners	Suspect area	3 measurements each in line across web and flange

Table I 2-17
Minimum Requirements for Overall and Close-up Survey and Thickness Measurements at Hull Intermediate Survey of Double Hull Oil Tankers

Age of ship at time of intermediate survey due date		
5 <Age ≤ 10	10 < Age ≤ 15	Age > 15
Overall survey of representative salt-water ballast tanks, selected by the attending Surveyor (the selection is to include fore and aft peak tanks and three other tanks)	Thickness measurements of those areas are as same as for special survey given in Table I 2-18 and Table I 2-19	Thickness measurements of those areas are as same as for special survey given in Table I 2-18 and Table I 2-19
Thickness measurements of those areas found to be Suspect Areas at the previous special survey

</table>

Notes: (1), (2), (3), (4), (5), (6) and (7) are areas to be subjected to close-up surveys and thickness measurements

(1) Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members

(2) Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable)

(3) Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted

(4) Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets

(5) Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted

(6) The knuckle area and the upper part (5 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 metres from the corners both on the bulkhead and the double bottom

(7) Web frame in a cargo oil tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members

*(1) Complete ballast tank: means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate

*(2) Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed

Table I 2-20
Requirements for Extent of Thickness Measurements in way of Substantial Corrosion at Hull Special Survey of Double Hull Oil Tankers (1/3)

Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure		
Bottom, inner bottom and hopper structure plating	Minimum of three bays across double bottom tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over 2 m^2 area
Hopper structure web frame ring	Three floors in bays where bottom plating measured	5-point pattern over 1 m^2 of plating. Single measurements on flange
Hopper structure transverse watertight bulkhead or swash bulkhead	lower 1/3 of bulkhead	5-point pattern over 1 m^2 of plating
	upper 2/3 of bulkhead	5-point pattern over 2 m^2 of plating
	stiffeners (minimum of three)	For web, 5-point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements
Deck structure		
Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	Three measurements in line vertically on webs and two measurements on flange (if fitted)
Deck girders and brackets (usually in cargo tanks only)	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements Two measurements across flange 5-point pattern on girder/bulkhead brackets
Deck transverse webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over 1 m^2 area. Single measurements on flange
Vertical web and transverse bulkhead in wing ballast tank (two metres from deck)	Minimum of two webs, and both transverse bulkheads	5-point pattern over 1 m^2 area
Panel stiffening	Where applicable	Single measurements

Table I 2-20
Requirements for Extent of Thickness Measurements in way of Substantial Corrosion at Hull Special Survey of Double Hull Oil Tankers (2/3)

Structural member	Extent of measurement	Pattern of measurement
Structure in wing ballast tanks		
Side shell and longitudinal bulkhead plating: - upper strake and strakes in way of horizontal girders - all other strakes	- Plating between each pair of longitudinals in a minimum of three bays (along the tank) - Plating between every third pair of longitudinals in same three bays	- Single measurement - Single measurement
Side shell and longitudinal bulkhead longitudinals on: - upper strake - all other strakes	- Each longitudinal in same three bays - Every third longitudinal in same three bays	- 3 measurements across web and 1 measurement on flange - 3 measurements across web and 1 measurement on flange
Longitudinals – brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
Vertical web and transverse bulkheads (excluding deckhead area): - strakes in way of horizontal girders - other strakes	- Minimum of two webs and both transverse bulkheads - Minimum of two webs and both transverse bulkheads	- 5-point pattern over approx. 2 m^2 area - two measurements between each pair of vertical stiffeners
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements
Longitudinal bulkheads in cargo tanks		
Deckhead and bottom strakes, and strakes in way of the horizontal stringers of transverse bulkheads	Plating between each pair of longitudinals in a minimum of three bays	Single measurement
All other strakes	Plating between every third pair of longitudinals in same three bays	Single measurement
Longitudinals on deckhead and bottom strakes	Each longitudinal in same three bays	Three measurements across web and one measurement on flange
All other longitudinals	Every third longitudinal in same three bays	Three measurements across web and one measurement on flange
Longitudinals – brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of bracket
Web frames and cross ties	Three webs with minimum of three locations on each web, including in way of cross tie connections	5-point pattern over approximately 2 m^2 area of webs, plus single measurements on flanges of web frame and cross ties
Lower end brackets (opposite side of web frame)	Minimum of three brackets	5-point pattern over approximately 2 m^2 area of brackets, plus single measurements on bracket flanges

Table I 2-20
Requirements for Extent of Thickness Measurements in way of Substantial Corrosion at Hull Special Survey of Double Hull Oil Tankers (3/3)

Structural member	Extent of measurement	Pattern of measurement
Transverse watertight and swash bulkheads in cargo tanks		
Upper and lower stool, where fitted	a. Transverse band within 25 mm of welded connection to inner bottom/deck plating b. Transverse band within 25 mm of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
Deckhead and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations : approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over one metre length
All other strakes	Plating between pair of stiffeners at middle location	Single measurement
Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about 1 m^2 of plating
Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over area of bracket
Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over 1 m^2 area, plus single measurements near bracket toes and on flanges

Table I 2-21
Minimum Requirements for Tank Testing at Hull Special Survey of Double Hull Oil Tankers

Age ≤ 5	5 < Age ≤ 10	Age > 10
All ballast tank boundaries	All ballast tank boundaries	All ballast tank boundaries
Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, representative fuel oil tanks, pump rooms or cofferdams	Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, representative fuel oil tanks, pump rooms or cofferdams	Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, representative fuel oil tanks, pump rooms or cofferdams
	All cargo tank bulkheads which form the boundaries of segregated cargoes	All remaining cargo tank bulkheads

Table I 2-22
Overall Survey of Fuel Oil Tanks in the Cargo Length Area for Double Skin Bulk Carriers at Special Survey

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
None	One	Two	Half, minimum two

Notes:

(1) These requirements apply to tanks of integral (structural) type.

(2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

(3) Peak tanks (all uses) are subject to internal examination at each special survey.

(4) At special survey No. 3 and subsequent special surveys, one deep tank for fuel oil in the cargo area is to be included, if fitted.

25% of ordinary transverse frames for transverse framing systems or 25% of longitudinals for longitudinal framing systems on side shell and inner side plating at forward, middle and aft parts in all doubleside tanks.(B)</td><td>All transverse webs with associated plating and longitudinals as applicable in each water ballast tank.(A)

All transverse bulkheads including stiffening system in each water ballast tank.(A)

All ordinary transverse frames for transverse framing systems or 25% of longitudinals for longitudinal framing systems on side shell and inner side plating at forward, middle and aft parts in all doubleside tanks.(B)</td></tr>
<tr><td>Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted.(C)</td><td>One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted.(C)</td><td>All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted.(C)</td><td rowspan="3">Areas (C) – (E) as for age interval 10 to 15 years.</td></tr>
<tr><td colspan="3">All cargo hold hatch covers and coamings (platings and stiffeners).(D)</td></tr>
<tr><td></td><td>All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches.(E)</td><td>All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches.(E)</td></tr>
</table>

Notes: **(A), (B), (C), (D)** and **(E)** are areas to be subjected to close-up surveys and thickness measurements (see Fig. I 2-4 and I 2-5).

(A) Transverse web frame or watertight transverse bulkhead in topside, hopper side and double side ballast tanks. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members.

(B) Ordinary transverse frame in double side tanks.

(C) Cargo hold transverse bulkheads plating, stiffeners and girders.

(D) Cargo hold hatch covers and coamings. For cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/ thickness measurement shall be done of accessible parts of hatch covers' structures.

(E) Deck plating and under deck structure inside line of hatch openings between cargo hold hatches.

Note: Close-up survey of transverse bulkheads to be carried out at four levels:

Level (a): Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.

Level (b): Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.

Level (c): Above mid-height of the bulkhead.

Level (d): Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

(A) Transverse web frame or watertight transverse bulkhead in ballast wing tanks and void spaces. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members.

(C) Cargo hold transverse bulkheads plating, stiffeners and girders.

(D) Cargo hold hatch covers and coamings. For cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/ thickness measurement shall be done of accessible parts of hatch covers' structures.

(E) Deck plating and under deck structure inside line of hatch openings between cargo hold hatches.

Note: Close-up survey of transverse bulkheads to be carried out at four levels:

Level (a): Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.

Level (b): Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.

Level (c): About mid-height of the bulkhead.

Level (d): Immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Table I 2-25
Minimum Requirements for Thickness Measurements
at Special Hull Survey of Double Skin Bulk Carriers

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
Suspect areas	Suspect areas	Suspect areas	Suspect areas
	Within the cargo length: - Two transverse sections of deck plating outside line of cargo hatch openings	Within the cargo length: - each deck plate outside line of cargo hatch openings - two transverse sections, one in the amidship area, outside line of cargo hatch openings - all wind and water strakes	Within the cargo length: - each deck plate outside line of cargo hatch openings - three transverse sections, one in the amidship area, outside line of cargo hatch openings - each bottom plate
	Wind and water strakes in way of the two transverse sections considered above. Selected wind and water strakes outside the cargo length area.	Selected wind and water strakes outside the cargo length area.	All wind and water strakes, full length.
	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table I 2-23.	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table I 2-23.	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Table I 2-23.

Table I 2-26
Minimum Requirements of Overall and Close-Up Survey and Thickness Measurements
at Intermediate Survey of Double Skin Bulk Carriers

Age of ship at time of intermediate survey due date		
5 < Age ≤ 10	10 < Age ≤ 15	Age > 15
Overall survey of Representative ballast tanks selected by the attending Surveyor. (the selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks)	The requirements of the previous special survey.	The requirements of the previous special survey.
Overall and close-up survey of Suspect Areas identified at previous surveys.		
Overall survey of all cargo holds.		
Thickness measurements to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey at 'suspect areas' identified at previous surveys.		

Table I 2-27
Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers Within The Cargo Length Area (1/4)

BOTTOM, INNER BOTTOM AND HOPPER STRUCTURE		
Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure plating	Minimum of three bays across double bottom tank, including aft bay Measurements around and under all suction bell mouths	Five-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across the flange and three measurements on the vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
Bottom floors, including the watertight ones	Three floors in the bays where bottom plating measured, with measurements at both ends and middle	Five-point pattern over two square metre area
Hopper structure web frame ring	Three floors in bays where bottom plating measured	Five-point pattern over one square metre of plating. Single measurements on flange.
Hopper structure transverse watertight bulkhead or swash bulkhead	- lower 1/3 of bulkhead	- five-point pattern over one square metre of plating
	- upper 2/3 of bulkhead	- five-point pattern over two square metre of plating
	- stiffeners (minimum of three)	- For web, five-point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements

Table I 2-27
Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers Within The Cargo Length Area (2/4)

DECK STRUCTURE INCLUDING CROSS STRIPS, MAIN CARGO HATCHWAYS, HATCH COVERS, COAMINGS AND TOPSIDE TANKS		
Structural member	Extent of measurement	Pattern of measurement
Cross Deck Strip plating	Suspect Cross Deck Strip plating	Five-point pattern between underdeck stiffeners over 1 metre length
Underdeck Stiffeners	Transverse members Longitudinal member	Five-point pattern at each end and mid span Five-point pattern on both web and flange
Hatch Covers	Side and end skirts, each three locations Three longitudinal bands, outboard strakes (2) and centreline strake (1)	Five-point pattern at each location Five-point measurement each band
Hatch Coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	Five-point measurement each band i.e. end or side coaming
Topside Ballast Tanks	a) watertight transverse bulkheads: - Lower 1/3 of bulkhead - Upper 2/3 of bulkhead - Stiffeners	 Five-point pattern over 1 sq. metre of plating Five-point pattern over 1 sq. metre of plating Five-point pattern over 1 metre length
Topside Ballast Tanks	b) two representative swash transverse bulkheads: - Lower 1/3 of bulkhead - Upper 2/3 of bulkhead - Stiffeners	 Five-point pattern over 1 sq. metre of plating Five-point pattern over 1 sq. metre of plating Five-point pattern over 1 metre length
Topside Ballast Tanks	c) three representative bays of slope plating - Lower 1/3 of tank - Upper 2/3 of tank	 Five-point pattern over 1 sq. metre of plating Five-point pattern over 1 sq. metre of plating
Topside Ballast Tanks	d) Longitudinals, suspect and adjacent	Five-point pattern on both web and flange over 1 metre length
Main Deck Plating	Suspect plates and adjacent (4)	Five-point pattern over 1 sq. metre of plating
Main Deck Longitudinals	Suspect Plates	Five-point pattern on both web and flange over 1 metre length
Web Frames/Transverses	Suspect Plates	Five-point pattern over 1 sq. metre

Table I 2-27
Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers Within The Cargo Length Area (3/4)

STRUCTURE IN DOUBLE SIDE SPACES OF DOUBLE SKIN BULK CARRIERS INCLUDING WING VOID SPACES OF ORE CARRIERS		
Structural member	Extent of measurement	Pattern of measurement
Side shell and inner plating: - Upper strake and strakes in way of horizontal girders - All other strakes	 - Plating between each pair of transverse frames / longitudinals in a minimum of three bays (along the tank) - Plating between every third pair of longitudinals in same three bays	 - Single measurement - Single measurement
Side shell and inner side transverse frames / longitudinals on: - upper strake - all other strakes - Transverse frames / Longitudinals - brackets	 - Each transverse frame / longitudinal in same three bays - Every third transverse frame / longitudinal in same three bays - Minimum of three at top, middle and bottom of tank in same three bays	 - Three measurements across web and 1measurement on flange - Three measurements across web and 1 measurement on flange Five-point pattern over area of bracket
Vertical web and transverse bulkheads: - strakes in way of horizontal girders - other strakes	 - Minimum of two webs and both transverse bulkheads - Minimum of two webs and both transverse bulkheads	 - Five-point pattern over approx. two square metre area - Two measurements between each pair of vertical stiffeners
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements

Table I 2-27
Requirements for Extent of Thickness Measurements at Those Areas of Substantial Corrosion of Double Skin Bulk Carriers Within The Cargo Length Area (4/4)

TRANSVERSE BULKHEADS IN CARGO HOLDS		
Structural member	Extent of measurement	Pattern of measurement
Lower stool, where fitted	- Transverse band within 25 mm of welded connection to inner bottom - Transverse bands within 25 mm of welded connection to shelf plate	- Five-point pattern between stiffeners over one metre length - Five-point pattern between stiffeners over one metre length
Transverse bulkheads	- Transverse band at approximately mid height - Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	- Five-point pattern over one square metre of plating - Five-point pattern over one square metre of plating

Table I 2-28
Survey Requirements for Automatic Air Pipe Heads at Special Surveys

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. ≥ 3 (Age > 10)
- Two air pipe heads, one port and one starboard, located on the exposed decks in the forward 0.25L, preferably air pipes serving ballast tanks. - Two air pipe heads, one port and one starboard, on exposed decks, serving spaces aft of 0.25L, preferably air pipes serving ballast tanks.(1) (2)	- All air pipe heads located on the exposed decks in the forward 0.25L. - At least 20% of air pipe heads on the exposed decks serving spaces aft of 0.25L, preferably air pipes serving ballast tanks.(1), (2)	- All air pipe heads located on the exposed decks.(3)

Notes:

(1) The selection of air pipe heads to be examined is left to the attending Surveyor.

(2) According to the results of this examination, the Surveyor may require the examination of other heads located on the exposed decks.

(3) Exemption may be considered for air pipe heads where there is substantial evidence of replacement after the last special survey.

Table I 2-29A
Minimum Requirements for Close-up Survey at Intermediate Surveys of Liquefied Gas Carrier

10 < Age ≤ 15	Age > 15
Close-up survey of : 1. all web frames and both transverse bulkheads in a representative ballast tank (1), (2) 2. the upper part of one web frame in another representative ballast tank 3. one transverse bulkhead in another representative ballast tank (1)	Close-up survey of : 1. all web frames and both transverse bulkheads in two representative ballast tanks (1), (2)

Notes:

(1) Complete transverse web frame including adjacent structural members

(2) Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure

Note:

1. Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.
2. For areas in tanks where protective coating is found to be in GOOD condition, the extent of close-up survey may be specially considered.
3. For ships having independent tanks of type C, with amidship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered.
4. The extent of close-up surveys may be extended by the surveyor as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

   -in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information;

   -in tanks having structures approved with reduced scantlings.

Table I 2-29B
Minimum Requirements for Close-up Survey
at Hull Special Surveys of Liquefied Gas Carriers

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. ≥ 3 (Age > 10)
1. One web frame in a representative ballast tank of topside, hopper side and double side type(1) 2. One transverse bulkhead in a ballast tank(3)	1. All web frames in a ballast tank, which is to be a double hull side tank or a topside tank. If such tanks are not fitted, another ballast tank is to be selected(1) 2. One web frame in each remaining ballast tank(1) 3. One transverse bulkhead in each ballast tank(2)	1. All web frames in all ballast tanks(1) 2. All transverse bulkheads in all ballast tanks(2)

Notes:

(1) Complete transverse web frame including adjacent structural members

(2) Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure

(3) Transverse bulkhead lower part including girder system and adjacent structural members.

Note:

1. Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.
2. For areas in tanks where protective coating is found to be in GOOD condition, the extent of close-up survey may be specially considered.
3. For ships having independent tanks of type C, with amidship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered.
4. The extent of close-up surveys may be extended by the surveyor as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

   -in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information ;

   -in tanks having structures approved with reduced scantlings.

Table I 2-29C
Minimum Requirements for the Thickness Measurement at Hull Special Survey of Liquefied Gas Carriers

SS No. 1 (Age ≤ 5)	SS No. 2 (5 < Age ≤ 10)	SS No. 3 (10 < Age ≤ 15)	SS No. ≥ 4 (Age > 15)
1. One section of deck plating for the full beam of the ship within 0.5 L amidships in way of a ballast tank, if any	1. Within the cargo area : - each deck plate - one transverse section within 0.5 L amidships in way of a ballast tank, if any	1. Within the cargo area: - each deck plate - two transverse sections(1) - all wind and water strakes	1. Within the cargo area: - each deck plate - three transverse sections(1) - each bottom plate - duct keel plating and internals
2. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey	2. Selected wind and water strakes outside the cargo area	2. Selected wind and water strakes outside the cargo area	2. All wind and water strakes , full length
3. Suspect areas	3 Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey	3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey	3. Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey
	4. Suspect areas	4. Suspect areas	4. Suspect areas

Notes:

(1) At least one section is to include a ballast tank within 0.5L amidships, if any.

Note:

1. For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of thickness measurements may be increased to include the tank top plating at the discretion of the surveyor.
2. For areas in spaces where coatings are found to be in GOOD condition, the extent of thickness measurements may be specially considered.
3. The surveyor may extend the thickness measurements as deemed necessary. Where substantial corrosion is found, the extent of thickness measurements is to be increased to the satisfaction of the surveyor.

Appendix 1
Loading Computer System (LCS) for Stability and Longitudinal Strength

A1.1 General Requirements

A1.1.1 Application

(a) The requirements of this appendix apply to ships equipped with computer based systems for calculation and control of loading conditions for compliance with the applicable stability, longitudinal and local strength requirements.

A1.1.2 Class Notation

(a) Ships equipped with loading computer systems designed, manufactured and tested in compliance with the requirements of this appendix, for calculation and control of stability, longitudinal and local strength, may be assigned the additional class notation **LCS**.

A1.1.3 General requirements

(a) The Loading Computer System is regarded as supplementary to the Loading Manual and Stability Booklet and if relevant the Grain Loading Manual which are always to be provided on board.

(b) The user's manual is always to be provided for the loading computer.

(c) The user's manual and the computer software must be prepared in a language understood by the user. If this language is not English, a translation into English is to be included.

(d) If the software includes on-line interface, for instance remote tank sounding or draught reading, it is assumed that the remote system is maintained and calibrated as recommended by the manufacturers.

(e) On-line computers are to be connected through a gateway if connected to the ship's network serving main functions. The gateway shall have read only possibility unless the computer is approved for two-way communication.

(f) The software may be type approved or approved on a case by case basis for a specific ship.

(g) The software may be type approved, the validity and limitations of the type approval are to be carefully noted. If a type approval is found not to cover all parts of relevance for a specific ship, addition testing and documentation as for a case-by-case approval may be required.

A1.1.4 Documentation

(a) Hardware documentation

If the hardware is not type-approved, the concerned documentation is to be submitted.

(b) Documentation needed when software is type approved

In case of type-approved software, the following documentation is to be submitted:

(i) Preliminary test conditions (print of input and output data).

(ii) Stored characteristic data. (e.g. hydraustatics, cross curves, VCG or GM limit curves, lightweight definition, tank data and associated limits to still water shear force, bending moments and torque, as applicable, and with explanation as found necessary.)

(iii) Number, position and limits of read-out points. The shear force limits are to be specially considered for ships sides and longitudinal bulkheads. The loading computer is to take into account the local correction of the shear forces for conditions with greater pressure differences on the ship's bottom structure.

(iv) Final test conditions (print of input and output data)

In case the user's manual is tailor made for a specific ship, the manual is to be submitted as well.

(c) Documentation needed for case-by-case approval of the software

With a case-by-case approval of the software, the following documentation is to be submitted:

(i) Software description and specifications, including flow chart.

(ii) User's manual, including flow chart.

(iii) Preliminary test conditions (print of point and output data).

(iv) Stored characteristic data. (e.g. hydrostatics, cross curves, VCG or GM limit curves, lightweight definition, tank data and associated limits to still water shear force, bending moments and torque, as applicable, and with explanation as found necessary.).

(v) Number, position and limits of read-out points

The shear force limits are to be specially considered for ships sides and longitudinal bulkheads. The loading computer is to take into account the local correction of the shear forces for conditions with greater pressure differences on the ship's bottom structure.

(vi) Final test conditions (print of input and output data)

A1.1.5 General software requirements

(a) Software

(i) The software and the stored characteristic data must be protected against erroneous use.

(ii) The software design is to be such that it limits possible input errors by the user, for instance tank volume input is not to exceed maximum tank volume, or negative volume input to be accepted.

(iii) The software is to be user-friendly, preferably with graphic presentation of loading conditions and on-line user's task help.

(iv) The software is to include loading limitations. A warning is to be given if these limits are exceeded.

Note:

Loading limitations should include minimum/maximum draught, maximum trim, shear force and bending moment limits, minimum/maximum metacentric height (GM), cargo tank filling height as a function of cargo density, limits to distributed loads on deck, filling of ballast and cargo tanks etc.

(v) The software is to present relevant parameters of loading conditions, such as displacement, draughts forward, midship and aft, trim, center of gravity, metacentric height, free surface correction, shear forces, bending moments, torque and local strength as well as the limiting values for those parameters and an overall judgment whether all loading parameters are within the limiting values.

(vi) If intended for stability calculations, the software must include effect of free surface from slack tanks on the initial metacentric height (GM) and the righting lever (GZ) as well as the effect of external heeling moments, if applicable.

Note :

If the software is based on interpolation on even keel hydrostatics only, the limiting trim will be considered as maximum 1% of the ship's length.

(vii) If the software calculates damage stability, a list of damage cases is to be included. Any intended loading condition must be checked for these damage cases. The results are to include the equilibrium position and the GZ curve after damage, as well as criteria control.

Software is to give an overall judgment whether all the damage cases were found comply with the applicable requirements, within an acceptable time.

(viii) If the software includes on-line interface, for instance remote tank sounding, or draught reading, a warning is to be given in case of on-line interface failure. Further, it is to be possible to give the on-line input manually.

(ix) In case of discrepancy between calculated and actual displacement, the software is to use the actual value and correct the center of gravity in a satisfactory manner. The normal procedure is located in the center of gravity of the deadweight.

A1.2 Approval and Testing Requirements

A1.2.1 Approval principles

(a) The requirements of hardware is to be complied with the Rules.

(b) The software can be either type approved or case-by-case approved. The latter case is only in condition with system installation on board a specific ship. In either case, relevant requirements stated in section A1.1 are to be complied with.

(c) Approval and certification.

(i) Documentation according to A1.1.4 including preliminary test conditions in accordance with A1.2.2 is to be submitted for approval.

(ii) Final test conditions according to A1.2.2, are to be tested on board in presence of a surveyor as described in A1.2.3.

(iii) Certificate of the loading computer system will be issued after checking of final test conditions on board.

A1.2.2 Test conditions

(a) General

(i) Preliminary test conditions are based on estimated lightweight data. Final test conditions are those conditions which are based on lightweight data obtained from the inclining test or the lightweight survey.

(ii) Special or additional test conditions as specified in (vii) may be required by the Society in case the standard test conditions do not fully expose critical aspects of software, e.g. limitations which need to be demonstrated in particular.

(iii) The units and reference system of the test conditions are to be the same as used in the loading manual and the stability booklet.

(iv) At least 4 preliminary test conditions are to be submitted. The corresponding final test conditions are to be submitted after satisfactory result on board in presence of a CR Surveyor.

(v) The selected test conditions are to be representative of the service conditions and the same as the conditions presented in the approved loading manual or the stability booklet. The 4 standard test conditions are to be as follows:

(1) Light ship condition.

(2) Ballast or partly loaded condition.

(3) Fully loaded condition.

(4) Arbitrary loading condition given extreme values.

(vi) Documentation of test conditions is to include input and output data for each condition.

(vii) Additional test conditions, if required, are to be tested of limiting loading parameters, such as maximum draught, maximum trim or maximum KG. Further, they are to include extreme loading conditions, with varying loading parameters such as tank filling heights as a function of cargo density, limits to distributed loads on deck, shear force limits, bending moments and torque as far as applicable.

A1.2.3 Testing and certification

(a) General

(i) At least 4 of the final test conditions are to be tested on board in presence of a CR surveyor, before the loading computer certificate is issued.

(ii) The results from the test conditions must not deviate significantly from the results in the approved loading manual or stability booklet. If found unacceptable, the reason for the deviation is to be clarified.

(iii) A copy of the final test conditions endorsed by a surveyor is to be kept on board.

(iv) If the final loading manual or the final stability booklet has not been approved before delivery, testing on board may take place after these documents have been approved.

Appendix 2

Guidance for Inclining Test

A2.1 General

This annex shows the standard method of inclining test.

A2.2 Preparation for the Test

A2.2.1 Data to be submitted

The following plans are to be available at the time of the test as necessary.

(a) General arrangement drawing.

(b) Tank capacity plan.

(c) Hydrostatic curves.

(d) Draft marks locations

A2.2.2 Inclining test condition

(a) The ship is to be as near to completion in lightweight condition as possible. Equipment used by the yard on board is to be moved outboard as far as possible.

(b) Prior to the inclining test, lists of all items which are to be added, removed, or relocated are to be prepared. These weights and their locations are to be accurately recorded.

(c) The total value of missing weights is not to exceed 2 percent and surplus weights, excluding liquid ballast, fuel oil, diesel oil and fresh water, not exceed 2 percent of the light ship displacement. For smaller ships, higher percentages may be allowed.

(d) All objects are to be secured in their regular positions. All weights which may swing or shift are to be secured in their sea stowage position. If more than one sea stowage positions are possible, the actual stowage position used during the test is to be recorded.

(e) The ship is to be cleared of residues of cargo, tools, debris, scaffolding and snow. Icing of the inner and outer surfaces, the underwater hull included, is not permitted.

(f) Bilge water and liquids accumulated on deck are to be removed in order to exclude an influence on measurements.

(g) Only the persons participating in the inclining test are to be stay on board the ship.

A2.2.3 Tank contents

(a) As a rule, all tanks are to be either full or empty. The number of tanks containing liquids is to be kept to a minimum.

(b) Soundings and density of liquids in tanks are to be taken in tanks containing liquids. Where tanks are partly filled, free surface effect which has an influence on the result of the test is to be estimated from the shape of tanks.

(c) Where tanks are intended to be filled completely, removal of air pockets is to be paid attention. All empty tanks are to be adequately dried.

(d) All connections between tanks are to be closed.

A2.2.4 Mooring arrangements and environmental conditions

(a) Mooring lines are to be free of any transverse tension during the reading. No external moments are to be brought upon the ship from mooring lines. If possible, the ship is to be located in a calm, protected area free from external forces.

(b) The depth of water under the hull is to be sufficient to ensure that the hull will be entirely free of the bottom even if the ship is inclined, taking into account tide differences, if applicable.

(c) The following mooring arrangements are to be referred to as the standard.

(i) A ship is moored by bow and stern lines on both sides of the ship attached at or near the center-line. Longitudinal mooring lines are to be as long as practicable.

(ii) A ship is moored by bow and stern lines on one side only and supplemented by spring lines.

(d) Where a single bow or stern line is proposed, the ship's freedom of movement is to be checked not adversely to effect the conduct of the experiment.

(e) When tidal currents are present the experiment is to be conducted at or around slack tide as far as possible.

(f) The ship's gangway is to be in the stowed position, and any shore gangway is to be removed during the inclining test. Cables, hoses, etc. are as few as possible to be connected to shore. Those which are needed are to be slack.

(g) To carry out the inclining test under the influence of wind and currents may be permitted, provided the accuracy of the test is assured.

A2.2.5 Inclining weights

(a) As a rule, not less than four solid weights are to be used for the inclining test. Use of water ballast transfer to incline the ship may be permitted only in cases where it is impracticable to incline the ship using solid weights.

(b) The solid weights are to be heavy enough to comply with the requirements in A2.3.3(a). Each solid weight is to be almost equal in mass.

(c) Each weight is to be compact, impervious to water. Its center of gravity is to be accurately determined.

(d) Each inclining weight is to be marked with an identification number. The inclining weights are to be weighted with a calibrated instrument to the satisfaction of the Surveyor.

A2.2.6 Measuring devices

(a) In general, not less than two measuring devices, one of which is to be a pendulum or a U-tube, are to be used to determine the ship's inclination.

(b) Where pendulums are used, the pendulums are normally to be long enough to give a measured deflection, to each side of upright, of at least 100 mm, and be suspended at sheltered locations to protect from the wind.

(c) Where U-tubes are used, the length and arrangement of the U-tube is to be such as to ensure the accuracy of its readings.

(d) Where stabilographs are used, the calibration of the instrument are to be verified to the Surveyor's satisfaction prior to the experiment.

A2.2.7 Initial Condition and Stability

(a) The ship is to be preferably upright prior to the inclining. However, an initial list of the ship not exceeding 0.5° is permissible.

(b) Initial trim of the ship is not to exceed 1% of the ship's length.

(c) The persons conducting the test are to be satisfied that the ship has adequate, positive stability and acceptable stress levels during the test.

A2.3 Inclining Test and Record of Data

A2.3.1 Accuracy of data

Measurement of inclining test data is to be as accurate as possible and to the satisfaction of the attending surveyor.

A2.3.2 Draught and water density measurements

(a) Draught is to be measured at fore, aft and midship draught mark at both sides immediately before the test.

(b) The distance from the draught mark, which is used as a reference point, to base line is to be verified prior to the test.

(c) It is to be ensured that no significant changes have occurred in the condition of the ship during the test.

(d) In case of non-coincidence of separate measuring points, additional measurements are to be taken.

(e) Water samples are to be taken at suitable depth to keep away from surface water which could contain rainwater.

A2.3.3 Weight shifts

(a) Positioning of inclining weights which gives a maximum heeling moment is to result in a minimum heel angle of 1° up to a maximum 4° from upright, depending upon ship type and size. Where it is impracticable that the ship is inclined above 1° because of too large GM or other factors, the precision of measurement is to be enhanced taking account of characteristic and condition of the ship and condition of the test.

(b) Procedures of shifting weights are shown in Table I A2-1.

(c) The transverse shift distance is to be as great as practicable. The inclining weights are to be positioned symmetrically to the center line in order to measure the transverse shift distance easily.

(d) The inclining weight positions are to be marked on the deck to ensure that consistency in placement is achieved.

A2.3.4 Measurement of heel angle

(a) Pendulum, or U-tube reading on the recording batten or scale is to be registered by either of the following ways:

(i) On the final stable position of the pendulum or liquid column after stopping of ship motions due to shifting of the inclining weight;

(ii) By marking the center of residual motion about the mean position.

(b) When using other devices, angles of inclination are to be recorded according to instructions supplied for each device.

(c) Whenever the inclining weights are shifted, the plot of heel angle against heeling moment is to be made. If there is a deviation of points from the straight line passing through the initial position, the deflections and moments are to be checked and corrected prior to the next weight movement.

(d) It is to be checked that weights remain on assigned positions and all mooring lines and so on remain slack during measurement.

A2.3.5 Other relevant data

(a) In the case where the inclining test is carried out by means of transfer of water, it has to be possible to evaluate accurately the weight and the center of the shifted liquid in relation to the ship's heel and trim.

(b) The weather conditions, i.e., wind speed and direction relative to the ship, sea state, air and water temperatures, etc., during the test are to be recorded.

A2.4 Postponement of the Test

If during the course of inclining test circumstances arise such that the requirements in this chapter are not complied with, the surveyor may advise the person in charge to postpone the test.

A2.5 Inclining Test Report

A2.5.1 The surveyor is to ensure that the data given in the report is consistent with that gathered during the test and to sign the report.

A2.5.2 Test report containing all data gathered during the test, the result calculated from these data and calculating papers is to be made, and to be submitted to the Society.

Table I A2-1
Procedures of Shifting Weights

	Four		Six	
	Port Side	Starboard Side	Port Side	Starboard Side
No.0	2, 4	1, 3	2, 4, 6	1, 3, 5
No.1	4	1, 2, 3	4, 6	1, 2, 3, 5
No.2		1, 2, 3, 4		1, 2, 3, 4, 5, 6
No.3	1	2, 3, 4	6	1, 2, 3, 4, 5
No.4	1, 3	2, 4	2, 4, 6	1, 3, 5
No.5	1, 2, 3	4	1, 2, 3, 4, 6	5
No.6	1, 2, 3, 4		1, 2, 3, 4, 5, 6	
No.7	2, 3, 4	1	1, 2, 4, 6	3, 5
No.8	2, 4	1, 3	2, 4, 6	1, 3, 5

Notes:

(1) The numbers shown in this table show identification number of the weights

(2) The underlined number indicates the last weight or weight group shifted.

Appendix 3

Procedure for Certification Firms Engaged in Thickness Measurement of Hull Structure

A3.1 Application

This guidance applies for certification of the firms which intended to engage in the thickness measurement of hull structure of the vessels.

A3.2 Procedures for Certification

A3.2.1 Submission of documents

The following documents are to be submission to the Society for approval:

(a) Outline of firms, e.g. organization and management structure.

(b) Experiences of the firms on thickness measurement inter alias of hull structures of the vessel.

(c) Technicians careers, i.e. experiences of technicians as thickness measurement operators, technical knowledge of hull structure etc. Operators, should be qualified according to a recognized industrial NDT Standard.

(d) Equipment used for thickness measurement such as ultra-sonic testing machines and its maintenance/ calibration procedure.

(e) A guide for thickness measurement operators.

(f) Training programmers of technicians for thickness measurement.

(g) Measurement record forms format in accordance with recommended procedures for thickness measurement.

A3.2.2 Auditing of Firms

Upon reviewing the documents submitted with satisfactory results, the firm is audited in order to ascertain that the firm is duly organized and managed in accordance with the documents submitted, and eventually is capable of conducting thickness measurement of the hull construction of the ships.

A3.2.3 Certification is conditional on an onboard demonstration at thickness measurements as well as satisfactory reporting.

A3.3 Certification

A3.3.1 Upon satisfaction results of both the audit of the firm in A3.2.2 and the demonstration tests in A3.2.3 above, the Society will issue a Certificate of Approval as well as notice to the effect that the thickness measurement operation system of the firm has been certified by the Society.

A3.3.2 Renewal/endorsement of the Certificate is to be made at intervals not exceeding 3 years by verification that original condition are maintained.

A3.4 Information of any alteration to Certified Thickness Measurement Operation System

In case where any alteration to the certified thickness measurement operation system of the firm is made, such an alteration is to be immediately informed to the Society. Re-audit is made where deemed necessary by the society.

A3.5 Cancellation of Approval

Approval may be cancelled in the following cases:

A3.5.1 Where the measurements were improperly carried out or the results were improperly report.

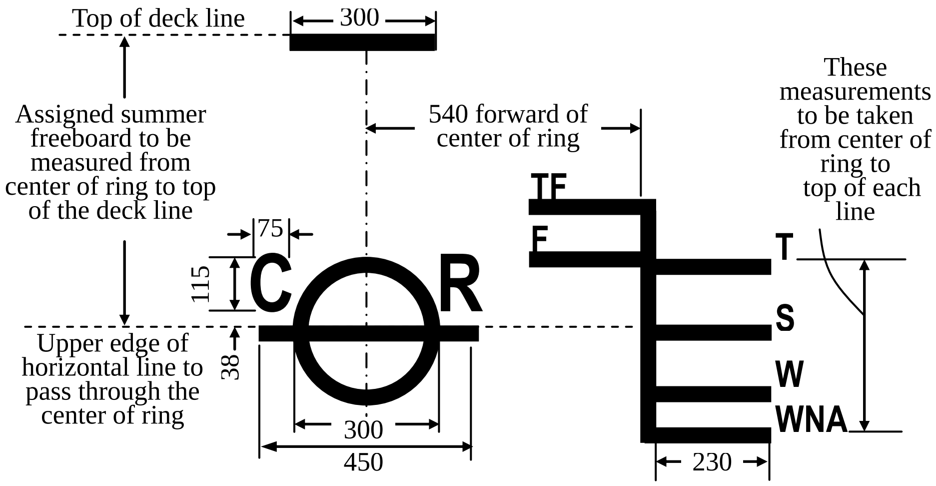
A3.5.2 Where the Society's Surveyor found any deficiencies in the approved thickness measurement operation system of the firm.

A3.5.3 Where the firm failed to inform of any alteration in A3.4 above to the Society.

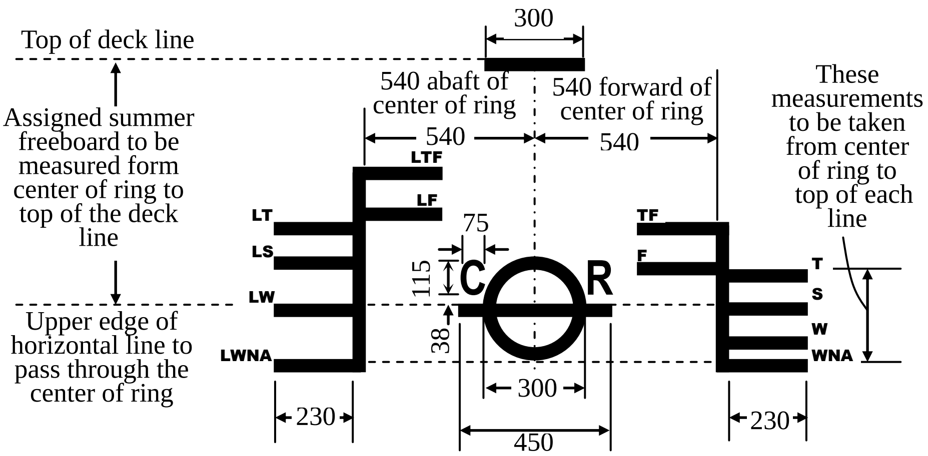
Appendix 4

Load-Line Markings

For Ocean-going Ships



For Ocean-going Ships with Timber Freeboards



Notes:

(1) The center of the ring is to be placed on each side of the vessel at the middle of the length as defined in the Load Line Regulations. The ring and lines are to be permanently marked, as by center punch, chisel cut or bead of weld.

(2) The thickness of all lines are 25 mm.

(3) The size of all letterings are 50 × 32 mm. except W 50 × 45 mm, unless otherwise noted.

VEC	Vapor Emission Control

RULES FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS 2019

PART II HULL CONSTRUCTION AND EQUIPMENT

CONTENTS

Chapter 1

General

1.1 General

1.1.1 The Rules are framed for ships not less than 90 m in length intended for ocean service and of normal ratio of breadth to depth. Special consideration is to be given to ships of novel design or for special purpose. For ships less than 90 m in length, are to comply with Part XV of the Rules.

1.1.2 The design which is not in direct compliance with the requirements of this Part may be accepted by the Society provided that such design is considered satisfactory and equivalent to the Rules.

1.1.3 The Rules are set forth for all welded constructions. Riveted construction, where used, is to comply with the applicable parts dealing with riveting in the 1972 edition of the Rules.

1.1.4 The section modulus of frames, beams, stiffeners, etc. required by the formula in the Rules is based on sections in conjunction with an effective width of plating as specified in 1.6.3.

1.1.5 Where the flanging of the plates may be considered as a substitute for face plates fitted to web plates, the rounding over of the flanges is to be of the smallest practicable radius and normally the width of the flanges excluding 1.5 times the thickness of the plates is to be considered as effective to obtain the effective area of the flanges.

1.1.6 The midship scantlings as specified in the Rules are to apply throughout the midship 0.4L; the end scantlings are not to extend for more than 0.1L from each end of the ship. The tapering from the midship to the end scantlings is to be effected in as a gradual manner as practicable.

1.1.7 Ships are to be built in accordance with controlled and transparent quality production standards with due regard to intellectual property rights. The ship construction quality procedures are to include, but not be limited to, specifications for material, manufacturing, alignment, assembling, joining and welding procedures, surface preparation and coating. All of the industrial standards employed may be recognized, for example, CNS, ISO, JIS, JSQS, DIN, AWS, IACS Rec.47, etc.

1.2 Definitions

1.2.1 Length of ship (L) is the distance, in meters, on the summer load waterline from the fore side of the stem to the after side of the rudder post, or to the center of the rudder stock if there is no rudder post. L is not to be less than 96 %, and need not be greater than 97 %, of the extreme length on the summer load waterline. The summer load waterline is the designed maximum load line corresponding to the full load condition. In ships without rudder post and stock, L is to be taken equal to 97% of the extreme length on the summer load waterline. In ships with unusual stem or stern arrangements, L is considered on a case by case basis.

1.2.2 Breadth of ship (B) is the horizontal distance, in meters, measured at the broadest part of the hull to the moulded line of the frame in the ship.

1.2.3 Depth of ship (D) is the vertical distance, in meters, at the middle of the length, L, from the top of keel to the top of the uppermost continuous deck beam at side. The depth, D_S, for the determination of the requirements for the shell plating and the strength deck area is measured to the strength deck as defined in 1.2.5 of this Part. When a round gunwale is arranged, the depth, D, is to be measured to the continuation of the molded deck line.

1.2.4 Draught (d) is the vertical distance, in meters, at the middle of the length, L, from the top of keel to the summer load waterline.

1.2.5 Strength deck is the deck that forms the top of the effective hull girder at any part of its length.

1.2.6 Bulkhead deck is the highest deck to which watertight transverse bulkheads except both peak bulkheads extend and are made effective.

1.2.7 Speed of ship (V) is the designed speed, in knots at the maximum continuous rating of the propelling machinery when the ship with clean bottom runs ahead on calm sea at the designed summer load draught.

1.2.8 Block coefficient (C_b) is the coefficient given by dividing the volume of moulded displacement by LBd.

1.2.9 Superstructure is the deck structure on the freeboard deck, extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 4% of the breadth of the ship for freeboard, B_f as specified in 1.2.11 below.

1.2.10 Length of ship for freeboard (L_f) means 96 % of the total length on a waterline at 85 % of the least moulded depth measured from the top of the keel, or the length from the fore-side of the stem to the axis of the rudder stock on that waterline, if that be greater. Where the stem contour is concave above the waterline at 85 % of the least moulded depth, both the forward terminal of the total length and the fore-side of the stem respectively shall be taken at the vertical projection to that waterline of the after most point of the stem contour (above that waterline). In ships designed with a rake of keel the waterline on which this length is measured shall be parallel to the designed waterline.

1.2.11 Breadth of ship for freeboard (B_f) is the maximum horizontal distance in meters, measured at the middle of the length of the ship for freeboard, L_f, to the moulded line of the frame in the ship.

1.2.12 Freeboard deck

(a) Freeboard deck is normally the uppermost continuous deck exposed to weather and sea, which has permanent means of closing all openings in the weather part thereof, and below which all openings in the sides of the ship are fitted with permanent means of watertight closing.

(b) In a ship having a discontinuous freeboard deck, the lowest line of the exposed deck and the continuation of that line parallel to the upper part of the deck is taken as the freeboard deck.

(c) Where the designed load draught is less than derived from the provision of the International Convention on Load Lines, 1966 assuming the existing deck below the freeboard deck as the freeboard deck, the existing lower deck may be designated as the freeboard deck in the application of the Rules, provided it is to be continuous in a fore and aft direction at least between the machinery space and peak bulkheads and continuous athwartships. Where this lower deck is stepped, the lowest line of the deck and the continuation of that line parallel to the upper part of the deck is taken as the freeboard deck.

1.2.13 The midship part of ship is the part 0.4L amidships unless otherwise specified.

1.2.14 The end parts of ship are the parts 0.1L from each end of the ship.

1.2.15 Keel line is a line parallel to the slope of the keel passing amidships through the top of the keel at the centerline or at the line of intersection of the inside of a shell plating with the keel if a bar keel extends below that line, on a ship with a metal shell.

1.2.16 Refer to IACS Rec. 82: Surveyor's Glossary – Hull terms & hull survey terms.

1.3 Submission of Plans

1.3.1 Plans should generally be submitted electronically to the Society via CR Plan Approval System (CRPA). However, hard copies in triplicate will also be accepted. In general, plans covering the following items are to be submitted and approved before the work of construction commences:

(a) Construction plans, as detailed in the respective Chapters of the Rules, such as Midship Section, Longitudinal Section, Decks, Shell Plating, Bottom Construction, Framing, Inner Bottom Plating, Watertight Bulkheads, Structural Non-tight Bulkheads, Deep Tanks, Pillars and Girders, Shaft Tunnels, Bow Construction, Stern Construction, Machinery Casing, Main Engine, Boiler and Main Auxiliary Foundations, Stem, Sternframe, Rudder, Shaft Struts, Spectacle Frames and Bossing, Superstructures and Deck Houses, etc. The proposed scantlings with the necessary particulars for determining the scantlings according to the Rules, the grade of steel to be used, and the arrangement of all parts relevant to the Rules are to be shown on the Plans.

(b) Longitudinal strength calculations including Still Water Bending Moment and Shear Force Calculations and Section Modulus Calculations as required by 3.2 of this Part.

(c) Equipment Calculations as required by 25.2 of this Part.

(d) Plans and Particulars relevant to the Freeboard Assignment, such as Freeboard Calculations, Safety Against Flooding, if any; Doors, Position of Hatchways, Doorways and Ventilators, Cargo and Other Hatchways, Miscellaneous Openings in Freeboard and Superstructure Decks, Ventilators, Air Pipes, Cargo Ports and other Similar Openings, Scuppers, Inlets and Discharges, Side Scuttles, Freeing Ports, Protection of the Crew, Gangway and Access etc.

1.3.2 Any alterations made to the approved plans are subject to approval by the Society before the work with respect to such alterations commences.

1.4 Testing Procedures for Tanks and Boundaries

1.4.1 Reference is made to IACS UR S14 (Rev. 6) for definition of applicable ships. The requirements of testing procedures are divided into two parts, PART A and PART B as follows:

(a) PART A - SOLAS ships (including CSR BC & OT)

(b) PART B - Non-SOLAS ships and SOLAS Exempt/Equivalent ships

1.4.2 Testing procedures of watertight compartments for SOLAS ships (including CSR BC & OT) are to be carried out in accordance with PART A, unless:

(a) the shipyard provides documentary evidence of the shipowner's agreement to a request to the Flag Administration for an exemption from the application of SOLAS Ch. II-1, Reg. 11, or for an equivalency agreeing that the content of PART B is equivalent to SOLAS Ch. II-1, Reg. 11; and

(b) the above-mentioned exemption or equivalency has been granted by the responsible Flag Administration.

1.4.3 Testing procedures of watertight compartments are to be carried out in accordance with PART B for non-SOLAS ships and those SOLAS Exempt/Equivalent ships for which:

(a) the shipyard provides documentary evidence of the shipowner's agreement to a request to the Flag Administration for an exemption from the application of SOLAS Ch. II-1, Reg. 11, or for an equivalency agreeing that the content of PART B is equivalent to SOLAS Ch. II-1, Reg. 11; and

(b) the above-mentioned exemption or equivalency has been granted by the responsible Flag Administration.

1.4.4 Part A – SOLAS ships

(a) General

(i) These test procedures are to confirm the watertightness of tanks and watertight boundaries, and the structural adequacy of tanks which consist of the watertight subdivisions of ships. These procedures may also be applied to verify the weathertightness of structures and shipboard outfitting. The tightness of all tanks and water tight boundaries of ships during new construction and those relevant to major conversions or major repairs is to be confirmed by these test procedures prior to the delivery of the ship.

(ii) Watertight subdivision means the main transverse and longitudinal subdivisions of the ship required to satisfy the subdivision requirements of SOLAS Chapter II-1.

(iii) Major repair means a repair affecting structural integrity.

(iv) Gravity tank means a tank that is subject to vapor pressure not greater than 70 kPa.

(b) Application

(i) All gravity tanks and other boundaries required to be watertight or weathertight are to be tested in accordance with 1.4.4 and proven tight and structurally adequate as follows:

(1) Gravity Tanks for their tightness and structural adequacy,

(2) Watertight Boundaries other than Tank Boundaries for their watertightness, and

(3) Weathertight Boundaries for their weathertightness.

(ii) The testing of cargo containment systems of liquefied gas carriers is to be in accordance with the testing requirements in 4.21 to 4.26 of the IGC Code and standards deemed appropriate by the Society.

(iii) The testing of structures not listed in Table II 1-1 or Table II 1-2 of this Chapter, is to be specially considered.

(c) Test Types Definitions

(i) The following two types of test are specified in this requirement:

(1) Structural Test
A test to verify the structural adequacy of tank construction. This may be a hydrostatic test or, where the situation warrants, a hydropneumatic test.

(2) Leak Test
A test to verify the tightness of a boundary. Unless a specific test is indicated, this may be a hydrostatic / hydropneumatic test or an air test. A hose test may be considered an acceptable form of leak for certain boundaries, as indicated by Note (3) of Table II 1-1 of this Chapter.

(ii) The definition of each test type is as follows:

(1) Hydrostatic Test (Leak and Structural)
A test wherein a space is filled with a liquid to a specified head.

(2) Hydropneumatic Test (Leak and Structural)
A test combining a hydrostatic test and an air test. wherein a space is partially filled with a liquid and pressurized with air.

(3) Hose Test (Leak)
A test to verify the tightness of a joint by a jet of water with the joint visible from the opposite side.

(4) Air Test (Leak)

A test to verify tightness by means of air pressure differential and leak indicating solution. It includes tank air tests and joint air tests, such as compressed air fillet weld tests and vacuum box tests.

(5) Compressed Air Fillet Weld Test (Leak)
An air test of fillet welded tee joint wherein leak indicating solution is applied on fillet welds.

(6) Vacuum Box Test (Leak)
A box over a joint with leak indicating solution applied on the welds. A vacuum is created inside the box to detect any leaks.

(7) Ultrasonic Test (Leak)
A test to verify the tightness of the sealing of closing devices such as hatch covers by means of ultrasonic detection techniques.

(8) Penetration Test (Leak)
A test to verify that no visual dye penetrant indications of potential continuous leakages exist in the boundaries of a compartment by means of low surface tension liquids (i.e. dye penetrant test).

(9) Other test
Other methods of testing may be considered by the Society upon submission of full particulars prior to the commencement of testing.

(d) Test Procedures

(i) General

Tests are to be carried out in the presence of the Surveyor at a stage sufficiently close to the completion of the work with all hatches, doors, windows, etc., installed and all penetrations including pipe connections fitted, and before any ceiling and cement work is applied over the joints. Specific test requirements are given in 1.4.4(d)(iv) and Table II 1-1 of this Chapter. For the timing of the application of coating and the provision of safe access to joints, see 1.4.4(d)(v), 1.4.4(d)(vi) and Table II 1-3 of this Chapter.

(ii) Structural test procedures

(1) Type and time of test
Where a structural test is specified in Table II 1-1 or Table II 1-2 of this Chapter, a hydrostatic test in accordance with 1.4.4(d)(iv)(1) of this Chpater will be acceptable. Where practical limitations (strength of building berth, density of liquid, etc.) prevent the performance of a hydrostatic test, a hydropneumatic test in accordance with 1.4.4(d)(iv)(2) of this Chapter may be accepted instead.
A hydrostatic test or hydropneumatic test for the confirmation of structural adequacy may be carried out while the vessel is afloat, provided the results of a leak test are confirmed to be satisfactory before the vessel is afloat.

(2) Testing Schedule for New Construction or Major Structural Conversion

a) Tanks which are intended to hold liquids, and which form part of the watertight subdivision of the ship* , shall be tested for tightness and structural strength as indicated in Table II 1-1 and Table II 1-2 of this Chapter.

* Watertight subdivision means the main transverse and longitudinal subdivisions of the ship required to satisfy the subdivision requirements of SOLAS Ch. II-1.

b) The tank boundaries are to be tested from at least one side. The tanks for structural test are to be selected so that all representative structural members are tested for the expected tension and compression.

c) The watertight boundaries of spaces other than tanks for structural testing may be exempted, provided that the water-tightness of boundaries of exempted spaces is verified by leak tests and inspections. Structural testing may not be exempted and the requirements for structural testing of tanks in 1.4.4(d)(ii)(2)a) to 1.4.4(d)(ii)(2)b) of this Chapter shall apply, for ballast holds, chain lockers and a representative cargo hold if intended for in-port ballasting.

d) Tanks which do not form part of the watertight subdivision of the ship, may be exempted from structural testing provided that the water-tightness of boundaries of exempted spaces is verified by leak tests and inspections.

(iii) Leak test procedures

(1) For the leak test specified in Table II 1-1, tank air tests, compressed air fillet weld tests, vacuum box tests in accordance with 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Chapter, or their combination, will be acceptable. Hydrostatic or hydropneumatic test may also be accepted as leak tests provided that 1.4.4(d)(v), 1.4.4(d)(vi) and 1.4.4(d)(vii) of this Chapter are complied with. Hose tests will also be acceptable for such locations as specified in Note (3) of Table II 1-1 of this Chapter, in accordance with 1.4.4(d)(iv)(3) of this Chapter.

(2) The application of the leak test for each type of welded joint is specified in Table II 1-3.

(3) Air tests of joints may be carried out in the block stage provided that all work on the block that may affect the tightness of a joint is completed before the test. See also 1.4.4(d)(v)(1) of this Chapter for the application of final coatings and 1.4.4(d)(vi) of this Chapter for the safe access to joints and the summary in Table II 1-3 of this Chapter.

(iv) Test Methods

(1) Hydrostatic Test

Unless other liquid is approved, the hydrostatic tests are to consist of filling the space by fresh water or sea water, whichever is appropriate for testing, to the level specified in Table II 1-1 or Table II 1-2 of this Chapter.

In case a tank is designed for cargo densities greater than sea water and testing is with fresh water or sea water, the testing pressure height is to simulate the actual loading for those greater cargo densities as far as practicable.

All external surfaces of the tested space are to be examined for structural distortion, bulging and buckling, other related damage and leaks.

(2) Hydropneumatic test

Hydropneumatic tests where approved, are to be such that the test condition in conjunction with the approved liquid level and supplemental air pressure will simulate the actual loading as far as practicable. The requirements and recommendations for tank air tests in 1.4.4(d)(iv)(4) of this Chapter will also apply to the hydropneumatic test. See also 1.4.4(d)(vii) of this Chapter.

All external surfaces of the tested space are to be examined for structural distortion, bulging and buckling, other related damage and leaks.

(3) Hose test

Hose tests are to be carried out with the pressure in the hose nozzle maintained at least at 2×10^5 Pa during the test. The nozzle is to have a minimum inside diameter of 12 mm and be at a perpendicular distance from the joint not exceeding 1.5 m. The water jet is to impinge directly upon the weld.

Where a hose test is not practical because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by a careful visual examination of welded connections, supported where necessary by means such as a dye penetrant test or ultrasonic leak test or the equivalent.

(4) Tank air test

All boundary welds, erection joints and penetrations, including pipe connections are to be examined in accordance with approved procedure and under a stabilized pressure differential above atmospheric pressure not less than 0.15×10^5 Pa, with a leak indicating solution such as soapy water/detergent or a proprietary brand applied.

A U-tube with a height sufficient to hold a head of water corresponding to the required test pressure is to be arranged. The cross sectional area of the U-tube is not to be less than that of the pipe supplying air to the tank. Arrangements involving the use of two calibrated pressure gauges to verify the required test pressure may be accepted taking into account the provisions in F5.1 and F7.4 of IACS Rec. 140, "Recommendation for Safe Precautions during Survey and Testing of Pressurized Systems".

A double inspection is to be made of tested welds. The first is to be immediately upon applying the leak indication solution; the second is to be after approximately four or five minutes in order to detect those smaller leaks which may take time to appear.

(5) Compressed air fillet weld test

In this air test, compressed air is injected from one end of a fillet welded joint and the pressure verified at the other end of the joint by a pressure gauge on the opposite side. Pressure gauges

are to be arranged so that an air pressure of at least 0.15×10^5 Pa can be verified at each end of all passages within the portion being tested.
Note: Where a leak test is required for fabrication involving partial penetration welds, a compressed air test is also to be applied in the same manner as to fillet weld where the root face is large, i.e., 6-8 mm.

(6) Vacuum box test
A box (vacuum testing box) with air connections, gauges and an inspection window is placed over the joint with leak indicating solution applied to the weld cap vicinity. The air within the box is removed by an ejector to create a vacuum of 0.20×10^5 – 0.26×10^5 Pa inside the box.

(7) Ultrasonic test
An ultrasonic echo transmitter is to be arranged inside of a compartment and a receiver is to be arranged on the outside. The watertight/weathertight boundaries of the compartment are scanned with the receiver in order to detect an ultrasonic leak indication. A location where the sound is detectable by the receiver indicates a leakage in the sealing of the compartment.

(8) Penetration test
A test of butt welds or other weld joints uses the application of a low surface tension liquid at one side of a compartment boundary or structural arrangement. If no liquid is detected on the opposite side of the boundaries after the expiration of a defined period of time, this indicates tightness of the boundaries. In certain cases, a developer solution may be painted or sprayed on the other side of the weld to aid leak detection.

(9) Other test
Other methods of testing may be considered by the Society upon submission of full particulars prior to commencement of the testing.

(v) Application of coating

(1) Final coating
For butt joints welded by an automatic process, the final coating may be applied any time before the completion of a leak test of spaces bounded by the joints, provided that the welds have been carefully inspected visually to the satisfaction of the Surveyor. The Surveyor reserves the right to require a leak test prior to the application of the final coating over automatic erection butt welds.
For all other joints, the final coating is to be applied after the completion of the leak test of the joint. See also Table II 1-3 of this Chapter.

(2) Temporary coating
Any temporary coating which may conceal defects or leaks is to be applied at the time as specified for the final coating. This requirement does not apply to shop primer.

(vi) Safe access to joints

For leak tests, a safe access to all joints under examination is to be provided. See also Table II 1-3 of this Chapter.

(vii) Hydrostatic or hydropneumatic tightness test

In cases where the hydrostatic or hydropneumatic tests are applied instead of a specific leak test, examined boundaries must be dew-free, otherwise small leaks are not visible.

1.4.5 PART B – Non-SOLAS Ships and SOLAS Exemption/Equivalent Ships

(a) General

These test procedures are to confirm the watertightness of tanks and watertight boundaries, and the structural adequacy of tanks which consist of the watertight subdivisions of ships. These procedures may also be applied to verify the weathertightness of structures and shipboard outfitting. The tightness of all tanks and water tight boundaries of ships during new construction and those relevant to major conversions or major repairs is to be confirmed by these test procedures prior to the delivery of the ship.

(b) Application

(i) Testing procedures are to be carried out in accordance with the requirements of 1.4.4(d)(ii) to 1.4.4(d)(vii) of this Chapter in association with the following alternative procedures for 1.4.4(d)(ii)(2) "Testing Schedule for New Construction or Major Structural Conversion" and alternative test requirements for Table II 1-1 of this Chapter.

(ii) The tank boundaries are to be tested from at least one side. The tanks for structural test are to be selected so that all representative structural members are tested for the expected tension and compression.

(iii) Structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localised differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test. The acceptance of leak testing using an air test instead of a structural test does not apply to cargo space boundaries adjacent to other compartments in tankers and combination carriers or to the boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships.

(iv) Additional tanks may require structural testing if found necessary after the structural testing of the first tank.

(v) Where the structural adequacy of the tanks of a vessel were verified by the structural testing required in Table II 1-1 of this Chapter, subsequent vessels in the series (i.e. sister ships built from the same plans at the same shipyard) may be exempted from structural testing of tanks, provided that:

(1) Water-tightness of boundaries of all tanks is verified by leak tests and thorough inspections are carried out.

(2) Structural testing is carried out for at least one tank of each type among all tanks of each sister vessel.

(3) Additional tanks may require structural testing if found necessary after the structural testing of the first tank or if deemed necessary by the attending Surveyor.

For cargo space boundaries adjacent to other compartments in tankers and combination carriers or boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships, the provisions of paragraph 1.4.5(b)(iii) of this Chapter are to apply in lieu of paragraph 1.4.5(b)(v)(2) of this Chapter.

(vi) Sister ships built (i.e. keel laid) two years or more after the delivery of the last ship of the series, may be tested in accordance with 1.4.5(b)(v) of this Chapter at the discretion of the Society, provided that:

(1) general workmanship has been maintained (i.e. there has been no discontinuity of shipbuilding or significant changes in the construction methodology or technology at the yard, shipyard personnel are appropriately qualified and demonstrate an adequate level of workmanship as determined by the Society); and

(2) an NDT plan is implemented and evaluated by the Society for the tanks not subject to structural tests. Shipbuilding quality standards for the hull structure during new construction are to be reviewed and agreed during the kick-off meeting. Structural fabrication is to be carried out in accordance with IACS Rec. 47, "Shipbuilding and Repair Quality Standard", or a recognised fabrication standard which has been accepted by the Society prior to the commencement of fabrication/construction. The work is to be carried out in accordance with the Rules and under survey of the Society.

1.4.6 General requirements for testing are given in Table II 1-1 of this Chapter.

1.4.7 Particular requirements for testing of certain spaces within the cargo area of: liquefied gas carriers, edible liquid carriers and chemical carriers are given in Table II 1-2 of this Chapter.

1.5 Materials

1.5.1 The requirements for hull scantling given in this Part are based on the use of mild steel as specified in Part XI.

1.5.2 High strength steel

(a) The material factor K for section modulus for 0.4 L amidship of hull and for other strength calculation is to be as follows:

K = Material factor.
= 1.00 for mild steel.
= 0.78 for HT32.
= 0.72 for HT36.
= 0.68 for HT40.
0.66 for HT40 provided that a fatigue assessment of the structure is performed to verify compliance with the requirements of the Society.
= 0.62 for HT47.

Material factor for extra high strength steels are to be specially considered.

(b) For longitudinal strength applicable of higher strength material are to be continuous over the length of the vessel to locations where the stresses levels will be suitable for the adjacent mild steel structure. Higher strength steel is to be extended to suitable locations below the strength deck and above the bottom, so that the stress levels will be satisfactory for the remaining mild steel structure. Longitudinal framing members are to be continuous throughout the required extent of higher strength steel.

(c) For rudder stocks, pintles, flanges, coupling bolts, keys and cast parts of rudders, required scantlings may be reduced with consideration of the following material factor when higher strength steels are used:

$$K = \left(\frac{235}{\sigma_y}\right)^e$$

where:

K = Material factor.
e = 0.75 for $\sigma_y > 235$ N/mm^2.
= 1.00 for $\sigma_y \leq 235$ N/mm^2.
σ_y = Yield stress of material used, in N/mm^{2}and is to be taken
≤ $0.7\sigma_t$ or 450 N/mm^2, whichever is smaller.
σ_t = Tensile strength of material, in N/mm^2.

(d) The scantling of local structure such as section modulus, moment of inertia, thickness, sectional area, etc. are to be specially considered by the Society.

1.5.3 Where materials other than those specified in 1.5.1 and 1.5.2 above are used, the use of such materials and the corresponding scantlings are to be specially approved by the Society.

1.5.4 Use of steel grades for ships

(a) Materials in the various strength members are not to be of lower grade than those corresponding to the material classes and grades specified in Table II 1-4 to Table II 1-9. General requirements are given in Table II 1-4, while additional minimum requirements for ships with length exceeding 150 m and 250 m, bulk carriers subject to the requirements of SOLAS regulation XII/6.4.3, and ships with ice strengthening are given in Table II 1-7 to Table II 1-8. The material grade requirements for hull members of each class depending on the thickness are defined in Table II 1-9.

(b) For strength members not mentioned in Table II 1-4 to Table II 1-8, Grade A/AH may generally be used. The steel grade is to correspond to the as-built plate thickness when this is greater than the rule requirement.

(c) Plating materials for stern frames, rudders, rudder horns and shaft brackets are in general not to be of lower grades than corresponding to Class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) Class III is to be applied.

1.5.5 Structures exposed to low air temperatures

(a) For ships intended to operate in areas with low air temperatures (below and including -20ºC), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D, to be taken as defined in 1.5.6.

(b) Materials in the various strength members above the lowest ballast water line (BWL) exposed to air are not to be of lower grades than those corresponding to Classes I, II and III, as given in Table II 1-10 of this Chapter, depending on the categories of structural members (SECONDARY, PRIMARY and SPECIAL). For non-exposed structures (except as indicated in Note (5) of Table II 1-10 of this Chapter) and structures below the lowest ballast water line, see 1.5.4 of this Chapter.

(c) The material grade requirements for hull members of each class depending on thickness and design temperature are defined in Table II 1-11 to Table II 1-13. For design temperatures t_D < -55ºC, materials are to be specially considered by the Society.

(d) Single strakes required to be of Class III or of Grade E/EH or FH are to have breadths not less than 800+ 5L mm, maximum 1800 mm.

(e) Plating materials for stern frames, rudder horns, rudders and shaft brackets are not to be of lower grades than those corresponding to the material classes given in 1.5.4.

1.5.6 The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation. For seasonally restricted service, the lowest value within the period of operation applies. Fig. II 1-1 illustrates the temperature definition.

1.5.7 For the purpose of issuing a Polar Ship Certificate in accordance with the Polar Code, the design temperature t_D shall be no more than 13ºC higher than the Polar Service Temperature (PST) of the ship. In the Polar Regions, the statistical mean over observation period is to be determined for a period of at least 10 years.

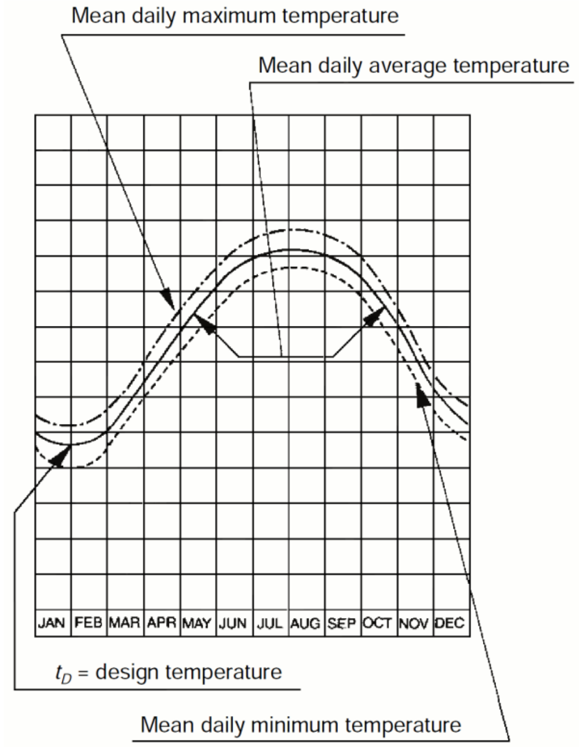

Fig. II 1-1
Commonly Used Definitions of Temperatures

1.6 Scantlings

1.6.1 The midship part and end parts of the ship used when describing the location of structural members and their scantlings are defined in 1.2.13 and 1.2.14 respectively.

1.6.2 Unless specified otherwise, scantlings of structural members of the midship part can be reduced gradually over the length of 0.1L afore and abaft.

1.6.3 Section moduli specified by the Rules include the steel plates with an effective breadth of 0.1*l* on either side of the members, unless specified otherwise. However, the 0.1*l* steel plates are not to exceed one-half of the distance to the next member. *l* is the length of the member specified in the relevant Chapters.

1.6.4 When calculating the section module of longitudinals or longitudinal stiffeners, these values may be properly reduced where these members are effectively supported inside the span defined in the formula.

1.6.5 Where flat bars, angles or flanged plates are welded to form beams, frames or stiffeners for which section moduli are specified, they are to be of suitable depth and thickness in proportion to the section modulus specified in the Rules.

1.6.6 For members such as girders and floors, to which sectional area of face plate is specified, the breadth of the flange is not to be less than that obtained from the following formula, where the inner edge of the web plate is flanged in lieu of a face plate.

$$\frac{100A}{t} + 1.5t \qquad \text{mm}$$

where:

A = Required sectional area, in cm^2, of face plate.

t = Thickness, in mm, of web plate.

1.6.7 Group of stiffeners

Scantlings of stiffeners based on requirements in this Part may be decided based on the concept of grouping designated sequentially placed stiffeners of equal scantlings on a single stiffened panel. The scantling of the group is to be taken as the greater of the following:

- The average of the required scantling of all stiffeners within a group.
- 90% of the maximum scantling required for any one stiffener within the group.

1.7 Connection of Ends of Stiffeners, Girders and Frames

1.7.1 Where the ends of girders are connected to locations such as bulkheads and tank tops, the end connections of all girders are to be balanced by effective supporting members on the opposite side of these locations.

1.7.2 The length of the frame-side arm of brackets connected to the frames or stiffeners of locations such as bulkheads or deep tanks is not to be less than one-eighth of *l* specified in the relevant Chapter, unless otherwise specified.

1.7.3 Where stiffeners support the longitudinals penetrating floors or transverse girders in tanks, the connection of the stiffeners to the longitudinals is to have enough fatigue strength for the dynamic pressure that occurs in such tanks. These stiffeners are to be of a thickness not less than the minimum thickness required for floors or transverse girders and the depth of which is not to be less than 0.08 times the depth of girders or transverse floors, d_0 (in mm), minus the height of the longitudinals. However, stiffeners of an equivalent or greater strength are deemed acceptable.

1.8 Brackets

1.8.1 The size of brackets is to be determined by Table II 1-14 of this Chapter according to the length of the longer arm.

1.8.2 The thickness of brackets is to be suitably increased where the depth of the brackets at the throat is less than two-thirds of the longer arm of the bracket.

1.8.3 Where lightening holes are cut into the brackets, the distance from the circumference of the hole to the free flange of the bracket is not to be less than the diameter of the lightening hole.

1.8.4 Where the length of the longer arm exceeds 800 mm, the free edges of the brackets are to be stiffened by flanging or by other means, except where tripping brackets or the like are provided.

1.9 Modification of Span (*l*) for Thicker Brackets

1.9.1 Span (*l*) for thicker brackets

Where brackets are not thinner than the girder plates, the value of *l* specified in this Part may be modified in accordance with the following:

(a) Where the sectional area of the face plate of the bracket is not less than one-half that of the girder and the face plate of the girder which is carried on to the bulkhead, deck, tank top, etc., l may be measured to a point 0.15m inside the toe of the bracket.

(b) Where the sectional area of the face plate of the bracket is less than one-half that of the girder and the face plate of the girder which is carried on to the bulkhead, deck, tank top, etc., l may be measured to a point where the sum of sectional areas of the bracket and its face plate outside the line of the girder is equal to the sectional area of the face plate of girder, or to a point 0.15m inside the toe of the bracket, whichever is greater.

(c) Where brackets are provided and the face plates of girders extend along the free edge of brackets to the bulkhead, deck, tank top, etc., even if the free edge of brackets is curved, l is to be measured to the toe of the bracket.

(d) Brackets are not to be considered effective beyond the point where the arm along the girder is 1.5 times the length of the arm on the bulkhead, deck, tank top, etc.

(e) In no case is the allowance in l at either end to exceed one-quarter of the overall length of the girder including the part of end connection.

1.9.2 Effective bending span (l_e) of stiffeners

The effective bending span (l_e) of stiffeners is to be measured as shown in Fig. II 1-2 for single skin structures and Fig. II 1-3 for double skin structures.

If the web stiffener is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full length between primary supporting members unless a backing bracket is fitted, see Fig. II 1-2.

The effective bending span may be reduced where brackets are fitted to the flange or free edge of the stiffener. Brackets fitted on the side opposite to that of the stiffener with respect to attached plating are not to be considered as effective in reducing the effective bending span.

In single skin structures, the effective bending span of a stiffener supported by a bracket or by a web stiffener on one side only of the primary supporting member web, is to be taken as the total span between primary supporting members as shown in item (a) of Fig. II 1-2. If brackets are fitted on both sides of the primary supporting member, the effective bending span is to be taken as in items (b), (c) and (d) of Fig. II 1-2.

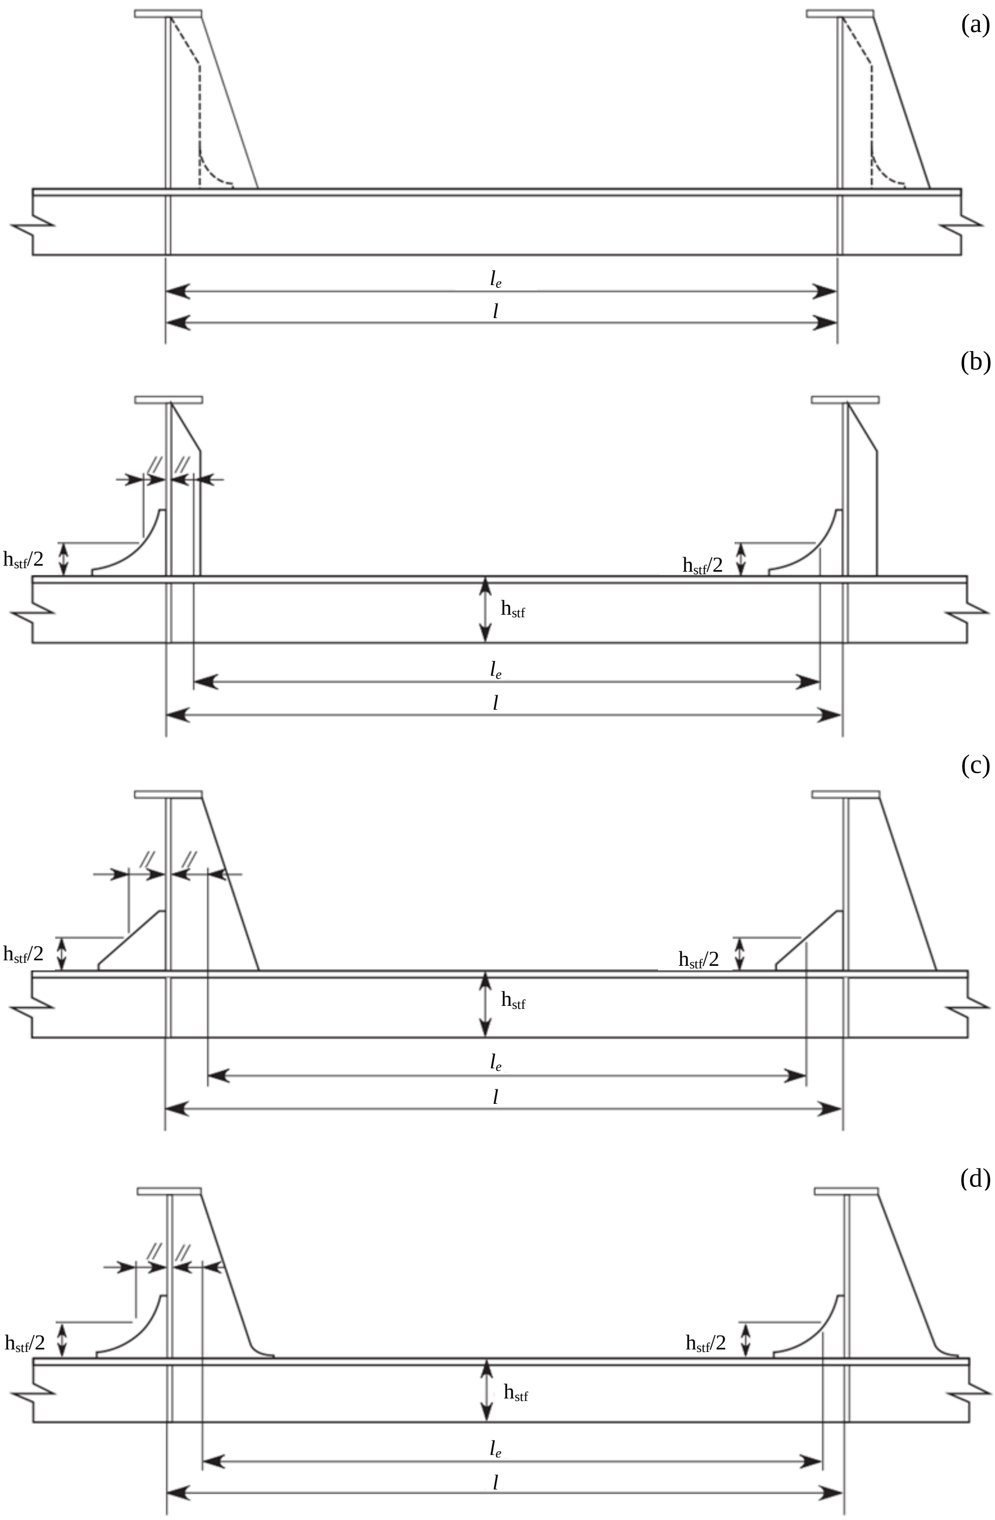

Fig. II 1-2
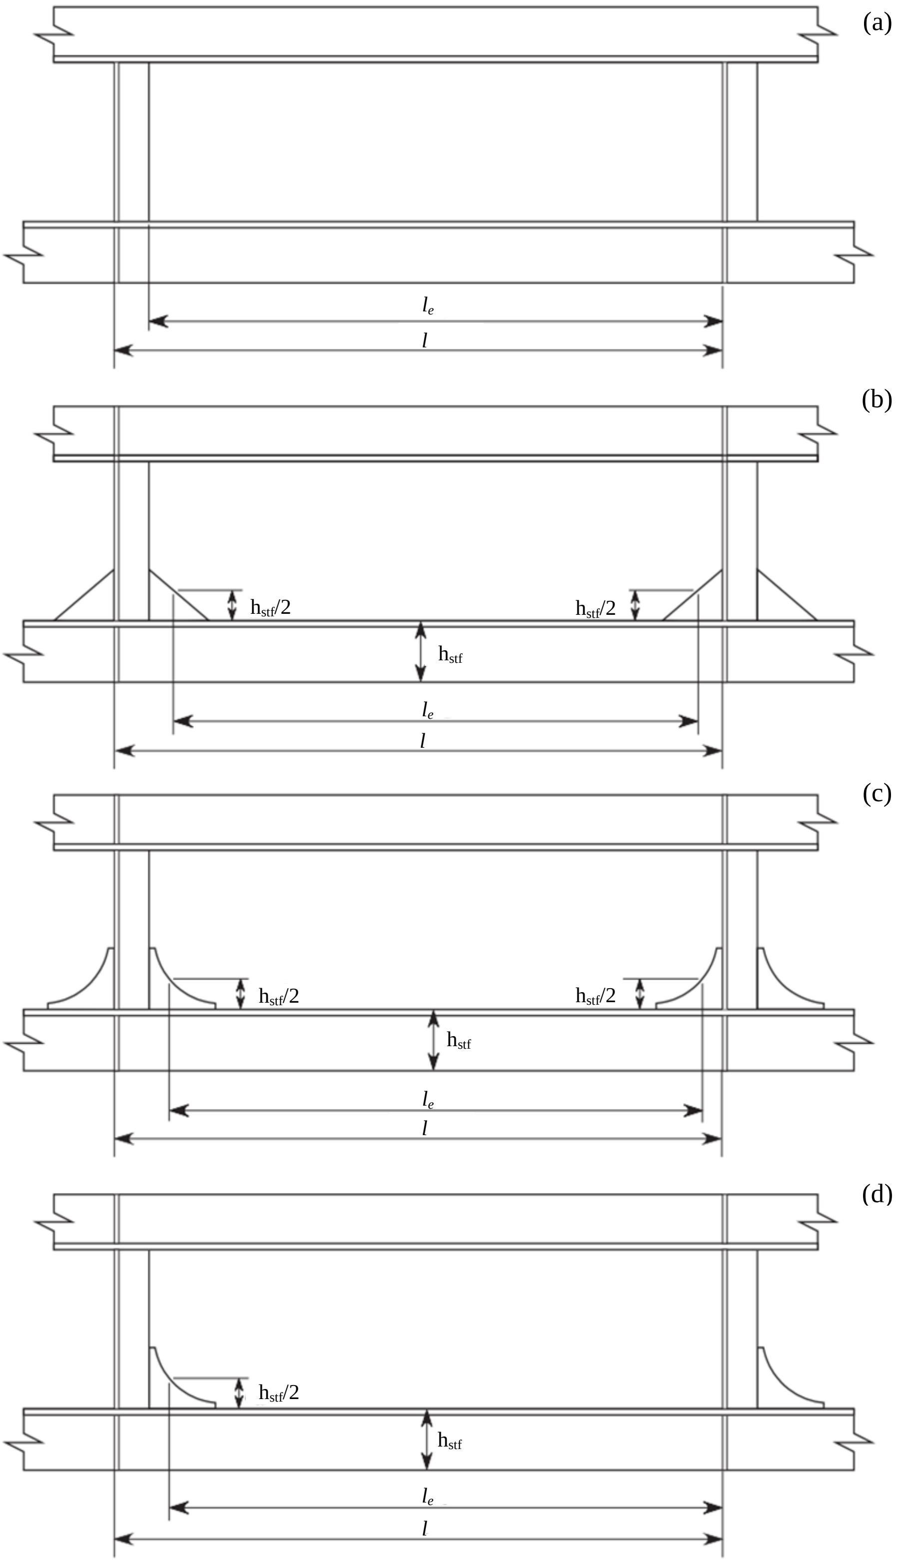
Effective Bending Span of Stiffeners Supported by Web Stiffeners (Single Skin Construction)



Note: Where the face plate of the stiffener is continuous along the edge of the bracket, the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener, see Fig. II 1-4.

Fig. II 1-3

Effective Bending Span of Stiffeners Supported by Web Stiffeners (Double Skin Construction)

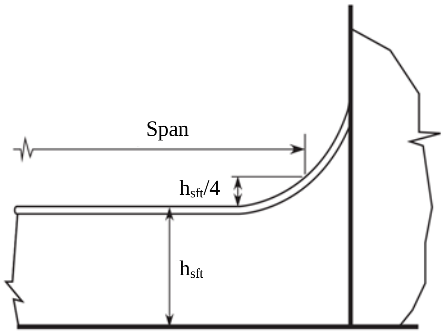


Fig. II 1-4
Effective Bending Span for Local Support Members with Continuous Face Plate along Bracket Edge

1.10 Workmanship

1.10.1 The workmanship is to be of the best quality. During construction, the builder is to supervise and inspect every job in detail performed in the shed and yard.

1.10.2 The connection of structural parts of the hull is to be fair and sound.

1.10.3 The edges of steel plates are to be accurate and fair.

1.10.4 The flanging inner radius is not to be less than two times but not greater than 3 times the thickness of plate.

1.10.5 Where frames or beams pass through watertight decks or bulkheads, the deck or bulkhead is to be constructed watertight without using wooden materials or cement.

1.10.6 The details of welded joints and their workmanship are to be as specified in Part XII.

1.11 Equipment

1.11.1 Masts and riggings, cargo handling, mooring and anchoring arrangements and other fittings for which there are no particular requirements in this Part are to be of appropriate construction and arrangement suitable for their respective purposes. Where deemed necessary, tests are to be carried out to the satisfaction of the Surveyor.

1.12 Direct Calculations

1.12.1 Where approved by the Society, direct calculations may be used to determine the scantlings of primary members. Where direct calculations are used, the data necessary for the calculations are to be submitted to the Society.

1.12.2 Where deemed necessary by the Society based on factors such as the type and size of the ship, the scantlings of primary members are to be determined by the direct strength analysis.

1.13 Structural Details

1.13.1 Continuity and alignment

(a) The arrangement of material is to be such as will ensure structural continuity. Abrupt changes of shape or section, sharp corners and points of stress concentration are to be avoided.

(b) Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment.

(c) Pillars and pillar bulkheads are to be fitted in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members.

(d) Continuity is to be maintained where primary members intersect and where the members are of the same depth, a suitable gusset plate is to be fitted.

(e) End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.

(f) The toes of brackets, etc. should not land on unstiffened panels of plating. Special care should be taken to avoid notch effects at the toes of brackets, by making the toe concave or otherwise tapering it off.

(g) Where primary and/or secondary members are constructed of higher tensile steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates which are welded onto the edge of primary member brackets are to be carried well around the radiused bracket toe and are to incorporate a taper not greater than 30º. Where sniped face plates are welded adjacent to the edge of primary member brackets, adequate cross sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area measured perpendicular to the face plate, is to be not less than 60 per cent of the full cross-sectional area of the face plate, see Fig. II 1-5 as below.

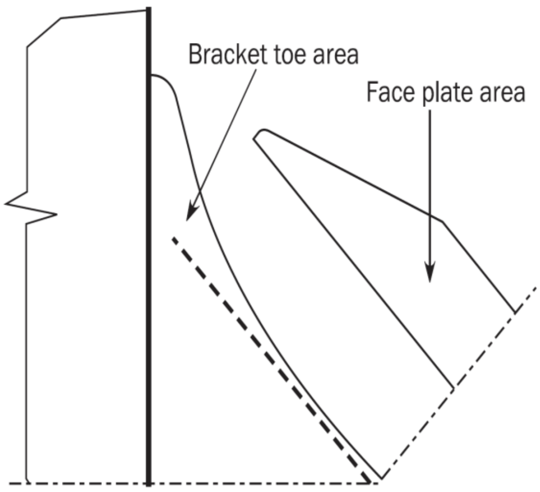

Fig. II 1-5
Bracket Toe Construction

1.13.2 Arrangements at intersections of continuous secondary and primary members

(a) Cut-outs for the passage of secondary members through the web of primary members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and in the attached hull envelope or bulkhead plating. The critical shear buckling stress of the panel in which the cut-out is made is to be investigated. Cut-outs for longitudinals are to be fitted with full collar plates in areas of high stress, e.g. in way of cross tie ends and floors under bulkhead stools in ore and ballast holds.

(b) Cut-outs are to have smooth edges, and the corner radii are to be as large as practicable, with a minimum of 20 percent of the breadth of the cut-out or 25 mm, whichever is the greater. It is recommended that the web plate connection to the hull envelope or bulkhead should end in a smooth tapered "soft toe". Recommended shapes of cut-out are shown in Fig. II 1-6 of this Chapter, but consideration will be given to other shapes on the basis of maintaining equivalent strength and minimizing stress concentration. Consideration is to be given to the provision of adequate drainage and unimpeded flow of air and water when designing the cut-outs and connection details.

(c) Asymmetrical secondary members are to be connected on the heel side to the primary member web plate. Additional connection by collars on the opposite side may be required.

(d) Symmetrical secondary members are to be connected by collars on one or both sides, as necessary.

(e) The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.

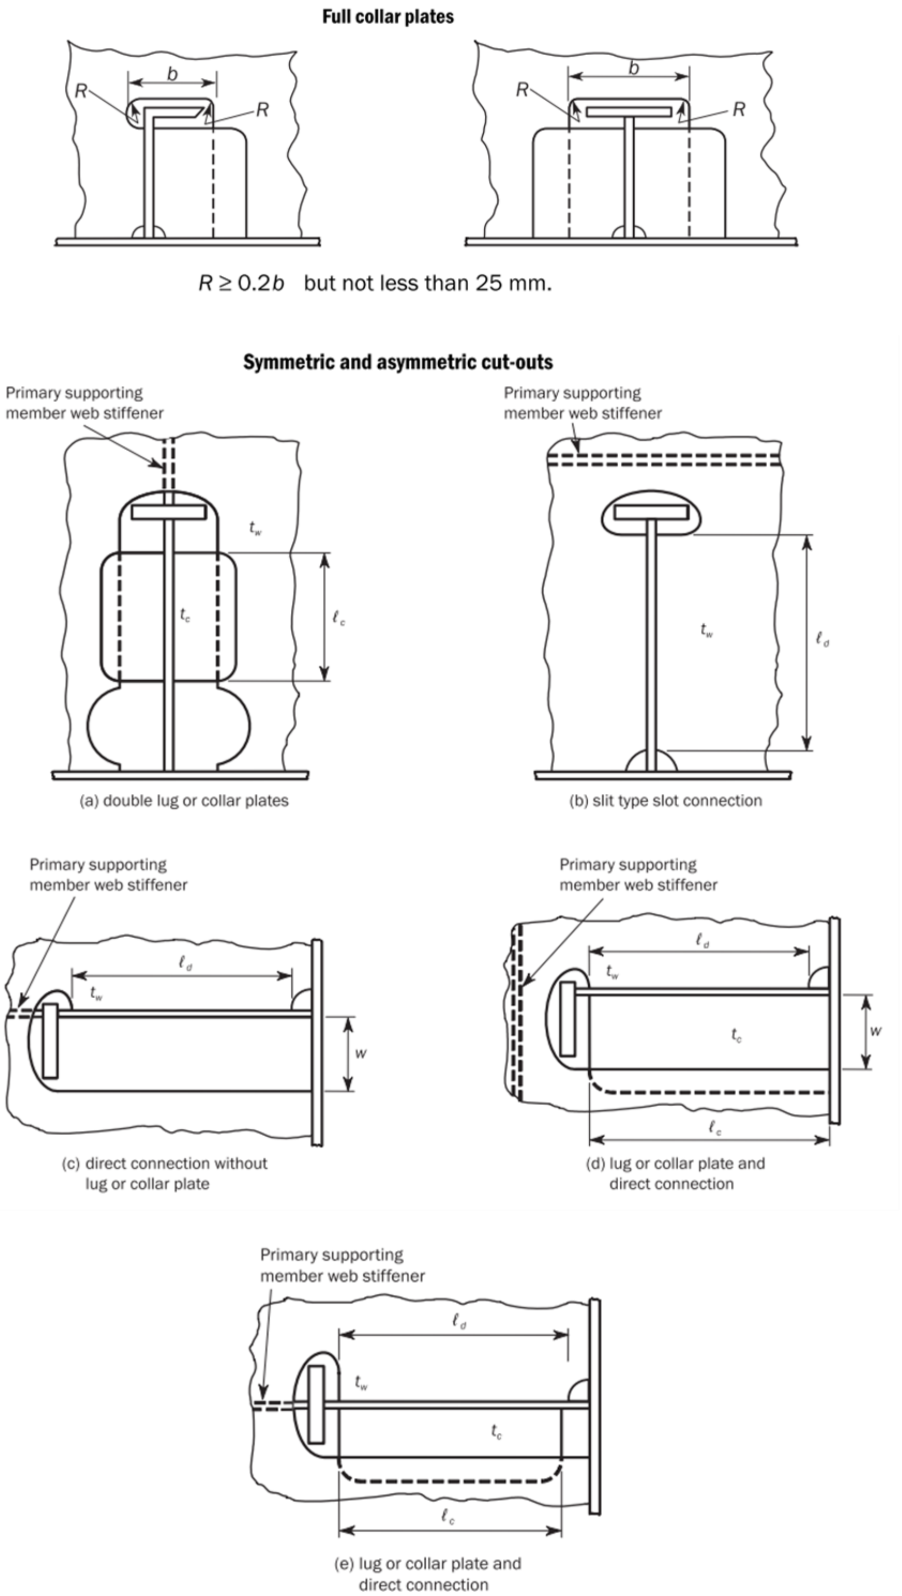

Fig. II 1-6
Cut-Outs and Connections

1.13.3 Openings

(a) Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are not to be cut in vertical or horizontal diaphragm plates in narrow cofferdams or double plate bulkheads within one-third of their length from either end, nor in floors or double bottom girders close to their span ends, or below the heels of pillars, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

(b) Manholes, lightening holes and other openings are to be suitably framed and stiffened where necessary.

(c) Air and drain holes, notches and scallops are to be kept at least 200 mm clear of the toes of end brackets and other areas of high stress, see Fig. II 1-7 as below. Openings are to be well rounded with smooth edges. Details of scalloped construction are shown in Fig. II 1-7 as below. Closely spaced scallops are not permitted in higher tensile steel members. Widely spaced air or drain holes may be accepted, provided that they are of elliptical shape, or equivalent, to minimise stress concentration and are, in general, cut clear of the weld connection.

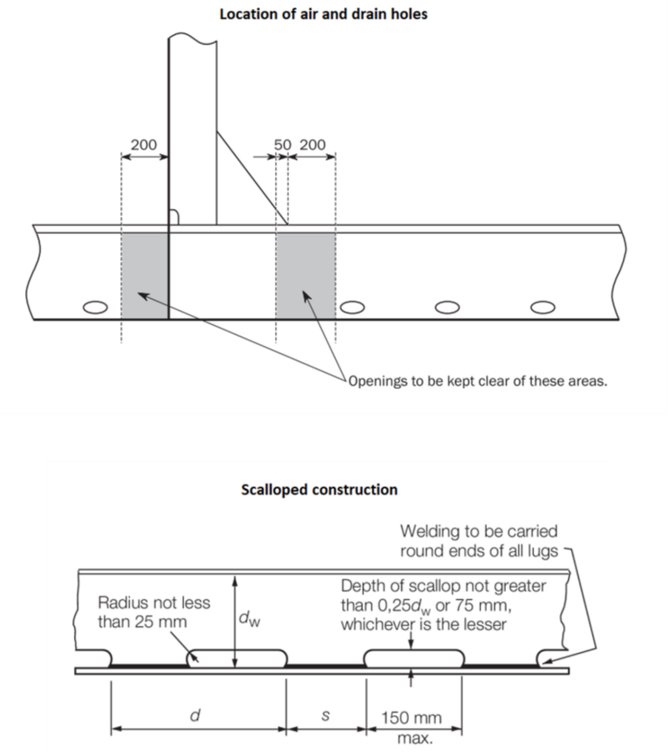

Fig. II 1-7
Air Hole, Drain Holes and Scallop

1.13.4 Sheerstrake and bulwarks

(a) Where an angled gunwale is fitted, the top edge of the sheerstrake is to be kept free of all notches and isolated welded fittings. Bulwarks are not to be welded to the top of the sheerstrake within the 0.5L amidships.

(b) Where a rounded gunwale is adopted, the welding of fairlead stools and other fittings to this plate is to be kept to the minimum, and the design of the fittings is to be such as to minimise stress concentration.

(c) Arrangements are to ensure a smooth transition from rounded gunwale to angled gunwale towards the ends of the ship.

(d) At the ends of superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.

1.13.5 Fittings and attachments, general

The quality of welding and general workmanship of fittings and attachments are to be equivalent to that of the main hull structure. Visual examination of all welds is to be supplemented by non-destructive testing as considered necessary by the Surveyor.

1.13.6 Bilge keels and ground bars

(a) It is recommended that bilge keels should not be fitted in the forward 0.3L region on ships intended to navigate in severe ice conditions.

(b) Bilge keels are to be attached to a continuous ground bar as shown in Fig. II 1-8 of this Chapter. Butt welds in shell plating, ground bar and bilge keels are to be staggered.

(c) The minimum thickness of the ground bar is to be equal to the thickness of the bilge strake or 14 mm, whichever is the lesser.

(d) The material of the bilge keel and ground bar is to be of the same yield stress as the material to which they are attached. In addition, when the bilge keel extends over a length more than 0.15 L, the material of the bilge keel and ground bar is to be of the same grade as the material to which they are attached.

(e) The ground bar is to be connected to the shell with a continuous fillet weld and the bilge keel to the ground bar with a light continuous fillet weld.

(f) Direct connection between ground bar butt welds and shell plating, and between bilge keel butt welds and ground bar is to be avoided.

(g) The design of single web bilge keels is to ensure that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of bilge keels does not exceed that of the ground bar.

(h) The end details of bilge keels and intermittent bilge keels, where adopted, are to be as shown in Fig. II 1-9 of this Chapter.

(i) The ground bar and bilge keel ends are to be tapered or rounded. Where the ends are tapered, the tapers are to be gradual with ratios of at least 3:1, see Fig. II 1-9 of this Chapter. Where the ends are rounded, details are to be as shown in Fig. II 1-9 of this Chapter. Cut-outs on the bilge keel web within zone 'A' (see Fig. II 1-9 of this Chapter) are not permitted.

(j) The end of the bilge keel web is to be between 50 mm and 100 mm from the end of the ground bar, see Fig. II 1-9 of this Chapter.

(k) An internal transverse support is to be positioned as close as possible to halfway between the end of the bilge keel web and the end of the ground bar, see Fig. II 1-9 of this Chapter.

(l) Where an internal longitudinal stiffener is fitted in line with the bilge keel web, the longitudinal stiffener is to extend to at least the nearest transverse member outside zone 'A', see Fig. II 1-9 of this Chapter. In this case, the requirement of (j) above does not apply.

(m) Holes are to be drilled in the bilge keel butt welds. The size and position of these holes are to be as illustrated in Fig. II 1-8 of this Chapter. Where the butt weld has been subject to non-destructive examination the stop hole may be omitted.

(n) Bilge keels of a different design from that shown in Fig. II 1-8 and Fig. II 1-9 of this Chapter will be specially considered.

(o) A plan of the bilge keels is to be submitted for approval of material grades, welded connections and detail design.

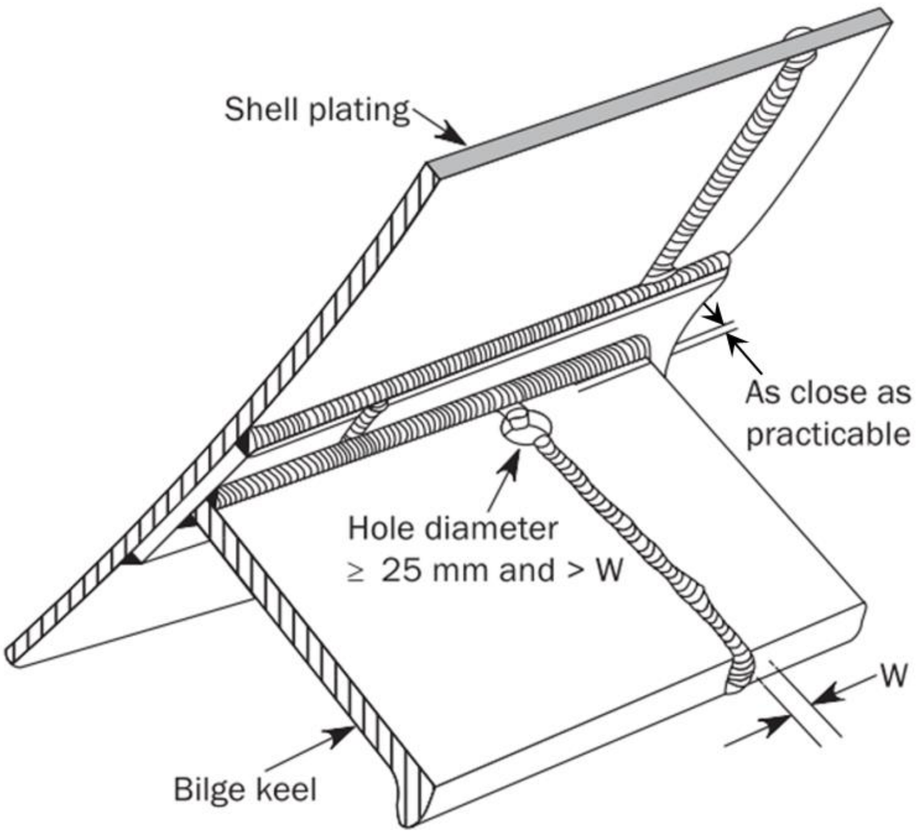

Fig. II 1-8
Bilge Keel Construction

1.13.7 Other fittings and attachments

(a) Gutterway bars at the upper deck are to be so arranged that the effect of main hull stresses on them is minimised.

(b) Minor attachments, such as pipe clips, staging lugs and supports, are generally to be kept clear of toes of end brackets, corners of openings and similar areas of high stress. Where connected to asymmetrical stiffeners, the attachments may be in line with the web providing the fillet weld leg length is clear of the offset face plate or flange edge. Where this cannot be achieved the attachments are to be connected to the web, and in the case of flanged stiffeners they are to be kept at least 25 mm clear of the flange edge. On symmetrical stiffeners, they may be connected to the web or to the centreline of the face plate in line with the web.

(c) Where necessary in the construction of the ship, lifting lugs may be welded to the hull plating but they are not to be slotted through. Where they are subsequently removed, this is to be done by flame or mechanical cutting close to the plate surface, and the remaining material and welding ground off. After removal the area is to be carefully examined to ensure freedom from cracks or other defects in the plate surface.

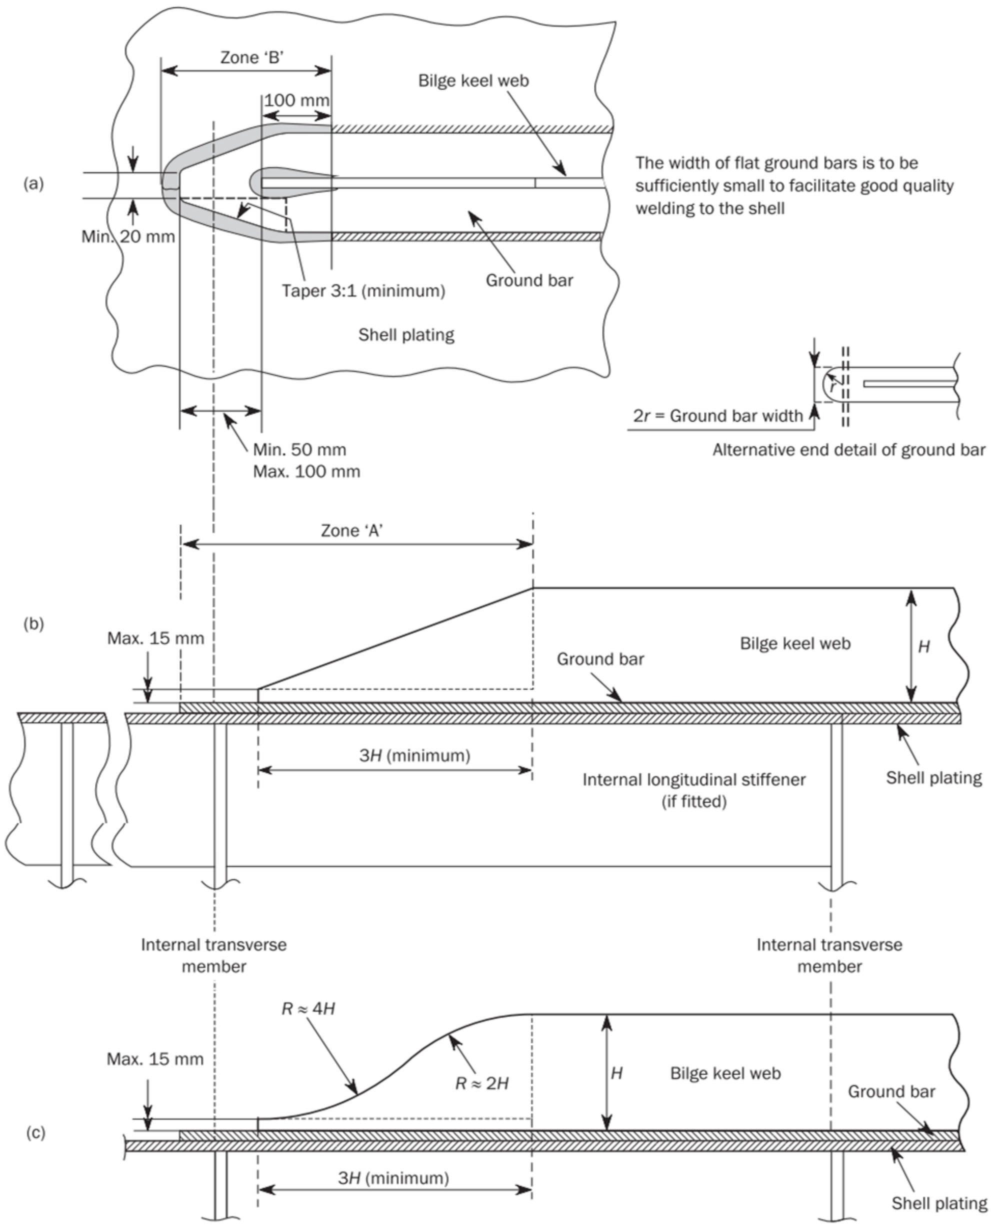

Fig. II 1-9
Bilge Keel End Design

Table II 1-1
Test Requirements for Tanks and Boundaries

Item No.	Tank or boundary to be tested	Test type	Test head or pressure	Remarks
1	Double bottom tanks[(4)]	Leak and structural [(1)]	The greater of - top of the overflow, - to 2.4 m above top of tank[(2)], or - to bulkhead deck	
2	Double bottom voids[(5)]	Leak	See 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Part, as applicable	including pump room double bottom and bunker tank protection double hull required by MARPOL Annex I
3	Double side tanks	Leak and structural[(1)]	The greater of - top of the overflow, - to 2.4m above top of tank[(2)], or - to bulkhead deck	
4	Double side voids	Leak	See 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Part, as applicable	
5	Deep tanks other than those listed elsewhere in this table	Leak and structural[(1)]	The greater of - top of the overflow, or - to 2.4m above top of tank[(2)]	
6	Cargo oil tanks	Leak and structural[(1)]	The greater of - top of the overflow, - to 2.4m above top of tank[(2)], or - to top of tank[(2)] plus setting of any pressure relief valve	
7	Ballast hold of bulk carriers	Leak and structural[(1)]	Top of cargo hatch coaming	
8	Peak tanks	Leak and structural[(1)]	The greater of - top of the overflow, or - to 2.4m above top of tank[(2)]	After peak to be tested after installation of stern tube
9	Fore peak spaces with equipment	Leak	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable.	
	Fore peak voids	Leak	See 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Part, as applicable	
	Aft peak spaces with equipment	Leak	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	
	Aft peak voids	Leak	See 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Part, as applicable	After peak to be tested after installation of stern tube
10	Cofferdams	Leak	See 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Part, as applicable	
11	Watertight bulkheads	Leak [(8)]	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable[(7)]	
	Superstructure end bulkhead	Leak	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as	

			applicable	
12	Watertight doors below freeboard or bulkhead deck	Leak(6), (7)	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	
13	Double plate rudder blade	Leak	See 1.4.4(d)(iv)(4) through 1.4.4(d)(iv)(6) of this Part, as applicable	
14	Shaft tunnel clear of deep tanks	Leak(3)	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	
15	Shell doors	Leak(3)	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	
16	Weathertight hatch covers and closing appliances	Leak(3), (7)	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	Hatch covers closed by tarpaulins and battens excluded
17	Dual purpose tank/dry cargo hatch cover	Leak(3), (7)	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	In addition to structural test in item 6 or 7 of this table
18	Chain locker	Leak and structural(1)	Top of chain pipe	
19	L.O. sump. tanks and other similar tanks/spaces under main engines	Leak(9)	See 1.4.4(d)(iv)(3) through 1.4.4(d)(iv)(6) of this Part, as applicable	
20	Ballast ducts	Leak and structural(1)	The greater of - ballast pump maximum pressure, or - setting of any pressure relief valve	
21	Fuel Oil Tanks	Leak and structural(1)	The greater of - top of the overflow, - to 2.4m above top of tank(2), or - to top of tank(2) plus setting of any pressure relief valves, or - to bulkhead deck	

Note :

(1) Refer to 1.4.4(d)(ii)(2) of this Part.

(2) The top of a tank is the deck forming the top of the tank excluding any hatchways.

(3) Hose Test may also be considered as a medium of the test. See 1.4.4(c)(ii) of this Part.

(4) Including tanks arranged in accordance with the provisions of SOLAS regulation II-1/9.4.

(5) Including duct keels and dry compartments arranged in accordance with the provisions of SOLAS II-1/11.2 and II-1/9.4 respectively, and/or oil fuel tank protection and pump room bottom protection arranged in accordance with the provisions of MARPOL Annex I, Chapter 3, Part A regulation 12A and Chapter 4, Part A, regulation 22 respectively.

(6) Where water tightness of watertight door has not been confirmed by prototype test, testing by filling watertight spaces with water is to be carried out. See SOLAS regulation II-1/16.2 and MSC/Circ.1176.

(7) As an alternative to the hose testing, other testing methods listed in 1.4.4(d)(iv)(7) through 1.4.4(d)(iv)(9) of this Part may be applicable subject to adequacy of such testing methods being verified. See SOLAS regulation II-1/11.1. For watertight bulkheads (item 11.1) alternatives to the hose testing may only be used where a hose test is not practicable.

(8) A “Leak and structural test”, see 1.4.4(d)(ii)(2) of this Part is to be carried out for a representative cargo hold if intended for in-port ballasting. The filling level requirement for testing cargo holds intended for in-port ballasting is to be the maximum loading that will occur in-port as indicated in the loading manual.

(9) Where L.O. sump tanks and other similar spaces under main engines intended to hold liquid form part of the watertight subdivision of the ship, they are to be tested as per the requirements of Item 5, Deep tanks other than those listed elsewhere in this table.

Table II 1-2
Additional Test Requirements for Special Service Ships/Tanks

Item No.	Type of Ship/Tank	Structures to be tested	Type of Test	Test Head or Pressure	Remarks
1	Liquefied gas carriers	Integral tanks	Leak and structural	Refer to IACS UR G1	
		Hull structure supporting membrane or semi-membrane tanks	Refer to IACS UR G1	Refer to IACS UR G1	
		Independent tanks type A	Refer to IACS UR G1	Refer to IACS UR G1	
		Independent tanks type B	Refer to IACS UR G1	Refer to IACS UR G1	
		Independent tanks type C	Refer to IACS UR G2	Refer to IACS UR G2	
2	Edible liquid carriers	Independent tanks	Leak and structural(1)	The greater of - top of the overflow, or - to 0.9m above top of tank(2)	
3	Chemical carriers	Integral or independent cargo tanks	Leak and structural(1)	The greater of - to 2.4m above top of tank(2), or - to top of tank(2) plus setting of any pressure relief valve	Where a cargo tank is designed for the carriage of cargoes with specific gravities larger than 1.0, an appropriate additional head is to be considered

Note :

(1) Refer to 1.4.4(d)(ii)(2) of this Part.

(2) Top of tank is deck forming the top of the tank excluding any hatchways.

Table II 1-3
Application of Leak Test, Coating and Provision of Safe Access for Type of Welded Joints

Type of welded joints		Leak test	Coating(1)		Safe Access(2)	
			Before leak test	After leak test but before structural test	Leak test	Structural test
Butt	Automatic	Not required	Allowed(3)	N/A	Not required	Not required
	Manual or Semi-automatic(4)	Required	Not allowed	Allowed	Required	Not required
Fillet	Boundary including penetrations	Required	Not allowed	Allowed	Required	Not required

Note :

(1) Coating refers to internal (tank/hold coating), where applied, and external (shell/deck) painting. It does not refer to shop primer.

(2) Temporary means of access for verification of the leak test.

(3) The condition applies provided that the welds have been carefully inspected visually to the satisfaction of the Surveyor.

(4) Flux Core Arc Welding (FCAW) semiautomatic butt welds need not be tested provided that careful visual inspections show continuous uniform weld profile shape, free from repairs, and the results of NDE testing show no significant defects.

Table II 1-4
Material Classes and Grades for Ships in General

Structural member category	Material class/grade
SECONDARY: A1. Longitudinal bulkhead strakes, other than that belonging to the Primary category A2. Deck plating exposed to weather, other than that belonging to the Primary or Special category A3. Side plating	- Class I within 0.4L amidships - Grade A/AH outside 0.4L amidships
PRIMARY: B1. Bottom plating, including keel plate B2. Strength deck plating, excluding that belonging to the Special category B3. Continuous longitudinal members above strength deck, excluding hatch coamings B4. Uppermost strake in longitudinal bulkhead B5. Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	- Class II within 0.4L amidships - Grade A/AH outside 0.4L amidships
SPECIAL: C1. Sheer strake at strength deck(1) C2. Stringer plate in strength deck(1) C3. Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships(1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
C4. Strength deck plating at outboard corners of cargo hatch openings in container carriers and other ships with similar hatch opening configurations	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Min. Class III within cargo region
C5. Strength deck plating at corners of cargo hatch openings in bulk carriers, ore carriers combination carriers and other ships with similar hatch opening configurations	- Class III within 0.6L amidships - Class II within rest of cargo region
C6. Bilge strake in ships with double bottom over the full breadth and length less than 150 m(1)	- Class II within 0.6L amidships - Class I outside 0.6L amidships
C7. Bilge strake in other ships(1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
C8. Longitudinal hatch coamings of length greater than 0.15L C9. End brackets and deck house transition of longitudinal cargo hatch coamings	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Not to be less than Grade D/DH

(1) Single strakes required to be of Class III within 0.4L amidships are to have breadths not less than 800+5L (mm), need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.

Table II 1-5
Minimum Material Grades for Ships with Length Exceeding 150 m and Single Strength Deck

Structural member category	Material grade
Longitudinal strength members of strength deck plating	Grade B/AH within 0.4L amidships
Continuous longitudinal strength members above strength deck	Grade B/AH within 0.4L amidships
Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and the strength deck	Grade B/AH within cargo region

Table II 1-6
Minimum Material Grades for Ships with Length Exceeding 250 m

Structural member category	Material grade
Shear strake at strength deck(1)	Grade E/EH within 0.4L amidships
Stringer plate in strength deck(1)	Grade E/EH within 0.4L amidships
Bilge strake(1)	Grade D/DH within 0.4L amidships

(1) Single strakes required to be of Grade E/EH and within 0.4L amidships are to have breadths not less than 800+5L (mm), need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.

Table II 1-7
Minimum Material Grades for Single-side Skin Bulk Carriers Subjected to SOLAS Regulation XII/6.4.3

Structural member category	Material grade
Lower bracket of ordinary side frame(1), (2)	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125h above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate(2)	Grade D/DH

(1) The term "lower bracket" means webs of lower brackets and webs of the lower part of side frames up to the point of 0.125h above the intersection of side shell and bilge hopper sloping plate or inner bottom plate.

(2) The span of the side frame, h, is defined as the distance between the supporting structures.

Table II 1-8
Minimum Material Grades for Ships with Ice Strengthening

Structural member category	Material grade
Shell strakes in way of ice strengthening area for plates	Grade B/AH

Table II 1-10
Application of Material Classes and Grades – Structures Exposed at Low Temperature

Structural member category	Material class	
	Within 0.4L amidships	Outside 0.4L amidships
SECONDARY: Deck plating exposed to weather, in general Side plating above BWL Transverse bulkheads above BWL(5)	I	I
PRIMARY: Strength deck plating(1) Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings Longitudinal bulkhead above BWL(5) Top wing tank bulkhead above BWL(5)	II	I
SPECIAL: Sheer strake at strength deck(2) Stringer plate in strength deck(2) Deck strake at longitudinal bulkhead(3) Continuous longitudinal hatch coamings(4)	III	II

Note:

(1) Plating at corners of large hatch openings to be specially considered. Class III or Grade E/EH to be applied in positions where high local stresses may occur.

(2) Not to be less than Grade E/EH within 0.4L amidships in ships with length exceeding 250 m.

(3) In ships with breadth exceeding 70 m at least three deck strakes to be Class III.

(4) Not to be less than Grade D/DH.

(5) Applicable to plating attached to hull envelope plating exposed to low air temperature. At least one strake is to be considered in the same way as exposed plating and the strake width is to be at least 600 mm.

650	13.0	9.0	65				

Chapter 2

Stems and Stern Frames

2.1 Stems

2.1.1 Plate stems

(a) The thickness of steel plate stems at the designed maximum load line is not to be less than that obtained from the following formula:

$t = 1.5\sqrt{L - 50} + 3.5$ mm for $L \geq 90$ m

where:
L = Length of ship, in m.
t = Thickness of plate stem, in mm.

(b) Above and below the designed maximum load line, the thickness may be gradually tapered toward the stem head and the keel. At the upper end of stem it may be equal to the thickness of the side shell plating (at the fore end part) of the ship, and at the lower end of stem, it is to be equal to the thickness of the plate keel.

(c) Horizontal webs are to be fitted at intervals not exceeding 1 m. Where the stem radius is large, a center line stiffener may be required.

2.2 Stern Frames

2.2.1 Propeller Posts

(a) Propeller posts of cast steel stern frames and those of plate stern frames are to be of shape suitable for the stream line at the after part of hull, and the scantlings are to be equivalent to the standards given by the formulae and figures in Fig. II 2-1. Below the propeller boss, if shoe pieces are fitted, the breadth and thickness of propeller post are to be gradually increased in order to provide with strength and stiffness in proportion to those of the shoe pieces.

(b) The thickness of boss of propeller post is not to be less than that obtained from the following formula:

$0.9L+10$ mm

(c) The propeller posts of cast steel stern frames and those of plate stern frames are to be provided with ribs at a suitable interval. Where the radius of curvature is large, a center line stiffener is to be provided.

(d) In ships with relatively high speed for their length and in ships exclusively engaged in towing purposes, the scantlings of various parts of propeller posts are to be suitably increased.

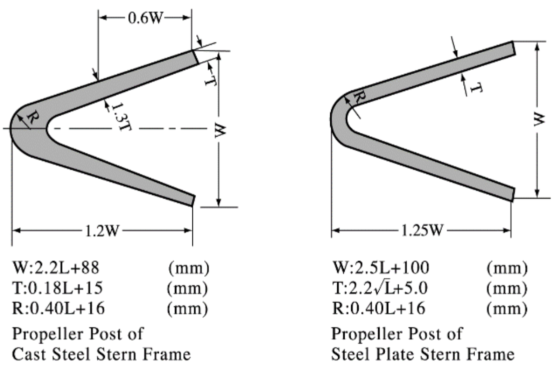

Fig. II 2-1
Standards of Propeller Posts

2.2.2 Shoe piece

(a) The section modulus about the vertical z-axis as shown in Fig. II 2-2 is not to be less than that obtained from the following formula:

$$Z_z = \frac{M_b K}{80} \qquad cm^3$$

(b) The section modulus about the transverse y-axis is not to be less than that obtained from the following formula:

$$Z_y = 0.5\ Z_z \qquad cm^3$$

(c) The sectional area is not to be less than that obtained from the following formula:

$$A_s = \frac{F_1 K}{48} \qquad mm^2$$

(d) At no section within the length l, the equivalent stress is to exceed 115/K (N/mm^2). The equivalent stress is to be determined by the following formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau^2} \qquad N/mm^2$$

(e) The depth of the shoe piece is not to be less than half the breadth.

Where:

M_b	=	Bending moment at the section considered, in N-m.
	=	$F_1 x$ N-m
	≤	$F_1 l$ N-m
x	=	Distance (m) from the mid-point of the pintle bearing to the section considered, as shown in Fig. II 2-2 of this Chapter.
l	=	Distance (m) from the mid-point of the pintle bearing to the fixed point of the shoe piece, as shown in Fig. II 2-2 of this Chapter.
F_1	=	Supporting force in the pintle bearing, in N, normally F_1 =F/2.
F	=	Rudder force, in N. (See 24.2 of this Part).

σ_b = $\frac{M_b}{Z_Z(x)}$ N/mm^2

$Z_z(x)$ = Section modulus about z-axis at the particular section under consideration, in cm^3.

τ = $\frac{F_1}{A_S}$ N/mm^2

K = Material factor as specified in 1.5.2(a) or 1.5.2 (c) of this Part respectively.

2.2.3 Heel pieces in general are to extend forward by a distance not less than 3 frame spacings from the fore edge of the boss.

2.2.4 Rudder gudgeon

(a) The rudder gudgeon is to be an integral part of the stern frame; where special circumstances render it necessary to separate the gudgeon from the stern frame, the proposed design is to be specially submitted for approval.

(b) The bearing length, L_p, of the pintle is to be such that:

$$D_p \le L_p \le 1.2\ D_p$$

The length of the pintle housing in the gudgeon is not to be less than the pintle diameter, D_p. The thickness of the pintle housing is not to be less than 0.25 D_p.

(c) For ships specified in 24.3.3 of this Part, the thickness of the gudgeon is to be appropriately increased.

2.2.5 Rudder horn

(a) The rudder horn is to be designed as a curved transition into the hull plating, and special consideration is to be given to the effectiveness of the rudder horn plate in bending and to the stresses in the transverse web plates.

(b) The loads on the rudder horn as shown in Fig. II 2-3 are to be obtained from the following formula:

M_b = $F_1\ z$ N-m
$\le$ $F_1\ d$ N-m
Q = F_1 N
Mt = $F_1\ e(z)$ N-m

where:

M_b	=	Bending moment.	N-m
Q	=	Shear force.	N
M_t	=	Torsional moment.	N-m
F_1	=	Supporting force in the pintle bearing as given in 24.2.3.	N
e(z), z and d	=	As shown in Fig. II 2-3.	m

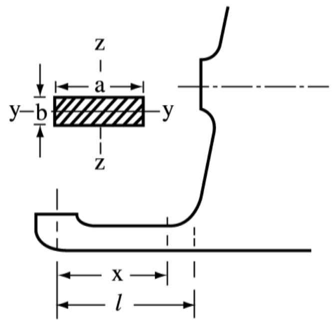

Fig. II 2-2
Shoe Piece

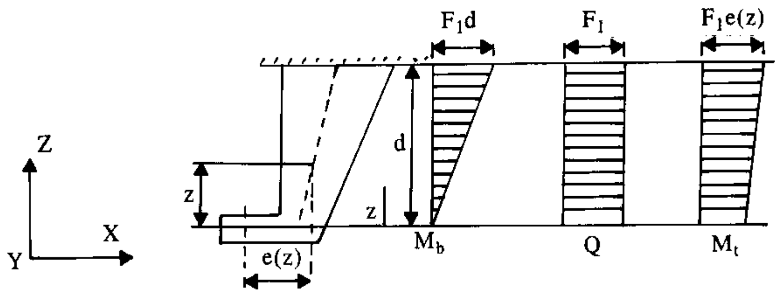

Fig. II 2-3
Loads on Rudder Horn

(c) The section modulus about the horizontal x-axis is not to be less than the value obtained from the following formula:

$$Z_x = \frac{M_b K}{67} \qquad cm^3$$

(d) The shear stress for the total section area A_h of the members in the y-direction is not to be larger than the value obtained from the following formula:

$$\tau = \frac{48}{K} \qquad N/mm^2$$

(e) At no section within the length d, the equivalent stress is to exceed 120/K (N/mm^2). The equivalent stress is to be calculated by the following formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3(\tau^2 + \tau_t^2)} \qquad N/mm^2$$

where:

$$\sigma_b = \frac{M_b}{Z_X} \qquad N/mm^2$$

$$\tau = \frac{F_1}{A_h} \qquad N/mm^2$$

$$\tau_t = \frac{M_t 10^3}{2A_t t_h} \qquad N/mm^2$$

A_h = Effective shear area of rudder horn in y-direction. mm^2

A_t = Area in the horizontal section enclosed by the rudder horn. mm^2

t_h	=	Plate thickness of rudder horn.	mm
K	=	Material factor as specified in 1.5.2(a) or 1.5.2 (c) of this Part respectively.	
Z_x	=	Actual section modulus.	cm^3

2.2.6 The stern frame is to be extended upward at the part of the propeller post and connected securely to the transom floor of thickness not less than the value obtained from the following formula:

$0.035L + 8.5$ mm

Chapter 3
Longitudinal Strength

3.1 General

3.1.1 Ships of $L \geq 90$ m intended to be classed for unrestricted service are to have longitudinal strength in accordance with the requirements in 3.1 to 3.4 of this Chapter except that ships having one or more of the following characteristics are to be subject to special consideration:

(a) Unusual proportions: $L/B \leq 5$, $B/D \geq 2.5$.

(b) Ship length of 500 m or more.

(c) Large deck opening.

(d) Small block coefficient: $C_b < 0.6$.

(e) Large flare and high speed.

(f) Carriage of heated cargoes.

(g) Unusual type of design.

3.1.2 Ship of $L \geq 90$ m, the requirements of loading manual and loading instrument in 3.5 of this Chapter are to be considered as applicable.

3.2 Bending Strength

3.2.1 The sign convention of bending moment is as shown in Fig. II 3-1.

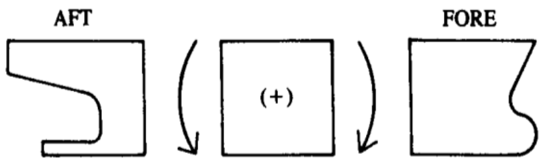

Fig. II 3-1
Sign Convention of Bending Moment

3.2.2 The required section modulus for 0.4 L amidship is to be obtained from the following equations, whichever gives greater value:

$$Z = \frac{M_t}{\sigma} \times 10^3 \quad cm^3, \text{or}$$

$$Z_{min} = C_1 L^2 B (C_b + 0.7) K \quad cm^3$$

where:

Z = Required midship section modulus, in cm^3.

Z_{min} = Minimum section modulus, in cm^3.

M_t	=	Obtained as the maximum algebraic sum of still water bending moment and wave induced bending moment.	
	=	$M_s + M_w$, in kN-m.	
M_s	=	Still water bending moment at the transverse section under consideration along the length of hull, which is calculated from light ship, load weight and buoyancy of still water displacement, in kN-m.	
M_w	=	Wave-induced bending moment at the transverse section under consideration along the length of the hull, which are obtained from the following formulae, in kN-m.	
$M_{w(+)}$	=	$+0.19C_1C_2L^2BC_b$	Hogging moment
$M_{w(-)}$	=	$-0.11C_1C_2L^2B(C_b+0.7)$	Sagging moment
C_1	=	Coefficient of ship length.	
	=	$10.75-\left(\frac{300-L}{100}\right)^{1.5}$	90 m ≤ L ≤ 300 m
	=	10.75	300 m < L < 350 m
	=	$10.75-\left(\frac{L-350}{150}\right)^{1.5}$	350 m ≤ L ≤ 500 m
C_2	=	Coefficient along ship length as given in Fig. II 3-2.	
L	=	Length of ship, in m.	
B	=	Breadth of ship, in m.	
C_b	=	Block coefficient at summer load water-line based on L as defined in 1.2.1. However, the value is to be taken as 0.6, where it is less than 0.6.	
σ	=	Permissible bending stress.	
	=	175/K, in N/mm^2.	
K	=	Material factor as specified in 1.5.2(a) of this Part.	

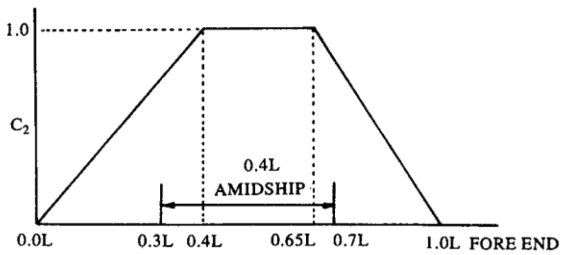

Fig. II 3-2
Coefficient C_2

3.2.3 Moment of inertia of the midship section I, is not to be less than the value obtained from the following formula:

$I = 3LZ$ cm^4

where:

I	=	Moment of inertia of the midship section, in cm^4.
L	=	Length of ship, in m.
Z	=	Required midship section modulus as specified in 3.2.2 above, in cm^3.

3.2.4 Bending strength at section other than amidship

(a) Bending strength at sections other than 0.4L amidships is to be determined according to the requirements of 11.2 of this Part. As a minimum, hull girder bending strength checks are to be carried out at the following locations:

(i) In way of the forward end of the engine room.

(ii) In way of the forward end of the foremost cargo hold.

(iii) At any locations where there are significant changes in hull cross-section.

(iv) At any locations where there are changes in the framing system.

Buckling strength of members contributing to the longitudinal strength and subjected to compressive and shear stresses is to be checked, in particular in regions where changes in the framing system or significant changes in the hull cross-section occur. The buckling evaluation criteria used for this check is determined by this Society. Continuity of structure is be maintained throughout the length of the ship. Where significant changes in structural arrangement occur adequate transitional structure is to be provided. For ships with large deck openings such as containerships, sections at or near to the aft and forward quarter length positions are to be checked. For such ships with cargo holds aft of the superstructure, deckhouse or engine room, strength checks of sections in way of the aft end of the aft-most holds, and the aft end of the deckhouse or engine room are to be performed.

(b) Where the Society considers that the application of requirements of (a) above is inappropriate, the bending strength at sections other than 0.4L amidships is to be determined according to the formula of $Z = M_t/\sigma$ given in 3.2.2 with necessary modifications.

3.2.5 Section modulus calculation

(a) In general, all of the following longitudinal members may be included in the calculation of the section modulus, provided that they are continuous or effectively developed within 0.4L amidships:

- (i) Deck plating of strength deck and other effective decks.
- (ii) Shell and inner bottom plating.
- (iii) Deck and bottom girders.
- (iv) Plating and longitudinal stiffeners of longitudinal bulkheads.
- (v) All longitudinals of deck, sides, bottom and inner bottom.
- (vi) Continuous trunks and longitudinal hatch coamings (if they are effectively supported by longitudinal bulkheads or deep girders).

(b) Deck openings on the strength deck are to be deducted from in the calculation of the section modulus. However, small openings not exceeding 2.5 m in length or 1.2 m in breadth need not be deducted provided that the sum of their breadths in any single transverse section is not more than $0.06(B - \sum b)$, where $\sum b$ is the sum of breadth of openings exceeding 1.2 m in breadth or 2.5 m in length, in m.

(c) Notwithstanding the requirements in (b), small deck openings on the strength deck need not be deducted, provided that the sum of their breadths or shadow area breadths in a single transverse section does not reduce the section modulus at deck or bottom by more than 3%, and provided that the height of lightening holes, draining holes and single scallops in longitudinals or longitudinal girders does not exceed 25% of the web depth, for scallops maximum 75 mm.

(d) Deck openings specified in (b) and (c) included the breadth in shadow area which is obtained by drawing two tangential lines with an opening angle of 30 degrees having the focus on the longitudinal lines of the ship.

(e) The section modulus at the strength deck is to be calculated by dividing the moment of inertia of the athwartship section about its horizontal neutral axis by the following distance (i) or (ii), whichever is greater:

- (i) Vertical distance from the neutral axis to the top of the strength deck at side.
- (ii) Distance obtained from the following formula:

$$y\left(0.9 + 0.2\frac{x}{B}\right) \quad \text{m}$$

where:

x = Horizontal distance from the top of continuous strength member to the center line of the ship, in m.
y = Vertical distance from the neutral axis to the top of continuous strength member, in m.

In this case, x and y are to be measured to the point giving the largest value of the above formula.

(f) The section modulus at the bottom is to be calculated by dividing the moment of inertia of the athwartship section about its horizontal neutral axis by the vertical distance from the neutral axis to the top of keel.

(g) Longitudinal girders between multi-hatchways will be considered by special calculations.

3.3 Shearing Strength

3.3.1 Thickness of Shell Plating of Ships without Longitudinal Bulkheads

(a) The thickness of side shell plating is not to be less than the values of t_s obtained from the following two formulae at any transverse section under consideration along the length of the hull for all conceivable loading and ballast conditions.

$$t_s = 0.455|F_s + F_w(+)|\frac{m}{I} \quad \text{mm}$$
$$t_s = 0.455|F_s + F_w(-)|\frac{m}{I} \quad \text{mm}$$

where:

I = Moment of inertia of the transverse section under consideration about its horizontal neutral axis, in cm^4.

m = Moment of area about the horizontal neutral axis on the transverse section for longitudinal members above the considered position of side shell plating when the considered position is above the horizontal neutral axis, and below the considered position when the considered position is under the horizontal neutral axis, in cm^3.

F_s = Shearing force in still water at the transverse section under consideration along the length of the hull, which is calculated by a method deemed appropriate by the Society, in kN. The positive value of F_s, however, is to be defined as a positive value which is obtained assuming that downward loads are taken as positive values and are integrated in the forward direction from the aft end of the ship. See Fig. II 3-3.

F_w = Wave induced shearing force at the transverse section under consideration along the length of the hull, which are obtained from the following formulae, in kN:

$F_w(+)$ = $+0.3C_1C_3LB(C_b+0.7)$

$F_w(-)$ = $-0.3C_1C_4LB(C_b+0.7)$

C_1, L, B and C_b = As specified in 3.2.2.

C_3 = Distribution factor as shown in Fig. II 3-4.

C_4 = Distribution factor as shown in Fig. II 3-5.

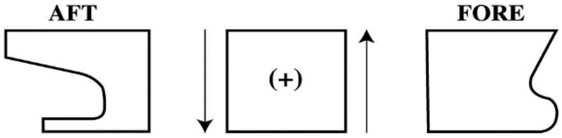

Fig. II 3-3
Sign Convention of Shear Force

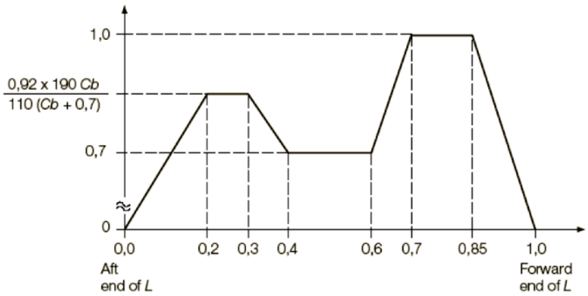

Fig. II 3-4
Distribution Factor, C_3

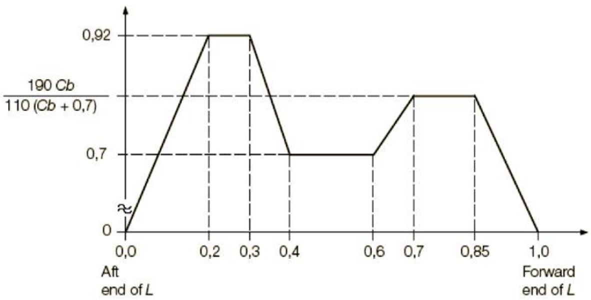

Fig. II 3-5
Distribution Factor, C_4

(b) In the case of ships which have bilge hopper tanks or top side tanks, or ships of which other longitudinal members below the strength deck are considered to share a part of the shearing force effectively, the thickness of side shell plating required by (a) may be reduced at the discretion of the Society.

3.3.2 Thickness of Side Shell Plating and Longitudinal Bulkhead Plating of Ships Having One to Four Rows of Longitudinal Bulkheads

(a) The thickness of side shell plating and longitudinal bulkhead plating of ships of types specified in Fig. II 3-6 is not to be less than the value of t_s obtained from the following formula at the transverse section under consideration along the length of hull for all conceivable loading and ballasting conditions. However, ships with double side hull construction provided with bilge hoppers in the double side hull structure are to be as deemed appropriate by the Society.

$$t_s = 0.91\frac{Fm}{I} \quad \text{mm}$$

where:

I	=	As specified in 3.3.1.
m	=	As specified in 3.3.1.
F	=	Shear force acting upon the side shell plating or longitudinal bulkhead plating, the value of which is to be F(+) or F(−), whichever is greater:
F(+)	=	$\left\|\alpha(F_s + F_w(+)) + \Delta F\right\|$ kN
F(−)	=	$\left\|\alpha(F_s + F_w(-)) + \Delta F\right\|$ kN
F_s, F(+) and F(−)	=	As specified in 3.3.1.

α and ΔF may be based on those specified in Table II 3-1

k_1	=	Value is to be as specified in (i) to (iii) below for longitudinal bulkhead other than those provided in the double side hull.
k_2	=	Value is to be as specified in (i) to (iii) below for longitudinal bulkhead provided in the double side hull. However, values k_1 and k_2 may be suitably modified when

members are considered to share part of the shearing force.
(i) For parts not provided with longitudinal bulkhead: 0.0
(ii) For parts provided with a longitudinal bulkhead excluding the length of $0.5D_s$ from both ends: 1.0
(iii) Value obtained by linear interpolation for the intermediate parts between those specified in (i) and (ii).

A_s, A_L and A_{DL} = Sectional area of side shell plating amidships, longitudinal bulkhead plating amidships other than in the double side hull, and longitudinal bulkhead plating amidships in the double side hull, in mm^2.

W_a, W_b and W_c = Values obtained from the following formulae:
$W_a = h_a + h_d - d'$
$W_b = h_b + h_d - d'$
$W_c = h_c + h_d - d'$

d' = Draught at the part concerned in the loading condition under consideration, in m.

h_a, h_b, h_c and h_d = Water head, in m, converted from the weight of cargo or ballast in the center tanks, wing tanks, double side hull tank (excluding double bottom parts) and double bottom tanks in the condition under consideration, in m. Where the double hull forms one single tanks, the requirements apply separately to the portion that is the double side hull tank and the portion that is the double bottom tank. Where the double bottom tank is divided within either a, b or c, h_d is to be determined for respective ranges of the tank divided.

a, b and c = Half breadth of the center tank, breadth of wing tanks and breadth of double side hull tanks, in m.

S = Spacing of floors in double bottom, in m.

n_i = Number of floors in double bottom from the mid-point of transverse bulkheads to the section under consideration. Where the sign of n_i is to be negative when counted afterward and positive when counted forward. However, a swash bulkhead with an opening ratio of not less than 20% is not to be considered as transverse bulkhead. When a floor is provided at the mid-point between transverse bulkheads, n_i in this case, is to be obtained counting the floor as 0.5.

β = As specified below:
Where there is no effective center girder on double bottom: 1.0
Where there is an effective center girder on double bottom: 0.7

3.3.3 Where opening are provided in the shell plating, adequate consideration is to be given to the shearing strength and suitable compensation is to be made as necessary.

3.4 Buckling Strength

3.4.1 Application

These requirements apply to plate panels and longitudinals subject to hull girder bending and shear stresses , including the following members:

(a) For the compressive, bending and torsional buckling strength: longitudinal frames, beams and stiffeners; longitudinal bulkhead plating; and strength deck, bottom, and side shell plating of a longitudinal system in the midship part.

(b) For the shear buckling strength: side shell plating and longitudinal bulkhead plating within a reasonable distance forward and aft of each transverse bulkhead between bottom and deck plating.

(c) Members other than those in (a) and (b) above, of which the buckling strength is deemed necessary by the Society.

3.4.2 Elastic buckling stresses

(a) Elastic buckling of plates

(i) Compression

The ideal elastic buckling stress is given by:

$$\sigma_E = 0.9mE\left(\frac{t_b}{1000s}\right)^2 \qquad N/mm^2$$

For plating with longitudinal stiffeners (parallel to compressive stress):

$$m = \frac{8.4}{\Psi + 1.1} \qquad \text{for } 0 \le \Psi \le 1$$

For plating with transverse stiffeners (perpendicular to compressive stress):

$$m = c\left[1 + \left(\frac{s}{l}\right)^2\right]^2 \frac{2.1}{\Psi + 1.1} \qquad \text{for } 0 \le \Psi \le 1$$

where:

E	=	Modulus of elasticity of material
	=	2.06×10^5 N/ mm² for steel
t_b	=	Net thickness, in mm, of plating considering standard deductions equal to the values given in the Table II 3-2;
s	=	Shorter side of plate panel, in m,
l	=	Longer side of plate panel, in m,
c	=	1.3 when plating stiffened by floors or deep girders,
	=	1.21 when stiffeners are angles or T-sections,
	=	1.10 when stiffeners are bulb flats,
	=	1.05 when stiffeners are flat bars,
Ψ	=	Ratio between smallest and largest compressive σ_a stress when linear variation across panel.

(ii) Shear

The ideal elastic buckling stress is given by:

$$\tau_E = 0.9K_tE\left(\frac{t_b}{1000s}\right)^2 \qquad N/mm^2$$

where:

$$K_t = 5.34 + 4\left(\frac{s}{l}\right)^2$$

E, t_b, s and *l* are given in (i).

(b) Elastic buckling of longitudinals

(i) Column buckling without rotation of the cross section

For the column buckling mode (perpendicular to plane of plating) the ideal elastic buckling stress is given by:

$$\sigma_E = 0.001E(I_a)/(Al^2) \qquad N/mm^2$$

I_a = Moment of inertia, in cm^4, of longitudinal, including plate flange and calculated with thickness as specified in 3.4.2(a)(i),

A = Cross-sectional area, in cm^2, of longitudinal, including plate flange and calculated with thickness as specified in 3.4.2(a)(i),

l = Span, in m, of longitudinal,

A plate flange equal to the frame spacing may be included.

(ii) Torsional buckling mode

The ideal elastic buckling stress for the torsional mode is given by:

$$\sigma_E = \frac{\pi^2 E I_w}{10^4 I_P l^2}\left(m^2 + \frac{K}{m^2}\right) + 0.385E\frac{I_t}{I_P} \qquad N/mm^2$$

where:

K = $\frac{Cl^4}{\pi^4 E I_w}10^6$

m = Number of half waves, given by the following table:

	0<K<4	4≤K<36	36≤K<144	$(m-1)^2m^2 \le K < m^2(m+1)^2$
m	1	2	3	m

I_t = St. Venant's moment of inertia, in cm^4, of profile (without plate flange)

= $\frac{h_w t_w^3}{3}10^{-4}$ for flat bars (slabs)

= $\frac{1}{3}\left[h_w t_w^3 + b_f t_f^3\left(1 - 0.63\frac{t_f}{b_f}\right)\right]10^{-4}$ for flanged profiles

I_p = Polar moment of inertia, in cm^4, of profile about connection of stiffener to plate,

= $\frac{h_w^3 t_w}{3}10^{-4}$ for flat bars (slabs)

= $\left(\frac{h_w^3 t_w}{3} + h_w^2 b_f t_f\right)10^{-4}$ for flanged profiles

I_w = Sectorial moment of inertia, in cm^6, of profile about connection of stiffener to plate

= $\frac{h_w^3 t_w^3}{36}10^{-6}$ for flat bars (slabs)

= $\frac{t_f b_f^3 h_w^2}{12}10^{-6}$ for "tee" profiles

= $\frac{b_f^3 h_w^2}{12(b_f + h_w)^2}[t_f(b_f^2 + 2b_f h_w + 4h_w^2) + 3t_w b_f h_w]10^{-6}$ for angles and bulb profiles

h_w = Web height, in mm,

t_w = Web thickness, in mm, considering standard deductions as specified in 3.4.2(a)(i),

b_f = Flange width, in mm,

t_f = Flange thickness, in mm, considering standard deductions as specified in 3.4.2(a)(i). For bulb profiles the mean thickness of the bulb may be used.

l = Span of profile, in m,

s = Spacing of profiles, in m,

C = Spring stiffness exerted by supporting plate

= $\frac{k_p E t_p^3}{3s\left(1 + \frac{1.33 k_p h_w t_p^3}{1000 s t_w^3}\right)}10^{-3}$

k_p = $1-\eta_p$ not to be taken less than zero

t_p = Plate thickness, in mm, considering standard deductions as specified in 3.4.2(a)(i).

η_p = σ_a/σ_{Ep}

σ_a = Calculated compressive stress. For longitudinals, see 3.4.4(a).
σ_{Ep} = Elastic buckling stress of supporting plate as calculated in 3.4.2(a).

For flanged profiles, k_p need not be taken less than 0.1.

(iii) Web and flange buckling

For web plate of longitudinals the ideal elastic buckling stress is given by:

$$\sigma_E = 3.8E\left(\frac{t_w}{h_w}\right)^2 \qquad N/mm^2$$

For flanges on angles and T-sections of longitudinals, buckling is taken care of by the following requirement:

$$\frac{b_f}{t_f} \leq 15$$

b_f = Flange width, in mm, for angles, half the flange width for T-sections.
t_f = As built flange thickness.

3.4.3 Critical buckling stresses

(a) Compression

The critical buckling stress in compressiong σ_C is determined as follows:

$$\sigma_C = \sigma_E \quad \text{when } \sigma_E \leq \frac{\sigma_F}{2}$$

$$= \sigma_F\left(1 - \frac{\sigma_F}{4\sigma_E}\right) \quad \text{when } \sigma_E > \frac{\sigma_F}{2}$$

σ_F = Yield stress of material, in N/mm^2, σ_F may be taken as 235 N/mm^2 for mild steel,
σ_E = Ideal elastic buckling stress calculated according to 3.4.2.

(b) Shear

The critical buckling stress in shear τ_C is determined as follows:

τ_C = τ_E when $\tau_E \leq \tau_F/2$
= $\tau_F\,[1 - \tau_F/(4\tau_E)]$ when $\tau_E > \tau_F/2$

τ_F = $\frac{\sigma_F}{\sqrt{3}}$

σ_F = As given in 3.4.3(a).
τ_E = Ideal elastic buckling stress in shear calculated according to 3.4.2(a)(ii).

3.4.4 Working stress

(a) For examination of buckling strength according to the requirements in this section, the working compressive stress of the member considered is to be obtained from the following formula, but is not to be less than 30/K.

$$\sigma_a = \frac{M_s + M_w}{I} y \cdot 10^5 \qquad N/mm^2$$

K = Material factor as specified in 1.5.2(a) of this part.
M_s = Longitudinal bending moment (kN-m), in still water as given in 3.2.2,

M_w = Wave induced longitudinal moment (kN-m) as given in 3.2.2,
I = Moment of inertia, in cm^4, at the transverse section considered.
y = Vertical distance, in m, from neural axis to the location of the member considered in the transverse section.

For members located above the neutral axis in the transverse section, the maximum values of M_s and M_w are to be taken in sagging condition, and for members located below the neutral axis, the maximum values of M_s and M_w are to be taken in hogging condition.

(b) For examination of buckling strength according to the requirements in this section, the working shearing stress of the member considered is to be obtained from the following (i) or (ii).

(i) Ships without longitudinal bulkhead

$$\tau_a = \frac{0.5mF}{It} \cdot 10^2 \qquad N/mm^2$$

where:

F = Shearing force as specified in 3.3.1(a), the value of whichever is greater: $|F_s + F_w(+)|$ or $|F_s + F_W(-)|$ kN
m = Moment of area, in cm^3, of the athwartship section considered, as specified in 3.3.1(a)
I = Moment of inertia, in cm^4, as in 3.4.4(a)
t = Thickness, in mm, of the member considered

(ii) Ships with longitudinal bulkhead

$$\tau_a = \frac{mF}{It} \cdot 10^2 \qquad N/mm^2$$

where:

F = Shearing force as specified in 3.3.2(a)
m, I and t = As specified in 3.4.4(b)(i)

3.4.5 Scantling criteria

(a) Buckling Stress

The design buckling stress σ_c of plate panels and longitudinals is not to be less than:

$$\sigma_c \geq \beta\sigma_a$$

where:

β = 1 for plating and for web plating of stiffeners (local buckling).
β = 1.1 for stiffeners.

The critical buckling stress τ_C of plate panels is not to be less than:

$$\tau_c \geq \tau_a$$

3.5 Loading Manual and Loading Instrument

3.5.1 These requirements apply to all classed sea-going ships of 90 m in length and above. Additional requirements applied to bulk carriers of 150 m in length and above are given in PART III, Chapter 1A.

3.5.2 Definitions

(a) Loading Manual: A loading manual is a document which describes:

(i) The loading conditions on which the design of the ship has been based, including permissible limits of still water bending moment and shear force

(ii) The results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional and lateral loads

(iii) The allowable local loading for the structure (hatch covers, decks, double bottom, etc.)

(b) Loading Instrument: A loading instrument is an instrument, which is either analog or digital, by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces, and the still water torsional moments and lateral loads, where applicable, in any load or ballast condition will not exceed the specified permissible values. An operational manual is always to be provided for the loading instrument. Single point loading instruments are not acceptable.

(c) Category I Ships:

(i) Ships with large deck openings where combined stresses due to vertical and horizontal hull girder bending and torsional and lateral loads have to be considered;

(ii) Ships liable to carry non-homogeneous loadings, where the cargo and/or ballast may be unevenly distributed. Ships less than 120 metres in length, when their design takes into account uneven distribution of cargo or ballast, belong to Category II;

(iii) Chemical tankers and gas carriers.

(d) Category II Ships:

Ships with arrangement giving small possibilities for variation in the distribution of cargo and ballast, and ships on regular and fixed trading pattern where the loading manual gives sufficient guidance, and in addition the exception given under Category I.

3.5.3 Annual and Special Survey

(a) At each annual and special Survey, it is to be checked that the approved loading guidance information is available on board.

(b) The loading instrument is to be checked for accuracy at regular intervals by the ship's Master by applying test loading conditions.

(c) At each special survey, this checking is to be done in the presence of the Surveyor.

3.5.4 Loading Conditions - Loading Manual and Loading Instrument

(a) General

An approved loading manual is to be supplied for all ships except those of Category II with length less than 90 m in which the deadweight does not exceed 30% of the displacement at the summer loadline draft. In addition, an approved loading instrument is to be supplied for all ships of Category I of 100 m in length and above.

(b) Conditions of Approval of Loading Manuals

The approved loading manual is to be based on the final data of the ship. The manual is to include the design loading and ballast conditions upon which the approval of the hull scantlings is based. Appendix II-1 contains, as guidance only, a list of the loading conditions which normally should be included in the loading manual.

In case of modifications resulting in changes to the main data of the ship, a new approved loading manual is to be issued. The loading manual must be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

(c) Conditions of Approval of Loading Instruments

(i) The loading instrument is subject to approval, which is to include:

(1) Verification of type approval, if any,

(2) Verification that the final data of the ship has been used,

(3) Acceptance of number and position of read-out points,

(4) Acceptance of relevant limits for all read-out points,

(5) Checking of proper installation and operation of the instrument on board, in accordance with agreed test conditions, and that a copy of the operation manual is available.

(ii) Recommendations on the approval of loading instruments are given in Part I/Appendix I-1 “Loading Computer System (LCS) for Stability and Longitudinal Strength”.

(iii) In case of modifications implying changes in the main data of the ship, the loading instrument is to be modified accordingly and approved.

(iv) The operation manual and the instrument output must be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

(v) The operation of the loading instrument is to be verified upon installation. It is to be checked that the agreed test conditions and the operation manual for the instrument is available on board.

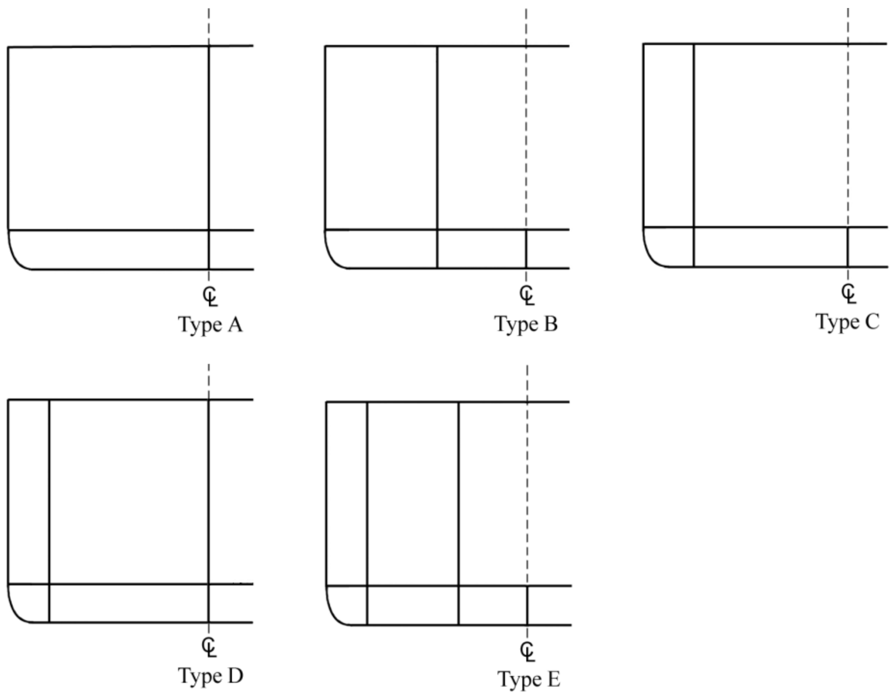

Fig. II 3-6
Types of Ships with Longitudinal Bulkheads

Table II 3-1
Values of α and ΔF

Type	Application	$\alpha = \alpha_1 \cdot \alpha_2$		$\Delta F = n_i(R - \alpha f)$	
		α_1	α_2	R	f
A	Side shell	$0.5 - 0.575\dfrac{k_1 A_L}{2A_s + A_L}$	1	$4.9W_b bS$	$19.6W_b bS$
	Longitudinal bulkhead	$0.575\dfrac{k_1 A_L}{2A_s + A_L}$	2	$9.8W_b bS$	
B	Side shell	$0.5 - 0.55\dfrac{k_1 A_L}{A_s + A_L}$	1	$4.9W_b bS$	$19.6(W_a a + W_b b)S$
	Longitudinal bulkhead	$0.55\dfrac{k_1 A_L}{A_s + A_L}$		$9.8(\beta W_a a + 0.5W_b b)S$	
C	Side shell	0.5	$1 - \dfrac{1.06k_2 A_{DL}}{A_s + A_{DL}}$	$4.9(\beta W_a a + W_c c)S$	$19.6(W_a a + W_c c)S$
	Longitudinal bulkhead		$\dfrac{1.06k_2 A_{DL}}{A_s + A_{DL}}$		
D	Side shell	$0.5 - \dfrac{0.675k_1 A_L}{2(A_s + A_{DL}) + A_L}$	$1 - \dfrac{1.05k_2 A_{DL}}{A_s + A_{DL}}$	$4.9(0.5W_b b + W_c c)S$	$19.6(W_b b + W_c c)S$
	Outer longitudinal bulkhead		$\dfrac{1.05k_2 A_{DL}}{A_s + A_{DL}}$		
	Center longitudinal bulkhead	$\dfrac{0.675k_1 A_L}{2(A_s + A_{DL}) + A_L}$	2	$9.8W_b bS$	
E	Side shell	$0.5 - \dfrac{0.615k_1 A_L}{A_s + A_{DL} + A_L}$	$1 - \dfrac{1.04k_2 A_{DL}}{A_s + A_{DL}}$	$4.9(0.5W_b b + W_c c)S$	$19.6(W_a a + W_b b + W_c c)S$
	Outer longitudinal bulkhead		$\dfrac{1.04k_2 A_{DL}}{A_s + A_{DL}}$		
	Inner longitudinal bulkhead	$\dfrac{0.615k_1 A_L}{A_s + A_{DL} + A_L}$	1	$9.8(\beta W_a a + 0.5W_b b)S$	

Table II 3-2
Net Thickness of Plating, t_b

Structure	Standard deduction (mm)	Limit values min-max (mm)
Compartments carrying dry bulk cargoes One side exposure to ballast and/or liquid cargo Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line	0.05t	0.5 - 1
One side exposure to ballast and/or liquid cargo Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line Two side exposure to ballast and/or liquid cargo Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line	0.10t	2 - 3
Two side exposure to ballast and/or liquid cargo Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line	0.15t	2 - 4

Chapter 4

Single Bottoms

4.1 Floors

4.1.1 Scantling of floors.

(a) Floors are to be fitted at every frame and to have the scantling necessary to obtain section modulus as obtained from the following formula:

$SM = 4.3\ s\ d\ l^2$ cm^3

where:

s = The spacing of floor, in m.

d = Draught or 0.66 the depth, whichever is greater, in m.

l = Unsupported span of floor in m, generally measured on upper edge of floor from side to side and normally the value of l is to be taken not less than 0.7B.

(b) The depth of floor plates at centerline is not to be less than $0.0625l$, in m.

(c) The thickness of floor plates is to be maintained throughout the midship one-half ship length, and is not to be less than:

$t = 0.01\ h + 3$ mm

where:

h = Depth of floor plates at centerline, in mm.

(d) The thickness of floor plates may be reduced by 10% at 0.1L from the ends, however, in the flat part of bottom forward, this reduction is not to be made.

4.1.2 Face plates and flanges

(a) The floors are to be stiffened at their upper edge with face plates to make section modulus not less than required by 4.1.1(a) of this Part.

(b) In the case of flanged plate floors, the effective width of flanges is to have the same sectional area as that required for face plates.

(c) If face plates are cut at the center keelson, care must be taken that strength is transferred efficiently by the face plates.

4.1.3 For floors in engine room and under the boiler bearer:

(a) The depth of the floors under the engine seating is to be increased to provide an efficient support and the thickness is to be increased by 1 mm to that given in 4.1.1(c) of this chapter and not to be less than the center keelson plate.

(b) The thickness of floor plates in the engine room is to be increased under boilers by at least 2 mm to that given in 4.1.1(c) of this chapter.

(c) The face plate area is to be doubled to that given in 4.1.2(a) of this Part.

4.1.4 Flanging instead of face plates is not permitted in the engine room, under the boiler bearer and in way of the strengthening of the bottom forward.

4.1.5 The upper edge of floors at any part is not to be below the level of the upper edge of floors at the center line.

4.1.6 Side frames are to be efficiently attached to floor plates. Where the rise of floors is small, the side frames are to be provided with brackets at their lower end.

4.1.7 Lighting holes may be provided in floor plates. Where the holes are provided, appropriate strength compensation is to be made by increasing the floor depth or by some other suitable means if deemed necessary.

4.1.8 Connection between side frame and floor

The size of side frame bracket, which is the connection between side frame and floor, as shown in Fig. II 4-1, is to be in accordance with the following requirements, and the free edge of bracket is to be stiffened also.

(a) The brackets are to extend to the height above the top of keel higher than twice the required depth of floors at the centre line.

(b) The arm length of brackets measured from the outer edge of frames to the bracket toe along the upper edge of floors, is not to be less than the required depth of floors at the centre line.

(c) The thickness of brackets is not to be less than that of the floors required in 4.1.1.

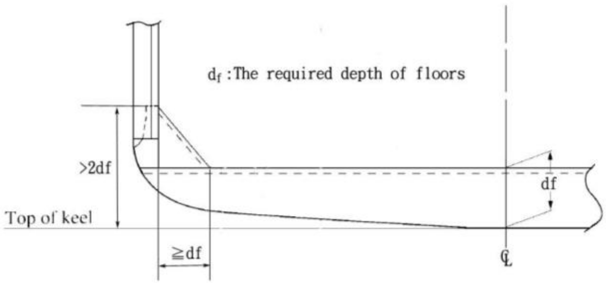

Fig. II 4-1
Side Frame Bracket

4.2 Center Keelsons

4.2.1 Center keelsons are to extend as far forward and aft as practicable. The depth is not to be less than the floor.

4.2.2 The scantling of center keelsons is to be obtained from the following formula:

(a) Minimum thickness of vertical plates and horizontal top plates amidships:

$t = 0.064 L + 5.5$ mm

(b) Minimum thickness of vertical plates and horizontal top plates at ends:

$t = 0.05\,L + 5.0$ mm

(c) Sectional area of horizontal top plates amidships:

$A = 0.7\,L + 10$ cm^2

(d) Horizontal top plate sectional area may be reduced by 10% at ends.
where:

L = Length of ship, in m.

4.2.3 For ships with length less than 50 m, where a horizontal plate is used as the center keelson on the top of the floor, it is to be stiffened between floors.

4.2.4 Where the center keelson is cut at bulkheads, the longitudinal strength is to be efficiently maintained.

4.3 Side Keelsons

4.3.1 Side Keelsons are to extend as far forward and aft as practicable.

4.3.2 The minimum thickness of vertical plates and face plates of side keelsons amidships is to be obtained from the following formula:

$t = 0.05\,L + 5.0$ mm

where:
L = Length of ship, in m.
The thickness may be reduced by 10% at ends.

4.3.3 Face plate area of side keelsons

(a) The face plate area of side keelsons is to be obtained from the following formula:

$A = 0.2\,L + 6$ cm^2

where:
L = Length of ship, in m.

(b) The face plate area is to be maintained continuously amidships, but may be reduced by 10% at ends.

4.3.4 Spacing of side keelsons

(a) Side keelsons are to be so arranged that the spacing is not more than 2.15 m between the center keelson and the first side keelson, between keelsons, or between the outboard side keelson and the lower turn of the bilge.

(b) Additional side keelsons are to be fitted in the machinery space.

4.3.5 In ships having a partial double bottom, side keelsons are to extend at least 3 frame spacings into the double bottom.

4.4 Strengthening of Bottom Forward

4.4.1 The strengthening of the bottom structure forward is to be in accordance with the requirements in Chapter 8 of this Part.

4.5 Pumping and Drainage

4.5.1 Efficient provision is to be made to permit water from every part of the bottom to reach pump suctions.

Chapter 5

Double Bottoms

5.1 General

5.1.1 Double bottoms are to be made as wide as possible, and not lower at any part than a plane parallel to the keel line and which is located not less than an upward vertical distance h measured from the keel line.

$h = B/20$

Where B is the ship moulded breadth
However, in no case is the value of h to be less than 0.76 m, and need not be taken greater than 2.0 m.

5.1.2 The double bottom is to be fitted extending from the collision bulkhead to the after peak bulkhead.

5.1.3 When deemed appropriate by the Society, the double bottom may be omitted wholly or partially. In this case, the arrangement and construction are to be specially considered.

5.1.4 The requirements of this Chapter may be suitably modified for the partial double bottom.

5.1.5 If double bottoms of different depths are arranged, efficient transmission of strength within 0.6L amidships is to be provided.

5.1.6 The strengthening of the bottom structure forward is to be in accordance with the requirements in Chapter 8 of this Part.

5.1.7 Efficient provision is to be made for the free passage of air and water from every part of the tank to air pipes and the suctions.

5.1.8 The scantling of members in double bottom tanks intended to be deep tanks are to be in accordance with the requirements in Chapter 16. However, the thickness of the inner bottom plating need not be increased by 1.0 mm as given for top plating of deep tanks in 16.2.7 of this Part.

5.1.9 The requirements of this chapter are to be applied where the apparent specific gravity of cargo in the loaded hold γ is not greater than 0.9. The requirements in Part III Chapter 1 are to be applied where γ is greater than 0.9, or to double bottom ships with empty holds in fully loaded condition or that have bilge hopper. The apparent specific gravity of cargo is to be obtained from the following formula:

$$\gamma = \frac{W}{V}$$

Where:
W: Mass (t) of cargoes in the hold
V: Volume (m^3) of the hold excluding hatchways

5.1.10 Special consideration is to be given to the double bottom structure of the hold when it is intended to carry heavy cargoes, where the ratio of cargo weight per unit area of the inner bottom plating to draught (d) is less than 5.40 or when cargo cannot be treated as evenly distributed loads. Where the value of cargo weight per unit area is given in t/m^2, kN/m^2 is obtained from the product of the value in t/m^2 and 9.81.

5.2 Center Girders

5.2.1 The scantling of center girders is to be obtained from the following formula:

(a) The depth of center girder plate is not to be less than B/16 unless specially approved by the Society.

(b) Thickness of center girder plate:

The thickness of the center girder plates is not to be less than that provided by the following requirements (i) and (ii) whichever is greater:

(i) $t = C_1 K \frac{SBd}{d_0 - d_1}\left(2.6\frac{x}{l_H} - 0.17\right)\left[1 - 4\left(\frac{y}{B}\right)^2\right] + 2.5$ mm

Where:

K	=	Material factor as specified in 1.5.2(a) of this Part
S	=	Distance (m) between the centres of two adjacent spaces from the girder under consideration to the adjacent longitudinal girders or the line of toes of tank side brackets
d_0	=	Depth (m) of the girder under consideration
d_1	=	Depth (m) of the opening at the point under consideration
l_H	=	Length (m) of the hold
x	=	Longitudinal distance (m) between the centre of l_H of each hold and the point under consideration, but not taken less than 0.2 l_H and more than $0.45l_H$
y	=	Transverse distance (m) from the centre line of the ship to the longitudinal girder
C_1	=	Coefficient given by the following formulae:

- Longitudinal framing:
  $\frac{3 - B/l_H}{103}$, but not to be taken less than 1/40 and more than 1/64.
- Transverse framing:
  $\frac{3 - B/l_H}{90}$, but not to be taken less than 1/35 and more than 1/56.

(ii) $t = \frac{C_1' d_0}{\sqrt{K}} K + 2.5$ mm

Where:

C_1'	=	Coefficient obtained from Table II 5-1 as below depending on S_1/d_0
S_1	=	Spacing of the brackets or stiffeners provided on the considered girder
K	=	Material factor as specified in 1.5.2(a) of this Part
d_0	=	Depth (m) of the girder under consideration

Table II 5-1
Values of C_1'

S_1/d_0		0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4	1.6 and over
C_1'	Center girder	4.4	5.4	6.3	7.1	7.7	8.2	8.6	8.9	9.3	9.6	9.7
	Side girder	3.6	4.4	5.1	5.8	6.3	6.7	7.0	7.3	7.6	7.9	8.0

(c) Where the boiler is mounted on the tank top, the thickness of center girder plate in way of the boiler is to be suitably increased.

5.2.2 Center girders are to extend as far forward and aft as practicable and to be attached to stern frames as far as possible.

5.2.3 Center girder plates are to be continuous within the midship 0.75L.

5.2.4 For the double bottom of longitudinal system, the center girders are to be suitably stiffened between floors and docking brackets of scantling not less than the following requirements are to be provided:

(a) The brackets are to be of a depth not less than 0.08 times the centre girder depth, and of a thickness not less than that obtained from the following formula.

$t = 0.6\sqrt{L} + 2.5$ mm

(b) The brackets are to extend from the center girder to the adjacent longitudinal.

(c) The brackets are to be spaced not more than 1.75 m. Where the spacing of these brackets exceeds 1.25 m, additional stiffeners are to be provided on the center girder plates.

5.3 Side Girders and Brackets Inside Tank

5.3.1 The thickness of the side girders is not to be less than that required in 5.2.1 (b) of this Chapter. Where the boiler is mounted on the tank top, the thickness of side girders is to be suitably increased.

5.3.2 Side girders may be fitted intercostally between floors

5.3.3 Side girders in 0.5L amidships and aft are to be so arranged that the spacing between the center girder and the first side girder, between the girders, or between the outboard side girder and the center of the margin plate is not to be more than 4.6 m.

5.3.4 Additional side girders of full or half depth are to be fitted under the machinery space, the thrust seating and the widely spaced pillar.

5.3.5 The thickness of brackets inside tanks is to be as given in 5.2.4(a) of this Chapter.

5.4 Solid Floors

5.4.1 Scantling of solid floors

(a) The thickness of the solid floor plates inside tanks, in holds and engine room is not to be less than that obtained from the following requirements (i) and (ii) whichever is greater.

(i) $t_1 = C_2 K \frac{SB'd}{d_0 - d_1}\left(\frac{2y}{B''}\right) + 2.5$ mm

Where:

C_2	=	Coefficient obtained from Table II 5-2 of this Chapter depending on B/l_H
K	=	Material factor as specified in 1.5.2(a) of this Part.
S	=	Spacing (m) of solid floors
B'	=	Distance (m) between the lines of toes of tank side brackets at the top of inner bottom plating at the midship part
B"	=	Distance (m) between the lines of toes of tank side brackets at the top of inner bottom plating at the position of the solid floor
y	=	Transverse distance (m) from the centreline to the point under consideration, but not to be taken less than B"/4 and more than B"/2.
d_0	=	Depth (m) of the solid floor at the point under consideration
d_1	=	Depth (m) of the opening at the point under consideration

(ii) $t_2 = 8.6 \times \sqrt[3]{\frac{H^2 d_0^2}{C_2' K}(t_1 - 2.5)} + 2.5$ mm

Where

t_1	=	Thickness obtained from 5.4.1(a)(i) above
C_2'	=	Coefficient given in Table II 5-3 depending on the ratio of the spacing of stiffener S_1 (m) to d_0
K	=	Material factor as specified in 1.5.2(a) of this Part.
H	=	Value obtained in accordance the cases as below:

	Cases	H
(a)	Slots of depth d_1 (m) on solid floors without reinforcement	$\sqrt{4\left(\frac{d_1}{S_1}\right) - 1.0}$ for $d_1/S_1 > 0.5$ 1.0 for $d_1/S_1 \leq 0.5$
(b)	Openings of major diameter ∅ (m) on solid floors without reinforcement	$1 + 0.5\frac{\varnothing}{d_0}$
(c)	Slots and Openings on solid floors without reinforcement	(a)×(b)
(d)	Where (a), (b) and (c) are not applicable	1.0

Table II 5-2
Values of C_2

B/l_H		Longitudinal framing	Transverse framing	
Above	Below		Where solid floors are provided at every frame	Elsewhere
	0.4	0.029		0.020
0.4	0.6	0.027		0.019
0.6	0.8	0.024		0.017
0.8	1.0	0.022		0.015
1.0	1.2	0.019		0.013
1.2		0.017		0.012

Table II 5-3

S_1/d_0	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_2'	64	38	25	19	15	12	10	9	8	7

(b) Where the boiler is mounted on the tank top, the thickness of the floor in way of the boiler is to be suitably increased.

5.4.2 Solid floors are to be fitted:

(a) On every frame under the machinery and the transverse boiler seatings.

(b) On every frame or alternate frame in way of strengthening of the bottom structure forward as specified in Chapter 8 of this Part.

(c) Under the transverse bulkhead.

(d) Except in cases of (a), (b) and (c), at intervals not exceeding 3.60 m in association with the intermediate open floor or the longitudinal framing of the double bottom.

5.4.3 Tank end floors

(a) Tank end floors are to be so arranged that the subdivision of the bottom generally corresponds to that of the ship.

(b) Tank end floors are to be of the thickness required for deep tank boundaries accordingly to Chapter 16 of this Part.

5.4.4 Oil tight cofferdams are to be provided in double bottoms between compartments for carrying oil and fresh water.

5.4.5 Solid floors under the thrust seating and under the pillar are to be specially strengthened.

5.4.6 Where the depth of the double bottom exceeds 900 mm, tank end floors are to be fitted with stiffeners whose scantling complies with the requirements in Chapter 16 of this Part.

5.5 Open Floors

5.5.1 Open floors are to be fitted at each frame where solid floors are not fitted.

5.5.2 Bottom frames and reverse frames

(a) The section modulus of bottom and reverse frames on the open floor are not to be less than that obtained from the following formula:

$$8\ s\ h\ l^2\ \text{cm}^3$$

where:

l	=	Span, in m, specified as follows:
	=	The distance between the connecting bracket on the center girder and the margin plate, where the side girder is not fitted.
	=	The greatest distance between the support given by the side girder and the bracket, where the side girder is fitted.
s	=	Frame spacing, in m.
h	=	The vertical distance, in m.
	=	The vertical distance, in m, measured from the top of keel to the load line, or to the line corresponding to 0.66 the depth to the free-board or bulkhead deck, whichever is the greater, where the bottom frames and the reverse frames are fitted with the strut.
	=	The vertical distance, in m, measured from the top of keel to the load line, or to the line corresponding to 0.66 the depth to the freeboard or bulkhead deck, or to the top of the deep tank, whichever is the greatest, where the bottom frames and the reverse frames are fitted with the strut in way of the deep tank.
	=	The vertical distance, in m, measured from the top of the double bottom, where the bottom frames and the reverse frames are not fitted with the struts.

(b) Where struts are fitted between brackets and side girders and spaced not more than 1.5 m apart, the section modulus of the bottom and reverse frame may be reduced to half that given in 5.5.2(a) of this Chapter.

5.5.3 Strengthening of bottom frames and reverse frames

(a) The thickness of bottom frames is to be increased by 1 mm in the boiler space.

(b) The thickness of reverse frames is to be increased by 2 mm in the boiler space.

5.5.4 Struts

(a) Struts, if fitted to reduce the unsupported span of frames is to be of a vertical angle with a sectional area not less than that obtained from the following formula:

$$2.82\ s\ h\ b \qquad \text{cm}^2$$

where:

b	=	The breadth of the area supported by the vertical strut, in m.
s and h	=	As defined in 5.5.2 of this Chapter.

(b) Struts are to be increased 1.5 mm in thickness in way of the boilers.

5.5.5 Center and side brackets

(a) The frames and reverse frames are to be connected to the center girder and the margin plate by the center and the side bracket of a thickness required for the adjoining solid floor.

(b) Center and side brackets are to have a breadth not less than 0.05B.

(c) The free edge of bracket is to be properly stiffened.

5.5.6 At side girders, bottom and reverse frames are to be supported by welded flat bars having the same depth as the reverse frames and the same thickness as the side girder plates.

5.6 Longitudinal Framing in Double Bottom

5.6.1 For requirements not specified in this Section, pertinent provisions in other Sections are to apply.

5.6.2 The standard spacing of longitudinal frames is obtained from the following formula:

$s = 2L + 550$ mm, but in no case over 1000 mm.

where:
L = Length of ship, in m.

5.6.3 The section modulus of bottom longitudinal frames is not to be less than that obtained from the following formula:

$$\frac{100CK}{24 - 15.5f_B K}(d + 0.026L')Sl^2 \quad cm^3$$

Where:

f_B = Ratio of the required hull girder section modulus as calculated in Chapter 3 of this Part when mild steel is used to the actual hull girder section modulus at bottom.

L' = Length (m) of the ship, not to be taken larger than 230 m.

l = Spacing (m) of the solid floors

S = Spacing (m) of the longitudinals

C = Coefficient given below:

Case 1: 1.0, when no strut provided midway between floors;

Case 2: When a strut provided midway between floors as specified in 5.5.4 of this Chapter:
0.625, for Lower part of deep tank, or
0.5, for elsewhere.

K = Material factor as specified in 1.5.2(a) of this Part.

5.6.4 The section modulus of inner bottom longitudinal frames may be 75% of that of bottom longitudinal frames but not less than the value obtained from the following formula:

$$\frac{100C'KShl^2}{24 - 12f_B K} \quad cm^3$$

Where:

f_B, l, and S = As specified in 5.6.3 of this Chapter.

h = Vertical distance (m) from the top of the inner bottom plating to the lowest deck at centreline. However, when the cargo is carrier exceeding the lowest deck, h is to be taken from the top of the inner bottom plating to the deck just above the top of the cargo at centreline.

C' = Case 1: 0.9, when no strut provided midway between floors;
Case 2: 0.54, when a strut provided midway between floors as specified in 5.5.4 of this Chapter.

K = Material factor as specified in 1.5.2(a) of this Part.

5.6.5 Bottom and inner bottom longitudinals are to be continuous or attached at their ends in such a manner as to develop effectively the sectional area and the resistance to bending.

5.6.6 Where vertical struts are fitted between bottom and inner bottom longitudinal frames midway between the floor plates, the sectional area of the struts is not to be less than that obtained in 5.5.4(a) of this Chapter.

5.6.7 Vertical stiffeners are to be fitted on floor plates at each longitudinal for which the thickness is to be at least that of the solid floors and the depth greater than 0.08 d_0 where d_0 is the depth of the floor at the point under consideration.

5.6.8 Vertical or horizontal stiffeners are to be arranged on side girders between floors which are fitted two or more frame spaces apart. The stiffeners are to have a depth not less than 100 mm and a thickness equal to the side girder thickness.

5.6.9 Flanged transverse brackets of the following scantling are to be fitted from margin brackets at every frame between solid floors.

(a) The thickness is not to be less than that required for side girder plates in engine room.

(b) The breadth is to be extended to the adjacent longitudinal.

5.6.10 Where some portion of the double bottom of the ship is built according to the transverse framing system, arrangement is to be made to insure the continuity of longitudinal strength at the point of the connection of both systems.

5.6.11 Where the double bottom is framed longitudinally, transverse brackets are to be provided at every hold frame extending from the margin plate to the adjacent bottom and inner bottom longitudinals and to be connected with margin plates, shell plating and longitudinals. The thickness of the bracket is no to be less than that required in 5.2.4(a) of this Chapter.

5.7 Inner Bottoms, Margin and Bottom Plates

5.7.1 Thickness of inner bottom plating

(a) The inner bottom plating in holds is to be of the thickness obtained from the following formula (i) and (ii) whichever is greater.

(i) $t = \frac{C_H K}{1000} \times \frac{B^2 d}{d_0} + 2.5$ mm

Where:

d_0 = Depth (m) of the center girder

K = Material factor as specified in 1.5.2(a) of this Part.

C_H = Coefficient set to:

b_0 for $B/l_H < 0.8$

b_0 or $\alpha . b_1$ whichever is greater for $0.8 \le B/l_H < 1.2$

$\alpha . b_1$ for $B/l_H \ge 1.2$

with:

$$\alpha = \frac{13.8}{24 - 11 f_B K}$$

where:

K: Material factor as specified in 1.5.2(a) of this Part.

f_B = Ratio of the required hull girder section modulus as calculated in Chapter 3 of this Part when mild steel is used to the actual hull girder section modulus at bottom.

b_0 & b_1 = Coefficients specified in Table II 5-4 of this Chapter depending on B/l_H. However for transverse framing b_1 is to be 1.1 times the value in this table.

Table II 5-4
Values of b_0 and b_1

B/l_H									
	over		0.4	0.6	0.8	1.0	1.2	1.4	1.6
	less than	0.4	0.6	0.8	1.0	1.2	1.4	1.6	
b_0		4.4	3.9	3.3	2.2	1.6	-	-	-
b_1		-	-	-	2.2	2.1	1.9	1.7	1.4

(ii) $t = C'S\sqrt{Kh} + 2.5$ mm

Where:

C' = Coefficient obtained by the following formula:

$0.43\frac{l}{S} + 2.5$ for $\frac{l}{S} < 3.5$

4.0 for $\frac{l}{S} \geq 3.5$

l = Distance (m) between floors for longitudinal framing or between girders for transverse framing

S = Spacing (m) of inner bottom longitudinals for bottom longitudinal framing or frame spacing for transverse framing

K = Material factor as specified in 1.5.2(a) of this Part.

h = Height (m) as specified in 5.6.4

(b) The thickness of the inner bottom plating in the engine and the boiler spaces is not to be less than that obtained from 5.7.1(a) above plus 2.0 mm or than that obtained from the requirements of 16.2.2 of this Part plus 2.0 mm in the case where the inner bottom in engine and the boiler spaces is also a tank top, whichever is greater.

5.7.2 If no ceiling is fitted and the cargo is not regularly handle by grab, then the thickness of the inner bottom plating under the hatchway is not to be less than that obtained in 5.7.1 of this Chapter plus 2.0 mm, or than that obtained from the requirements of 16.2.2 of this Part plus 2.0 mm in the case where the inner bottom is also a tank top, whichever is greater.

5.7.3 Under the boiler there is to be a clear space of at least 460 mm above the inner bottom. If the clear space is necessarily smaller, the thickness of the plating is to be suitably further increased.

5.7.4 Where the double bottom is used for carrying fuel oil for ship's used and no ceiling is fitted, the thickness of the inner bottom plating is not to be less than 10 mm in association with 760 mm frame spacing. Where the frame spacing differs from 760 mm, the thickness of the inner bottom plating is to be modified in direct proportion.

5.7.5 In ships classed with "ore cargoes" notation and if cargo is to be regularly discharged by grabs or similar mechanical appliances, it is recommended that flush inner bottom plating be adopted throughout cargo spaces and double ceiling be fitted otherwise the thickness of the inner bottom plating under the hatchway is not to be less than that obtained in 5.7.1 of this Chapter plus 2.5 mm, or than that obtained from the requirements of 16.2.2 of this Part plus 2.5 mm in the case where the inner bottom is also a tank top, whichever is greater.

5.7.6 Where engine foundation plates or the thrust seat rest directly on the inner bottom plating, the thickness of the plating is to be increased in proportion to the kind, size and power of the engine and to be at least twice the thickness as given in 5.7.1(b) of this Chapter.

5.7.7 Where margin plates are approximately vertical, these plates fitted amidships are to extend for the full depth of the double bottom with a thickness as obtained from 5.7.1(a)(i) of this Chapter plus 1.5 mm. Where approximately horizontal, they may be of the thickness of the adjacent tank top plating.

5.7.8 The thickness of the margin plate is to be in no case less than that of the remainder of the plating in the corresponding location.

5.7.9 Where the inner bottom or the double bottom structure forms part of a sea chest, the thickness of the plating is not to be less than that of the shell plating in the same location, but need not exceed 25 mm.

5.7.10 The thickness of the bottom shell plating of cargo hold in way of double bottom is not to be less than that obtained from Chapter 7 of this Part, or than that from 5.7.1(a)(i) of this Chapter with C_H obtained using α from the following formula:

$$\alpha = \frac{13.8}{24 - 15.5 f_B K}$$

where:
α, f_B, K = See5.7.1(a)(i) above.

5.8 Manholes, Lightening Holes, Air and Drainage Holes

5.8.1 Manholes

(a) A sufficient number of manholes are to be cut in the inner bottom plating, floors and side girders to provide the access to all parts of the double bottom.

(b) Care is to be taken in locating manholes to avoid the possibility of interconnection of the main subdivision compartment through the double bottom in so far as practicable.

(c) Manholes in the inner bottom plating are to have a good shift with each other in the longitudinal direction and to be minimum in number.

(d) Manholes in the inner bottom plating are to be fitted with doubling plates or rims to take fastenings of covers.

(e) Manholes in the inner bottom plating are to be fitted with steel or wrought iron covers.

(f) Where no ceiling is fitted in the cargo hold, manhole covers are to be effectively protected against damage by the cargo.

(g) Manholes are to be cut clean and without jagged edge and to a well rounded design.

(h) The position and the size of manholes cut in the center girder is to be submitted for approval by the Society.

5.8.2 Lightening holes

(a) Lightening holes are to be cut in nontight floors, side girders and brackets.

(b) The diameter of lightening holes in brackets normally is not to be greater than 1/3 of the breadth of the bracket.

5.8.3 Neither manholes nor lightening holes are to be cut in the floor or the girder under the widely spaced pillar.

5.8.4 Air and drainage holes

(a) Air and drainage holes are to be cut in non-tight floor or girders to ensure the free escape of air and drain water.

(b) The air and the drainage holes are to be cut as closely to the inner and outer bottom plating as practicable.

Chapter 6

Frames

6.1 General

6.1.1 The requirement in this Chapter apply to ships having transverse strength and transverse stiffness provided by bulkheads that are not less effective than those specified in Chapter 14. Where the transverse strength and stiffness provided by bulkheads are less effective, additional stiffening is to be made by means of increasing scantling of frames, additional provision of web frames, etc.

6.1.2 The scantlings of frames in way of deep tanks are to comply with the provisions in Chapter 16 as well as those in this Chapter.

6.1.3 Frames are not to extend through the tops of water or oil tanks, unless the effective watertight or oiltight arrangements are specially submitted and approved.

6.1.4 Where large holes are cut in the web of frames, the scantlings of the frames are to be appropriately increased.

6.1.5 Thorough consideration is to be given to the concentration of stress and other forces acting on the lower end construction of frames.

6.1.6 Frames in boiler spaces and in way of bossing

(a) In boiler spaces, the scantlings of members such as frames, web frames, and side stringers are to be appropriately increased.

(b) The construction and scantlings of frames in way of bossing are to be at the discretion of the Society.

6.1.7 Where the angle between the web of frames or stringers and shell plating is extremely small, the scantlings of frames or stringers are to be suitably increased above the normal requirements and where necessary, appropriate supports are to be provided to prevent tripping.

6.1.8 The transverse frames, side longitudinals and web frames supporting side longitudinals that are fitted at the place where the bow flare is considered to endure large wave impact pressure are to be properly strengthened and particular attention is to be paid to the effectiveness of their end connections.

6.2 Frame Spacing

6.2.1 Transverse frame spacing

(a) The standard spacing of transverse frames is obtained from the following formula:

$$s = 2L + 450 \text{ mm}$$

(b) Transverse frame spacing in peaks or cruiser sterns is not to exceed 610 mm.

(c) Transverse frame spacing between 0.2L from the fore end and the collision bulkhead is not to exceed 700 mm or the standard spacing specified in (a), whichever is smaller.

(d) The requirements in (b) and (c) may be modified, where structural arrangements or scantlings are suitably considered.

6.2.2 The standard spacing of longitudinal frames is obtained from the following formula:

$s = 2\,L + 550$ mm

6.2.3 Where the spacing of frames exceeds the standard spacing stipulated in 6.2.1 and 6.2.2 by at least 250 mm, the scantlings and structural arrangement of double bottoms and other relevant structures are to be specially considered.

6.2.4 Maximum frame spacing is recommended not to exceed one metre.

6.3 Transverse Hold Frames

6.3.1 Application

(a) The transverse hold frame is the frame below the lowest deck from the collision bulkhead to the after peak bulkhead including the machinery space.

(b) The provisions in 6.3.2 to 6.3.4 apply to the transverse hold frames of ships of ordinary construction.

(c) The application of these provisions to transverse hold frames of ships which have bilge hopper tanks, or which have a special construction such as a double side shell, are to be at the discretion of the Society.

(d) Special considerations are to be given to the scantlings of transverse hold frames, where the specific gravity of cargoes in the loaded hold exceeds 0.9.

6.3.2 Scantlings of transverse hold frames

(a) The section modulus of transverse hold frames between 0.15L from the fore end and the after peak bulkhead is not to be less than that obtained from the following formula:

$KC_0CSh\mathit{l}^2$ cm³

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Frame spacing, in m.

l = Vertical distance, in m, from the top of the inner bottom plating at side to the top of the deck beams above the frames.
For frames abaft 0.25L from the fore end, *l* is to be measured at amidships. For frames between 0.25L and 0.15L from the fore end, *l* is to be measured at 0.25L from the fore end. For frames that are attached to the shell that has a remarkable flare, *l* is to be the length of the frame between supports.
Where the length of frames is markedly different from that measured above on account of discontinuity in the lowest deck or change in the height of the double bottom, lines extended from the lowest deck or the top of the double bottom parallel to the upper deck or keel respectively are to

be taken as the lowest deck or double bottom top and l is to be measured at the corresponding places of measurement. See Fig. II 6-1 and Fig. II 6-2 (a) and (b).

h = Vertical distance, in m, from the lower end of *l* at the place of measurement to a point d+0.038 L' above the top of the keel. See Fig. II 6-2 (a) and (b).

L' = Length of ship, in m. However, where L exceeds 230 m, L' is to be taken as 230 m.

C_0 = Coefficient obtained from the following formula, but not to be less than 0.85.

$$1.25 - 2\frac{e}{l}$$

e = Height, in m, of the tank side bracket measured from the lower end of *l*.

C = C_1+C_2

(i) For ordinary framing systems without top side tanks,

$$C_1 = 2.1 - 1.2\frac{l}{h}$$

$$C_2 = 2.2k\alpha\frac{d}{h}$$

α = Coefficient given in Table II 6-1. For intermediate values of B/l_H, α is to be obtained by linear interpolation.

l_H = Length of hold, in m.

k = Coefficient given below according to the number of layers of deck:
= 13, for single deck systems
= 21, for double deck systems
= 50, for triple deck systems

Where B / *l* exceeds the following value according to the deck systems, the value of k is to be suitably increased:
= 2.8, for single deck systems
= 4.2, for double deck systems
= 5.0, for triple deck systems

(ii) For framing systems with top side tanks,

$$C_1 = 3.4 - 2.4\frac{l}{h}$$

$$C_2 = 2.7\alpha\frac{d}{h}$$

Where B/*l* exceeds 4.0, the value of C_2 is to be suitably increased.

Table II 6-1
Coefficient α

B / l_H	≤ 0.5	0.6	0.8	1.0	1.2	≥ 1.4
α	0.023	0.018	0.010	0.006	0.0034	0.002

(b) The section modulus of transverse hold frames between 0.15L from the fore end and the collision bulkhead is not to be less than that obtained from the following formula:

KC_0CShl^2 cm³

where:

K	=	Material factor as specified in (a) above
l	=	Vertical distance as specified in (a) above, except that it is to be measured at 0.15 L from the fore end.
S, h and C_0	=	As specified in (a) above.
C	=	Coefficient, 1.3 times the value specified in (a) above.

(c) For the frames under transverse web beams supporting deck longitudinals, the section modulus is to be obtained as in (a) and (b), but not to be taken as less than that obtained from the following formula:

$$2.4n\left[0.17+\frac{h_1}{9.81h}\left(\frac{l_1}{l}\right)^2-0.1\frac{l}{h}\right]KShl^2$$

where:

n	=	Ratio of transverse web beam spacing to frame spacing.
h_1	=	Deck load, in kN/m^2, stipulated in 9.2 for the deck beam at the top of frame.
l_1	=	Total length, in m, of the transverse web beam. See Fig. II 6-2 (a) of this Chapter.
K, S, l and h	=	As specified in (a) and (b) above.

(d) Where the ratio of the depth of the frame to the length measured from the deck at the top of the frame to the toe of the lower bracket is less than 1/24 for the frame prescribed in (a) and 1/22 for (b), the scantlings of such frames are to be suitably increased.

(e) Where the depth of the double bottom center girder is less than B/16, the scantlings of frames are to be suitably increased.

(f) Where long hatchways or multi-row hatchways are provided on the deck at the top of frames, special consideration is to be given to the scantlings of transverse hold frames and their upper end construction.

6.3.3 Transverse hold frames supported by web frames and side stringers

(a) Where transverse hold frames are supported by web frames and side stringers specified in Chapter 6A, the section modulus of frames is not to be less than that obtained from the following formula:

(i) For frames between 0.15L from the fore end and the after peak bulkhead:

$$2.1KCShl^2 \text{ cm}^3$$

(ii) For frames between 0.15L from the fore end and the collision bulkhead:

$$3.2KCShl^2 \text{ cm}^3$$

where:

K = Material factor as specified in 1.5.2(a) of this Part.

h = Vertical distance as specified in 6.3.2(a) of this Chapter.

l = Vertical distance as specified in 6.3.2(a) or (b) of this Chapter, as applicable. Where this distance is less than 2 metres, l is to be 1 metre more than one half of the distance. See Fig. II 6-1 and Fig II 6-2 (c) of this Chapter.

C = As obtained from the following formula, but to be taken as 1.0, where C is less than 1.0:

$$C = \left[\alpha_1\left(3 - \frac{l_2}{l}\right) - \alpha_2\frac{e}{l}\right]C_4$$

l_2 = Vertical distance, in m, at side from the lowest side stringer to the one immediately above or to the deck. See Fig. II 6-2 (c) of this Chapter.

e = Height, in m, of the lower bracket measured from the lower end of l. However, where this height, in m, exceeds $0.25l$, e is to be taken as $0.25l$. See Fig. II 6-2 (c) of this Chapter.

α_1, α_2 = As specified in Table II 6-2 of this Chapter.

C_4 = As obtained from the following formula, but to be taken as 1.0 where C_4 is less than 1.0, and as 2.2 where C_4 exceeds 2.2:

$$2\frac{H}{H_0} - 1.5$$

H_0 = Vertical distance, in m, from the top of the inner bottom plate at side to the lowest deck. See Fig. II 6-2 (c) of this Chapter.

H = Vertical distance, in m, from the lower end of H_0 to the freeboard deck at side. See Fig. II 6-2 (c) of this Chapter.

(b) The scantlings of frames specified in (a) are to be as deemed appropriate by the Society if the difference between any two adjacent unsupported spans of the frames (the vertical distance between adjacent stringers or from a stringer to the end of the frame) is not less than 25% or the difference between the largest and smallest unsupported spans is not less than 50%.

(c) Where the height of lower brackets of frames is less than 0.05 times l specified in (a), special considerations are to be given to the scantlings of transverse hold frames and their lower end constructions.

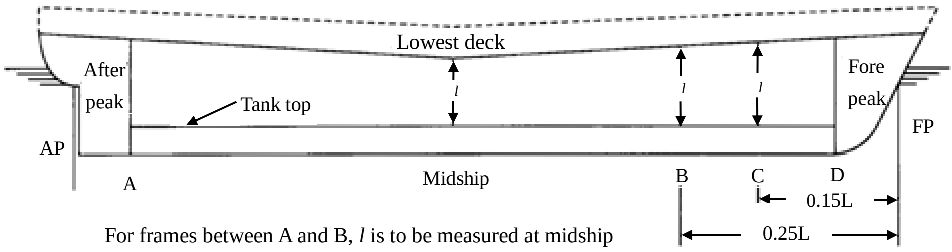
Table II 6-2
Values of α_1 and α_2

Numbers of side stringers installed below the lowest deck	α_1	α_2
1	0.75	2.0
2	0.90	1.8
≥ 3	1.25	1.3

6.3.4 Connection of transverse hold frames

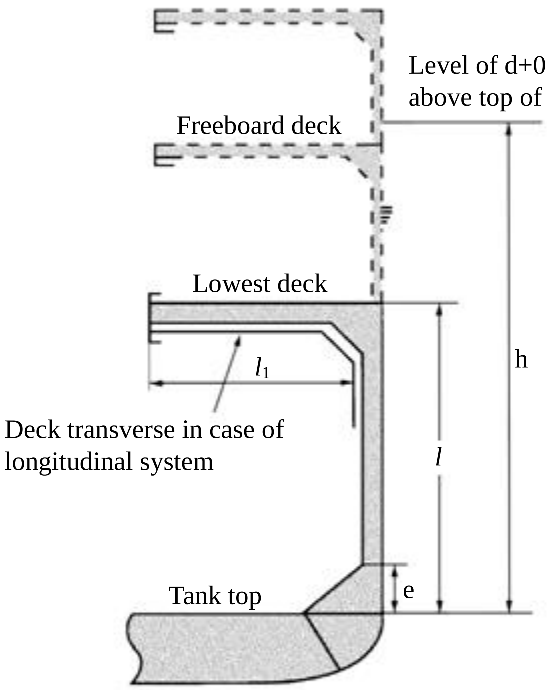
(a) Transverse hold frames are to be overlapped with tank side brackets by at least 1.5 times the depth of frame sections and are to be effectively connected thereto.

(b) The upper ends of transverse hold frames are to be effectively connected by brackets with the deck and deck beams, and where the deck at the top of frames is longitudinally framed, the upper end brackets are to be extended and connected to the deck longitudinals adjacent to the frames.

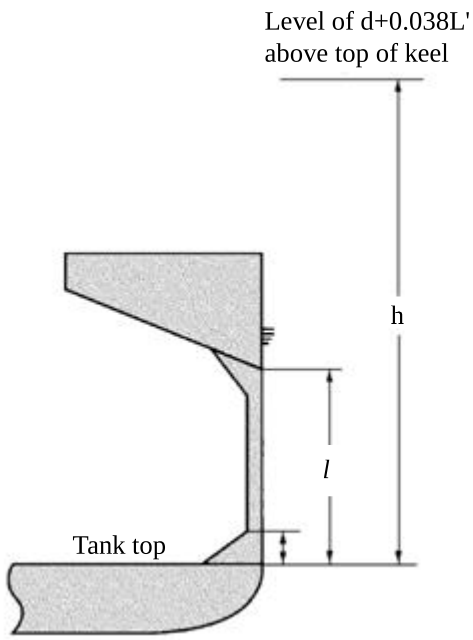


For frames between A and B, *l* is to be measured at midship
For frames between B and C, *l* is to be measured at B
For frames between C and D, *l* is to be measured at C

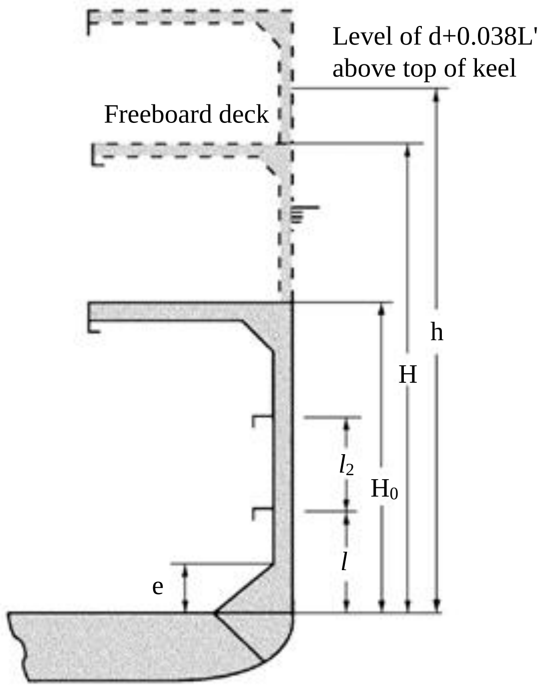
Fig. II 6-1
Measuring Point of *l* for Hold Frames



(a) Ordinary framing system without top side tanks



(b) Framing system with top side tanks



(c) Web and stringer system

Notes: e is not be more than $0.25l$

Where l is less than 2.0 m, l is to be 1.0 m more than a half of the actual span.

Fig. II 6-2
Measurement of *l*, h, H, etc for Transverse Hold Frames

6.4 Side Longitudinals and Other Structural Members

6.4.1 Side longitudinals

(a) The section modulus of side longitudinals in the midship part below the freeboard deck is not to be less than that obtained from the following formula, whichever is greater:

$100KCShl^2$ cm^3
$2.9K\sqrt{L'}S\,l^2$ cm^3

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Spacing, in m, of longitudinals.

l = Distance, in m, between the web frames or between the transverse bulkhead and the web frame including the length of connection.

h = Vertical distance, in m, from the side longitudinal concerned to a point d+0.038L' above the top of keel.

L' = Length of ship, in m. However, where L exceeds 230 m, L' is to be taken as 230 m.

C = Coefficient given by the following formula:

$$\frac{1}{24 - kK}$$

k = (i) or (ii) whichever is greater:

(i) $15.5\, f_B(1 - 2.5\frac{y}{D_s})$

(ii) $\frac{6}{a}$ for $L \leq 230$ m

$\frac{10.5}{a}$ for $L \geq 400$ m

Liner interpolation for intermediate L.

a = $\sqrt{K}$ if at least 80% of side shell is of high tensilte steel in the transverse section at amidships.
1.0 for otherwise.

y = Vertical distance, in m, from the top of keel to the longitudinal under consideration.

f_B = Ratio of the section modulus of the transverse section of hull required in 3.2.2 of this Part to the actual section modulus of the transverse section of hull at bottom. However, where f_B is less than 0.85/K, it is to be taken as 0.85/K.

(b) Beyond the midship part, the section modulus of side longitudinals may be gradually reduced towards the ends of the ship, and may be 0.85 times that obtained from the formula in (a) at the ends. However, the section modulus of side longitudinals between 0.15L from the fore end and the collision bulkhead is not to be less than that obtained from the formula in (a).

(c) The depth of flat bars used for longitudinals is not to exceed 15 times the thickness of flat bars.

(d) Side longitudinals on sheer strakes in the midship part are to be of a slenderness ratio not greater than 60, as far as is possible.

(e) The section modulus of bilge longitudinals need not exceed that of bottom longitudinals.

(f) Side longitudinals are to be continuous through transverse bulkheads or to be connected thereto by brackets, so as to provide adequate fixity and continuity of longitudinal strength.

6.4.2 The web frames supporting side longitudinals are to comply with the requirements in (a) to (c).

(a) Web frames are to be arranged at sections where solid floors are provided.

(b) The scantlings of web frames are not to be less than that obtained from the following formulae:
Depth: $0.1l$, in m, or 2.5 times the depth of the slot for longitudinals, whichever is greater.
Section modulus: KC_1Shl^2 cm^3
Thickness of web: t_1 or t_2, whichever is greater:

$$t_1 = \frac{KC_2}{1000}\frac{Shl}{d_0} + 2.5 \quad \text{mm}$$

$$t_2 = 8.6\sqrt[3]{\frac{{d_0}^2(t_1 - 2.5)}{kK}} + 2.5 \quad \text{mm}$$

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
S	=	Web frame spacing, in m.
l	=	Unsupported length, in m, of web frame.
d_0	=	Depth (m) of web frame. However, in the calculation of t_1, the depth of slots for side longitudinals, if any, is to be deducted from the web depth. Where the depth of webs is divided by vertical stiffeners, the divided depth may be taken as d_0 in the calculation of t_2.
h	=	Vertical distance, in m, from the lower end of l to a point d+0.038L' above the top of keel. However, where the distance is less than $1.43l$,in m, h is to be taken as $1.43l$.
L'	=	As specified in 6.4.1(a) of this Chapter.
C_1, C_2	=	As specified in Table II 6-3 of this Chapter.
k	=	Coefficient given in Table II 6-4 of this Chapter according to the ratio of S_1 to d_0, where S_1 is the spacing (m) of stiffeners or tripping brackets provided on web plates. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

(c) Web frames are to be provided with tripping brackets at an interval of about three metres. Where the breadth of the face plates of web frames exceeds 180 mm on either side of the web, the tripping brackets are to support the face plates as well. Moreover, a stiffener is to be provided on the web at every longitudinal except for the middle part of the span of web frames where stiffeners may be provided at alternate longitudinals. Webs of longitudinals and web frames are to be connected to each other.

Table II 6-3
Coefficients C_1 and C_2

	For web frames abaft 0.15 L from the fore end	For web frames between 0.15 L from the fore end and the collision bulkhead
C_1	$6.6\left(1 - 0.4\frac{l}{h}\right)$	$8.6\left(1 - 0.4\frac{l}{h}\right)$
C_2	$35\left(1.43 - 0.43\frac{l}{h}\right)$	$45.5\left(1.43 - 0.43\frac{l}{h}\right)$

Table II 6-4
Coefficients k

S_1/d_0	≤ 0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.5	≥2.0
k	60.0	40.0	26.8	20.0	16.4	14.4	13.0	12.3	11.1	10.2

6.5 Cantilever Beam Systems

6.5.1 Cantilever beams

(a) The depth of cantilever beams measured at the toe of end brackets is not to be less than one-fifth of the horizontal distance from the inboard end of the cantilever beam to the toe of the end bracket.

(b) The depth of cantilever beams may be gradually tapered from the toe of end brackets towards the inboard end where it may be reduced to about a half of the depth at the toe of the end bracket.

(c) The section modulus of cantilever beams at the toe of end brackets is not to be less than that obtained from the following formula: (see Fig. II 6-3)

$$7.1Sl_0\left(\frac{1}{2}b_1h_1 + b_2h_2\right) \quad \text{cm}^3$$

where:

S = Cantilever beam spacing, in m.

l_0 = Horizontal distance, in m, from the inboard end of cantilever beams to the toe of end brackets.

b_1 = Horizontal distance, in m, from the inboard end of cantilever beams to the toe of end brackets of beam or transverse deck girder at side. However, where the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, b_1 is to be taken as l_0.

b_2 = A half of the breadth, in m, of the hatch opening in the deck supported by the cantilever beams.

h_1 = 9.81h
Deck load, in kN/m^2, stipulated in 9.2 for the deck transverses supported by the cantilever beams.

h_2 = Load, in kN/m^2, on hatch covers of the deck supported by the cantilever beams which is not to be less than obtained from the following (i) to (iii), depending on the type of deck.

(i) For weather decks, h_2=9.81h, which is the deck load stipulated in 9.2.1 for the deck transverses or the maximum design cargo weight on hatches per unit area (kN/m^2), whichever is greater. h_2 is not to be less than 17.5 kN/m^2 for hatches at Position 1 and 12.8 kN/m^2 for those at Position 2 specified in 17.1.2, respectively.

(ii) For decks other than the weather deck where ordinary cargoes or stores are intended to be carried, h_2 is the design deck load.

(iii) For decks other than those specified in (i) or (ii) above, h_2 is the value equal to h_1.

(d) The sectional area of face plates of cantilever beams may be gradually tapered from the inner edge of end brackets towards the inboard end of cantilever beams, where it may be reduced to 0.60 times that at the inner edge of the end brackets.

(e) The web thickness of cantilever beams at any point is not to be less than the greater of the values obtained from the following formula:

$$t_1 = \frac{0.0095S\left(\frac{1}{2}b_1h_1 + b_2h_2\right)}{d_c} + 2.5 \quad \text{mm}$$

$$t_2 = 5.8 \times \sqrt[3]{d_c^2(t_1 - 2.5)} + 2.5 \quad \text{mm}$$

where:

S, b_1, b_2, h_1 and h_2 = As specified in (c).
However, where the deck is framed longitudinally and no deck transverse is

provided between the cantilever beams, $b_1/2$ is to be substituted by the horizontal distance in metres from the inboard end of cantilever beams to the section under consideration in the formula for t_1.

d_c	=	Depth, in m, of the cantilever beam at the section under consideration. However, in the calculation of t_1, the depth of slots for deck longitudinals, if any, is to be deducted from the depth of cantilever beams. Where the webs are provided with horizontal stiffeners, the divided web depth may be used for d_c in the formula for t_2.

(f) Cantilever beams are to be provided with tripping brackets at an interval of about three metres. Where the breadth of the face plates of cantilever beams exceeds 180 mm on either side of the web, the tripping brackets are to support the face plates as well. Moreover, a stiffener is to be provided on the web at every longitudinal except for the middle part of the span of cantilever beams where stiffeners may be provided at alternate longitudinals.

(g) Web plates adjacent to the inner edge of end brackets are to be specially reinforced.

(h) Cantilever beams supporting hatch covers on lower decks are to comply with the requirements in (i) and (ii):

(i) The leg length of the fillet welds between webs and hatch side girders is to be Type 1 specified in Table XII 5-3, Part XII of the Rules.

(ii) Where the stiffeners are provided to prevent web plates from buckling, consideration is to be given to the arrangement of the ends of such stiffeners to ensure that there are no stress concentrations at the connections betweeen web plates and the members supporting hatch covers on lower decks.

6.5.2 Web frames

(a) The depth of web frames is not to be less than one-eighth of the length including the length of connections at both ends.

(b) The section modulus of web frames is not to be less than that obtained from the following formula. However, where a tween deck web frame in association with a cantilever beam supporting the deck above is provided at the top of the web frame, the value of the formula may be reduced to 60%.

$$7.1Sl_1\left(\frac{1}{2}b_1h_1 + b_2h_2\right) \quad cm^3$$

where:

S	=	Web frame spacing, in m.
l_1	=	Horizontal distance, in m, from the end of supported cantilever beams to the inside of web frames
b_1, b_2, h_1 and h_2	=	As specified in 6.5.1(c) for the supported cantilever beams. However, where the deck is framed longitudinally and no deck transverse is provided between the cantilever beams, l_1 is to be substituted for b_1.

(c) The section modulus of tween deck web frames is to be in accordance with the requirements in (b), and is not to be less than that obtained from the following formula:

$$7.1C_1Sl_1\left(\frac{1}{2}b_1h_1 + b_2h_2\right) \quad cm^3$$

where:

S, l_1, b_1, b_2, h_1 and h_2	=	As specified in (b).
C_1	=	$0.15 + 0.5\left(\frac{\frac{1}{2}b_1'h_1' + b_2'h_2'}{\frac{1}{2}b_1h_1 + b_2h_2}\right)$
b_1', b_2', h_1' and h_2'	=	b_1, b_2, h_1 and h_2 respectively stipulated in (b) in respect to the cantilever beams provided below the web frames concerned.

(d) The web thickness is not to be less than that obtained from the following formula, whichever is greater:

$$t_1 = 0.0095\frac{C_2S\left(\frac{1}{2}b_1h_1 + b_2h_2\right)}{d_w}\frac{l_1}{l} + 2.5 \quad \text{mm}$$

$$t_2 = 5.8 \times \sqrt[3]{d_w^2(t_1 - 2.5)} + 2.5 \quad \text{mm}$$

where:

S, b_1, b_2, h_1, h_2, and l_1	=	As specified in (b).
d_w	=	The smallest depth, in m, of web frame. However, in the calculation of t_1, the depth of slots for side longitudinals, if any, is to be deducted from the web depth. Where the depth of webs is divided by vertical stiffeners, the divided depth may be used for d_w in the calculation of t_2.
l	=	Length, in m, of web frame including the length of connections at both ends.
C_2	=	Coefficient given below: For hold web frames: Where a web frame in association with a cantilever beam supporting the deck above is provided directly above: 0.9 Elsewhere: 1.5 For tween deck web frames: C_1+0.6 C_1= Coefficient given by (c)

(e) Where web frames supporting cantilever beams also support side longitudinals or side stringers, the scantlings are to comply with the following requirements in addition to those in 6.4.2.

(i) The section modulus is not to be less than that obtained from the formula in (b), multiplied by the following coefficient:

Where tween deck web frame together with cantilever beam is provided above:

$$0.6 + 9.81\frac{0.05hl^2 + 0.09h_u l_u^2}{1.4\left(\frac{1}{2}b_1h_1 + b_2h_2\right)l_1}$$

Elsewhere: 1.0

where:

l	=	Length, in m, of hold web frame including the length of connections at both ends.
l_u	=	Length, in m, of tween deck web frame provided directly above, including the length of connections at both ends.
h	=	Vertical distance, in m, from the middle of l to a point d+0.038L' above the top of keel.
L'	=	Length of ship, in m. However, where L exceeds 230 m, L' is to be taken as 230 m.
h_u	=	Vertical distance, in m, from the middle of l_u to a point to which h is measured. However, where the point is below the middle of l_u , h_u is to be taken as zero.
b_1, b_2, h_1, h_2, and l_1	=	As specified in (b).

(ii) The web thickness is not to be less than that given by (d), in which the value of t_1 is to be increased by the amount obtained from the following formula:

$$0.0255\frac{Shl}{d_w} \quad \text{mm}$$

S	=	Web frame spacing, in m.
h, l	=	As specified in (i).
d_w	=	As specified in (d)

(f) Web frames are to be provided with tripping brackets at an interval of about three metres. Where the breadth of the face plates of web frames exceeds 180 mm on either side of the web, the tripping brackets are to support the face plates as well. Moreover, a stiffener is to be provided on the webs at every side longitudinal except for the middle part of the span of web frames where stiffeners may be provided at alternate longitudinals. Webs of longitudinals and web frames are to be connected to each other.

(g) Web frames are to be effectively connected with other web frames located beneath or solid floors so as to maintain strength continuity.

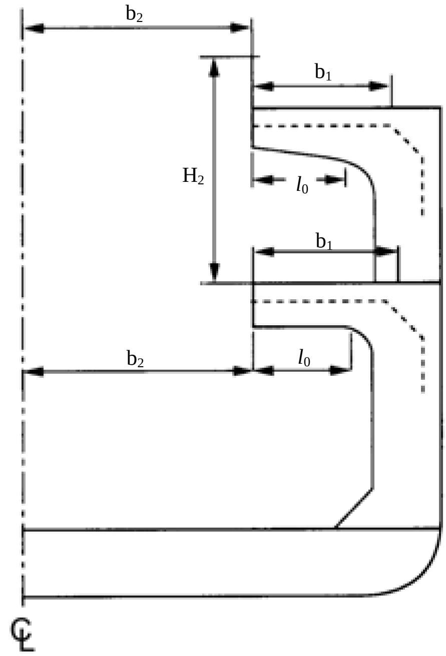
6.5.3 Cantilever beams and web frames supporting them are to be effectively connected by brackets required in (a) to (d):

(a) The radius of curvature of the free edges of brackets is not to be less than the depth of cantilever beams at the toes of brackets.

(b) The thickness of brackets is not to be less than that of the webs of cantilever beams or web frames, whichever is greater.

(c) The brackets are to be properly strengthened by stiffeners.

(d) The free edges of brackets are to have face plates of a sectional area not less than that of cantilever beams or web frames, whichever is greater, and the face plates are to be connected with those of cantilever beams and web frames.



The loading height of cargo (H_2) is to be taken into consideration when h_2 of the lower deck is assumed.

Fig. II 6-3
Measurement of l_0, b_1, b_2 and H_2

6.6 Tween Deck Frames

6.6.1 General

(a) The scantlings of tween deck frames are to be determined in relation to the strength of hold frames, the arrangement and transverse stiffness of bulkheads, etc.

(b) Tween deck frames are, in association with the hold frames, to be determined in consideration of maintaining the continuity of strength of framing from the bottom to the uppermost deck.

(c) The scantlings of tween deck beams specified in 6.6 are based on the standard structural arrangement so as to maintain transverse stiffness of ships by means of efficient tween deck bulkheads provided above the hold bulkheads or by web frames extended to the top of superstructures at proper intervals.

6.6.2 Scantlings of tween deck frames

(a) The section modulus of tween deck frames below the freeboard deck is not to be less than that obtained from the following formula:

$6KShl^2$ cm^3

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Frame spacing, in m.

l = Tween deck height, in m.

h = Vertical distance, in m, from the middle of l to the point d+0.038L' above the top of keel.

However, where h is less than 0.03L, h is to be taken as 0.03L.

L' = Length of ship, in m. However, where L exceeds 230 m, L' is to be taken as 230 m.

(b) The section modulus of tween deck frames except those specified in (a) is not to be less than that obtained from the following formula:

$KCSlL$ cm^3

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
S and l	=	As specified in (a).
C	=	Coefficient given in Table II 6-5 of this Chapter.
L	=	Length of ship, in m, as specified in 1.2.1 of this part.

(c) The scantlings of tween deck frames below the freeboard deck within 0.15L from the fore end and within 0.125L from the after end are to be appropriately increased above those given by (a) and (b).

(d) Where decks are supported by longitudinal beams and web beams, the section modulus of tween deck frames supporting web beams is not to be less than that obtained from the following formula, in addition to those in (a) and (c).

$$2.4\left(1 + 0.0714n\frac{h_1}{h}\right) KShl^2 \qquad cm^3$$

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
S, h and l	=	As specified in (a).
n	=	Ratio of spacing of web beams to tween deck frame spacing.
h_1	=	Deck load, in kN/m^2, stipulated in 9.2 of this Part for the deck beam at the top of frame.

Table II 6-5
Coefficients C

Description of tween deck frames	C
Superstructure frames (excluding the following two items)	0.44
Superstructure frames for 0.125L from aft end	0.57
Superstructure frames for 0.125L from fore end and cant frames at stern	0.74

6.6.3 Special precautions regarding tween deck frames

(a) Care is to be taken so that the strength and stiffness of framing at the ends of the ship may be increased in proportion to the actual unsupported length of frame as well as the vertical height of tween decks.

(b) In ships having an especially large freeboard, the scantlings of tween deck frames may be properly reduced.

6.6.4 Superstructure frames

(a) Superstructure frames are to be provided at every frame located below.

(b) Notwithstanding the requirements in 6.6.2(b), superstructure frames for four frame spaces at the ends of bridges and of detached superstructures within 0.5L amidships are to be of the section modulus obtained from the formula in 6.6.2 using 0.74 as the coefficient C.

(c) Web frames or partial bulkheads are to be provided above the bulkheads required by Chapter 15 or at other positions such as may be considered necessary to give effective transverse rigidity to the superstructures.

6.6.5 The section modulus of frames of cruiser sterns is not to be less than 0.86 times that required by 6.8.1.

6.7 Frames Below Freeboard Deck Forward of Collision Bulkhead

6.7.1 The section modulus of transverse frames below the freeboard deck is not to be less than that obtained from the following formula:

$8KSh l^2$ cm^3

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Frame spacing, in m.

l = Unsupported length of frame, in m, but not to be less than 2.15 metres.

h = Vertical distance, in m, from the middle of *l* to a point 0.12L above the top of keel. However, where h is less than 0.06L, h is to be taken as 0.06L.

6.7.2 Longitudinals below the freeboard deck are to comply with the requirements in (a) and (b):

(a) The section modulus of longitudinals is not to be less than that obtained from the following formula. However, the modulus obtained from the formula is to be increased by 25% (between 0.05D and 0.15D from the top of the keel), and 50% (below 0.05D from the top of the keel).

$8KSh l^2$ cm^3

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Longitudinal frame spacing, in m.

l = Distance, in m, between the side transverse or between the side transverse and the transverse bulkhead. However, where *l* is less than 2.15 metres, *l* is to be taken as 2.15 metres.

h = Vertical distance, in m, from the longitudinals to a point 0.12L above the top of keel. However, where h is less than 0.06L, h is to be taken as 0.06L.

(b) Longitudinals are to be connected at each end to breast hooks and transverse bulkheads by efficient brackets.

6.8 Frames Below Freeboard Deck Abaft of After Peak Bulkhead

6.8.1 Transverse frames below freeboard deck

(a) The section modulus of transverse frames below the freeboard deck is not to be less than that obtained from the following formula:

$8Shl^2$ cm^3

where:

S = Frame spacing, in m.

l = Unsupported length of frame, in m.
However, where the length is less than 2.15 metres, *l* is to be taken as 2.15 metres.

h = Vertical distance, in m, from the middle of *l* to a point d+0.038L' above the top of keel.
However, where the distance is less than that 0.04L, h is to be taken as 0.04L.

(b) Where the ship speed exceeds 14 knots, the section modulus of side frames is to be increased over the value required by (a) by 2% per knot excess to a maximum of 12%.

Chapter 6A

Web Frames and Side Stringer

6A.1 General

6A.1.1 The requirements in this Chapter apply to side stringers supporting the transverse hold frames specified in 6.3.3 and the web frames supporting these side stringers.

6A.1.2 Web frames and side stringers are to be arranged to provide effective stiffness to the ship side structures.

6A.1.3 The strength of web frames and side stringers in way of deep tanks is not to be less than that required for vertical or horizontal girders on deep tank bulkheads.

6A.1.4 The side stringers supporting transverse hold frames that are fitted where the bow flare is considered to endure large wave impact pressure, and the web frames supporting these side stringers are to be properly strengthened and particular attention is to be paid to the effectiveness of their end connections.

6A.2 Web Frames

6A.2.1 Scantlings of web frames

(a) The scantlings of web frames supporting side stringers are not to be less than that obtained from the following formula:

Depth = $0.125l$, in m

Section modulus = KC_1Shl^2, in cm^3

Thickness of web = t_1 or t_2, in mm, whichever is greater:

$$t_1 = \frac{KC_2}{1000}\frac{Shl}{d_0} + 2.5 \quad \text{mm}$$

$$t_2 = 8.6\sqrt[3]{\frac{{d_0}^2(t_1-2.5)}{kK}} + 2.5 \quad \text{mm}$$

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
S	=	Web frame spacing, in m.
l	=	Unsupported length, in m, of web frame.
d_0	=	Depth, in m, of web frame. Where the webs are provided with vertical stiffeners, the divided web depth may be used for d_0 in the formula of t_2.
h	=	Vertical distance, in m, from the lower end of l to a point d+0.038L' above the top of keel.
L'	=	Length of ship, in m. Where, however, L exceeds 230m, L' is to be taken as 230m.
C_1 and C_2	=	As specified in Table II 6A-1 of this Chapter.
k	=	Coefficient given in Table II 6A-2 according to the ratio of S_1 to d_0, where S_1 is the spacing (m) of stiffeners or tripping brackets provided on web plates of web frames. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

(b) Where the web frames are in close proximity to boilers, the thickness of webs and face plates is to be suitably increased.

Table II 6A-1
Coefficients C1 and C2

	For web frames abaft 0.15 L from the fore end	For web frames between 0.15 L from the fore end and the collision bulkhead
C_1	3.0	3.8
C_2	23	28

Table II 6A-2
Coefficients k

S_1/d_0	≤ 0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.5	≥ 2.0
k	60.0	40.0	26.8	20.0	16.4	14.4	13.0	12.3	11.1	10.2

6A.2.2 Stiffening of webs

(a) Stiffeners or tripping brackets are to be provided on webs of web frames as may be required.

(b) Tripping brackets are to be arranged at intervals of about 3 metres.

(c) Where the breadth of face plates on either side of the web exceeds 180 mm, tripping brackets are to be arranged to support the face plates.

6A.2.3 Below the bulkhead deck, tween deck web frames are to be provided over the hold web frames as may be required, to provide continuity of transverse strength of the web frames in holds and machinery spaces.

6A.2.4 Beams at the top of web frames are to be suitably increased in both strength and stiffness.

6A.3 Hold Side Stringers

6A.3.1 Scantlings of hold side stringers

(a) The scantlings of side stringers are not to be less than that obtained from the following formula:

Depth = $0.125l$ m
plus one quarter of the depth (m) of slot for ordinary frames.

Section modulus = $C_1 S h l^2$ cm^3

Thickness of web = t_1 or t_2, whichever is greater: mm

$$t_1 = \frac{KC_2}{1000}\frac{Shl}{d_0} + 2.5 \quad \text{mm}$$

$$t_2 = 8.6\sqrt[3]{\frac{d_0^2(t_1-2.5)}{kK}} + 2.5 \quad \text{mm}$$

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Distance, in m, between the mid-points of the spaces from the side stringer concerned to the adjacent side stringers or to the top of the inner bottom plating at side or to the top of deck beams at side.

l = Web frame spacing, in m.

d_0	=	Depth of side stringer, in m. However, where the depth of the web is divided by providing a stiffener in parallel to the face plate, the divided depth may be taken as d_0 in the calculation of t_1.
h	=	Vertical distance, in m, from the middle of S to a point d+0.038L' above the top of keel. However, where h is less than that 0.05L (m), h is to be taken as 0.05L.
L'	=	Length of ship, in m. Where, however, L exceeds 230m, L' is to be taken as 230m.
C_1 and C_2	=	As specified in Table II 6A-3 of this Chapter.
k	=	Coefficient given in Table II 6A-2 of this Chapter according to the ratio of S_1 to d_0, where S_1 is the spacing (m) of stiffeners or tripping brackets provided on web plates of side stringers. For the intermediate values of S_1/d_0, k is to be obtained by linear interpolation.

Table II 6A-3
Coefficients C_1 and C_2

	For side stringers abaft 0.15L from the fore end	For side stringers between 0.15L from the fore end and the collision bulkhead
C_1	5.1	6.4
C_2	42	52

(b) In boiler spaces, the thickness of various parts of the stringer plate such as web plates and face plates are to be suitably increased.

6A.3.2 Stiffeners on webs

Stiffeners that cover the entire width of the web are to be provided on the webs of side stringers at alternate frames.

6A.3.3 Tripping brackets

(a) Tripping brackets are to be provided on side stringers at intervals of about 3 metres.

(b) Where the breadth of face plates on either side of the side stringer exceeds 180 mm, tripping brackets are to be arranged to support the face plates.

6A.3.4 Connection of side stringers to web frames

(a) Connection of side stringers to web frames is to extend for the full depth of the web frame.

(b) Where stringers are of the same depth as web frames, efficient gussets are to be used to connect the face plates of the side stringers with the face plates of the web frames.

6A.3.5 Connection of side stringers to transverse bulkhead

Brackets of a proper size are to be used to effectively connect side stringers to the transverse bulkheads.

Chapter 7
Shell Plating

7.1 General

7.1.1 Throughout this Chapter, the terms "Garboard Strake", "Sheer Strake", "Bottom Plating", "Side Plating", "Bottom Plating Forward", "End Plating" and "Superstructure Side Plating", are of the meanings as follows:

(a) The garboard strake is the first strake of plating next to a bar keel.

(b) The sheer strake is the strake of plating running alongside the strength deck.

(c) The bottom plating is the plating extending across the bottom of the ship from the keel to the upper turn of the bilge for 0.4L amidships, excluding the keel and the garboard strake.

(d) The side plating is the plating extending from the upper turn of the bilge up to the sheer strake for 0.4L amidships.

(e) The bottom plating forward is the plating on the flat of the bottom forward for 0.2L from the fore end (0.25L with machinery aft).

(f) The end plating is the shell plating for 0.1L from both ends.

(g) The superstructure side plating is the vertical plating extending from the freeboard deck to the superstructure deck.

7.1.2 The thickness of the shell plating is neither to be less than that required for purpose of longitudinal strength in accordance with Chapter 3 of this Part, nor that required by this Chapter.

7.1.3 The thickness of shell plating at such parts that the corrosion is considered excessive due to the location and/or the service condition of the ship is to be properly increased over that required in this Chapter.

7.1.4 With regard to the prevention of buckling of the shell, adequate consideration is to be given to the prevention of buckling due to compression in addition to complying with the requirements in 3.4 of this Chapter.

7.1.5 Sufficient consideration is to be made regarding the continuity in the thickness of shell plating and to the avoidance of remarkable differences between the thickness of the shell plating under consideration and that of the adjacent shell plating.

7.1.6 Where the shell plating is prone to denting due to contact with the wharf, special consideration is to be given to the thickness of the shell plating.

7.1.7 The requirements in this Chapter for side plating may be appropriately modified when the distance from the designed maximum load line to the strength deck is very large.

7.1.8 Moving parts penetrating the shell plating below the summer load draught, are to be fitted with a watertight sealing arrangement acceptable to the Society. The inboard gland is to be located within a watertight space of such volume that, if flooded, the bulkhead deck is not to be submerged. The Society may require that if such a compartment is flooded, essential or emergency power and lighting, internal communication, signals or other emergency devices remain available in other parts of the ship.

7.2 Plate Keels

7.2.1 The breadth of the plate keel over the whole length of the ship is not to be less than that obtained from the following formula:

$2L + 1000$ mm

7.2.2 The thickness of the plate keel over the whole length of the ship is not to be less than the thickness of the bottom shell for the midship part obtained from the requirements in 7.3.4 of this Chapter plus 2.0 mm. However, this thickness is not to be less than that of the adjacent bottom shell plating.

7.3 Shell Plating below the Strength Deck

7.3.1 The minimum thickness of shell plating below the strength deck is not to be less than that obtained from the following formula:

$\sqrt{KL}$ mm

Where:

K = Material factor as specified in 1.5.2(a) of this Part.

L = Length of ship, in m, as specified in 1.2.1 of this Part.

7.3.2 The thickness of side shell plating other than the sheer strake of the strength deck of the midship part is to be as required in the following (a) and (b) in addition to the requirements in 3.3.1 and 3.3.2 of this Part.

(a) In ships with transverse framing, the thickness of side shell plating is not to be less than that obtained from the following formula:

$C_1 C_2 S \sqrt{d - 0.125D + 0.05L' + h_1} + 2.5$ mm

Where:

S	=	Spacing of transverse frames	m
L'	=	Length of ship However, where L exceeds 230 m, L' is to be taken as 230 m.	m
C_1	=	Coefficient given below: Where L is 230 metres and under: 1.0 Where L is 400 metres and over: 1.07 For intermediate values of L, C_1 is to be obtained by linear interpolation.	
C_2	=	Coefficient given below: $91\sqrt{\dfrac{K}{576 - \alpha^2 K^2 x^2}}$	

where:

K = Material factor as specified in 1.5.2(a) of this Part.

α = As given in (1) or (2), whichever is greater

(1) $15.5 f_{BH} \left(1 - \frac{y}{y_B}\right)$

(2) Where L is 230 metres and under: $\frac{6}{a}$

Where L is 400 metres and over: $\frac{10.5}{a}$

For intermediate values of L, α is to be obtained by linear interpolation.

a = $\sqrt{K}$ if at least 80% of side shell is of high tensile steel in the transverse section amidships. Otherwise, a is to be 1.0.

y_B = Vertical distance from the top of keel at midship to the horizontal neutral axis of the athwartship section of hull m

y = Vertical distance from the top of keel to the lower edge of the side shell plating under consideration m

f_B = Ratio of the required hull girder section modulus as calculated in Chapter 3 when Mild steel is used to the actual hull girder section modulus at bottom.

x = As given by the following formula (hereinafter the same applies in (a):

$$\frac{X}{0.3L}$$

X = Distanceb from the fore end for side shell plating afore the midship, or from the after end for side shell plating after the midship. However, where X is less than that 0.1L, X is to be taken as 0.1L and where X exceeds 0.3L, X is to be taken as 0.3 L. m

h_1 = As given in (1) or (2) as follows.

(1) For 0.3L from the fore end:

$$\frac{9}{4}(17 - 20C_b{}')(1 - x)^2$$

(2) For elsewhere: 0

$C_b{}'$ = Block coefficient
Where C_b exceeds 0.85, $C_b{}'$ is to be taken as 0.85.

(b) In ships with longitudinal framing, the thickness of side shell plating is not to be less than that obtained from the following formula:

$$C_1 C_2 S \sqrt{d - 0.125D + 0.05L' + h_1} + 2.5 \quad \text{mm}$$

Where:

S = Spacing of longitudinal frames m

L′ = Length of ship specified in (a) m

C_1 = Coefficient specified in (a)

h_1 = As given in (a)

C_2 = Coefficient given by the following formula:

$$13\sqrt{\frac{K}{24-\alpha Kx}}$$, but it is not to be less than $3.78\sqrt{K}$

where:
K = Material factor as specified in 1.5.2(a) of this Part.

α = Coefficient specified in (a)

x = As given in (a)

7.3.3 The thickness of sheer strakes alongside the strength deck for the midship part is not to be less than 0.75 times that of the stringer plate of the strength deck. However, the thickness is not to be less than that of the adjacent side shell plating. For a rounded sheer strake the radius is not to be less than 15 times the thickness.

7.3.4 The thickness of bottom shell plating is to be as required in (a) and (b):

(a) In ships with transverse framing, the thickness is not to be less than that obtained from the following formula:

$$C_1C_2S\sqrt{d+0.035L'+h_1}+2.5 \quad \text{mm}$$

Where:

S	=	Spacing of transverse frames	m
L′	=	Length of ship specified in 7.3.2(a) of this Chapter	m
C_1	=	Coefficient specified in 7.3.2(a) of this Chapter	
h_1	=	Head specified in 7.3.2(a) of this Chapter	
C_2	=	Coefficient given by the following formula:	

$$\frac{91}{\sqrt{576-(15.5f_Bx)^2}}$$

f_B	=	As specified in 7.3.2(a) of this Chapter
x	=	As specified in 7.3.2(a) of this Chapter

(b) In ships with longitudinal framing, the thickness is not to be less than that obtained from the following formula:

$$C_1C_2S\sqrt{d+0.035L'+h_1}+2.5 \quad \text{mm}$$

Where:

S	=	Spacing of longitudinal frames	m
L'	=	Length of ship specified in 7.3.2(a) of this Chapter	m
C_1	=	Coefficient specified in 7.3.2(a) of this Chapter	
h_1	=	Head specified in 7.3.2(a) of this Chapter	
C_2	=	Coefficient given by the following formula	

$$13\sqrt{\frac{K}{24-15.5\,f_HKx}}$$, but it is not to be less than $3.78\sqrt{K}$

where:
K = Material factor as specified in 1.5.2(a) of this Part.

f_B = As specified in 7.3.2(a) of this Chapter

x = As specified in 7.3.2(a) of this Chapter

7.3.5 The thickness of bilge strakes for the midship part is not to be less than that obtained from the following formula. However, it is not to be less than the thickness of adjacent bottom plating.

$$\left\{5.22\left(d + 0.035L'\right)\left(R + \frac{a+b}{2}\right)^{1.5} l\right\}^{0.4} + 2.5 \quad \text{mm}$$

Where:

R	=	Bilge radius	m
a, b	=	Distance from the lower and upper turns of the bilge to the longitudinal frames nearest to the turns taking the distance outward from the bilge part as positive. However, where (a + b) is negative, (a + b) is to be taken as zero. (See Fig. II 7-1 of this Chapter)	m
L'	=	As specified in 7.3.2(a) of this Chapter	
l	=	Spacing of solid floors, bottom transverses or bilge brackets	m

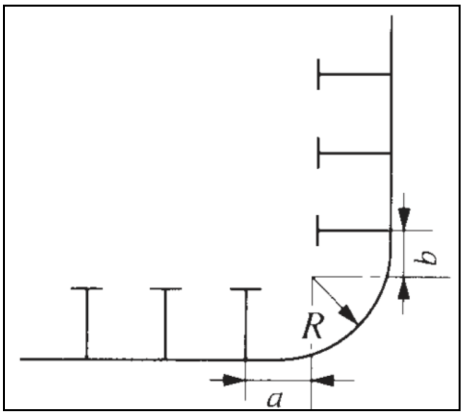


Fig. II 7-1
Measurement of a and b

Where some of the longitudinal frames at the bilge part in a longitudinal framing system are omitted, longitudinal frames are to be provided as near to the turns of the bilge as practicable and suitably constructed to maintain the continuity of strength.

Where longitudinal frames are provided at the bilge part at nearly the same spacing as that of bottom longitudinals, the bilge strakes may be in accordance with the requirements in 7.3.4 of this Chapter irrespective of the requirements in 7.3.5 of this Chapter.

Where bilge keels are fitted, special consideration is to be given to both the material and the arrangement.

7.4 Special Requirements for Shell Plating

7.4.1 Bow impact pressure

For shell plating where the bow impact pressure is assumed to be large, sufficient consideration is to be made regarding reinforcement against forces acting on the bow such as wave impact pressure.

7.4.2 Distance between frames

Where the distance between frames measured along the shell plating is remarkably different from the frame spacing, the shell plating is to be reinforced by such measures as increasing its thickness in accordance with the spacing of the frames.

7.4.3 Powerful engines

For shell plating at the aft part of ships that have especially powerful engines compared with the ship length, sufficient consideration is to be made regarding reinforcement against vibration.

7.4.4 Thickness of shell plating at the strengthened bottom forward

The thickness of shell plating at the strengthened bottom forward specified in Chapter 8 is to be as required in the following (a), (b) and (c). Where the ship has an unusually small draught at the ballast condition and has especially high speed for the ship s length, special consideration is to be given to the thickness of the shell plating.

(a) In ships having a bow draught of not more than $0.025L'$ at the ballast condition, the thickness of shell plating at the strengthened bottom forward is not to be less than that obtained from the following formula, where L' is as defined in 7.3.2 of this Chapter.

$CS\sqrt{P} + 2.5$ mm

Where:

C = Coefficient given in Table II 7-1 of this Chapter
For intermediate values of α, C is to be obtained by linear interpolation.

α = Value of the spacing of frames or spacing of girders or longitudinal shell stiffeners, whichever is greater divided by S

S = Spacing of frames or girders or longitudinal shell stiffeners, whichever is the smallest m

P = Slamming impact pressure specified in Chapter 8 kPa

Table II 7-1
Value of C

α	1.0	1.2	1.4	1.6	1.8	2.0 and above
C	1.04	1.17	1.24	1.29	1.32	1.33

(b) In ships having a bow draught of not less than $0.037L'$ at the ballast condition, the thickness of shell plating at the strengthened bottom forward is not to be less than that specified in 7.3.4 of this Chapter or obtained from the following formula, whichever is greater. Where L' is as defined in 7.3.2 of this Chapter.

$1.34S\sqrt{L} + 2.5$ mm

Where:

S = Spacing of frames or girders or longitudinal shell stiffeners, whichever is the smallest m

(c) In ships having an intermediate value of the bow draught specified in (a) and (b) above, the thickness is to be obtained by linear interpolation from the requirements in (a) and (b) above.

7.4.5 The thickness of shell plating adjacent to the stern frame or in way of spectacle bossing is not to be less than that obtained from the following formula. However, where the spacing of transverse frames in the after peak exceeds 610 mm or the length of ship exceeds 200 m, the thickness of the shell plating concerned is to be in accordance with the satisfaction of the Society.

$4.5L + 0.09L$ mm

7.5 Side Plating in way of Superstructure

Where the superstructure deck is not designed as a strength deck, the thickness of the superstructure side plating is not to be less than that obtained from the following formula, but it is not to be less than 5.5 mm. Side plating of superstructures exceeding 0.15L in length, except for those at the end parts, is to be suitably increased in thickness. From the fore end to 0.25L abaft the fore end:

$1.15S\sqrt{L} + 2.5$ mm

Elsewhere: $0.95S\sqrt{L} + 2.0$ mm

Where:

S = Spacing of longitudinal or transverse frames at the position m

7.6 Compensation at Ends of Superstructure

7.6.1 Breaks of superstructures are to be strengthened according to the following requirements in (a) to (c):

(a) Sheer strakes of the strength deck are to extend well into the superstructure and are to be increased in thickness by not less than 20% above the normal thickness for sheerstrakes at that location for an appropriate span on both sides of the superstructure end.

(b) Side plating of the superstructure is to extend to an appropriate length beyond the end of the superstructure and taper off into the upper deck sheerstrakes to avoid an abrupt change of form at the break. The thickness of side plating at the ends of the superstructure is to be 20% greater than the normal thickness of superstructure side plating and this is to be taken as the standard.

(c) For superstructures located at the bow and stern, the requirements in (a) and (b) above may be suitably modified.

7.6.2 Openings in shell

Gangway ports, large freeing ports and other openings in the shell or bulwarks are to be kept well clear of the end of superstructures. Where holes are unavoidably required in the plating, they are to be made as small as possible and to be circular or oval in form.

7.7 Local Compensation of Shell Plating

7.7.1 Openings in shell

All openings in the shell plating are to have their corners well rounded and to be compensated as necessary.

7.7.2 Sea chest

Where a sea chest is provided in the shell plating for suction or discharge, the thickness of the sea chest is not to be less than that obtained from the following formula and to be suitably stiffened so as to provide sufficient rigidity as necessary. Also, the thickness is not to be less than the required thickness of the shell plating at that location.

$\sqrt{L} + 2.0$ mm

7.7.3 Openings such as cargo ports and gangway ports are to be kept well clear of discontinuous parts in the hull construction, and the places where they are provided are to be locally compensated for so as to maintain the longitudinal and transverse strengths of the hull.

7.7.4 The shell plating fitted with hawse pipes and the plating below them is to be increased in thickness or to be doubled, and to be constructed so that their longitudinal seams are not damaged by anchors and anchor cables.

7.7.5 Cargo ports and other similar openings

(a) Cargo ports and other similar openings in the sides of ships below the freeboard deck are to be fitted with doors so designed as to ensure watertightness and structural integrity as the surrounding shell plating. Unless otherwise granted by the Society, these opening are to open outwards. The number of such openings is to be the minimum compatible with the design and proper working of the ship.

(b) Unless otherwise permitted by the Society, the lower edge of openings referred to in paragraph (a) is not to be below a line drawn parallel to the freeboard deck at side, which is at its lowest point at least 230 mm above the upper edge of the uppermost load line.

(c) Where it is permitted to arrange cargo ports and other similar openings with their lower edge below the line specified in paragraph (b), additional features are to be fitted to maintain the watertight integrity.

(d) The fitting of a second door of equivalent strength and watertightness is none acceptable arrangement. A leakage detection device is to be provided in the compartment between the two doors. Drainage of this compartment to the bilges, controlled by a readily accessible screw down valve, is to be arranged. The outer door is to open outwards.

(e) Arrangements for bow doors and their inner doors, side doors and stern doors and their securings are to be in compliance with the requirements of a recognized organization, or with the applicable national standards of the society which provide an equivalent level of safety.

7.7.6 Where side scuttles are fitted in the shell plating, the location and the size are to be clearly indicated in the plan for approval.

Chapter 8

Strengthening of Bottom Structure Forward

8.1 General

8.1.1 In ships having a bow draught under 0.037L' in the ballast condition, the construction of the strengthened bottom forward is to be in accordance with the requirements in 6.8, where L' is as defined in 7.3.2.

8.1.2 In ships having an unusually small draught in the ballast condition and that have especially high speed for the ship s length, special attention is to be paid to the construction of the strengthened bottom forward.

8.1.3 In ships having a bow draught of not less than 0.037L' in the ballast condition, the construction of the strengthened bottom forward may be as specified in 5.2 to 5.6 of this Part.

8.1.4 The part of flat bottom forward from the position specified in Table II 8-1 of this Chapter as below is defined as the strengthened bottom forward.

Table. II 8-1
After End of Range of Strengthened Bottom Forward

$V/\sqrt{L}$	and over		1.1	1.25	1.4	1.5	1.6	1.7
	less than	1.1	1.25	1.4	1.5	1.6	1.7	-
Position (from stem)		0.15L	0.175L	0.2L	0.225L	0.25L	0.275L	0.3L

8.1.5 Notwithstanding the requirement in 8.1.1 above, ships that have an especially small draught in ballast condition or where C_b is especially small are to have the strengthened bottom forward extended to the satisfaction of the Society.

8.2 Double Bottom Structure

8.2.1 Strengthening on the double bottom structure forward of transverse framing system is to be provided with one of the methods prescribed in the following 8.2.3 and 8.2.4 in association with the solid floor fitted on every frame.

8.2.2 Strengthening on double bottom structure forward of longitudinal framing system is to be provided in accordance with 8.2.5 hereunder in association with the solid floor fitted on the alternate frame.

8.2.3 Half height intercostal girder and intermediate frame

(a) The additional half-height intercostal girder is to be fitted with a spacing not more than 1.5 m apart and not more than 760 mm on each side of the center girder and is to be carried as far forward as practicable. The half height girder plate is to be of the thickness not less than that required for the floor in the machinery space and to be flanged on its upper edge.

(b) The intermediate frame is to be fitted between solid floors and is to extend from the center girder to the margin plate or to the first side girder outside the flat part of the bottom. The scantling of the intermediate frame is to be as required for the frame in the peak.

8.2.4 Spacing of girders

(a) Between the collision bulkhead and 0.05L abaft the after end of the strengthened bottom forward, full intercostal side girders in the bottom forward are to be so arranged that the spacing of the girders is not more than 2.3 m.

(b) Additional half-height girders or longitudinal shell stiffeners are to be fitted in the midway of the full side girder, between the collision bulkhead and 0.025L abaft the after end of strengthened bottom forward.

8.2.5 Solid floors

(a) Between the collision bulkhead and the after end of the strengthened bottom forward, solid floors are to be provided at every frame in the transverse framing system, or at least at alternate frames in the longitudinal framing system.

(b) The solid floors are to be strengthened by providing vertical stiffeners in way of half-height girders or longitudinal shell stiffeners, except where the longitudinal shell stiffeners are spaced especially close and the solid floors are adequately reinforced, the vertical stiffeners for the solid floors may be provided on alternate shell stiffeners.

8.2.6 The spacing of longitudinal frames on double bottom structure forward of longitudinal framing system is not to exceed 700 mm.

8.2.7 In ships having a bow draught of more than 0.025L′ but less than 0.037L′ in the ballast condition, where the construction and arrangement of the strengthened bottom forward are impracticable to comply with the above-mentioned requirements, suitable compensation is to be provided for the floors and side girders.

8.3 Scantlings of Longitudinal Shell Stiffeners or Bottom Longitudinals

8.3.1 In ships having a bow draught of not more than 0.025L' in the ballast condition, the section modulus of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward is not to be less than that obtained from the following formula:

$0.53P\lambda l^2$ cm^3

Where:

l = Spacing of solid floors m

λ = $0.774\, l$
However, where the spacing (m) of longitudinal shell stiffeners or bottom longitudinals is not more than $0.774\, l$, λ is to be taken as the spacing.

P = Slamming impact pressure obtained from the following formula: kPa

$$2.48\frac{LC_1C_2}{\beta}$$

C_1 = Coefficient given in Table II 8-2 of this Chapter
For intermediate values of $V/\sqrt{L}$, C_1 is to be obtained by linear interpolation.

C_2 = Coefficient obtained from the following formula:
Where $V/\sqrt{L}$ is 1.0 and under: 0.4
Where $V/\sqrt{L}$ is over 1.0, but less than 1.3: $0.667\frac{V}{\sqrt{L}} - 0.267$
Where $V/\sqrt{L}$ is 1.3 and over: $1.5\frac{V}{\sqrt{L}} - 1.35$

β = Slope of the ship's bottom obtained from the following formula, but C_2/β need not be taken as greater than 11.43 (See Fig. II 8-1 of this Chapter).

$$\frac{0.0025L}{b}$$

b = Horizontal distance measured in the station 0.2L from the stem, from the centre line of ship to the intersection of the horizontal line 0.0025L above the top of keel with the shell plating (See Fig. II 8-1 of this Chapter) m

Table II 8-2
Value of C_1

$V/\sqrt{L}$	1.0 and under	1.1	1.2	1.3	1.4	1.5 and above
C_1	0.12	0.18	0.23	0.26	0.28	0.29

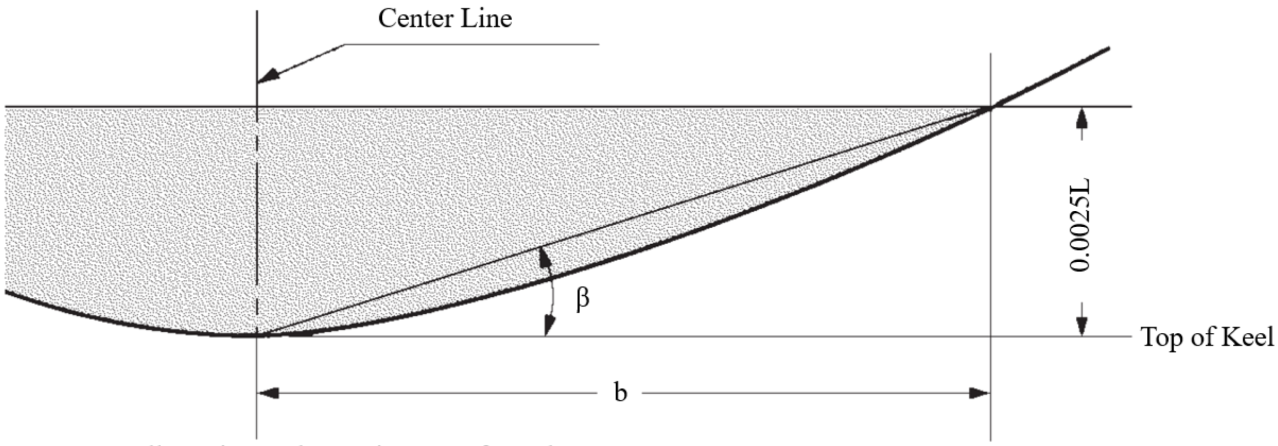

Fig. II 8-1
Measurement of b

8.3.2 In ships having a bow draught of more than 0.025L′ but less than 0.037L′ in ballast condition, the section modulus of longitudinal shell stiffeners or bottom longitudinals in way of the strengthened bottom forward is to be obtained by linear interpolation from the values given by the requirements in 8.3.1 above and 5.6 of this Part.

Chapter 9

Beams and Deck Longitudinals

9.1 General

9.1.1 Beam spacing

(a) Transverse beams are to be fitted on every frame in the following cases:

(i) At the freeboard deck in ships exceeding 4.6 m in depth and having no deck below the freeboard deck.

(ii) At the freeboard deck under bridge for 8 frame spacings from each end of the bridge.

(iii) At the strength deck in ships more than 105 m in length.

(iv) At the unsheathed strength deck.

(v) At the unsheathed deck where the frame spacing exceeds 760 mm.

(vi) At the tank top, tunnel top and bulkhead recess.

(vii) At the forecastle deck for 0.125L from the fore end.

(b) Besides the cases mentioned above, transverse beams are to be fitted not more than 2 frame spacings apart.

9.1.2 Transverse beams in different tiers if fitted on alternate frames are to be fitted on the same frames.

9.2 Beams

9.2.1 The section modulus of the beam is not to be less than that derived from the following formula:

$4.8Ksh l^2$ cm^3

where:

K = Material factor as specified in 1.5.2(a) of this Part.

s = The spacing of the beam, in m.

l = The horizontal span, in m.

= The span between adjacent lines of girder supports, or from the inner edge of the beam knee to the nearest line of support, whichever is greater.

≥ 0.2 B, normally.

≤ 4.6 m, under the top of deep tank and in way of the bulkhead recess.

* For decks intended to carry ordinary cargoes or stores, the value of h for head (m) is to be in accordance with the following

h = The actual height, in m, as follows

= The actual height from the deck to the deck above, measured at the side of the ship, for the beam at the deck on which cargo, coal or store may be carried.
Where the cargo load differs from 7.04 kN/m^3 multiplied by the tween-deck height, in m, the height is to be proportionately adjusted.

= For bulkhead recesses and tunnel flats is the height, in m, to the bulkhead deck at the centerline; where that height is less than 6.10 m, the value of h is to be taken as 0.8 times the actual height plus 1.22 m.

= For deep-tank tops is not to be less than two-thirds of the distance from the top of the tank to the top of the overflow; it is not to be less than given in Table II 9-1/ e type of deck, appropriate to the length of the vessel, the height to the load line or two-thirds of the height to the bulkhead or freeboard deck, whichever is greatest. The section modulus is not to be less than would be required for cargo beams.

*Elsewhere for the weather deck, the value of h for head (m) may be taken from the appropriate type of decks h = The value given in Table II 9-1 of this Chapter and the associated note, for beams at other decks than those mentioned above.

*Note: The value of h_1 for load (kN/m^2) is to be obtained by multiplying the head mentioned above by 7.

9.2.2 The size of the beam is to be suitably increased where heavy concentrated load such as at end of the deck house, in way of the mast, king post, winch, auxiliary machinery, etc. is to be carried by the beam.

9.2.3 Where no hold pillar is fitted at the hatch corner, the hatch end beam is to be in accordance with 10.5 of this Part.

9.2.4 Beams on bulkhead recesses and others

The section modulus of beams at deck forming the top of bulkhead recesses, tunnels and tunnel recesses is not to be less than that obtained from the formula in 14.2.8 of this Part.

9.2.5 Beams on top of deep tanks

The section modulus of beams at deck forming the top of deep tanks is to be in accordance with this Chapter, and not to be less than that obtained from the formula in 16.2.3 of this Part, taking the top of deck beams as the lower end of h and beams as stiffeners.

9.3 Deck Longitudinals

9.3.1 The standard spacing of deck longitudinals is to be as given in 5.6.2 of this Part.

9.3.2 Deck longitudinals are to be supported by transverse web beams of a spacing not more than 3.6m apart.

9.3.3 The section modulus of the deck longitudinal is to be determined by the following formula:

$$CKshl^2 \quad cm^3$$

where:

C = Constant as given in Table II 9-2 of this Chapter.

K = Material factor as specified in 1.5.2(a) of this Part.

s = Spacing of the deck longitudinal, in m.

h = The height as defined in 9.2.1 of this Chapter, in m.

l = The span between the web beams or between the web beam and the midpoint of end bracket, in m.

9.3.4 Continuity of deck longitudinals

(a) Deck longitudinals are to be fitted continuously through transverse web beams.

(b) Where the deck longitudinal is cut at the bulkhead, sufficient end connections are to be provided so as to effectively develop the sectional area and its resistance to bending.

9.3.5 In the part where the longitudinal system is transformed to the transverse system, care is to be taken to avoid any abrupt discontinuity.

9.4 End Attachment of Beams and Deck Longitudinals

9.4.1 Beam Knees

(a) Deck beams are to be connected to frames or stiffeners of the longitudinal bulkhead by beam knees. The scantlings of the beam knee brackets are to be obtained from the following formulae:

$t_1 = 1.26 \times \sqrt[3]{Z} + 1$ mm for plain bracket

$t_2 = t_1 - 2$ mm for flanged bracket

$t_{min} = 6.5$ mm

$l = 50\sqrt{\frac{Z}{t_1}}$ mm

$l_{min} = 100$ mm

$b = 40 + \frac{Z}{30}$ mm

where:

t = Thickness of bracket, in mm.

Z = Section modulus of the smaller section to be connected, in cm^3.

l = Arm length, i.e. the length of the welded connection, in mm.

b = Width of flange, in mm, but is to be at least 50 mm and needed not be greater than 90 mm.

(b) For single deck ships within 0.6L amidships the arm length of the beam bracket is to be increased by 20%.

9.4.2 Longitudinally framed decks

(a) The bracket connecting the side frame to the deck clear of the transverse is to be in accordance with 9.4.1 (a) above based on the modulus of the frame, but the horizontal arm of the bracket is to be extended to a longitudinal.

(b) Where the deck longitudinal is cut at the transverse bulkhead, the minimum sectional area of the bracket at the end of the longitudinal, and also the area of weld connection, are to be equal to the sectional area of the longitudinal. The area of weld connection is defined as the product of throat thickness and length of weld. The depth of the bracket below the longitudinal is to be at least equal to the depth of the longitudinal.

Table II 9-1
Height h

Type of decks	L (m)	h (m)
(a) - Exposed freeboard deck having no deck below	90 ≤ L ≤ 110	0.02 L + 0.76
	110 < L	2.90
(b) - Exposed freeboard deck having deck below - Exposed superstructure deck first above the freeboard deck for 0.25L from fore end	90 ≤ L ≤ 100	0.0029 L+ 2.0
	100 < L	2.29
(c) - Forecastle deck first above the freeboard deck - Bridge deck first above the freeboard deck - Exposed superstructure deck, over 0.1L in length first above the freeboard deck between 0.25L from fore end and 0.2L from aft end - The freeboard deck within superstructure - The deck below freeboard deck	90 ≤ L ≤ 100	0.0168 L
	100 < L ≤ 110	0.021 L-0.41
	110 < L ≤ 120	0.008 L+1.02
	120 < L	1.98
(d) - Exposed bridge deck, not over 0.1L in length first above the freeboard deck - Poop deck first above the freeboard deck - Exposed superstructure deck first above the freeboard deck for 0.2L from the aft end - Exposed superstructure deck second above the freeboard deck(1) - First tier of deck house above the freeboard deck	90 ≤ L ≤ 100	0.01 L+0.31
	100 < L ≤ 110	0.014 L-0.1
	110 < L	0.02 L-0.76
(e) - Second tier of deck house above the freeboard deck(2)	90 ≤ L ≤ 100	0.01 L+0.15
	100 < L ≤ 110	1.15
	110 < L	0.012 L-0.17
(f) - The third and higher tiers of deck house above the freeboard deck(2) - Superstructure decks (third and higher above the freeboard deck) which contain only accommodation spaces	90 ≤ L	0.91

Notes:

(1) Where the superstructure above the first superstructure extends forward of 0.5L amidhsips the value of h is to be suitably increased.

(2) Where the deck to which the side shell plating does not extend is generally used only as weather covering, the value of h may be reduced, but in no case is to be less than the minimum value 0.46 m.

Table II 9-2
Constant C

Type of decks	C
1. Strength deck	7.7
2. Within the line of openings at all decks	4.8
3. Effective second and third decks	7.0
4. Platform deck	4.8

Chapter 10

Deck Girders and Pillars

10.1 General

10.1.1 Deck beams are to be supported by longitudinal deck girders in association with pillars or strong hatch end beams.

10.1.2 Deck girders spacing

(a) In way of the bulkhead recess and the top of tank, deck girders are to be spaced not more than 4.6 m apart.

(b) Additional girders are to be fitted under masts, derrick posts, deck machinery or other heavy concentrated load areas.

10.1.3 The deck plating in way of the girder is to be increased in thickness or effectively stiffened where necessary to provide an effective flange of the girder.

10.1.4 Pillars in the tween deck and holds are to be in the same vertical line as far as possible.

10.1.5 Wide spaced pillars are to be fitted in line with keelsons or double bottom girders, and if infeasible, to be as close as practicable.

10.1.6 The seating under wide spaced pillars is to be of ample strength and of a character which provides effective distribution of the load.

10.1.7 Where the pillar is not directly above the intersection of the solid floor and the intercostal girder, the partial floor and intercostal girder are to be fitted to support the pillar.

10.1.8 Manholes and lightening holes are not to be cut in the floor and girder below the heel of pillars.

10.1.9 Where the heel of pillars is carried on a tunnel, suitable arrangement is to be made to support the load.

10.1.10 Additional supports are to be arranged at the end and corner of the deck house, in the machinery space, at the end of partial superstructure and under the heavy concentrated load areas.

10.2 Deck Girders Clear of Tanks

10.2.1 Scantling

(a) The section modulus is not to be less than that obtained from the following formula:

$4.8Kb\,h\,l^2$ cm^3

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
b	=	The mean breadth of the area of the deck supported, in m.
h	=	The height as defined in 9.2.1 of this Part, in m.
l	=	The span between centers of supporting pillars, or between the pillar and the center of end bracket at the bulkhead, in m.

(b) The depth of the web of the girder is not to be less than 5% of the span *l*.

(c) The thickness of web plates is not to be less than 1% of the depth plus 4 mm but is not to be less than 8.5 mm, 10 mm, 12.5 mm or 15 mm where the sectional area of face plates is 38 cm^2, 65 cm^2, 130 cm^2 or 195 cm^2 respectively. The thickness for intermediate area may be obtained by interpolation.

10.2.2 Where the girder is subjected to concentrated load such as the pillar out of line, the hanging load, etc., the section modulus is to be specially calculated.

10.2.3 Tripping brackets are to be fitted at intervals of about 3 m and near the change of section. Where the breadth of the flanges on either side of the web exceeds 200 mm, tripping brackets are to be arranged to support the flange. Additional supports are to be provided for the flanges where their breadth exceeds 400mm.

10.2.4 The girder is to be attached to the bulkhead by flanged bracket. At the bulkhead, the stiffener is to be suitably strengthened to provide ample support to the girder.

10.3 Deck Transverses

The deck transverse supporting deck longitudinal is to be of the size obtained from the formula given in 10.2 of this Chapter, where l is the span, in m, between supporting girders, or between the girder and the ship's side deducting $\frac{1}{2}$ the distance between the toe of the bracket and the ship's side; b is the spacing of transverse, in m; and h is the height, in m, as defined in 9.2.1 of this Part. The requirement for minimum depth and thickness of web plates and arrangement of tripping brackets are to be the same as given in 10.2 of this Part.

10.4 Hatch Side Girders

10.4.1 Scantling for hatch side girder supporting the transverse shifting beam or hatch cover is to be obtained in the same manner as the deck girder.

10.4.2 The hatch side girder along the lower deck hatch under the trunk in which no cover is fitted is to be increased in proportion to the extra load to be carried due to the loading up into the trunk.

10.4.3 Where the deep coaming is fitted above such as at weather deck, the girder below deck may be modified so as to obtain a section modulus when taken in conjunction with the coaming up to and including the horizontal coaming stiffener, of not less than that given by the following formula:

$$6.5\,K b h l^2 \quad cm^3$$

where K, *l*, b and h are as specified in 10.2.1 of this Chapter.

10.4.4 Where the hatch side girder is not continuous under the deck beyond the hatchway to the bulkhead, the bracket extending for at least 2 frame spaces beyond the end of the hatchway is to be fitted.

10.4.5 The gusset plate is to be fitted at the hatchway corner and arranged so as to effectively connect the flange of the hatch side girder and the hatch end beam.

10.5 Hatch End Beams

10.5.1 The hatch end beam supported only by a center line pillar without a pillar at the corner of the hatchway is classified into 2 cases as follows:

Case 1: Where the deck girder is not fitted on the line of the hatch side beyond the hatchway.

Case 2: Where the deck girder is fitted fore and aft beyond the hatchway.

10.5.2 The section modulus is not to be less than that derived from the following formula:

For Case 1: $K A B h l$ cm^3

For Case 2: $K (A B + C D) h l$ cm^3

where:

l = The distance from the center of beam bracket to the center line, in m.

A = The length of the hatchway, in m.

B = The distance from the center line to the midpoint between the hatch side and the line of the toe of the beam knee, in m.

C = The distance from a point midway between the center line and the line of hatch side to the midpoint between the hatch side and the line of the toe of beam knee; where no girder is fitted on the center line beyond the hatchway, C is equal to B, in m.

D = The distance from the hatch end beam to the adjacent hold bulkhead, in m.

h = The height as specified in 9.2.1 of this Chapter, in m.

K = $2.20 + 1.29 (F/N)$ when $F/N \leq 0.6$

= $4.28 - 2.17 (F/N)$ when $F/N > 0.6$

N = One-half the breadth of the vessel in way of the hatch-end beam, in m.

F = Distance from the side of the vessel to the hatch side girder, in m.

10.5.3 The depth and thickness of the hatch end beam are to be in accordance with the requirement specified in 10.2.1 of this Chapter.

10.5.4 The weather deck hatch end beam having a deep coaming above the deck for the full width of the hatchway may have the face plate area reduced from a point well within the line of the hatch side girder to approximately 50% of the required area at the center line.

10.5.5 Tripping brackets are to be fitted to hatch end beams in accordance with 10.2.3.

10.5.6 The frame in way of the hatch end beam is to be strengthened if considered necessary.

10.6 Pillars

10.6.1 The sectional area of pillars is to be determined from the following formula:

$$\frac{W}{k - \frac{nl}{r}} \quad cm^2$$

where:

l	=	The distance from the top of the inner bottom, deck or other structure on which the pillar is based to the under side of the beam or girder supported, in m.
r	=	The least radius of gyration, in cm.
W	=	Deck load supported by the pillar, in kN.
	=	$9.81S\ b\ h + W_o$
S	=	The mean length of the area supported by the pillar, in m.
b	=	The mean width of the area supported by the pillar. Normally the minimum value of b is to be taken as 0.2 B, in m.
h	=	Deck height for the area supported as defined in the 9.2.1 of this Part, in m.
W_o	=	Deck load of the upper tween deck pillar above the lower pillar in question, as defined in 10.6.2 of this Chapter, in kN.
k	=	12.09 for mild steel
	=	16.11 for HT32
	=	18.12 for HT36
n	=	4.44 for mild steel
	=	7.47 for HT32
	=	9.00 for HT36

10.6.2 Load of upper pillar

(a) Where no pillar is fitted in the tween deck space directly above the deck supported by the pillar in question, W_o is equal to zero.

(b) Where the pillar is fitted in the tween deck space directly above the deck supported by the pillar in question, W_o is to be taken equal to W for the tween deck pillar.

(c) Where the pillar is not directly in line with those above or not on the line of the girder but which supports the load from above or the deck girder through a system of supplementary fore and aft or transverse girder, W_o is to be the actual load transmitted to the pillar in question through the system of the girder.

10.6.3 The pillar under the top of the deep tank is to be of solid section and of a size not less than that required by 10.6.1 or the sectional area required by the following formula, whichever is the greater:

$1.09\ kS\ b\ h \quad cm^2$

where:
S and b are as specified in 10.6.1 of this Part.

k	=	1.00 for mild steel
	=	0.75 for HT32
	=	0.67 for HT36
h	=	The vertical distance, in m, from the top of the tank to the load line, or to 2/3 of the depth to the freeboard or bulkhead deck, or to1/2 of the height from the tank top to the overflow pipe, whichever is the greatest.

10.7 End Attachment of Pillars

10.7.1 Effective arrangement is to be made to distribute the load at the head and heel of the pillar.

10.7.2 Wide-spaced pillars are to bear solidly at head and heel and are to be attached by welding properly proportioned on the size of the pillar.

10.7.3 The end attachment of the pillar under bulk-head recess, tunnel top or deep tank top which may be subjected to tension load is to be efficiently welded to withstand the tension load.

Chapter 11

Decks

11.1 General

11.1.1 All ships are required to be plated over in the following portions of the deck:

(a) In way of the crown of the machinery space.

(b) In way of the top of the tank.

(c) In way of the step in the bulkhead.

11.1.2 In cases other than specified in 11.1.1 of this Chapter, the deck may be either plated throughout or fitted with the stringer and the tie plate.

11.1.3 Passability through decks by frames

(a) The frame is not to extend through the weather deck, tank top, or watertight flat, unless efficient means for watertightness is provided.

(b) Where the frame passes through other tight deck below the weather deck or the freeboard deck within superstructure which is not fully and permanently enclosed, or the bulkhead deck in a passenger ship, efficient means for watertightness is to be provided.

11.1.4 Approved deck composition may be laid on the steel deck provided that the steel deck is to be coated with a suitable material in order to prevent corrosive action and that the composition is to be effectively secured to the deck.

11.1.5 The thickness of deck plating within the midship 0.4L for ships of 90 m or more in length is neither to be less than that required to obtain the section modulus for longitudinal strength specified in Chapter 3 of this Part, nor that required by this Chapter.

11.2 Tapering of Deck Sectional Areas and Deck Transitions

11.2.1 Deck sectional areas used in the deck area and section modulus calculations are to be maintained throughout the midship 0.4L. They may be gradually reduced to 50% the normal requirement at 0.15L from the ends.

11.2.2 In way of the superstructure beyond the midship 0.4L the strength deck area may be reduced to approximately 70% of the normal requirement at that position.

11.2.3 Where effective areas in the same deck change, as in way of partial superstructures or over discontinuous decks, care is to be taken to extend the heavier plating well into the section of the ship in which the lesser requirements apply, to obtain a good transition from one arrangement to the other. Partial decks within the hull are to be tapered off to the shell by means of long brackets. Where effective decks change in level, the change is to be accomplished by a gradually sloping section or the deck material at each level is to be effectively overlapped and thoroughly tied together by diaphragms, webs, brackets, etc., in such a manner as will compensate for the discontinuity of the structure.

11.3 Plated Decks

11.3.1 If the thickness of the strength deck plating is less than that of the side shell plating, a stringer plate having the width of the sheer strake and the thickness of the side shell plating is to be fitted to strength deck.

11.3.2 Thickness of strength deck plating amidships outside line of opening

(a) The minimum thickness of the strength deck plating amidships outside line of the opening is not to be less than that obtained from the following formulae:

(i) For decks on transverse beams:

(1) t = 0.01s + 2.3 mm s ≤ 760 mm
t = 0.0066s + 4.9 .mm s > 760 mm
To extend over 0.8L amidships, beyond which the thickness forward and aft is not to be less than required for forecastle and poop deck plating respectively.

(2) and $t = \frac{s(L+45.73)}{25L+6082}$ mm, which ever is greater
To extend over 0.4L amidships and tapered beyond in a manner the same as in 11.2.3 of this Chapter.
Vessels designed on still water bending moment envelope curves will be specially considered.

(ii) For decks on longitudinal beams:

(1) t = 0.009s + 2.4 .mm s ≤ 760 mm
t = 0.006s + 4.7 .mm s > 760 mm
To extend over 0.8L amidships, beyond which the thickness forward and aft is not to be less than required for forecastle and poop deck plating respectively.

(2) and $t = \frac{s(L+45.73)}{26L+8681}$ mm, for L ≤ 183 m, which ever is greater

To extend over 0.4L amidships and tapered beyond in a manner the same as in 11.2.3 of this Chapter.
Vessels designed on still water bending moment envelope curves will be specially considered.

where:

s = Beam spacing, in mm.
L = Length of ship, in m

(b) In small vessels, the minimum thickness of the deck plating outside line of the opening may be reduced to the thickness of the plating inside the line of the opening, provided that the required effective deck area is fully distributed to the thicker plate along the hatchway and the stringer plate.

11.3.3 The thickness of the strength deck plating amidships inside the line of the opening is to be obtained from the following formulae:

(a) Exposed strength deck within line of openings

t = 0.01s + 0.9 mm s ≤ 760 mm
t = 0.0067s + 3.4 mm s > 760 mm

The equation above applies amidships. At the forward and aft ends, plating is to be as required for exposed forecastle and poop deck.

(b) Enclosed strength deck within line of openings

t = 0.009s + 0.8 mm s ≤ 760 mm
t = 0.0039s + 4.3 mm s > 760 mm

where:

s = Beam spacing, in mm.

11.3.4 The thickness of the strength deck plating at 0.1L from the ends is not to be less than obtained from the following formula:

t = 0.025 L + 4.7 mm

where:

L = Length of ship, in m.

11.3.5 The thickness of the plating of the lower deck which is designated as platform deck and considered to be non-effective deck for longitudinal strength, is not to be less than that obtained from the following formula.

(a) Platform decks in enclosed cargo spaces

$t = Ks\sqrt{h} + a$ mm , but not less than 5.0 mm
K = 0.00394
a = 1.5 mm
h = tween deck height in m

When a design load is specified, h is to be taken as p/n where p is the specified design load in kN/m^2 and n is defined as 7.04.

(b) Platform decks in enclosed accommodation spaces

t = 0.0058s + 1.0 mm, but not less than 4.5 mm

Where the platform decks are subjected to hull girder bending, special consideration is to be given to the structural stability of deck supporting members.

11.3.6 The minimum thickness of the effective lower deck plating is not to be less than the following:

(a) Second deck:

	D	> 15.2 m :	Same as 11.3.2 (a)(i)
15.2 m ≥	D	> 12.8 m :	Same as 11.3.2 (a)(ii)
	D	< 12.8 m :	Same as 11.3.3

where:

D = Depth of ship, in m.

(b) Third deck:

	D	> 17.7 m :	Same as 11.3.2 (a)(i)
17.7 m ≥	D	> 13.4 m :	Same as 11.3.2(a)(ii)
13.4 m ≥	D	> 9.8 m :	Same as 11.3.3
	D	< 9.8 m :	Same as 11.3.5

where:

D = Depth of ship, in m.

11.3.7 Where the superstructure deck is not designed as the strength deck, the minimum thickness of superstructure deck plating is not to be less than that obtained from the following formulae:

(a) Forecastle and bridge deck plating:

t = 0.009 s + 2.4 mm	s ≤ 760 mm, L > 122 m
t = 0.006 s + 4.7 mm	s > 760 mm, L > 122 m
t = 0.01 s + 0.9 mm	s ≤ 760 mm, L ≤ 122 m
t = 0.0067 s + 3.4 mm	s > 760 mm, L ≤ 122 m

where:

L = Length of ship, in m.

s = Beam spacing, in mm.

(b) Poop deck plating:

$t = 0.01\ s + 0.9$ mm $s \leq 760$ mm, $L > 100$ m
$t = 0.0067\ s + 3.4$ mm $s > 760$ mm, $L > 100$ m
$t = 0.009\ s + 0.8$ mm $s \leq 760$ mm, $L \leq 100$ m
$t = 0.0039\ s + 4.3$ mm $s > 760$ mm, $L \leq 100$ m

(c) Exposed bridge deck plating:

$t = 0.01s + 0.25$ mm $s \leq 760$ mm
$t = 0.0043s + 4.6$ mm $s > 760$ mm

where
L = Length of ship, in m.
s = Beam spacing, in mm.

(d) Where the beam is fitted on every alternative frame, the thickness given in 11 3.7(a) and (b) above is to be increased by 50%.

11.3.8 Where the plated deck of the strength deck is covered by the superstructure or the deck house the minimum thickness may be reduced by 1 mm.

11.3.9 Thickness of effective deck plating under boiler, in bunker space or refrigerated space

(a) The thickness of the effective deck plating under the boiler is to be increased by 3 mm to the required thickness specified above.

(b) The thickness of the deck plating in the refrigerating space where no special means for the protection against corrosion of the deck is provided, is to be increased by 1 mm to the required thickness specified above.

11.3.10 Deck plating over deep tank, tunnel, or forming recess or step in bulkhead

(a) The deck plating over the tunnel or forming the recess or the step in the bulkhead is to be of a thickness not less than that required for the plating of the ordinary bulkhead at the same level plus 1 mm.

(b) The deck plating over the deep tank is to be of a thickness not less than that required for the plating of the deep tank bulkhead at the same level plus 1 mm.

11.4 Compensation at Opening

11.4.1 To avoid excessive local stress at the corner of the hatchway or other openings in the strength deck or the effective deck, the plating at the corner is to be well rounded with insert plates of increased thickness or other approved equivalent. Elliptical or parabolic hatch corners without insert plates of an approved design may be accepted.

11.4.2 In way of the machinery space, additional transverse strengthening is to be provided by means of web frames and strong beams, with proper pillaring or other equivalent arrangements.

11.5 Thickness of Deck Plating Loaded by Wheeled Vehicles

11.5.1 The thickness of deck plating loaded by wheeled vehicles is to be determined by considering the concentrated loads from the wheeled vehicles.

11.6 Higher-strength Material

11.6.1 In general, proposed applications of higher-strength material for decks are to be accompanied by submission of calculations in support of adequate strength against buckling. Care is to be exercised to avoid the adoption of reduced thickness of material such as might be subject to damage during normal operation.

11.6.2 The thickness of deck plating for longitudinally framed decks, where constructed of higher-strength material, is to be not less than required for longitudinal strength, nor is it to be less than obtained from the following equation.

$t_{hts} = (t_{ms} - C)K + C$ mm

where

t_{ms} = thickness of ordinary-strength steel, in mm, as required by the Rules

C = 4.3 mm for exposed deck plating.

K = Material factor as specified in 1.5.2(a) of this Part

11.6.3 The thickness t_{hts} is also to be determined from the above equation using the t_{ms} as obtained from 11.3.2(a)(ii), with a factor of 0.92/ K in lieu of K. The factor 0.92/ K is not to be less than 1.00.

11.6.4 Where the deck plating is transversely framed, or where the Rules do not provide a specific thickness for the deck plating, the thickness of the higher-strength material will be specially considered, taking into consideration the size of the vessel, intended service and the requirements of the Rules.

Chapter 12

Superstructures and Deckhouses

12.1 General

12.1.1 All ships classed for ocean service are to have adequate bow height or deck sheer, sufficient length and height of superstructure fitted with efficient closing appliances in compliance with the requirements of International Convention on Load Line, 1966.

12.1.2 A bridge or poop is not to be regarded as enclosed unless access is provided for the crew to reach machinery and other working spaces inside these superstructures by alternative means which are available at all times when bulkhead openings are closed.

12.1.3 Superstructures with openings which do not fully comply 12.4 of this Part are to be considered as open superstructures.

12.2 Side Plating and Deck of Superstructures

12.2.1 The thickness of the side plating of the superstructure is to be determined from 7.5 and 7.6 of this Part.

12.2.2 The scantling of the superstructure deck is to be as required by 11.3.3 of this Part.

12.2.3 Superstructure Stiffeners

(a) The superstructure frame is to be of the scantling as required by 6.6 of this Part.

(b) Transverse rigidity is to be maintained by fitting with web frames or the partial bulkhead over the main bulkhead and elsewhere as may be required.

12.2.4 The break in the continuity of the superstructure is to be specially strengthened as required in 7.5 of this part.

12.3 Superstructure End Bulkheads and Deckhouse Walls

12.3.1 Stiffeners

(a) The section modulus of stiffeners, in association with the plating to which they are attached, is not to be less than that obtained from the following formula:

$3.5\ s\ h\ l^2$ cm^3

where:

s	=	Spacing of stiffeners, in m.
l	=	Tween deck height, in m. However, where l is less than 2 m, l is to be taken as 2 m.
h	=	a[(b f) − y]c, the design head, in m.
	=	For unprotected front bulkheads on the lowest tier, h is to be taken as not less than 2.5 +L/100 m in which L need not be taken as greater than 300 m. For all other bulkheads the minimum value of h is to be not less than one-half that required for unprotected front bulkheads on the lowest tier.
a	=	Coefficient given in Table II 12-1.

$$b = 1.0 + \left(\frac{\frac{x}{L} - 0.45}{C_b + 0.2}\right)^2 \quad \text{where } \frac{x}{L} \leq 0.45$$

$$= 1.0 + 1.5\left(\frac{\frac{x}{L} - 0.45}{C_b + 0.2}\right)^2 \quad \text{where } \frac{x}{L} > 0.45$$

Table II 12-1
Values of a

Bulkhead location	Values of a
Unprotected front, lowest tier	$2.0 + \frac{L_2}{120}$
Unprotected front, 2nd tier	$1.0 + \frac{L_2}{120}$
Unprotected front, 3nd tier	$0.5 + \frac{L_2}{150}$
Protected front, all tiers	$0.5 + \frac{L_2}{150}$
Sides, all tiers	$0.5 + \frac{L_2}{150}$
Aft ends, aft of amidships, all tiers	$0.7 + \frac{L_2}{1000} - 0.8\frac{x}{L}$
Aft ends, forward of amidships, all tiers	$0.5 + \frac{L_2}{1000} - 0.4\frac{x}{L}$
Note: L_2 =Length of ship (m) need not be taken as greater than 300 m	

where:

C_b = Block coefficient at summer load waterline, based on the ship's length L not to be taken as less than 0.60 nor greater than 0.80. For aft end bulkheads forward of amidships, C_b need not be taken as less than 0.80.

x = Distance in m between the after perpendicular and the bulkhead being considered. Deckhouse side bulkheads are to be divided into equal parts not exceeding 0.15L in length and x is to be measured from the after perpendicular to the center of each part considered.

L = Length of ship, in m.

f = Coefficient given in Table II 12-2.

y = Vertical distance from the summer load waterline to the midpoint of the stiffener span, in m.

c = $0.3 + 0.7\frac{b'}{B'}$

but is not to be taken as less than 1.0 for exposed machinery casing bulkheads.

In no case is $\frac{b'}{B'}$ to be taken as less than 0.25.

b′ = Breadth of deckhouse at the position being considered.

B′ = Actual breadth of the ship at the freeboard deck at the position being considered.

Table II 12-2
Values of f

L (m)	f
$L \le 150$	$\frac{L\left(e^{-\frac{L}{300}}\right)}{10} - \left[1 - \left(\frac{L}{150}\right)^2\right]$
$150 < L < 300$	$\frac{L\left(e^{-\frac{L}{300}}\right)}{10}$
$L \ge 300$	11.03

(b) Both ends of webs of lower tier bulkhead stiffeners are to be effectively welded to decks. The scantlings of stiffeners having other types of end connections are to be specially considered.

12.3.2 Thickness of plating

(a) The thickness of the plating is not to be less than that obtained from the following formula:

$t = 3s\sqrt{h}$ mm

where s and h are as defined in 12.3.1 of this Part. When determining h, y is to be measured to the middle of the plate. In no case is the thickness for the lowest tier bulkheads to be less than $5.0 + \frac{L_2}{100}$ mm. For other tier bulkheads the thickness is to be not less than $4.0 + \frac{L_2}{100}$ mm, however, not less than 5.0 mm, where L_2 need not be taken as greater than 300 m.

(b) For small coasters and fishing ships up to 40 m in length the above mentioned minimum thickness may be reduced by 0.5 mm.

12.3.3 Front end bulkheads of raised quarter deck

(a) Front end bulkheads of the raised quarter deck are to have a plating of the thickness not less than that required for the bridge front bulkhead.

(b) The size of stiffeners for the front end bulkheads are to be specially considered on the basis of the strength of the ship.

12.4 Openings in End Bulkheads of Enclosed Superstructures

12.4.1 All openings in the bulkheads of enclosed superstructures are to be provided with efficient means of closing, so that in any sea conditions water will not penetrate the ship. Openings and closing appliances are to be framed or stiffened so that the whole structure is equivalent to the unpierced bulkhead when closed.

12.4.2 Doors for access openings into enclosed superstructures are to be of steel or other equivalent material, permanently and strongly attached to the bulkhead. The doors are to be provided with gaskets and clamping devices or other equivalent arrangements, permanently attached to the bulkhead or to the doors themselves, and the doors are to be so arranged that they can be operated from both sides of the bulkhead.

12.4.3 Doors are to be opened outwards to provide additional security against the impact of the sea.

12.4.4 Except as otherwise provided in the Rules, the height of sills of access openings in bulkheads at the ends of enclosed superstructures is to be at least 380 mm above the deck.

12.4.5 Side scuttles in end bulkheads of enclosed superstructures are to be of substantial construction and provided with efficient inside dead lights (See 13.3 of this Part).

12.4.6 A bridge or poop is not regarded as enclosed unless alternate means of access is provided for the crew from any point on the exposed portion of uppermost continuous deck to reach machinery space or other working spaces within these superstructures when the bulkhead openings are closed.

Chapter 12A

Helicopter Decks and Facilities

12A.1 General

12A.1.1 The structure of the helicopter deck is to be designed to suit landing of the largest type of helicopter intended to use.

12A.1.2 Ships with helicopter decks built in accordance with these rules are to be assigned a class notation “Helideck” affixed to classification symbols, which is classified into four classes: **Helideck-I**, **Helideck-II**, **Helideck-III** and **Helideck-IV**.

12A.1.3 Class notation **Helideck-I** requires compliance with the requirements given in 12A.1, 12A.2, 12A.3 and 12A.4.

12A.1.4 Class notation **Helideck-II** requires compliance with the requirements given in 12A.5, in addition to the requirements for **Helideck-I**.

12A.1.5 Class notation **Helideck-III** requires compliance with the requirements given in 12A.6, in addition to the requirements for **Helideck-II**.

12A.1.6 Class notation **Helideck-IV** requires compliance with the requirements given in 12A.7, in addition to the requirements for **Helideck-III**.

12A.1.7 Details of the helicopter types to be used are to be included in the Loading Manual (See 3.1.2), and be contained in a notice displayed on the helicopter landing deck.

12A.1.8 The attention of owners, builders and designers is drawn to various international and governmental regulations and guides regarding the operational and other design requirements for helicopters landing on ships.

12A.1.9 Construction of helicopter decks

(a) Steel or other equivalent material

In general, the construction of the helicopter decks is to be of steel or other equivalent materials. If the helicopter deck forms the deckhead of a deckhouse or superstructure, is to be insulated to “A-60” class standard.

(b) Aluminium or other low melting point metals

If helicopter deck of aluminium or other low melting point metal construction that is not made equivalent to steel, the following provisions are to be satisfied:

(i) If the platform is cantilevered over the side of the ship, after each fire on the ship or on the platform, the platform is to undergo a structural analysis to determine its suitability for further use; and

(ii) If the platform is located above the ship’s deckhouse or similar structure, the following conditions are to be satisfied:

(1) The deckhouse top and bulkheads under the platform are to have no openings;

(2) Windows under the platform are to be provided with steel shutters; and

(3) After each fire on the platform or in close proximity, the platform is to undergo a structural analysis to determine its suitability for further use.

12A.1.10 Definition

(a) Helicopter deck is a purpose built helicopter landing area located on a ship including all structure, fire-fighting appliances and other equipment necessary for the safe operation of helicopters.

(b) Helicopter facility is a helicopter deck including any refueling and hangar facilities.

(c) Helicopter landing area means an area on a ship designed for emergency landing of helicopters.

12A.2 Plans

12A.2.1 Plans showing the arrangement, scantlings, and details of the helicopter deck are to be submitted.

12A.2.2 The type, size and weight of helicopters to be used, the predetermined position used for accommodating the secured helicopter and the locations of deck fittings for securing the helicopter as well as the overall size of the helicopter deck and the designated landing area are to be shown.

12A.2.3 Where aluminium alloy platforms are connected to steel structures, details of the arrangements in way of the bimetallic connections are to be submitted.

12A.3 Structural Strength

12A.3.1 Steel decks

The deck plate thickness, t, within the landing area is to be not less than that obtained from the following formula:

$$t = \frac{\alpha s}{1000\sqrt{k}} + 1.5 \quad \text{mm}$$

where:

α	=	Thickness coefficient, obtained from Fig. II 12A-1.
s	=	As shown in Fig. II 12A-1.
k	=	$\frac{235}{\sigma_0}$ or 0.66, whichever is the greater.
σ_0	=	Specific minimum yield stress in N/mm^2.
β	=	Tyre print coefficient, used in Fig. II 12A-1.
	=	$\log_{10}\left(\frac{2.5\lambda_1\lambda_2\lambda_3\gamma f P_w k^2}{s^2} \times 10^7\right)$
f	=	1.15 for landing decks over manned spaces, e.g., deckhouse, bridges, control rooms, etc.;
	=	1.0 elsewhere.
P_w	=	Landing load, on the tyre print in tonnes;
	=	The maximum all up weight of the helicopter divided equally between the two main undercarriages for helicopter with a single main rotor, in ton.
	=	The maximum all up weight of the helicopter distributed between all main undercarriages in proportion to the static loads they carry for helicopter with tandem main rotors, in tones.
γ	=	A location factor given in Table II 12A-1.

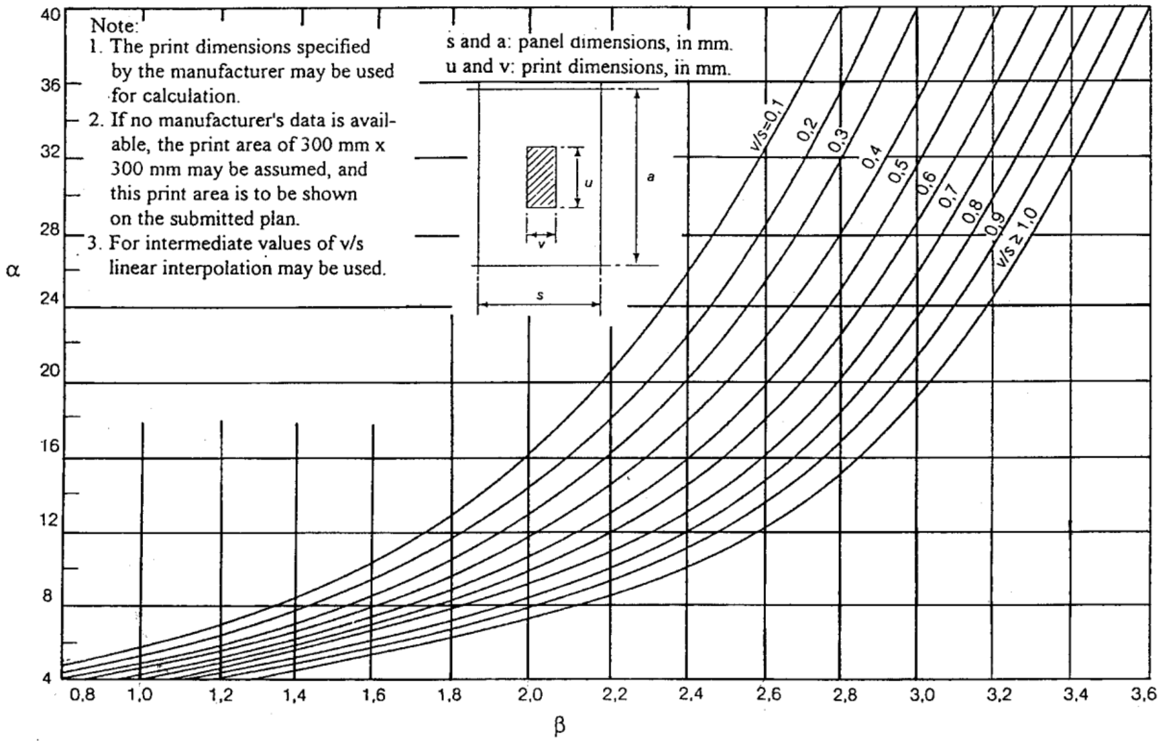

Fig. II 12A-1
Tyre Print Curves

Table II 12A-1
Location Factor

Location		γ
On decks forming part of the hull girder	within 0.4 L amidships	0.71
	at the F.P. or A.P.	0.6
Elsewhere		0.6
Note: Value for intermediate locations on decks forming part of the hull girder between ship ends and 0.4 L amidships are to be obtained by interpolation.		

where:

λ_1 = Patch aspect ratio correction factor;

= $\frac{2v + 1.1s}{u + 1.1s}$ for $v \leq s$ and $u \leq a$.

λ_2 = Panel aspect ratio correction factor;

= 1.0 for $u \leq (a - s)$

= $\frac{s}{1.3s - 0.3(a - u)}$ for $a \geq u > (a - s)$

= $\frac{0.77a}{u}$ for $u > a$

λ_3 = Wide patch load factor;

= 1.0 for $v < s$

= $0.6\frac{s}{v} + 0.4$ for $1.5 > \frac{v}{s} \geq 1.0$

= $1.2\frac{s}{v}$ for $\frac{v}{s} \geq 1.5$

12A.3.2 Aluminium decks

(a) The plate thickness for aluminium decks, t_a is to be not less than that obtained from the following formula:

$t_a = 1.4\, t + 1.5$ mm

where:

t = The steel thickness defined in 12A.3.1.

(b) The air gap between the deckhouse top and the underside of the helicopter deck is to be at least 1 m.

(c) There are no openings in the deckhouse top and in the exterior bulkheads both directly below the helicopter decks.

(d) All windows in the lower exterior bulkheads are to be fitted with steel shutters.

12A.3.3 Deck stiffening and supporting structure

The helicopter deck stiffening and the supporting structure for helicopter platforms is to be designed on the basis of the following load cases given in Table II 12A-2 in association with the permissible stresses given in Table II 12A-3.

Table II 12A-2
Design Load Cases for Deck Stiffening and Supporting Structure

Load case	Loads			
	Supporting structure		Landing area(1)	
	Self weight	Horizontal load(2)	Uniformly distributed vertical load over entire landing area, kN/m^2	Helicopter(2)
1. Overall distributed loading	–	–	2	–
2. Helicopter emergency landing	W	0.5 P	0.5	2.5 $P_w f$
3. Normal usage	W	0.5 P + 0.5 W	0.5	1.5 P_w

Notes:

(1) For the design of the supporting structure for helicopter platforms applicable self weight and horizontal loads are to be added to the landing area loads.

(2) The helicopter is to be so positioned as to produce the most severe loading condition for each structural member under consideration.

(3) f = As defined in 12A.3.1.

W = The structural weight of helicopter platform, in ton.

P = The maximum all up weight of the helicopter, in ton.

P_w = As defined in 12A.3.1.

Table II 12A-3
Permissible Stresses for Deck Stiffening and Supporting Structure

Load case (See Table II 12A-2)	Permissible stresses (N/mm^2)			
	Deck secondary structure (Beams, longitudinals)	Primary structure (transverses, girders, pillars, trusses)		All structure
	Bending		Combined bending and axial	Shear
1. Overall distributed loading	$\frac{147}{K}$	$\frac{147}{K}$	0.6 σ_c	$\frac{\text{Bending stress}}{\sqrt{3}}$
2. Helicopter emergency landing	$\frac{245}{K}$	$\frac{220.5}{K}$	0.9 σ_c	
3. Normal usage	$\frac{176}{K}$	$\frac{147}{K}$	0.6 σ_c	

Notes:

(1) K = Material factor;
= k for steel (See 12A.3.1);
= Ka for aluminium alloy (See 12A.3.4).

(2) σ_c = Yield stress, 0.2% proof stress or compressive buckling stress, whichever is lesser, in N/mm^2.

(3) For strength deck longitudinals and girders the permissible bending stresses are to be reduced as follows:
(a) within 0.4 L of amidships- by 30%.
(b) at F.P. and F.P.- by 0%.
Values at intermediate locations are to be calculated by interpolation between (a) and (b).

(4) When determining bending stresses in secondary structure for compliance with the above permissible stresses, 100% end fixity may be assumed.

12A.3.4 The minimum moment of inertia, I, of aluminium secondary structure stiffening is to be not less than that obtained from the following formula:

$$I = \frac{5.25Zl}{K_a} \quad cm^4$$

where:

Z = The required section modulus of the aluminium stiffener and the attached plating, in cm^3.

l = Effective length of the stiffening member measured between span points, in m.

K_a = $\frac{245}{\sigma_a}$

σ_a = Yield stress, 0.2% proof stress or 70% of the ultimate strength of the material, whichever is lesser, in N/mm^2.

12A.4 Arrangements

12A.4.1 The landing area is to be sufficiently large to allow for the landing and maneuvering of the helicopter.

(a) For helicopter landing areas located amidships, across ship obstacle free sectors of 210° is to be provided. These sectors is to originate at the most forward and aft points on the periphery of the "D" reference circle ("D" is the actual value of diameter in metres of the helicopter deck) and diverge at 15° forward and 15° aft relative to straight transverse lines.

(b) For location at ship’s ends, a free approach and take-off sector of at least 210° is required.

(c) For any helicopter landing areas amidships located adjacent to the ship's side with one-sided approach, the obstacle free sector is to originate at the most forward and aft points on the periphery of the "D" reference circle and diverge to achieve 1.5 D at the ship's side.

12A.4.2 Suitable arrangements are to be made to minimize the risk of personnel or machinery sliding off the landing area.

12A.4.3 The helicopter deck is to have a non-slip surface.

12A.4.4 Tie-down points

(a) Helicopter decks are to have tie-down points for lashing of the helicopter. The tie-down points are not to protrude above the level of the helicopter deck.

(b) The breaking load of the tie-down points for helicopters calling at the vessel is to be confirmed from helicopter operator or manufacturer.

(c) Tie-down points located on helicopter decks are to be flush fitted.

12A.4.5 Means of escape

(a) A helicopter deck is to be provided with both a main and an emergency means of escape and access for fire fighting and rescue personnel. These are to be located as far apart from each other as is practicable and preferably on opposite sides of the helicopter deck.

12A.4.6 Drainage facilities

(a) Drainage facilities in way of helicopter decks are to be constructed of steel and are to lead directly overboard independent of any other system and are to be designed so that drainage does not fall onto any part of the ship.

12A.4.7 Fire-fighting appliances

(a) In close proximity to the helicopter deck, the following fire-fighting appliances are to be provided and stored near the means of access to that helicopter deck:
   (i) at least two dry powder extinguishers having a total capacity of not less than 45 kg;
   (ii) carbon dioxide extinguishers of a total capacity of not less than 18 kg or equivalent;
   (iii) a suitable foam application systemm, with the requirements of IMO MSC.1/Circ.1431 consisting of monitors or foam making branch pipes capable of delivering foam to all parts of the helicopter deck in all weather conditions in which helicopters can operate. The system is to be capable of delivering a discharge rate as required in Table II 12A-4 for at least five minutes;

Table II 12A-4
Foam discharge rates

Category	Helicopter overall length	Discharge rate foam solution (*l*/min.)
H1	up to but not including 15m	250
H2	from 15m up to but not including 24m	500
H3	from 24m up to but not including 35m	800

   (iv) the principal agent is to be suitable for use with salt water, and a type deemed as appropriate by the Society.
   (v) at least two nozzles of an approved dual-purpose type (jet/spray) and hoses sufficient to reach any part of the helicopter deck.
   (vi) in addition to the requirements of SOLAS Reg. II-2/10.10, two sets of fire-fighter's outfits; and

(vii) at least the following equipment is to be stored in a manner that provides for immediate use and protection from the elements:
(1) adjustable wrench;
(2) blanket, fire resistant;
(3) cutters, bolt 60cm;
(4) hook, grab or salving;
(5) hacksaw, heavy duty complete with 6 spare blades;
(6) ladder;
(7) lift line 5mm diameter × 15m in length;
(8) pliers, side cutting;
(9) set of assorted screwdrivers; and
(10) harness knife complete with sheath.

12A.5 Additional Requirements for Helideck-II

12A.5.1 Communication

(a) Helicopter and vessel shall communicate through a VHF installation, maritime or aeromobile.

(b) A portable VHF apparatus with earphones is to be available. Three-way communication between helicopter, helicopter deck and bridge is to be possible.

12A.6 Additional Requirements for Helideck-III

12A.6.1 Marking of helicopter deck

(a) Obstacles, which the helicopter operator should be especially aware of, are to be painted in diagonal stripes of contrasting colors.

(b) The perimeter of the helicopter deck is to be marked with a 300mm white line. The preferred colour of deck within perimeter line is dark grey or dark green.

(c) The name of the vessel is to be marked on the helicopter deck surface between the origin of the obstacle-free sector and the aiming circle in symbols not less than 1200mm high and in a colour which contrasts to the helicopter deck surface.

(d) Obstacle-free sector is to be marked on the helicopter deck by a black chevron, each leg being 790mm long and 100mm wide. The chevron is to delineate the separation of the 210º obstacle-free sector and the 150º limited obstacle sector.

(e) The actual D-value of the helicopter deck is to be painted in white colour around the perimeter of the helicopter deck with symbol of 600mm height and rounded down to the nearest whole number.

(f) The maximum allowable mass is to be marked on the helicopter deck in a position that is readable from the preferred final approach direction and consist of a two-or three-digit number expressed to one decimal place rounded to the nearest 100kg and followed by the letter "t". The height of the numbers is to be 900mm with a line width of 120mm.

(g) An aiming circle, which is to be a 1000mm yellow line with inner diameter 0.5D.

(h) A letter "H" is to be painted 4 × 3m of 750mm white lines located in the centre of the aiming circle.

(i) A signal flag to alert approaching helicopters that landing is prohibited in case the helicopter deck for technical reasons can not be used is to be carried onboard. This shall be a red flag 4000 × 4000mm with yellow diagonal cross that can be laid above the "H" inside of the aiming circle.

12A.6.2 Height of obstacles

(a) The landing area is to be as flush as possible to avoid damage on skids, wheels or pontoons.

(b) Steel or other solid construction at perimeter may extend 50mm above deck level.

(c) In the approach sector, on and outside of perimeter, only aids essential to helicopter operations are allowed to extend up to a maximum height of 250 mm, e.g. landing lights, floodlights, foam monitors, outer edge of safety net and similar arrangements.

(d) In bow or stern located helicopter landing areas, outside the obstacle free sector, obstacle heights is to be limited to 0.05 D to a distance 0.62 D from the centre of the landing area and thence are required to be below a rising plane of 1:2 to a distance of 0.83 D from the centre of the landing area.

(e) Forward and aft of the approach sector of a flight channel across the ship, within a length equal to helicopter overall length forward and aft of sector, obstacles are required to be below a plane with 1:5 longitudinal inclination.

(f) For helicopter landing areas located adjacent to the ship’s side, outside the obstacle free sector, obstacles is to be limited to a height of 0.05 D for a distance of 0.25 D from the edge of the obstacle free sector and the landing area.

12A.6.3 Wind direction indicator is to be provided so as to indicate the clear area wind condition representative for the helicopter deck.

12A.6.4 Special requirements for night operation

(a) Floodlights are to be arranged for illumination of the total landing area, with care not to dazzle the pilot.

(b) Green lights are to be fitted on the perimeter line, maximum 3m apart. The intensity of lighting is to be 30 candela. The lighting is not to be visible below the helicopter deck level.

(c) Floodlights, perimeter lights, and obstruction lights are to have electric power fed from emergency and transitional source of power in compliance with the requirements in Chapter 11, Part VII of the Rules. The transitional power is to last for at least 30 min. The system is also to have a supply circuit from main power so that a single failure in either the main electric power distribution system or the emergency power distribution system is not to render the helicopter deck lighting inoperable. Floodlights, perimeter lights, and obstruction lights are to have individual protected distribution circuits.

(d) The wind indicator is to be illuminated.

(e) All obstacles, which may obstruct the landing approach are to be indicated by red obstruction lights visible from all directions, or floodlighting or a combination of both.

12A.6.5 Instrumentation

(a) Wind velocity and direction, barometric pressure, vessel’s roll and pitch are to be recorded and communicated to helicopter before landing. Simple instruments for this purpose are to be available.

12A.7 Additional Requirements for Helideck-IV

12A.7.1 Helicopter refueling and hangar facilities

The class notation **Helideck-IV** requires the ship having helicopter refueling and hangar facilities in compliance with the following requirements:

(a) A designated area is to be provided for the storage of fuel tanks which is to be:

(i) as remote as is practicable from accommodation spaces, escape routes and embarkation stations; and

(ii) isolated from areas containing a source of vapour ignition;

(b) The fuel storage area is to be provided with arrangements whereby fuel spillage may be collected and drained to a safe location;

(c) Tanks and associated equipment are to be protected against physical damage and from a fire in an adjacent space or area;

(d) Where portable fuel storage tanks are used, special attention is to be given to:

(i) design of the tank for its intended purpose;

(ii) mounting and securing arrangements;

(iii) electric bonding; and

(iv) inspection procedures;

(e) Storage tank fuel pumps are to be provided with means which permit shutdown from a safe remote location in the event of a fire. Where a gravity fuelling system is installed, equivalent closing arrangements are to be provided to isolate the fuel source;

(f) The fuel pumping unit is to be connected to one tank at a time. The piping between the tank and the pumping unit is to be of steel or equivalent material, as short as possible, and protected against damage;

(g) Electrical fuel pumping units and associated control equipment are to be of a type suitable for the location and potential hazards;

(h) Fuel pumping units are to incorporate a device which will prevent over-pressurization of the delivery or filling hose;

(i) Equipment used in refueling operations is to be electrically bonded;

(j) "NO SMOKING" signs are to be displayed at appropriate locations;

(k) Hangar, refueling and maintenance facilities are to be treated as category ‘A’ machinery spaces with regard to structural fire protection, fixed fire-extinguishing and detection system requirements;

(l) Enclosed hangar facilities or enclosed spaces containing refueling installations are to be provided with mechanical ventilation, as required by13.3.2, Part IX of the Rules, for closed ro/ro spaces of cargo ships. Ventilation fans are to be of non-sparking type; and

(m) Electric equipment and wiring in enclosed hangar or enclosed spaces containing refueling installations are to comply with 13.3.2, Part IX of the Rules.

Chapter 13

Bulwarks, Freeing Ports, Side Scuttles, Shell Doors and Gangways

13.1 Bulwarks and Guardrails

13.1.1 Guard rails or bulwarks are to be fitted around all exposed decks. The height of the bulwarks or guard rails is to be at least 1 m from the deck, provided that where this height would interfere with the normal operation of the ship, a lesser height may be approved, if complying with the requirements of the Administration and the Society is satisfied that adequate protection is provided.

13.1.2 Bulwark constructions

(a) Bulwarks are to be of ample strength in proportion to the height and stiffened at the upper edge and supported by the stay from the deck. Bulwarks are not to be cut for a gangway or other openings near breaks of superstructures, and also to be arranged to ensure their freedom from main structural stresses. Generally the bulwark is not to be welded to the top of sheer strake within 0.5L amidships.

(b) Thickness of plate bulwarks

(i) The thickness of plate bulwarks of ordinary height on the freeboard deck is generally not to be less than 6 mm.

(ii) Bulwarks in way of the mooring pipe, cargo gear fittings, deck cargo lashing fittings, etc., the plating is to be suitably increased or doubled and adequate stiffened.

(iii) The thickness of plate bulwarks at the break of the superstructure is to be modified in accordance with 7.5 of this Part.

(c) Bulwark stays

(i) Stays on bulwarks are not to be spaced more than 1.8 m apart.

(ii) Stays on bulwarks which are designed to subject timber deck cargoes is not to be spaced more than 1.5 m apart.

13.1.3 Guard rails fitted on superstructure and freeboard decks are to have at least three courses. The opening below the lowest course of the guard rails is to not exceed 230 mm. The other courses are to be not more than 380 mm apart. In the case of ships with rounded gunwales the guard rail supports are to be placed on the flat of the deck. In other locations, guardrails with at least two courses are to be fitted. Guard rails are to comply with the following provisions:

(a) Fixed, removable or hinged stanchions are to be fitted about 1.5 m apart. Removable or hinged stanchions are to be capable of being locked in the upright position;

(b) At least every third stanchion is to be supported by a bracket or stay;

(c) Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires are to be made taut by means of turnbuckles; and

(d) Where necessary for the normal operation of the ship, chains fitted between two fixed stanchions and/or bulwarks are acceptable in lieu of guard rails.

13.1.4 A bracket type is recommended for the lower connections of bulwark stays (See Fig. II 13-1 as below). In cases where a gusset type is applied for the lower connections of bulwark stays (See Fig. II 13-1 as below), special consideration is to be given.

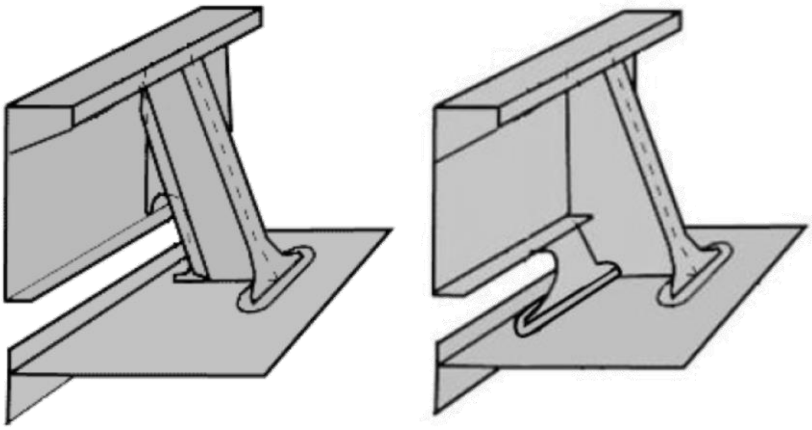

Fig. II 13-1
Example of Bracket Type (Left) and Example of Gusset Type (Right)

13.1.5 In cases where a bracket type is applied for the lower connections of bulwark stays, the bulwark stays are to be properly stiffened for the prevention of local buckling.

13.1.6 Expansion joints are to be provided at appropriate intervals in bulwarks.

13.1.7 The plating of bulwarks in way of mooring pipes is to be doubled or increased in thickness.

13.1.8 At ends of superstructures, the bulwark rails are to be bracketed either to the superstructure end bulkheads or to the stringer plates of the superstructure decks; or other equivalent arrangements are to be made so that an abrupt change of strength may be avoided.

13.1.9 Where bulwarks are cut to form gangways or other openings, stays of increased strength are to be provided atthe ends of the openings.

13.2 Freeing Ports

13.2.1 Freeing ports

(a) Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of water and for draining them.

(b) Except as provided in paragraphs 13.2.1(c) and 13.2.2, the minimum freeing port area (A) on each side of the ship for each well on the freeboard deck is to be that given by the following formulae in cases where the sheer in way of the well is standard or greater than standard.

The minimum area for each well on superstructure decks is to be one-half of the area given by the following formulae:

Where the length of bulwark (l) in the well is 20 m or less:

$$A = 0.7 + 0.035l \quad m^2$$

where l exceeds 20m:

$$A = 0.07l \quad m^2$$

l need in no case be taken as greater than $0.7L_f$.

If the bulwark is more than 1.2 m in average height, the required area is to be increased by $0.004m^2$ per metre of length of well for each 0.1 m difference in height. If the bulwark is less than 0.9 m in average height, the required area may be decreased by $0.004m^2$ per m of length of well for each 0.1 m difference in height.

(c) In ships with no sheer, the area calculated according to 13.2.1(b) is to be increased by 50%. Where the sheer is less than the standard, the percentage is to be obtained by linear interpolation.

(d) On a flush deck ship with a deckhouse amidships having a breadth at least 80% of the beam of the ship and the passageways along the side of the ship not exceeding 1.5 m in width, two wells are formed. Each is to be given the required freeing port area based upon the length of each well.

(e) Where a screen bulkhead is fitted completely across the ship at the forward end of a midship deckhouse, the exposed deck is divided into tow wells and there is no limitation on the breadth of the deckhouse.

(f) Wells on raised quarterdecks are to be treated as being on freeboard decks.

(g) Gutter bars greater than 300 mm in height fitted around the weather decks of tankers in way of cargo manifolds and cargo piping are to be treated as bulwarks. Freeing ports are to be arranged in accordance with this regulation. Closures attached to the freeing ports for use during loading and discharge operations are to be arranged in such a way that jamming cannot occur while at sea.

13.2.2 Where a ship fitted with a trunk, open rails are not fitted on the weather part of the free board deck in way of the trunk at least half their length or where continuous or substantially continuous hatchway side coamings are fitted between detached superstructures, the minimum area of the freeing port openings is to be calculated from the following table:

Breadth of hatchway or trunk in relation to the breadth of ship	Area of freeing ports in relation to the total area of the bulwarks
40% or less	20%
75% or more	10%

The area of freeing ports at intermediate breadths is to be obtained by linear interpolation.

13.2.3 The effectiveness of the freeing area in bulwarks required by paragraph 13.2.1 above depends on the free flow area across the deck of a ship. Where there is no free flow due to the presence of a continuous trunk or hatchway coaming, the freeing area in bulwarks is calculated in accordance with 13.2.2 above. The free flow area on deck is the net area of gaps between hatchways, and between hatchways and superstructures and deckhouses up to the actual height of the bulwark.

The freeing port area in bulwarks is to be assessed in relation to the net free flow area as follows:

(a) If the free flow area is not less than the freeing area calculated from 13.2.2 as if the hatchway coamings were continuous, then the minimum freeing port area calculated from 13.2.1 is to be deemed sufficient.

(b) If the free flow area is equal to, or less than the area calculated from 13.2.1, the minimum freeing area in the bulwarks is to be determined from 13.2.2.

(c) If the free flow area is smaller than calculated from 13.2.2,but greater than calculated from 13.3.1, the minimum freeing area in the bulwark is to be determined from the following formula:

$$F = F_1 + F_2 - F_p \quad m^2$$

where:

F_1 = The minimum freeing area calculated from 13.2.1;

F_2 = The minimum freeing area calculated from 13.2.2; and

F_p = The total net area of passages and gaps between hatch ends and superstructures or deckhouse up to the actual height of bulwark.

13.2.4 In ships having superstructures on the freeboard deck or superstructure decks, which are open at either or both ends to wells formed by bulwarks on the open decks, adequate provision for freeing the open spaces within the superstructures is to be provided. The minimum freeing port area on each side of the ship for the open superstructure (A_s) and for the open well (A_w), is to be calculated in accordance with the following procedure:

(a) Determine the total well length (l_t) equal to the sum of the length of the open deck enclosed by bulwarks (l_w) and the length of the common space within the open superstructure (l_s).

(b) To determine A_s:

(i) Calculate the freeing port area (A) required for an open well of length l_t in accordance with 13.2.1 with standard height bulwark assumed;

(ii) Multiply by a factor of 1.5 to correct for the absence of sheer, if applicable, in accordance with 13.2.1.

(iii) Multiply by the factor (b_o/l_t) to adjust the freeing port area for the breadth (b_o) of the openings in the end bulkhead of the enclosed superstructure;

(iv) To adjust the freeing port area for that part of the entire length of the well which is enclosed by the open superstructure, multiply by the factor:

$$1-(l_w/l_t)^2$$

where:

l_w and l_t = as defined in 13.2.4(a).

(v) To adjust the freeing port area for the distance of the well deck above the freeboard deck, for decks located more than $0.5h_s$ above the freeboard deck, multiply by the factor:

$$0.5(h_s/h_w)$$

where:

h_w = The distance of the well deck above the freeboard deck.

h_s = One standard superstructure height.

(c) To determine A_w:

(i) The freeing port area for the open well (A_w) is to be calculated in accordance with 13.2.4(b)(i), using l_w to calculate a nominal freeing port area (A’), and then adjusted for the actual height of the bulwark (h_b) by the application of one of the following area corrections, whichever is applicable:

for bulwarks greater than 1.2 m in height:

$$A_c = l_w((h_b-1.2)/0.10)(0.004) \quad m^2$$

for bulwarks less than 0.9 m in height:

$$A_c = l_w((h_b-0.9)/0.10)(0.004) \quad m^2$$

for bulwarks between 1.2 m and 0.9 m in height there is no correction (i.e. $A_c=0$);

(ii) The corrected freeing port area ($A_w=A'+A_c$) is to then be adjusted for absence of sheer, if applicable, and height above freeboard deck as in 13.2.4(b)(ii) and (b)(v), using h_s and h_w.

(d) The resulting freeing port areas for the open superstructure (As) and for open well (Aw) are to provided along each side of the open space covered by the open superstructure and each side of the open well, respectively.

(e) The above relationships are summarized by the following equations, assuming l_t, the sum of l_w and l_s is greater than 20 m:

freeing port area A_w for the open well:

$$A_w = (0.07l_w+A_c)(\text{sheer correction})(0.5h_s/h_w);$$

freeing port area A_s for the open superstructure:

$$A_s = (0.07l_t)(\text{sheer correction})\{b_o/l_t[1-(l_w/l_t)^2]\}(0.5h_s/h_w);$$

Where l_t is 20 m or less, the basic freeing port area is $A=0.7+0.035 l_t$ in accordance with 13.2.1.

13.2.5 On ships with continuous longitudinal hatch coamings, where water may accumulate between the transverse coamings, freeing ports shall be provided at both sides, with a minimum section area in m^2:

$$A_q = 0.07\, b_Q$$

where:
b_Q = breadth of transverse box girder in m.

In case of a partial closed structures the area A_q may be reduced by the ratio of clear opening of the transverse hatch coaming and the total area of enclosed space.

13.2.6 The lower edges of freeing ports are to be as near the deck as practicable. Two-thirds of the freeing port area required is to be provided in the half of the well nearest the lowest point of the sheer curve. One third of the freeing port area required is to be evenly spread along the remaining length of the well. With zero or little sheer on the exposed freeboard deck or an exposed superstructure deck the freeing port area is to be evenly spread along the length of the well.

13.2.7 All freeing port openings in the bulwarks are to be protected by rails or bars spaced approximately 230 mm apart. If shutters are fitted to freeing ports, ample clearance is to be provided to prevent jamming. Hinges are to have pins or bearings of non-corrodible material. Shutters are not to be fitted with securing appliances.

13.3 Side Scuttles, Windows and Skylights

13.3.1 Side scuttles and windows, together with their glasses, deadlights and storm coves, if fitted, are to be of an approved design and substantial construction. Non-metallic frames are not acceptable.

13.3.2 Side scuttles are defined as being round or oval openings with an area not exceeding 0.16 m^2. Round or oval openings having areas exceeding 0.16 m^2 are to be treated as windows.

13.3.3 Windows are defined as being rectangular openings generally, having a radius at each corner relative to the window size and round or oval openings with an area exceeding 0.16 m^2.

13.3.4 Side scuttles to the following spaces are to be fitted with the following hinged inside deadlights which are to be capable of being closed and secured watertight if fitted below the freeboard deck and weathertight if fitted above:

(a) spaces below freeboard deck;

(b) spaces within the first tier of enclosed superstructures; and

(c) first tier deckhouses on the freeboard deck protecting openings leading below or considered buoyant in stability calculations

13.3.5 Side scuttles are not to be fitted in such a position that their sills are below a line drawn parallel to the freeboard deck at side and having its lowest point 2.5% of the breadth (B_f), or 500 mm, whichever is the greatest distance, above the Summer Load Line (or Timber Summer Load Line if assigned).

13.3.6 If the required damage stability calculations indicate that the side scuttles would become immersed at any intermediate stage of flooding or the final equilibrium waterline, they are to be of the non-opening type.

13.3.7 Windows are not to be fitted in the following locations:

(a) below the freeboard deck;

(b) in the first tier end bulkheads or sides of enclosed superstructures; or

(c) in first tier deckhouses that are considered buoyant in the stability calculations.

13.3.8 Side scuttles and windows at the side shell in the second tier are to be provided with hinged inside deadlights capable of being closed and secured weathertight if with hinged inside deadlights capable of being closed and secured weathertight if the superstructure protects direct access to an opening leading below or is considered buoyant in the stability calculations.

13.3.9 Side scuttles and windows in side bulkheads set inboard from the side shell in the second tier which protect direct access below to spaces listed in 13.3.4 are to be provided with either hinged inside deadlights or, where they are accessible, permanently attached external storm covers which are capable of being closed and secured weathertight.

13.3.10 Cabin bulkheads and doors in the second tier and above separating side scuttles and windows from a direct access leading below or the second tier considered buoyant in the stability calculations may be accepted in place of deadlights or storm covers fitted to the side scuttles and windows.

13.3.11 Deckhouses situated on a raised quarter deck or on the deck of a superstructure of less than standard height may be regarded as being in the second tier as far as the requirements for deadlights are concerned, provided that the height of the raised quarter deck or superstructure is equal to or greater than the standard quarter deck height.

13.3.12 Fixed or opening skylights are to have a glass thickness appropriate to their size and position as required for side scuttles and windows. Skylight glasses in any position are to be protected from mechanical damage and, where fitted in position 1 or 2, are to be provided with permanently attached deadlights or storm covers.

13.4 Bow Doors and Inner Doors

13.4.1 Application

(a) This section gives requirements for the arrangement, strength and securing of bow doors and inner doors leading to a complete or long forward enclosed superstructure.

(b) Two types of bow door are provided for
   (i) Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.
   (ii) Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outboard edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is anticipated that side –opening bow doors are arranged in pairs.

   Other types of bow door will be specially considered in association with the applicable requirements of the Rules.

(c) The requirements apply to all ro-ro passenger ships and ro-ro cargo ships engaged on international voyages and also to ro-ro passenger ships and ro-ro cargo ships engaged only in domestic (non-international) voyages, except where specifically indicated otherwise herein.

(d) The requirements are not applicable to high speed, light displacement craft as defined in the IMO Code of Safety for High Speed Craft.

13.4.2 Arrangement

(a) Bow doors are to be situated above the freeboard deck. A watertight recess in the freeboard deck located forward of the collision bulkhead and above the deepest waterline fitted for arrangement of ramps or other related mechanical devices may be regarded as part of the freeboard deck for the purpose of this requirement.

(b) An inner door is to be fitted. The inner door is to be part of the collision bulkhead. The inner door needs not be fitted directly above the bulkhead below, provided it is located within the limits specified for the position of the collision bulkhead, refer to 14.1.1. A vehicle ramp may be arranged for this purpose, provided its position complies with 14.1.1. If this is not possible a separate inner weathertight door is to be installed, as far as practicable within the limits specified for the position of the collision bulkhead.

(c) Bow doors are to be so fitted as to ensure tightness consistent with operational conditions and to give effective protection to inner doors. Inner doors forming part of the collision bulkhead are to be weathertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.

(d) Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a separate inner weathertight door is to be installed, as indicated in (b) above.

(e) The requirements for inner doors are based on the assumption that vehicles are effectively lashed and secured against movement in stowed position.

13.4.3 Definitions

(a) Securing device – a device used to keep the door closed by preventing it from rotating about its hinges.

(b) Support device – a device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.

(c) Locking device – a device that locks a securing device in the closed position

13.4.4 Strength Criteria

(a) Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be determined to withstand the design loads defined in 13.4.5 using the following permissible stresses:

shear stress: $\tau = \frac{80}{K}$ N/mm^2

Bending stress: $\sigma = \frac{120}{K}$ N/mm^2

Equivalent stress: $\sigma_e = \sqrt{\sigma^2 + 3\tau^2} = \frac{150}{K}$ N/mm^2

Where K is the material factor as given in 1.5.2 (a) of Part II, but is not to be taken less than 0.72 unless a direct fatigue analysis is carried out.

(b) The buckling strength of primary members is to be verified as being adequate.

(c) For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 0.8 σ_F, where σ_F is the yield stress of the bearing material. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification.

(d) The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads of bolts not carrying support forces is not to exceed:

$\frac{125}{K}$ N/mm^2

13.4.5 Design loads

(a) Bow doors

(i) The design external pressure to be considered for the scantlings of primary members, securing and supporting devices of bow doors is not to be less than the pressure as follows:

$$P_e = 2.75\lambda C_H(0.22 + 0.15\tan\alpha)\cdot\left(0.4V\sin\beta + 0.6\sqrt{L}\right)^2 \qquad kN/m^2$$

where:

V	=	Contractual ship's speed, in knots,
L	=	Ship's length, in m, but need not be taken greater than 200 m.
λ	=	Coefficient depending on the area where the ship is intended to be operated;
	=	1 for seagoing ships,
	=	0.8 for ships operated in coastal waters,
	=	0.5 for ships operated in sheltered waters.
C_H	=	0.0125L for $L < 80$ m,
	=	1 for $L \geq 80$ m.
α	=	Flare angle at the point to be considered, defined as the angle between a vertical line and the tangent to the side shell plating, measured in a vertical plane normal to the horizontal tangent to the shell plating.
β	=	Entry angle at the point to be considered, defined as the angle between a longitudinal line parallel to the centerline and the tangent to the shell plating in a horizontal plane.

(ii) The design external forces considered for the scantlings of securing and supporting devices of bow doors are not to be less than:

$F_x = P_e A_x$ kN
$F_y = P_e A_y$ kN
$F_z = P_e A_z$ kN

where:

A_x	=	Area, in m², of the transverse vertical projection of the door between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded.
A_y	=	Area, in m², of the longitudinal vertical projection of the door between the levels of the bottom of the door and the upper dick of between the bottom of the door and the top of the door, whichever is the lesser. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded.
A_z	=	Area, in m², of the horizontal projection of the door between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded.
h	=	Height, in m, of the door between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser.
l	=	Length, in m, of the door at a height h/2 above the bottom of the door.

w = Breadth, in m, of the door at a height h/2 above the bottom of the door.
P_e = External pressure, in kN/m^2, as given in 13.4.5(a)(i) with angles α and β.
α = Flare angle measured at the point on the bow door, *l*/2 aft of the stem line on the plane h/2 above the bottom of the door, as shown in Fig. II 13-1 of this Chapter.
β = Entry angle measured at the same point as α.

For bow doors including bulwark, of unusual form or proportions, e.g. ships with a rounded nose and large stem angles, the areas and angles used for determination of the design values of external forces may require to be specially considered.

(iii) For visor doors the closing moment M_y under external load is to be taken as:

$M_y = F_x a + 10Wc - F_z b$ kN-m

where:
W = Mass of the visor door, in t.
a = Vertical distance, in m, from visor pivot to the centroid of the transverse vertical projected area of the visor door, as shown in Fig. II 13-2.
b = Horizontal distance, in m, from visor pivot to the centroid of the horizontal projected area of the visor door, as shown in Fig II 13-2.
c = Horizontal distance, in m, from visor pivot to the center of gravity of visor mass, as shown in Fig II 13-2.

(iv) Moreover, the lifting arms of a visor door and its supports are to be dimensioned for the static and dynamic forces applied during the lifting and lowering operations, and a minimum wind pressure of 1.5 kN/m^2 is to be taken into account.

(b) Inner doors

(i) The design external pressure considered for the scantlings of primary members, securing and supporting devices and surrounding structure of inner doors is to be taken as the greater of the following:

(1) P_e = 0.45L kN/m^2

(2) P_h = 10h,

where:
P_h = Hydrostatic pressure.
h = The distance, in m, from the load point to the top of the cargo space.
L = The ship's length, as defined in 13.4.5(a)(i).

(ii) The design internal pressure P_b considered for the scantlings of securing devices of inner doors is not to be less than:

$P_b = 25$ kN/m^2

13.4.6 Scantlings of bow doors

(a) The strength of bow doors is to be commensurate with that of the surrounding structure.

(b) Bow doors are to be adequately stiffened and means are to be provided to prevent lateral or vertical movement of the door when closed. For visor doors adequate strength for the opening and closing operations is to be provided in the connections of the lifting arms to the door structure and to the ship structure.

(c) Plating and secondary stiffeners

(i) The thickness of the bow door plating is not to be less than that required for the side shell plating, using bow door stiffener spacing, but in no case less than the minimum required thickness of fore end shell plating.

(ii) The section modulus of horizontal or vertical stiffeners is not to be less than that required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and bow doors stiffeners.

(iii) The stiffener webs are to have a net sectional area not less than.

$$A = \frac{QK}{10} \qquad cm^2$$

where:

Q = Shear force, in kN, in the stiffener calculated by using uniformly distributed external pressure P_e as given in 13.4.5(a)(i).

K = Material factor as given in 1.5.2 (a).

(d) Primary structure

(i) The bow door secondary stiffeners are to be supported by primary members constituting the main stiffening of the door.

(ii) The primary members of the bow door and the hull structure in way are to have sufficient stiffness to ensure integrity of the boundary support of the door.

(iii) Scantlings of the primary members are generally to be supported by direct calculations in association with the external pressure given in 13.4.5(a)(i) and permissible stresses given in 13.4.4(a). Normally, formulae for simple beam theory may be applied.

13.4.7 Scantlings of inner doors

(a) Scantlings of the primary members are generally to be supported by direct calculations in association with the external pressure given in 13.4.5(b)(i) and permissible stresses given in 13.4.4(a). Normally, formulae for simple beam theory may be applied.

(b) Where inner door also serve as a vehicle ramps, the scantlings are not to be less than those required for vehicle decks.

(c) The distribution of the forces acting on the securing and supporting devices is generally to be supported by direct calculations taking into account the flexibility of the structure and the actual position and stiffness of the supports.

13.4.8 Securing and supporting of bow doors

(a) Bow doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow door is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is not generally to exceed 3 mm. A means is to be provided for mechanically fixing the door in the open position.

(b) Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices. Small and/or flexible devices such as cleats intended to provide local compression of the packing material are not generally to be included in the calculations called for in 13.4.8(d)(v). The number of securing and supporting devices are generally to be the minimum practical whilst taking into account the requirements for redundant provision given in 13.4.8(d)(vi) and 13.4.8(d)(vii) and the available space for adequate support in the hull structure.

(c) For opening outwards visor doors, the pivot arrangements is generally to be such that the visor is self closing under external loads, that is $M_y > 0$. Moreover, the closing moment M_y as given in 13.4.5(a)(iii) is to be not less than:

$$M_{yo} = 10Wc + 0.1(a^2 + b^2)^{0.5}(F_x^2 + F_z^2)^{0.5} \qquad kN\text{-}m$$

(d) Scantlings

(i) Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in 13.4.4(a).

(ii) For visor doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door.

Case 1 F_x and F_z.
Case 2 0.7 F_y acting on each side separately together with 0.7 F_x and 0.7 F_z.

where F_x , F_y and F_z are determined as indicated in 13.4.5(a)(ii) and applied at the centroid of projected areas.

(iii) For side-opening doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door.

Case 1 F_x, F_y and F_z acting on both doors.
Case 2 0.7 F_x and 0.7 F_z acting on both doors and 0.7 F_y acting on each door separately.

where F_x , F_y and F_z are determined as indicated in 13.4.5(a)(ii) and applied at the centroid of project areas.

(iv) The support forces as determined according to 13.4.8(d)(ii) case 1 and 13.4.8(d)(iii) case1 are to generally give rise to a zero moment about the transverse axis through the centroid of the area A_x. For visor doors, longitudinal reaction forces of pin and/or wedge supports at the door base contributing to this moment are not to be of the forward direction.

(v) The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports.

(vi) The arrangement of securing and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 per cent the permissible stresses as given in 13.4.4.

(vii) For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reactions force required to prevent opening of the door within the permissible stresses given in 13.4.4(a). The opening moment M_o to be balanced by this reaction force, is not to be taken less than:

$M_o = 10Wd + 5A_xa$ kN-m

where:

d	=	Vertical distance, in m, from the hinge axis to the center of gravity of the door.
A_x, W, a	=	As defined in 13.4.5(a)(iii).

(viii) For visor doors, the securing and supporting devices excluding the hinges are to be capable of resisting the vertical design force ($F_z - 10W$), in kN, within the permissible stresses given in 13.4.4(a).

(ix) All load transmitting elements in the design load path, from door through securing and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices.

(x) For side-opening doors, thrust bearing has to be provided in way of girder ends at the closing of the two leaves to prevent one leaf to shift towards the other one under effect of unsymmetrical pressure (see example of Fig II 13-3). Each part of the thrust bearing has to be kept secured on the other part by means of securing devices. Any other arrangement serving the same purpose may be proposed.

Thrust Bearing

13.4.9 Securing and locking arrangement

(a) Systems for operation

(i) Securing devices are to be simple to operate and easily accessible. Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or to be of the gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

(ii) Bow doors and inner doors giving access to vehicle decks are to be provided with an arrangement for remote control, from a position above the freeboard deck, of:

(1) the closing and opening of the doors, and

(2) associated securing and locking devices for every door
Indication of the open/closed position of every door and every securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorized persons. A notice plate, giving instructions to the effect that all securing devices are closed and locked before leaving harbor, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

(iii) Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position. This means that, in the event of loss of the hydraulic fluid, the securing devices remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits, when in closed position.

(b) Systems for indication/monitoring

(i) Separate indicator lights and audible alarms are to be provided on the navigation bridge and on the operating panel to show that the bow door and inner door are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It is to not be possible to turn off the indicator eight.

(ii) The indicator system is to be designed on the fail-safe principle and is to show by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating and closing the doors. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

(iii) The indication panel on the navigation bridge is to be equipped with a mode selection function "harbor/sea voyage", so arranged that audible alarm is given if vessel leaves harbor with the bow door or inner door not closed and with any of the securing devices not in the correct position.

(iv) A water leakage detection system with audible alarm and television surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of leakage through the inner door.

(v) Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system must monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting color of objects under surveillance.

(vi) A drainage system is to be arranged in the area between bow door and ramp, as well as in the area between the ramp and inner door where fitted. The system is to be equipped with an audible alarm function to the navigation bridge for water level in these areas exceeding 0.5 m above the car deck level.

13.4.10 Operating and Maintenance manual

(a) An Operating and Maintenance Manual for the bow door and inner door is to be provided on board and contain necessary information on:

(i) Main particulars and design drawings, including:

(1) special safety precautions,

(2) details of vessel,

(3) equipment and design loading (for ramps),

(4) key plan of equipment (doors and ramps),

(5) manufacturer’s recommended testing for equipment,

(6) description of equipment for bow doors, inner bow doors, bow ramp/doors, side doors, stern doors, central power pack, bridge panel, engine control room panel.

(ii) Service conditions, including:

(1) limiting heel and trim of ship for loading/unloading,

(2) limiting heel and trim for door operations,

(3) doors/ramps operating instructions,

(4) doors/ramps emergency operating instructions.

(iii) Maintenance, including:

(1) schedule and extent of maintenance,

(2) trouble shooting and acceptable clearances,

(3) manufacturer's maintenance procedures.

(iv) Register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

(b) This Manual is to be submitted for approval that the above mentioned items are contained in the Operating and Maintenance Manual and that the maintenance part includes the necessary information with regard to inspections, troubleshooting and acceptance/rejection criteria. It is recommended that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the shell doors. Any damages recorded during such inspections are to be reported to the Society.

(c) Documented operating procedures for closing and securing the bow door and inner door are to be kept on board and posted at appropriate place.

13.5 Side Shell Doors and Stern Doors

13.5.1 Application

(a) This section gives requirements for the arrangement, strength and securing of side shell doors abaft the collision bulkhead, and stern doors leading into enclosed spaces.

(b) The requirements apply to all ro-ro passenger ships and ro-ro cargo ships engaged on international voyages and also to ro-ro passenger ships and ro-ro cargo ships engaged only in domestic (non international) voyages, except where specifically indicated otherwise herein. The requirements are not applicable to high speed, light displacement craft as defined in the IMO Code of Safety for High Speed Craft.

13.5.2 Arrangement

(a) Stern doors for passenger vessels are to be situated above the freeboard deck. Stern doors for Ro-Ro cargo ships and side shell doors may be either below or above the freeboard deck.

(b) Side shell doors and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure.

(c) Where the sill of any side shell door is below the uppermost load line, the arrangement is to be specially considered.

(d) Doors are to preferably open outward.

(e) The number of door openings is to be kept to the minimum compatible with design and proper operation of the ship.

(f) The strength criteria is to refer that specified in 13.4.4 of this Chapter.

13.5.3 Definitions

(a) Securing device – Same as 13.4.3(a).

(b) supporting device – Same as 13.4.3(b).

(c) Locking device – Same as 13.4.3(c).

(d) Ro-ro passenger ship – a passenger ship with ro-ro spaces or special category spaces.

(e) Ro-ro spaces – are spaces not normally sub-divided in any way and extending to either a substantial length or the entire length of the ship, in which motor vehicles with fuel in their tanks for their own propulsion and/or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks or in or on similar stowage units or, other receptacles) can be loaded and unloaded normally in a horizontal direction.

(f) Special category spaces – are those enclosed vehicle spaces above or below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10m.

13.5.4 Design loads

(a) The design forces considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be not less than:

(i) Design forces for securing or supporting devices of doors opening inwards:

(1) External force : $F_e = AP_e + F_p$ kN

(2) Internal force : $F_i = F_o + 10W$ kN

(ii) Design forces for securing or supporting devices of doors opening outwards:

(1) External force : $F_e = AP_e$ kN

(2) Internal force : $F_i = F_o + 10W + F_p$ kN

(iii) Design forces for primary members:

(1) External force : $F_e = AP_e$ kN

(2) Internal force: $F_i = F_o + 10W$ kN

whichever is the greater.

where:

A	=	Area, in m^2, of the door bears the actual load in the loading direction.
W	=	Mass of door, in t.
F_p	=	Total packing force in kN. Packing line pressure is normally not to be taken less than 5N/mm.
F_o	=	The greater of. F_c and 5A (kN).
F_c	=	Accidental force, in kN, due to lose of cargo etc., to be uniformly distributed over the area A and not to be taken less than 300kN. Where the area of doors is less than 30 m^2, the value of F_c may be appropriately reduced to 10A (kN). However, the value of F_c may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental forces to loose cargoes.
P_e	=	External design pressure determined at the center of gravity of the door opening and not taken less than:
	=	$10(T - Z_G) + 25$ kN/m^2 for $Z_G < T$
	=	25 kN/m^2 for $Z_G \geq T$
	=	Moreover, for stern doors of ships fitted with bow doors, P_e is not to be taken less than:
	=	$0.6\lambda C_H\left(0.8 + 0.6\sqrt{L}\right)^2$ kN/m^2
L, λ and C_H	=	As specified in 13.4.5(a)(i) of this Chapter.
T	=	Draught, in m, at the highest subdivision load line.
Z_G	=	Height of the center of area of the door, in m. above the baseline.

13.5.5 Scantlings of side shell doors and stern doors

(a) The strength of side shell doors and stern doors is to be commensurate with that of the surrounding structure.

(b) Side shell doors and stern doors are to be adequately stiffened and means are to be provided to prevent any lateral or vertical movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/maneuvering arms and hinges to the door structure and to the ship's structure.

(c) Where doors also serve as vehicle ramps, the design of the hinges is to take into account the ship angle of trim and heel which may result in uneven loading on the hinges.

(d) Shell door openings are to have well-rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below.

(e) Plating and secondary stiffeners
   (i) The thickness of the door plating is not to be less than the required thickness for the side shell plating or the superstructure side shell plating, using the door stiffener spacing, but the thickness of the stern door which is not exposed to direct wave impact by a permanent ramp way provided outside the stern door may be reduced by 20% from the required thickness prescribed above.
   (ii) Notwithstanding the provision in (i) above, the thickness of the door plating is not to be less than the minimum required thickness of shell plating.
   (iii) Where doors serve as vehicle ramps, the plating thickness is to be not less than required for vehicle deck.
   (iv) The section modulus of horizontal or vertical stiffeners is not to be less than that required for side framing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and door stiffeners. Where doors serve as vehicle ramps, the stiffener scantlings are not to be less than required for vehicle decks.

(f) Primary Structure
   (i) The secondary stiffeners are to be supported by primary members constituting the main stiffening of the door.
   (ii) The primary members and the hull structure in way are to have sufficient stiffness to ensure structural integrity of the boundary of the door.
   (iii) Scantlings of the primary members are generally to be supported by direct calculations in association with the design forces given in 13.5.4 above and permissible stresses given in 13.4.4 of this Chapter. Normally, formulae for simple beam theory may be applied to determine the bending stresses. Members are to be considered to have simply supported end connections.
   (iv) Webs of primary members are to be properly stiffened in the vertical direction to shell plating.
   (v) Ends of stiffeners and primary members of the doors are to have sufficient rigidity against rotation and the moment of inertia is not to be less than that obtained from the following formula:

$$8d^4F_p \quad cm^4$$

where:

d = Distance (m) between securing devices

F_p = See 13.5.4 of this Chapter

13.5.6 Securing and Supporting of Doors

(a) Side shell doors and stern doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is not generally to exceed 3 mm. A means is to be provided for mechanically fixing the door in the open position.

(b) Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices. Small and /or flexible devices such as cleats intended to provide local compression of the packing material are not generally to be included in the calculations called for in 13.5.6(c)(ii). The number of securing and supporting devices are generally to be the minimum practical whilst taking into account the requirement for redundant provision given in 13.5.6(c)(iii) and the available space for adequate support in the hull structure.

(c) Scantlings

(i) Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in 13.4.4.

(ii) The distribution of the reaction forces acting on the securing devices and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position of the supports.

(iii) The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 per cent the permissible stresses as given in 13.4.4.

(iv) All load transmitting elements in the design load path, from the door through securing and supporting devices into the ship's structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices.

13.5.7 Securing and Locking Arrangement

(a) Systems for operation

(i) Securing devices are to be simple to operate and easily accessible. Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement) or are to be of the gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

(ii) Doors which are located partly or totally below the freeboard deck with a clear opening area greater than 6 m^2 are to be provided with an arrangement for remote control, from a position above the freeboard deck, of :

(1) The closing and opening of the doors,

(2) Associated securing and locking devices.
For doors which are required to be equipped with a remote control arrangement, indication of the open/closed position of the door and the securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorized persons. A notice plate, giving instructions to the effect that all securing devices is to be closed and locked before leaving harbor, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

(iii) Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position. This means that, in the event of loss of the hydraulic fluid, the securing devices remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits, when closed position.

(b) Systems for indication/monitoring

(i) The following requirements apply to doors in the boundary of special category spaces or ro-ro spaces, through which such spaces may be flooded. For cargo ships, where no part of the door is below the uppermost waterline and the area of the door opening is not greater than 6m^2 ,then the requirement of this section need not be applied.

(ii) Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It is to not be possible to turn off the indicator light.

(iii) The indicator system is to be designed on the fail-safe principle and is to indicate by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating and closing the doors and is to be provided with a backup power supply. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

(iv) The indication panel on the navigation bridge is to be equipped with a mode selection function "harbor/sea voyage", so arranged that audible alarm is given if the vessel leaves harbor with side shell or stern doors not closed or with any of the securing devices not in the correct position.

(v) For passenger ships, a water leakage detection system with audible alarm and television surveillance is to be arranged to provided an indication to the navigation bridge and to the engine control room of any leakage through the doors. For cargo ships, a water leakage detection system with audible alarm is to be arranged to provide an indication to the navigation bridge.

(vi) For ro-ro passenger ships, on international voyages, the special category spaces and ro-ro spaces are to be continuously patrolled or monitored by effective means, such as television surveillance, so that any movement of vehicles in adverse weather conditions and unauthorized access by passengers thereto, can be detected whilst the ship is underway.

13.5.8 Operating and Maintenance Manual

(a) An operating and Maintenance Manual for the side shell and stern doors is to be provided on board and contain necessary information on:

(i) Main particulars and design drawings, including:

(1) Special safety precautions,

(2) Details of vessel,

(3) Equipment and design loading (for ramps),

(4) Key plan of equipment (doors and ramps),

(5) Manufacturer's recommended testing for equipment,

(6) Description of equipment for bow doors, inner bow doors, bow ramp/doors, side doors, stern doors, central power pack, bridge panel, engine control room panel.

(ii) Service conditions, including:

(1) Limiting heel and trim of ship for loading/unloading,

(2) Limiting heel and trim for door operations,

(3) Doors/ramps operating instructions,

(4) Doors/ramps emergency operating instructions.

(iii) Maintenance, including:

(1) Schedule and extent of maintenance,

(2) Trouble shooting and acceptable clearances,

(3) Manufacturer's maintenance procedures.

(iv) Register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

(b) This Manual is to be submitted for approval that the above mentioned items are contained in the Operating and Maintenance Manual and that the maintenance part includes the necessary information with regard to inspections, troubleshooting and acceptance/rejection criteria. It is recommended that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the shell doors. Any damages recorded during such inspections are to be reported to the Society.

(c) Documented operating procedures for closing and securing side shell and stern doors are to be kept on board and posted at the appropriate places.

13.6 Means of Embarkation and Disembarkation

13.6.1 Ships are to be provided with appropriate means of embarkation on and disembarkation from ships for use in port and in port related operations, such as gangways and accommodation ladders.

13.6.2 Where a ship is engaged in voyages between designated ports where appropriate shore accommodation / embarkation ladders (platforms) are provided, special approval may be made by the Society.

13.6.3 the means of embarkation and disembarkation are to be in accordance with the following.

(a) Accommodation ladders and gangways are to be constructed based on ISO 5488:1979 "Shipbuilding - accommodation ladders", ISO 7061:1993 "Shipbuilding - aluminium shore gangways for seagoing vessels" or standards where deemed appropriate by the Society. Accommodation ladder winches are to be constructed based on ISO 7364:1983 "Shipbuilding and marine structures – deck machinery – accommodation ladder winches" or standards where deemed appropriate by the Society or are to be the one pursuant to aforementioned standards.

(b) The structure of the accommodation ladders and gangways and their fittings and attachments are to be such as to allow regular inspection, maintenance of all parts and, if necessary, lubrication of their pivot pin. Special care is to be paid to welding connection.

(c) As far as practicable, the means of embarkation and disembarkation are to be sited clear of the working area and are not to be placed where cargo or other suspended loads may pass overhead. However, in cases where the Society recognizes unavoidable circumstances, the means of embarkation and disembarkation may be installed within the above mentioned areas or places, provided that safe passage is ensured through description in operation manuals, the installation of warning plates, and so on.

(d) Each accommodation ladder is to be of such a length to ensure that, at a maximum design operating angle of inclination, the lowest platform will be not more than 600 mm above the waterline in the lightest seagoing condition (in this regard, trim is to be the condition resulting from the loading condition of the lightest seagoing condition), as defined in SOLAS Regulation III/3.13. However, in cases where the height of the embarkation / disembarkation deck exceeds 20 m above the waterline or is deemed appropriate by the Society, an alternative means of providing safe access to the ship or supplementary means of access to the bottom platform of the accommodation ladder may be accepted.

(e) The arrangement at the head of the accommodation ladder is to provide direct access between the ladder and the ship’s deck by a platform securely guarded by handrails and handholds. The ladder is to be securely attached to the ship to prevent overturning.

(f) Each accommodation ladder or gangway is to be clearly marked at each end with a plate showing the restrictions on the safe operation and loading, including the maximum and minimum permitted design angles of inclination, design load, maximum load on bottom end plate, etc. Where the maximum operational load is less than the design load, it is also to be shown on the marking plate.

(g) Gangways are not to be used at an angle of inclination greater than 30 degrees from the horizontal and accommodation ladders are not to be used at an angle greater than 55 degrees from the horizontal, unless designed and constructed for use at angles greater than these and marked as such.

(h) Gangways are not to be secured to a ship’s guardrails unless they have been designed for that purpose. If positioned through an open section of bulwark or railings, any remaining gaps are to be adequately fenced.

(i) Adequate lighting is to be provided to illuminate the means of embarkation and disembarkation, the position on deck where persons embark or disembark and the controls of the arrangement.

(j) A lifebuoy equipped with a self-igniting light and a buoyant lifeline is to be available for immediate use in the vicinity of the embarkation and disembarkation arrangement when in use.

(k) A safety net is to be mounted and arrangements that enable the installation of such net are to be provided to prevent falling accident in cases where it is possible that a person may fall from the means of embarkation and disembarkation or between the ship and quayside.

13.6.4 Ships that have small freeboards and are provided with boarding ramps needs not to be in accordance with the requirements of 13.6.3.

Chapter 14
Watertight Bulkheads

14.1 General

14.1.1 Collision Bulkhead

(a) A collision bulkhead is to be fitted which is to be watertight up to the bulkhead deck. This bulkhead is to be located at a distance from the forward perpendicular of not less than $0.05L_f$ (L_f is defined in 1.2.10 of Part II)or 10 m, whichever is the less, and, except as may be permitted by the Society, not more than $0.08L_f$ or $0.05L_f$ + 3 m, whichever is the greater. Where any part of the ship below the waterline at 85% of the least moulded depth extends forward of the forward perpendicular of the length for freeboard, e.g., a bulbous bow, the above-mentioned distance is to be measured from the point either:

(i) at the mid-length of such extension;

(ii) at a distance $0.015L_f$ forward of the forward perpendicular; or

(iii) at a distance 3.0 m forward of the forward perpendicular,

whichever gives the smallest measurement.

(b) The bulkhead may have steps or recesses provided they are within the limits prescribed in (a).

(c) No doors, manholes, access openings, ventilation ducts or any other openings are to be fitted in the collision bulkhead below the bulkhead deck. Where a collision bulkhead extends up to a deck above the freeboard deck in accordance with the requirements of 14.1.5(b), the number of openings in the extension of the collision bulkhead is to be kept to a necessary minimum and all such openings are to be provided with weathertight means of closing.

(d) The collision bulkhead arrangement in a ship provided with bow doors is to be at the discretion of the Society. Where a sloping ramp forms a part of the collision bulkhead above the bulkhead, the part of the ramp which is more than 2.3 m above the bulkhead deck may extend forward of the limit specified in (a) above. In this case, the ramp is to be weathertight over its complete length. However, ramps not meet the above requirement are to be disregarded as an extension of the collision bulkhead.

(e) Notwithstanding the requirements in (c), the collision bulkhead may be pierced below the bulkhead deck by not more than one pipe for dealing with fluid in the forepeak tank, provided that the pipe is fitted with a screw-down valve capable of being operated from above the bulkhead deck, the valve chest being secured inside the forepeak to the collision bulkhead. The Society may, however, agree the fitting of this valve on the after side of the collision bulkhead provided that the valve is readily accessible under all service conditions and the space in which it is located is not a cargo space. All valves shall be of steel, bronze or other approved ductile material. Valves of ordinary cast iron or similar material are not acceptable.

14.1.2 After Peak Bulkhead

(a) Ships are to have an after peak bulkhead.

(b) The stern tube is to be enclosed in a watertight compartment by the after peak bulkhead or other arrangements.

14.1.3 At each end of the machinery space, a watertight bulkhead is to be provided.

14.1.4 Hold Bulkheads

(a) Cargo ships of an ordinary type are to have hold bulkheads in addition to the bulkheads specified in 14.1.1 to 14.1.3 at reasonable intervals. The total number of watertight bulkheads may not be less than that given by Table II 14-1.

Table II 14-1
Total Number of Watertight Bulkheads

Length of ship, L, in m	Total number of bulkheads
$67 \leq L < 87$	4
$87 \leq L < 102$	5
$102 \leq L < 123$	6
$123 \leq L < 143$	7
$143 \leq L < 165$	8
$165 \leq L < 186$	9
$186 \leq L$	Approved by the Society

(b) Where it is impracticable to adhere to the number of hold bulkheads required above, an alternative arrangement may be accepted subject to the approval by the Society.

14.1.5 Height of Watertight Bulkheads

The watertight bulkheads required in 14.1.1 to 14.1.4 are to extend to the freeboard deck with the following exceptions.

(a) A watertight bulkhead in way of the raised quarter or the sunken forecastle deck is to extend up to the captioned deck.

(b) Where a forward superstructure having openings without closing appliances leads to a space below the freeboard deck, or a long forward superstructure is provided, the collision bulkhead is to extend up to the superstructure deck and to be weathertight. However, where the extension is located within the limits specified in 14.1.1 and the part of the deck which forms the step is made effectively weathertight, it need not be fitted directly above the collision bulkhead.

(c) The aft peak bulkhead may terminate at a deck above the designed maximum load line provided that this deck is watertight to the stern of the ship.

14.1.6 Transverse Strength of Hull

(a) Where the watertight bulkheads required in 14.1.1 to 14.1.5 are not extended up to the strength deck, deep webs or partial bulkheads situated immediately or nearly above the main watertight bulkheads are to be provided so as to maintain the transverse strength and stiffness of the hull.

(b) Where the length of a hold exceeds 30 meters, suitable means are to be provided so as to maintain the transverse strength and stiffness of the hull.

14.2 Construction of Watertight Bulkheads

14.2.1 The thickness of bulkhead plating is not to be less than that obtained from the following formula:

$$3.2S\sqrt{Kh} + 2.5 \quad \text{mm}$$

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Spacing of stiffeners, in m.

h = Vertical distance, in m, measured from the lower edge of the bulkhead plate to the bulkhead deck at the centre line of ship. It is not to be less than 3.4 meters.

14.2.2 Increase in Thickness of Plates of Special Parts

(a) The thickness of the lowest strake of bulkhead plating is to be at least 1.0 mm thicker than that obtained from the formula in 14.2.1.

(b) The lowest strake of bulkhead plating is to extend at least 610 mm above the top of the inner bottom plating in way of double bottom or 915 mm above the top of keel in way of single bottom. Where the double bottom is provided only on one side of the bulkhead, the extension of the lowest strake is to be up to the higher of the two heights given in the preceding sentence.

(c) The bulkhead plating in the limber is to be at least 2.5 mm thicker than that given in 14.2.1.

(d) The bulkhead plating is to be doubled or increased in thickness in way of the stern tube opening or propelling shaft opening, notwithstanding the requirements in 14.2.1.

14.2.3 The section modulus of bulkhead stiffeners is not to be less than that obtained from the following formula:

$2.8KShl^2 \quad cm^3$

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
l	=	Span, in m, measured between the adjacent supports of stiffeners including the length of connection. Where girders are provided, *l* is the distance from the heel of the end connection to the first girder or the distance between the girders.
S	=	Breadth, in m, of the area supported by the stiffener.
h	=	Vertical distance, in m, measured from the mid-point of *l* for vertical stiffeners, and from the mid-point of S for horizontal stiffeners, to the top of the bulkhead deck at the centre line of the ship. Where the vertical distance is less than 6.0 meters, h is to be taken as 1.2 meters greater than 0.8 times the vertical distance.
C	=	Coefficient given in Table II 14-2, according to the type of end connections.

14.2.4 Corrugated Bulkheads

(a) The plate thickness of corrugated bulkheads is not to be less than that obtained from the following formula:

$3.4CS_1\sqrt{Kh} + 2.5 \quad mm$, but not to be less than $5.9CS_1 + 2.5$ mm

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
h	=	As specified in 14.2.1.
S_1	=	Breadth, in m, of face part or web part indicated as a or b, respectively, in Fig. II 14-2 of this Chapter.
C	=	Coefficient for face part: $\dfrac{1.5}{\sqrt{1+\left(\dfrac{t_w}{t_f}\right)^2}}$
	=	Coefficient for web part: 1.0
t_w	=	Thickness, in mm, of plates of web.
t_f	=	Thickness, in mm, of plates of face.

(b) The actual section modulus per half pitch of corrugated bulkheads is to be greater than that obtained from the following formula:

$3.6KShl^2 \quad cm^3$

where:

K	=	Material factor as specified in 1.5.2(a) of this Part.
S	=	Half pitch length, in m, of the corrugation (See Fig. II 14-2).
h	=	As specified in 14.2.3.
l	=	Length, in m, between the supports, as indicated in Fig. II 14-3.
C	=	Coefficient given in Table II 14-3, according to the type of end connection.

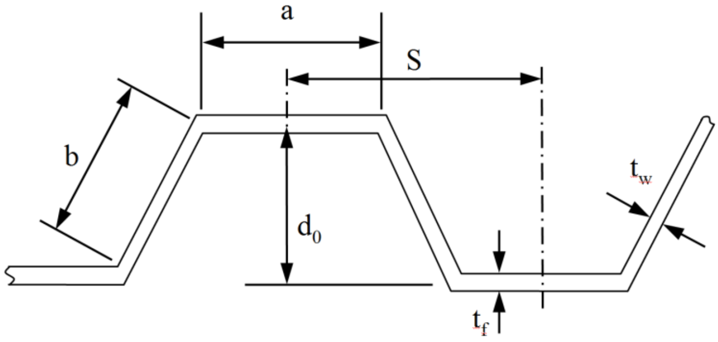

Fig II 14-2
Measurement of S

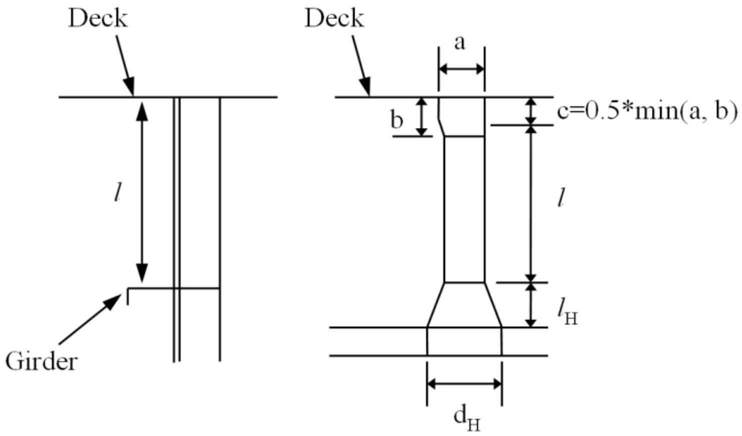

Fig II 14-3
Measurement of *l*

(c) Where the end connection of corrugated bulkheads is remarkably effective, the value of C specified in (b) may be adequately reduced.

(d) The thickness of plates at end parts for 0.2*l* in line with *l* is not to be less than that obtained from the following formulae respectively:

Web part:

$$\frac{CKShl}{24d_0} + 2.5 \quad \text{mm}$$

The web thickness is not to be less than that obtained from the following formula:

$$\sqrt[3]{\frac{CShlb^2}{0.19 \cdot d_0}} + 2.5 \quad \text{mm}$$

Face part, except the upper end part of vertically corrugated bulkheads:

$$\frac{12a}{\sqrt{K}} + 2.5 \quad \text{mm}$$

where:

K, S, h, *l* and d_0 = As specified in (b).

a and b = Breadth, in m, of face part and web part, respectively.

C = Coefficient given in Table II 14-4. Where the vertically corrugated bulkheads are constructed with a single span, the value of C may be taken as the value for the uppermost span in the Table.

(e) The thickness of the plates specified in (a) and (d) is to be in accordance with 14.2.2.

(f) The actual section modulus per half pitch of corrugated bulkheads is to be calculated using the following formula:

$$167 \cdot (3at_f d_0 + bt_w d_0) \qquad cm^3$$

where:

a and b = Breadth, in m, of face part and web part, respectively.

t_f and t_w = Thickness, in mm, of plates of face part and web part, respectively.

d_0 = Depth, in m, of corrugation.

14.2.5 For collision bulkheads, the plate thickness and section modulus of stiffeners are not to be less than that those specified in 14.2.1 and 14.2.3 or 14.2.4 taking h as 1.25 times the specified height.

14.2.6 Girders Supporting Bulkhead Stiffeners

(a) The section modulus of girders is to be greater than that obtained from the following formula:

$$4.75KSh l^2 \qquad cm^3$$

where:

K = Material factor as specified in 1.5.2(a) of this Part.

S = Breadth, in m, of the area supported by the girder.

h = Vertical distance, in m, measured from the mid-point of *l* for vertical girders, and from the mid-point of S for horizontal girders, to the top of the bulkhead deck at the centre line of the ship. Where the vertical distance is less than 6.0 metres, h is to be taken as 1.2 meters greater than 0.8 times the vertical distance.

l = Span, in m, measured between the adjacent supports of girders *l* may be modified in accordance with 1.9 of this Part.

(b) The moment of inertia of girders is not to be less than that obtained from the following formula. The depth of girders is not to be less than 2.5 times the depth of slots for stiffeners.

$$10h l^4 \qquad cm^4$$

where:

h and *l* = As specified in (a).

(c) The thickness of web plates is not to be less than that obtained from the following formula:

$$10S_1 + 2.5 \qquad mm$$

where:

S_1 = Spacing, in m, of web stiffeners or depth of girders, whichever is smaller.

(d) The thickness of web plates at both end parts for $0.2l$ is not to be less than that obtained from the following formulae, whichever is greater:

$$\frac{CSh l}{24 \cdot d_0} + 2.5 \qquad mm$$

$$\sqrt[3]{\frac{CSh l S_1^2}{0.19 \cdot d_0}} + 2.5 \qquad mm$$

where:

S, h and *l* = As specified in (a).

d_0 = Depth, in m, of girders.
S_1 = As specified in (c).
C = As specified in 14.2.4 (d).

(e) Tripping brackets are to be provided at intervals of about 3 meters and where the breadth of face plates exceeds 180 mm on either side of the girder, these brackets are to be so arranged as to support the face plates.

(f) The actual section modulus and moment of inertia of girders are to be calculated in accordance with 1.6.3 of this Part. Where stiffeners are provided within the effective breadth, they may be included in the calculation.

14.2.7 Plating of bulkheads, decks, inner bottoms, etc. are to be, if necessary, strengthened at the location of the end brackets of stiffeners and the end of girders.

14.2.8 Bulkhead Recesses

(a) In way of bulkhead recesses, beams are to be provided at every frame and under the upper bulkhead in accordance with the requirements in 9.2.1 and 14.2.3 taking the beam spacing as the stiffener spacing. Where the lower end of the upper bulkhead is especially strengthened, the beam under the upper bulkhead may be dispensed with.

(b) The thickness of deck plating forming the top of bulkhead recesses is to be at least 1.0 mm greater than that given by 14.2.1, regarding the deck plating as bulkhead plating and the beams as stiffeners. However, the thickness is not to be less than that required for deck plating in that location.

(c) The thickness of pillars supporting bulkhead recesses are to be determined taking into account the water pressure that might be applied on the upper surface of the recesses, and their end connections are to be sufficiently strong enough to withstand the water pressure which might be applied on the under surface.

14.2.9 Where stiffeners are cut or the spacing of stiffeners is increased in order to provide the watertight door in the bulkhead, the opening is to be suitably framed and strengthened as to maintain the full strength of the bulkhead. The door frames are not to be considered as stiffeners.

14.3 Watertight Doors

14.3.1 General

(a) All openings in the watertight bulkheads and the part of the deck which forms the step of the bulkheads are to be closed by watertight closing appliances (referred to as "watertight doors" in this chapter) in accordance with the requirements in 14.3.2 to 14.3.5.

(b) Watertight doors as specified in (a) above are to be normally closed at sea, except where deemed necessary for the ship's operation by the Society. Watertight doors or ramps fitted to internally subdivided cargo spaces are to be permanently closed at sea.

14.3.2 Types of Watertight Doors

(a) Watertight doors are to be of a sliding type.

(b) Notwithstanding the provisions in (a) above, watertight doors provided at small access openings, which are approved by the Society, may be of a hinged type or rolling type, except where the doors are required to be capable of being operated remotely by the provisions of 14.3.4(b).

(c) Notwithstanding the provisions in (a) above, watertight doors or ramps fitted to internally subdivided cargo spaces may be of a type other than the sliding type.

(d) Doors which are closed by dropping or by the action of a dropping weight are not permitted.

14.3.3 Strength and Watertightness

(a) Watertight doors are to be of ample strength and watertightness for water pressure to a head up to the bulkhead deck, and door frames are to be effectively secured to the bulkheads. Watertight doors are to be tested by water pressure before they are fitted other than those specified in the following (i) to (iii).

(i) The prototype of such doors has been tested by design water pressure.

(ii) The design of such doors has been verified to have enough strength and watertightness by direct structural analysis. Where watertight doors utilize gasket seals, a prototype pressure test to confirm that the compression of the gasket material is capable of accommodating any deflection is to be carried out.

(iii) Such doors are complying with a standard deemed appropriate by the Society.

(b) Hydrostatic tests specified in 14.3.3(a) are to be carried out as follows:

(i) The head of water used for the hydrostatic test is to correspond at least to the head measured from the lower edge of the door opening (at the location in which the door is to be fitted in the ship) to the bulkhead deck. However, for watertight doors subject to the damage stability requirements, the head is not to be less than the height of the final damage waterline or the intermediate waterline, whichever is greater.

(ii) The acceptable leakage rate at the test is not to be greater than the following values.

(1) Doors with gaskets: No leakage

(2) Doors with metallic sealing: 1.0 liter/min

(iii) Notwithstanding (ii) above, the following leakage rate may be accepted for hydrostatic tests on large doors located in cargo spaces employing gasket seals or guillotine doors located in conveyor tunnels.

(1) For doors of design head exceeding 6.1 m:

$$(P + 4.572) \cdot \frac{h^3}{6568} \qquad \text{liter/min}$$

Where P, in m, is the perimeter of door opening, and h, in m, is the test head of water.

(2) For doors with a design head not exceeding 6.10 m, the acceptable leakage rate is the value calculated by the formula specified in (1) above or 0.375 liter/min, whichever is greater.

(c) Where watertight doors are provided in cargo spaces, such doors are to be protected by suitable means against damage from items such as cargoes.

14.3.4 Control

(a) All watertight doors, except those which are to be permanently closed at sea, are to be capable of being opened and closed by hand locally, from both sides of the doors, with the ship listed 30 degrees to either side.

(b) In addition to the requirements of (a) above, watertight doors which are used at sea or normally open at sea are to be capable of being remotely closed by power from the navigation bridge.

(c) Watertight doors are not to be able to be opened remotely. In addition, watertight doors complying with the provisions of 14.3.2 (c) are not to be remotely controlled.

14.3.5 Indication

(a) Watertight doors, except those permanently closed at sea, are to be provided with position indicators showing whether the doors are open or closed on the bridge and at all operating positions.

(b) For watertight doors which are to be capable of being remotely closed, an indication is to be placed locally showing that the door is in remote control mode.

14.3.6 Watertight doors which are capable of being remotely closed are to be provided with an audible alarm which will sound at the door position whenever such a door is remotely closed.

14.3.7 Source of Power

(a) The remote controls, indications and alarms required in 14.3.4 to 14.3.6 are to be operable in the event of main power failure.

(b) Electrical installations for devices specified in (a) except those of a water-proof type approved by the Society are not to be under the freeboard deck.

(c) Cables for devices specified in (a) are to be protected by means deemed appropriate by the Society.

14.3.8 Notices

(a) Watertight doors which are to be normally closed at sea but not provided with a means of remote closure are to have notices fixed to both sides of the doors stating "To be kept closed at sea".

(b) Watertight doors which are to be permanently closed at sea are to have notices fixed to both sides stating "Not to be opened at sea". Such doors which are accessible during the voyage are to be fitted with a device which prevents unauthorized opening.

14.3.9 Sliding Doors

(a) Where a sliding watertight door is operated by rods, the lead of the operating rods is to be as direct as possible and the screw is to work in a nut of brass or other approved materials.

(b) The frames of vertically sliding watertight doors are not to have a groove at the bottom in which dirt might lodge and prevent the door from closing.

14.3.10 Hinged Doors and Rolling Doors

(a) For hinged and rolling watertight doors, the hinge pins and the wheel axle of these doors are to be of brass or other approved materials.

(b) Hinged and rolling watertight doors except those that are to be permanently closed at sea are to be of quick acting or single action type which is capable of being closed and secured from both sides of the doors.

14.4 Other Watertight Construction

14.4.1 For the application of this chapter, trunks required to maintain watertightness are to be capable of withstanding internal or external pressure under the most severe conditions at the intermediate or final stages of flooding.

Table II 14-2
Value of C

Vertical Stiffener

Lower end	Upper end: Lug-connection or supported by horizontal girders	Upper end: Connection Type A	Upper end: Connection Type B	Upper end: End of stiffener unattached
Lug-connection or supported by horizontal girders	1.00	1.00	1.15	1.35
Connected by brackets	0.80	0.80	0.90	1.00
stiffener web attached at end only	1.15	1.15	1.35	1.60
End of stiffener unattached	1.35	1.35	1.60	2.00

Horizontal Stiffener

The other end	One end: Lug-connection, connected by brackets or supported by vertical girders	One end: End of stiffener unattached
Lug-connection, connected by brackets or supported by vertical girders	1.00	1.35
End of stiffener unattached	1.35	2.00

Notes:

(1) Lug-connection is a connection where both webs and face plates of stiffeners are effectively attached to the bulkhead plating, decks or inner bottoms and which are strengthened by effective supporting members on the opposite side of the plating.

(2) " Type A" of vertical stiffeners is a connection by bracket to the longitudinal members or to the adjacent members, in line with the stiffeners, of the same or larger sections. (See Fig. II 14-1 (a))

(3) " Type B" of vertical stiffeners is a connection by bracket to the transverse members such as beams, or other connections equivalent to the connection mentioned above. (See Fig. II 14-1 (b))

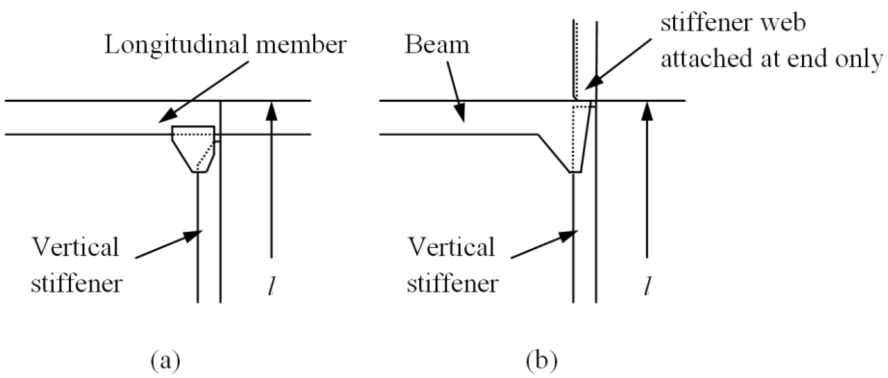

Fig. II 14-1
Types of End Connections

Table II 14-3
Value of C (for corrugated bulkheads)

The other end of bulkhead	One end of bulkhead		
	Supported by horizontal or vertical girders	Upper end welded directly to deck	Upper end welded to stool efficiently supported by ship structure
Supported by horizontal or vertical girders or lower end of bulkhead welded directly to decks or inner bottoms	$\frac{4Z_0}{2Z_0+Z_1+Z_2}$	$\frac{4Z_0}{2.2Z_0+Z_2}$	$\frac{4Z_0}{2.6Z_0+Z_2}$
Lower end of bulkhead welded to stool efficiently supported by ship structure	$\frac{4.8\left(1+\frac{l_H}{l}\right)^2}{2+\frac{Z_1}{Z_0}+\frac{d_H}{d_0}}$	$\frac{4.8d_0\left(1+\frac{l_H}{l}\right)^2}{2.2d_0+d_H}$	$\frac{4.8d_0\left(1+\frac{l_H}{l}\right)^2}{2.6d_0+d_H}$
	The value of C is not to be less than that obtained from 14.2.4 (a).		

Notes:

Z_0 : Minimum section modulus, in cm^3, per half pitch of mid part for $0.6l$ of the corrugated bulkhead

Z_1 and Z_2 :

Section modulus, in cm^3, per half pitch of end part
For vertical corrugation, Z_1 is the section modulus of the upper end part and Z_2 is that of the lower end part. Where the plate thickness is increased in accordance with 14.2.4(e) the section modulus is to be that for the plate thickness reduced by the increment.

l_H : Height, in m, of stool measured from inner bottom plating

d_H : Breadth, in m, of stool measured on inner bottom plating

d_0 : Depth, in m, of corrugation

Table II 14-4
Value of C

Position		Upper end	Lower end
Vertically corrugated bulkhead	Uppermost span	0.4	1.6
	Other spans	0.9	1.1
Both ends of horizontally corrugated bulkhead		1.0	

Chapter 15

Non-Watertight Centerline Bulkheads in Cargo Spaces

15.1 Construction

15.1.1 The thickness of bulkhead plating is to be not less than that obtained from the following formulas:

$t = 6$ mm for $s \leq 760$ mm

$t = 6 + 0.5\left(\frac{s - 760}{150}\right)$ mm for $s > 760$ mm

where:

s = Stiffener spacing, in mm.

15.1.2 Where the centerline bulkhead is arranged to support beams, stiffeners are to be of such scantlings as to provide supports equivalent to pillars as given in 10.6 of this Part. However, stiffeners are not to be less in depth than 150 mm in holds and 100 mm in tween decks.

Chapter 16
Deep Tanks

16.1 General

16.1.1 The deep tank is a tank used for the carriage of water, fuel oil and other liquids, forming a part of the hull in holds or tween decks. Deep tanks used for the carriage of oils that need to be especially specified are designated as "deep oil tanks".

16.1.2 Watertight divisions (other than those specified in 16.1.3(c), peak tank bulkheads, and boundary bulkheads of deep tanks are to be constructed in accordance with the requirements in this Chapter. Where the bulkhead of a deep tank partly serves as a watertight bulkhead, that part of the bulkhead is to be in accordance with the requirements in Chapter 14.

16.1.3 Tank Division

(a) Deep tanks are to be provided with such longitudinal watertight divisions as necessary to meet the requirements for stability in service conditions as well as while the tanks are being filled or discharged.

(b) Deep tanks for fresh water or fuel oil or those which are not intended to be kept entirely filled in service conditions are to have additional divisions or deep wash plates as necessary, to minimize the dynamic forces acting on the structure.

(c) Longitudinal watertight divisions which will be subjected to pressure from both sides in tanks which are to be entirely filled or emptied in service conditions may be of the scantlings required for ordinary watertight bulkheads as stipulated in Chapter 14. In such cases, the tanks are to be provided with fittings such as deep hatches and inspection plugs in order to ensure that the tanks are kept full in service conditions.

16.1.4 In wing tanks and hold tanks of which the length or breadth exceeds 0.1L+5.0, in m, and in topside tanks and hopper tanks, the thickness of girders, struts and their end brackets and bulkhead plates is not to be less than that given by Table II 16-1 in accordance with the length of ship.

Table II 16-1
Minimum Thickness

L, in m	≥	90	105	120	135	150	165	180	195	225	275
	<	105	120	135	150	165	180	195	225	275	--
Thickness, in mm		8.0	8.5	9.0	9.5	10.0	10.5	11.0	11.5	12.0	12.5

16.1.5 For large tank boundaries, the scantlings of bulkhead plates, stiffeners, girders and cross ties are not to be less than that obtained from the relevant formulae in 16.2.2, 16.2.3, 16.2.4, 16.2.5 and 16.2.6, where the value of h is that given by the following formula or the one specified in each requirement, whichever is greater.

$0.85(\mathrm{h} + \Delta \mathrm{h})$ m

where:

h = As specified in each requirement of 16.2.2(a) or of 16.2.3(a).

Δh = Additional water head as the following formula:

$\frac{16}{\mathrm{L}}(l_\mathrm{t} - 10) + 0.25(\mathrm{b_t} - 10)$ m

l_t = Tank length, in m. Not to be less than 10 m.

b_t = Tank breadth, in m. Not to be less than 10 m, but may be 2/3B for ballast holds of bulk carrier with top side tanks.

16.2 Deep Tank Bulkheads

16.2.1 The construction of bulkheads and decks forming boundaries of deep tanks is to be in accordance with the requirements in Chapter 14, unless otherwise specified in this Chapter.

16.2.2 The thickness of deep tank bulkhead plating is not to be less than that obtained from the following formula:

$3.6S\sqrt{Kh} + 3.5$ mm

where:

S	=	Spacing of stiffeners, in m.
h	=	Greater of the distances given below: (a) Vertical distance, in m, measured from the lower edge of plate to the midpoint of the distance between the top of tanks and the top of overflow pipes. (b) 0.7 times the vertical distance, in m, measured from the lower edge of the plate to the point 2.0 m above the top of the overflow pipes.
K	=	Material factor as specified in 1.5.2 (a) of this Part

16.2.3 The section modulus of bulkhead stiffeners is not to be less than that obtained from the following formula:

$7CKShl^2$ mm

where:

S and l	=	As specified in 14.2.3 of this Part.
h	=	Greater of the vertical distances given below, with the lower end being regarded as the mid-point of l for vertical stiffeners and as S for horizontal stiffeners. (a) Vertical distance, in m, measured from the lower end to the midpoint of the distance between the top of the tanks and the top of the overflow pipes. (b) 0.7 times the vertical distance, in m, measured from the lower end to the point 2.0 m above the top of the overflow pipes.
C	=	Coefficient given in Table II 16-2 of this Chapter, according to the type of end connections
K	=	Material factor as specified in 1.5.2 (a) of this Part

16.2.4 Corrugated Bulkheads

(a) The thickness of plates of corrugated bulkheads is not to be less than that obtained from the following formula:

$3.6CS_1\sqrt{h} + 3.5$ mm

where:

S_1	=	As specified in 14.2.4(a) of this Part.
h	=	As specified in 16.2.2 of this Chapter.
C	=	Coefficient given below:
	=	$\dfrac{1.4}{\sqrt{1+\left(\frac{t_w}{t_f}\right)^2}}$ for face part
	=	1.0 for web part
t_f and t_w	=	As specified in 14.2.4(a) of this Part.
K	=	Material factor as specified in 1.5.2 (a) of this Part

(b) The section modulus per half pitch of corrugated bulkheads is not to be less than that obtained from the following formula:

$7CKShl^2$ cm^3

where:

S	=	As specified in 14.2.4 (b) of this Part.
l	=	Length, in m, between the supports, as indicated in Fig II 16-1 of this Chapter.
C	=	Coefficient given in Table II 16-3 of this Chapter, according to the type of end connection.
h	=	As specified in 16.2.3 of this Chapter.
K	=	Material factor as specified in 1.5.2 (a) of this Part

For bulkheads with lower stools of which the width in the longitudinal direction at the lower end, d_H, is less than 2.5 times the web depth of the bulkhead, d_0 (See Fig. II 16-1), the measurement of *l* and the values of C are to be at the discretion of the Society.

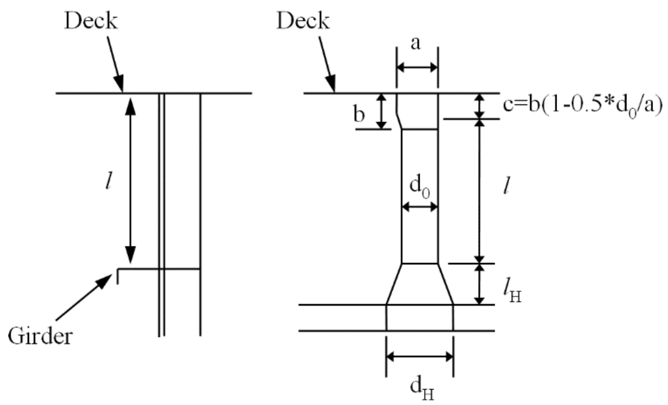

Fig. II 16-1
Measurement of *l*

(c) The thickness of plates at end parts for 0.2*l* in line with *l* is not to be less than that obtained from the following formulae:

Thickness of web:

$$\frac{CKShl}{24 \cdot d_0} + 3.5 \quad \text{mm}$$

Not to be less than that obtained from the following formula:

$$\sqrt[3]{\frac{CShlb^2}{0.19 \cdot d_0}} + 3.5 \quad \text{mm}$$

Thickness of the face part except the upper end part of vertically corrugated bulkheads:

$$\frac{12a}{\sqrt{K}} + 3.5 \quad \text{mm}$$

where:

h	=	As specified in 16.2.3 of this Chapter.
C, S, d_0, *a* and *b*	=	As specified in 14.2.4 (d) of this Part.
l	=	As specified in (b).
K	=	Material factor as specified in 1.5.2 (a) of this Part

16.2.5 Girders Supporting Bulkhead Stiffeners

(a) The section modulus of girders is not to be less than that obtained from the following formula:

$$7.13KShl^2 \quad \text{cm}^3$$

where:

S	=	Breadth, in m, of the area supported by the girders.
h	=	Vertical distance, in m, measured from the mid-point of S for horizontal girders, and from the mid-point of l for vertical girders, to the top of h specified in 16.2.3.
l	=	Span, in m, specified in 14.2.6 of this Part.
K	=	Material factor as specified in 1.5.2 (a) of this Part.

(b) The moment of inertia of girders is not to be less than that obtained from the following formula. The depth of girders is not to be less than 2.5 times the depth of slots for stiffeners.

$$30Kh\,l^4 \quad \text{cm}^4$$

where:

h and l	=	As specified in (a).
K	=	Material factor as specified in 1.5.2 (a) of this Part

(c) The thickness of web plates is not to be less than that obtained from the following formulae, whichever is the greatest:

$$\frac{CKSh l}{24 \cdot d_1} + 3.5 \quad \text{mm}$$

$$\sqrt[3]{\frac{CShlS_1^2}{0.19 \cdot d_1}} + 3.5 \quad \text{mm}$$

$$10S_1 + 3.5 \quad \text{mm}$$

where:

S, h, and l	=	As specified in (a).
S_1	=	Spacing of web stiffeners or the depth of girders, whichever is smaller, in m.
d_1	=	Depth of the girder at the location considered, reduced by the depth of slots for stiffeners, in m.
C	=	Coefficient obtained from the following formulae, but not to be less than 0.5. $\left|1-2\frac{x}{l}\right|$ for horizontal girders $\left|1+\frac{1}{5}\frac{l}{h}-\left(2+\frac{l}{h}\right)\frac{x}{l}+\frac{l}{h}\left(\frac{x}{l}\right)^2\right|$ for vertical girders
x	=	Distance, in m, measured from the end of l for horizontal girders, and from the lower end of l for vertical girders, to the location considered.
K	=	Material factor as specified in 1.5.2 (a)

(d) The actual section modulus and moment of inertia of girders are to be calculated in accordance with the provisions in 14.2.6 (f).

16.2.6 Cross Ties

(a) Where efficient cross ties are provided across deep tanks connecting girders on each side of the tanks, the span of girders specified in 16.2.5 may be measured between the end of the girder and the centre line of the cross tie or between the centre lines of adjacent cross ties.

(b) The sectional area of cross ties is not to be less than that obtained from the following formula:

$$1.3Sb_s h \quad \text{cm}^2$$

where:

h and S	=	As specified in 16.2.5.
b_s	=	Breadth, in m, of the area supported by the cross ties.

(c) The ends of cross ties are to be bracketed to girders.

16.2.7 The scantlings of the members forming the top or the bottom of deep tanks are to be in accordance with the requirements in this Chapter, where the members are treated as if they were members forming a deep tank bulkhead at that location. The scantlings of the members are not to be less than that required by the other requirements for the construction of the tank top as well as the bottom. For top plating of deep tanks, the thickness of plates is to be at least 1 mm greater than that of the thickness specified in 16.2.2.

16.2.8 The thickness of plates of bulkheads and girders which are not in contact with sea water in service conditions may be reduced from the requirements in 16.2.2, 16.2.4 and 16.2.5 by the values given below:

For plates with only one side in contact with sea water: 0.5 mm
For plates with neither side in contact with sea water: 1.0 mm

However, bulkhead plates in way of locations such as bilge wells are to be regarded as plates in contact with sea water.

16.3 Fittings of Deep Tanks

16.3.1 Limbers and air holes are to be cut suitably in the structural members to ensure that air or water does not remain stagnated in any part of the tank.

16.3.2 Efficient arrangements are to be made for draining bilge water from the top of deep tanks.

16.3.3 The inspection plugs provided on deep tank tops as required in 16.1.3 are to be located in readily accessible positions, and the plugs are to be open as far as is practicable when filling the tank with water.

16.3.4 Cofferdams

(a) Oiltight cofferdams are to be provided between the tanks carrying oils and those carrying fresh water, such as for personnel use or boiler feed water, to prevent the fresh water from being contaminated by the oil.

(b) Crew spaces and passenger spaces are not to be directly adjacent to tanks carrying fuel oil. Such compartments are to be separated from the fuel oil tanks by cofferdams which are well ventilated and accessible. Where the top of fuel oil tanks have no opening and is coated with incombustible coverings of not less than 38 mm in thickness, the cofferdam between such compartments and the top of the fuel oil tanks may be omitted.

16.4 Welding of Corrugated Bulkheads

16.4.1 The welding of corrugated bulkheads is to be in accordance with Table II 16-4.

16.4.2 For the supporting members of corrugated bulkheads or stools, such as floors, girders or other primary supporting members and stiffeners, fillet weld leg length is to be suitably increased or to be beveled and welded. In cases where the angle between the side plating of a lower stool and inner bottom plating is relative small, the fillet weld leg lengths for supporting members to inner bottom plating are to be suitably increased taking into account such an angle.

16.4.3 In cases where stools are fitted, the fillet weld leg length for the top or bottom plating of stools to the side plating of stools as well as the side plating of stools to inner bottom plating is to be suitably increased or to be beveled and welded.

16.4.4 Where shedder plates are fitted at the lower parts of corrugated bulkheads, the welding to the corrugation and the top plate of the lower stool is to be one-side penetration welds or equivalent.

16.4.5 Where gusset plates are fitted at the lower parts of corrugated bulkheads, the welding to the top of the lower stool is to be either full penetration or deep penetration welds.

</table>

Chapter 17

Hatchways, Machinery Space Openings and Other Deck Openings

17.1 General

17.1.1 The requirements in this Chapter may be specially considered for the ship with an unusually large freeboard.

17.1.2 Position of Exposed Deck Openings

(a) For the purpose of this Chapter, two positions of exposed deck openings are defined as follows:

Position 1 :

Upon exposed freeboard and raised quarter decks, and upon exposed superstructure decks situated forward of a point located a quarter of the ship's length for freeboard, L_f, from the forward perpendicular.

Position 2 :

Upon exposed superstructure decks situated abaft a quarter of the ship's length for freeboard, L_f, from the forward perpendicular and located at least one standard height of superstructure above the freeboard deck, or upon exposed superstructure decks situated forward of a point located a quarter of the ship's length for freeboard, L_f, from the forward perpendicular and located at least two standard heights of superstructure above the freeboard deck.

(b) The forward perpendicular mentioned in (a) is to be taken at the forward end of length of ship for freeboard, L_f, as defined in 1.2.10 of this Part. The forward perpendicular is to coincide with the foreside of the stem on the waterline on which the Length is measured.

17.1.3 Renewal Thickness of Steel Hatchway Covers and Hatchway Coamings for Ships in Operation

Structural drawings for hatch covers and hatch coamings complying with the requirements of 17.2 are to indicate the renewal thickness, $t_{renewal}$, for each structural element given by the following formula in addition to the as built thickness, $t_{as\text{-}built}$. If the thickness for voluntary addition is included in the as built thicknesses, the value may be at the discretion of the Society.

$t_{renewal} = t_{as\text{-}built} - t_c + 0.5$ mm

where:

t_c = Corrosion additions specified in Table II 17-1

Where corrosion addition t_c is 1.0, in mm, renewal thickness may be given by the formula:

$t_{renewal} = t_{as\text{-}built} - t_c$ mm

17.2 Hatchways

17.2.1 Application

(a) The construction and the means for closing of cargo and other hatchways are to comply with the requirements in 17.2.

(b) When the loading condition or the type of construction differs from that specified in this section, the calculation method used is to be as deemed appropriate by the Society.

17.2.2 General Requirement

(a) Primary supporting members and secondary stiffeners of hatch covers are to be continuous over the breadth and length of hatch covers. When this is impractical, appropriate arrangements are to be adopted to ensure sufficient load carrying capacity and sniped end connections are not to be allowed.

(b) The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed 1/3 of the span of the primary supporting members.

(c) Secondary stiffeners of hatch coamings are to be continuous over the breadth and length of said hatch coamings.

17.2.3 Net Scantling Approach

(a) Unless otherwise specified, the structural scantlings specified in this section are to be net scantlings which do not include any corrosion additions.

(b) "Net scantlings" are the scantlings necessary to obtain the minimum net scantlings required by 17.2.5 and 17.2.9.

(c) Required gross scantlings are not to be less than the scantlings obtained from adding the corrosion addition t_c specified in (d) below to the net scantlings obtained from the requirements in this section.

(d) The corrosion addition t_c is to be taken as specified in Table II 17-1 according to ship type, the type of structure and structural members of steel hatchway covers, steel pontoon covers and steel weathertight covers (hereinafter referred to as "steel hatch covers").

(e) Strength calculations using beam theory, grillage analysis or FEM are to be performed with net scantlings.

17.2.4 Design Loads

The design loads for steel hatchway covers, steel pontoon covers, steel weathertight covers, portable beams and hatchway coamings applying the requirements in 17.2 are specified in following (a) to (e):

(a) Design vertical wave load P_V, in kN/m^2, is not to be less than that obtained from Table II 17-2. Design vertical wave loads need not to be combined with cargo loads according to (c) and (d) simultaneously.

(b) Design horizontal wave load P_H, in kN/m^2, is not to be less than that obtained from the following formulae. However, P_H is not to be taken less than the minimum values given in Table II 17-3 of this Chapter. P_H needs not be included in the direct strength calculation of the hatch cover, expect where structures supporting stoppers are assessed.

$P_H = ac(bC_1 - y)$

where:

a = As given by the following:

= $20 + \frac{L'}{12}$ for unprotected front coamings and hatch cover skirt plates

= $10 + \frac{L'}{12}$ for unprotected front coamings and hatch cover skirt plates, where the distance from the actual freeboard deck to the summer load line exceeds the minimum non-corrected tabular freeboard according to the ILCC by at least one superstructure standard height

= $5 + \frac{L'}{15}$ for side and protected front coamings and hatch cover skirt plates

= $7 + \frac{L'}{100} - 8\frac{x}{L}$ for aft ends of coamings and aft hatch cover skirt plates abaft amidships

= $5 + \frac{L'}{100} - 4\frac{x}{L}$ for aft ends of coamings and aft hatch cover skirt plates forward of amidships

L' = Length of ship L, in m. However, where L exceeds 300 m, L' is to be taken as 300 m.

L = Length of ship specified in 1.2.1 of this Part.

C_1 = As given by the following formulae:

= $10.75 - \left(\frac{300 - L}{100}\right)^{1.5}$ for $L \leq 300$

= 10.75 for $300 < L \leq 350$

= $10.75 - \left(\frac{L-350}{150}\right)^{1.5}$ for $350 < L$

b = As given by the following formula:

= $1.0 + \left(\frac{0.45 - \frac{x}{L}}{C_{b1} + 0.2}\right)^2$ for $\frac{x}{L} < 0.45$

= $1.0 + 1.5\left(\frac{\frac{x}{L} - 0.45}{C_{b1} + 0.2}\right)^2$ for $\frac{x}{L} \geq 0.45$

x = Distance, in m, from the hatchway coamings or hatch cover skirt plates to after perpendicular, or distance from the mid-point of the side hatchway coaming or hatch cover skirt plates to after perpendicular. However, where the length of the side hatchway coaming or hatch cover skirt plates exceeds 0.15 L, the side hatchway coaming or hatch cover skirt plates are to be equally subdivided into spans not exceeding 0.15 L and the distance from the mid-point of the subdivisions to the after perpendicular is to be taken.

C_{b1} = Block coefficient. However, where C_b is 0.6 or under, C_{b1} is to be taken as 0.6 and where C_b is 0.8 and over, C_{b1} is to be taken as 0.8. When determining scantlings of the aft ends of coamings and aft hatch cover skirt plates forward of amidships, C_{b1} does not need to be taken as less than 0.8.

c = As given by the following formula. However, where $\frac{b'}{B'}$ is less than 0.25, $\frac{b'}{B'}$ is to be taken as 0.25.

= $0.3 + 0.7\frac{b'}{B'}$

b' = Breadth, in m, of hatchway coamings at the position under consideration

B' = Breadth, in m, of ship on the exposed weather deck at the position under consideration

y = Vertical distance, in m, from the designed maximum load line to the mid-point of the span of stiffeners when determining the scantlings of stiffeners and to the mid-point of the plating when determining the thickness of plating

(c) The load on hatch covers due to cargo loaded on said covers is to be obtained from the following (i) and (ii). Load cases with partial loading are also to be considered.

(i) Distributed load due to cargo load P_{cargo}, in kN/m^2, resulting from heave and pitch is to be determined according to the following formula:

$P_{cargo} = P_C(1 + a_v)$

where:

P_C = Static uniform cargo load, in kN/m^2

a_v = Acceleration addition given by the following formula:

$$a_v = \frac{0.11mV'}{\sqrt{L}}$$

m = As given by the following formulae:

= $m_0 - 5(m_0 - 1)\frac{x}{L}$ for $0 \leq \frac{x}{L} \leq 0.2$

= 1.0 for $0.2 < \frac{x}{L} \leq 0.7$

= $1 + \frac{m_0 + 1}{0.3}\left(\frac{x}{L} - 0.7\right)$ for $0.7 < \frac{x}{L} \leq 1.0$

m_0 = As given by the following formula:

$$m_0 = 1.5 + \frac{0.11V'}{\sqrt{L}}$$

V' = Speed of ship, in knots, specified in 1.2.7. However, where V' is less than $\sqrt{L}$, V' is to be taken as $\sqrt{L}$.

x and L = As specified in (b) above

(ii) Point load F_{cargo} , in kN, due to a single force resulting from heave and pitch (e.g. in the case of containers) is to be determined by the following formula. When the load case of a partially loaded container is considered, the point load is at the discretion of the Society.

$F_{cargo}=F_s(1+a_v)$

where:

F_S	=	Static point load due to cargo, in kN
a_v	=	As specified in (i) above

(d) Where containers are stowed on hatch covers, cargo loads determined by the following (i) to (iii) are to be considered:

(i) Cargo loads, in kN, due to heave, pitch and roll motion of the ship determined by the following formulae are to be considered (see Fig. II 17-1 of this Chapter). When the load case of a partially loaded container is considered, the cargo load is at the discretion of the Society.

$$A_z = 9.81\frac{M}{2}(1+a_v)\left(0.45-0.42\frac{h_m}{b}\right)$$
$$B_z = 9.81\frac{M}{2}(1+a_v)\left(0.45+0.42\frac{h_m}{b}\right)$$
$$B_Y = 2.4M$$

where:

M	=	Maximum designed mass of container stack, in ton
h_m	=	Design height of the centre of gravity of the stack above hatch cover supports, in m
b	=	Distance between foot points, in m
A_Z and B_Z	=	Support forces in vertical direction, in kN, at the forward and aft stack corners
B_Y	=	Support force, in kN, in transverse direction at the forward and aft stack corners
a_v	=	As specified in (c) above

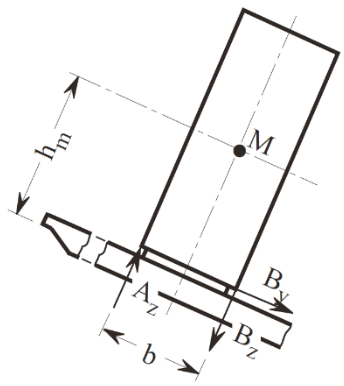

Fig. II 17-1
Forces due to Container Loads

(ii) Details of the application of (i) above are to be in accordance with the following:

(1) For the maximum design mass of container stack M and the design height of the centre of gravity of the stack above hatch cover supports h_m, it is recommended to apply the values which are used for the calculations of cargo securing (container lashing). If different assumptions are made for M and h_m, sufficient data which show that the hatch cover structure is not loaded by less than the recommended values is to be submitted.

(2) When the strength of a hatch cover structure is assessed by FEM analysis using shell or plane strain elements, h_m may be taken as the design height of the centre of gravity of the stack above the hatch cover top plate.

(3) The values of M and h_m applied for the assessment of hatch cover strength are to be shown in the drawings of the hatch covers.

(4) In the case of container stacks secured to lashing bridges or carried in cell guides, the forces acting on the hatch covers may be specially considered by the Society.

(5) Container loads may be applied based on accelerations calculated by an individual acceleration analysis for the lashing system being used as deemed appropriate by the Society.

(iii) Stack load P_{stack} (kN), acting on each corner of a container stack, due to heave and pitch (e.g. ship in upright condition) is to be determined by the following formula.

$$P_{stack} = 9.81\frac{M}{4}(1 + a_V)$$

Where

a_V = As specified in (c)(i) above

M = As specified in (i) above

(e) In addition to the loads specified in (a) to (d) above, when the load in the ship's transverse direction by forces due to elastic deformation of the ship's hull is acting on the hatch covers, the sum of stresses is to comply with the permissible values specified in 17.2.5(a)(i).

17.2.5 Strength Criteria of Steel Hatch Covers and Hatch Beams

(a) Permissible stresses and deflections

(i) The equivalent stress σ_E, in N/mm^2, in steel hatchway covers and steel weathertight covers is to comply with the criteria in the following (1) and (2):

(1) For beam element calculations and grillage analysis:

$$\sigma_E = \sqrt{\sigma^2 + 3\tau^2} \leq 0.8\sigma_F$$

where:

σ = Nominal stress, in N/mm^2

τ = Shear stress, in N/mm^2

σ_F = Minimum upper yield stress, in N/mm^2, or proof stress, in N/mm^2, of the material. However, when material with σ_F of more than 355 N/mm^2 is used, the value for σ_F is to be as deemed appropriate by the Society.

(2) For FEM calculations, in cases where the calculations use shell or plane strain elements, the stresses are to be taken from center of the individual element.

$\sigma_E = \sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau^2} \leq 0.8\sigma_F$, when assessed using the design load specified in 17.2.4(a), and

$\sigma_E = \sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau^2} \leq 0.9\sigma_F$, when assessed using any other design loads

where:

σ_x = Normal stress, in N/mm^2, in the x-direction

σ_y = Normal stress, in N/mm^2, in the y-direction

τ = Shear stress, in N/mm^2, in the x-y plane

x, y = Coordinates of a two dimensional Cartesian system in the plane of the considered structural element

σ_F = As specified in (1) above

(ii) The equivalent stress σ_E, in N/mm^2, in steel pontoon covers and hatch beams is not to be greater than $0.68\sigma_F$,where σ_F is as specified in (i) above.

(iii) Deflection is to comply with following (1) and (2):

(1) When the design vertical wave load specified in 17.2.4(a) is acting on steel hatchway covers, steel pontoon covers, steel weathertight covers and portable beams, the vertical deflection of primary supporting members is not to be taken as more than that given by the following:

$0.0056l$ for steel hatchway covers and steel weathertight covers

$0.0044l$ for steel pontoon covers and hatch beams

l = Span of primary supporting members, in m

(2) Where steel hatch covers are arranged for carrying containers and mixed stowage is allowed, i.e., a 40-foot container is stowed on top of two 20-foot containers, particular attention is to be paid to the deflections of hatch covers. In addition the possible contact of deflected hatch covers within hold cargo has to be observed.

(iv) For FEM calculations, equivalent stress σ_E (N/mm^2)in girders with unsymmetrical flanges of steel hatchway covers and steel weathertight covers is to be determined according to the following (1) or (2):

(1) FEM calculations using the stress obtained for fine mesh elements; or

(2) FEM calculations using the stress at the edge of the element or the stress at the centre of the element, whichever is greater.

(b) Local net plate thickness of steel hatch covers

(i) The local net thickness t_{net}, in mm, of steel hatch cover top plating is not to be less than that obtained from the following formula, and it is not to be less than 1% of the spacing of the stiffeners or 6 mm, whichever is greater:

$$t_{net} = 15.8 F_P S \sqrt{\frac{P_{HC}}{0.95\sigma_F}}$$

where:

F_P = Coefficient given by the following formula:

= $\frac{1.9\sigma}{\sigma_a}$ (for $\frac{\sigma}{\sigma_a} \geq 0.8$, for the attached plate flange of primary supporting members)

= 1.5 (for $\frac{\sigma}{\sigma_a} < 0.8$, for the attached plate flange of primary supporting members)

σ = Normal stress, in N/mm^2, of the attached plate flange of primary supporting members. The normal σ may be determined at a distance S from the webs of adjacent primary supporting members perpendicular to secondary stiffeners and at a distance S/2 from the web of an adjacent primary supporting member parallel to secondary stiffeners, whichever is greater (see Fig. II 17-2). The distribution of normal stress σ between two parallel girders is to be in accordance with 17.2.5(f)(iii)(3).

σ_a = Permissible stress, in N/mm^2, is to be as given by following formula:

$\sigma_a = 0.8\sigma_F$

S = Stiffener spacing, in m

P_{HC} = Design load, in N/mm^2, specified in 17.2.4(a) and 17.2.4(c)(i)

σ_F = Minimum upper yield stress or proof stress of the material, in N/mm^2

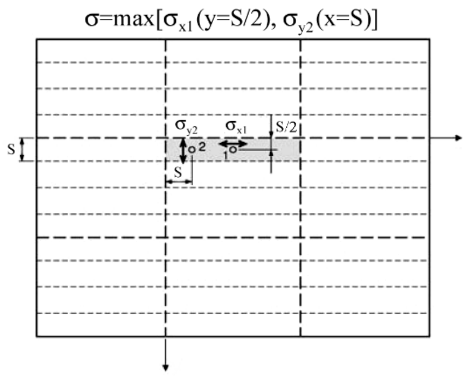

Fig. II 17-2
Determination of the Normal Stress of Hatch Cover Plating

(ii) The net thickness of double skin hatch covers and box girders is to be obtained in accordance with 17.2.5(e) below taking into consideration of the permissible stresses specified in 17.2.5(a)(i)

(iii) In addition to (ii) above, when the lower plating of double skin hatch covers is taken into account as a strength member of the hatch cover, the net thickness t_{net} of the lower plating is not to be less than 5 mm.

(iv) When lower plating is not considered to be a strength member of the hatch cover, the thickness of the lower plating is to be determined as deemed appropriate by the Society.

(v) When cargo likely to cause shear buckling is intended to be carried on a hatch cover, the net thickness t_{net}, in mm is not to be less than that obtained from the following formulae. In such cases, "cargo likely to cause shear buckling" refers particularly to large or bulky cargo lashed to the hatch cover, such as parts of cranes or wind power stations, turbines, etc. Cargo that is considered to be uniformly distributed over the hatch cover (e.g., timber, pipes or steel coils) does not need to be considered.

$t_{net} = 6.5S$
$t_{net} = 5$

(c) Net scantling of secondary stiffeners

(i) The net section modulus Z_{net}, in cm^3, of the secondary stiffeners of hatch cover top plates, based on stiffener net member thickness, is not to be less than that obtained from the following formula. The net section modulus of the secondary stiffeners is to be determined based on an attached plate width that is assumed to be equal to the stiffener spacing.

$$Z_{net} = \frac{K_L S P_{HC} l^2}{\sigma_F}$$

where:

K_L	=	Design loads coefficient, 104 for design loads specified in 17.2.4(a) above and 93 for loads specified in 17.2.4(c)(i) above
l	=	Secondary stiffener span, in m, is to be taken as the spacing of primary supporting members or the distance between a primary supporting member and the edge support, as applicable.
S	=	Stiffener spacing, in m
P_{HC}	=	Design load, in kN/m^2, as specified in 17.2.5(b)(i) above
σ_F	=	Minimum upper yield stress, N/mm^2, or proof stress, N/mm^2, of the material

(ii) The net shear sectional area A_{net}, in cm^2, of the secondary stiffener webs of hatch cover top plates is not to be less than that obtained from the following formula:

$$A_{net} = \frac{K_L S P_{HC}\, l}{\sigma_F}$$

where:

K_L	=	Design loads coefficient, 10.8 for design loads specified in 17.2.4(a) above and 9.6 for loads specified in 17.2.4(c)(i) above
l, S, P_{HC}, σ_F	=	As specified in (i) above

(iii) For flat bar secondary stiffeners and buckling stiffeners, the following formula is to be applied:

$$\frac{h}{t_{W,net}} \leq 15\sqrt{k}$$

where:

h	=	Height, in mm, of the stiffener
$t_{W,net}$	=	Net thickness, in mm, of the stiffener
k	=	$235/\sigma_F$
σ_F	=	As specified in (i) above

(iv) Stiffeners parallel to primary supporting members and arranged within the effective breadth according to 17.2.5(e)(ii) of this Chapter are to be continuous at crossing primary supporting member and may be regarded for calculating the cross sectional properties of primary supporting members.

(v) The combined stress of those stiffeners induced by the bending of primary supporting members and lateral pressures is not to exceed the permissible stresses according to 17.2.5(a)(i) of this Chapter.

(vi) For hatch cover stiffeners under compression, sufficient safety against lateral and torsional buckling according to 17.2.5(f)(iii) of this Chapter is to be verified.

(vii) For secondary stiffeners of the lower plating of double skin hatch covers, the requirements in (i) and (ii) above do not need to be applied due to the absence of lateral loads.

(viii) The net thickness (mm) of a stiffener (except for U-type stiffeners) web is not to be taken as less than 4 mm.

(ix) Single-side welding is not permitted for secondary stiffeners, except for U-type stiffeners.

(x) The requirements in this (c) do not need to be applied to stiffeners of the lower plating of double skin hatch covers in cases where the lower plating is not considered to be a strength member.

(d) Primary supporting members of steel hatch covers and hatch beams

(i) Scantlings of the primary supporting members of steel hatch covers and hatch beams are to be determined according to 17.2.5(e) below taking into consideration the permissible stresses specified in 17.2.5(a)(i).

(ii) Scantlings of the primary supporting members of steel hatch covers and hatch beam with variable cross-sections are to be not less than that obtained from the following formulae. For steel hatchway covers, S and *l* are to be read as b and S, respectively.

The net section modulus, in cm^3, of hatch beams or primary supporting members at the mid-point

$$Z_{net} = Z_{net\_cs}$$
$$Z_{net} = k_1 Z_{net\_cs}$$

The net moment of inertia, in cm^4, of hatch beams or primary supporting members at the mid-point

$$I_{net} = I_{net\_cs}$$
$$I_{net} = k_2 I_{net\_cs}$$

where:

Z_{net_cs}	=	Net section modulus, in cm^3, complying with requirement (i) above
I_{net_cs}	=	Net moment of inertia, in cm^4, complying with requirement (i) above
S	=	Spacing, in m, of portable beams or primary supporting members
l	=	Unsupported span, in m, of portable beams or primary supporting members
b	=	Width, in m, of steel hatch covers
k_1 , k_2	=	Coefficients obtained from the formulae given in Table II 17-4

(iii) In addition to (i) and (ii) above, the scantlings of the primary supporting members of steel hatch covers are to comply with the requirements specified in 17.2.5(f).

(iv) When biaxial compressed flange plates are considered, the effective width of flange plates is to comply with 17.2.5(f)(iii).

(v) In addition to (i) to (iv) above, net thickness t_{net} , in mm, of the webs of primary supporting members is not to be less than that obtained from the following formulae, whichever is greater:

$$t_{net} = 6.5S$$
$$t_{net} = 5$$

where:

S = Stiffener spacing, in m

(vi) In addition to (i) to (v) above, the net thickness t_{net} , in mm, of edge girders exposed to sea wash is not to be less than that obtained from the following formulae, whichever is greater:

$$t_{net} = 15.8S\sqrt{\frac{P_H}{0.95\sigma_F}}$$

$$t_{net} = 8.5S$$

where:

P_H	=	Design horizontal wave load in kN/m^2, as specified in 17.2.4(b)
S	=	Stiffener spacing, in m
σ_F	=	Minimum upper yield stress or proof stress of the material, in N/mm^2

(vii) The moment of inertia, in cm^4, of the edge elements of hatch covers is not to be less than that obtained from the following formula:

$$I = 6pa^4$$

where:

a	=	Maximum of the distance a_i, in m, between two consecutive securing devices, measured along the hatch cover periphery, not to be taken as less than $2.5a_C$, in m (see Fig. II 17-3)
a_C	=	$\max(a_{1.1}, a_{1.2})$, in m (see Fig. II 17-3)
p	=	Packing line pressure, in N/mm, minimum 5.0 N/mm

When calculating the actual gross moment of inertia of edge elements, the effective breadth of the attached plating of hatch covers is to be taken as equal to the lesser of 0.165a, or half the distance between the edge element and the adjacent primary member.

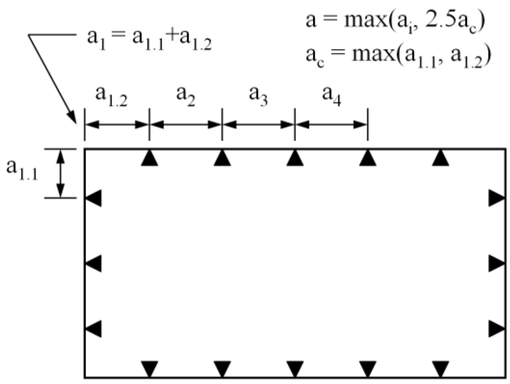

Fig. II 17-3
Distance between Securing Devices, Measured Along Hatch Cover Periphery

(e) Strength calculation

(i) Strength calculation for steel hatch covers may be carried out by either using beam theory, grillage analysis or FEM. Net scantlings are to be used for modeling. Strength calculations for double skin hatch covers or hatch covers with box girders are to be assessed using FEM, as specified in 17.2.5 (e)(iii) as below.

(ii) Effective cross-sectional properties for calculation by beam theory or grillage analysis are to be determined by the following (1) to (5):

(1) The effective breadth of the attached plating e_m of the primary supporting members specified in Table II 17-5 according to the ratio of *l* and e is to be considered for the calculation of effective cross-sectional properties. For intermediate values of *l*/e, e_m is to be obtained by linear interpolation.

(2) Separate calculations may be required for determining the effective breadth of one-sided or non-symmetrical flanges.

(3) The effective cross sectional areas of plates is not to be less than the cross sectional area of the face plate.

(4) The cross sectional area of secondary stiffeners parallel to the primary supporting member under consideration within the effective breadth may be included in the calculations (see Fig. II 17-5).

(5) For flange plates under compression with secondary stiffeners perpendicular to the web of the primary supporting member, the effective width is to be determined according to 17.2.5(f)(iii).

(iii) General requirements for FEM are as follows:

(1) The structural model is to be able to reproduce the behavior of the structure with the highest possible fidelity. Stiffeners and primary supporting members subject to pressure loads are to be included in the modelling. However, buckling stiffeners may be disregarded for stress calculation.

(2) Net scantlings which exclude corrosion additions are to be used for modeling.

(3) Element size is to be suitable to take effective breadth into account.

(4) In no case is element width to be larger than stiffener spacing. The ratio of element length to width is not to exceed 4.0.

(5) The element height of the webs of primary supporting members is not to exceed one-third of the web height.

(6) Stiffeners may be modelled using shell elements, plane stress elements or beam elements.

(f) Buckling strength of steel hatch covers

The buckling strength of the structural members of steel hatch covers is to be in accordance with the following (i) to (iii):

(i) The buckling strength of a single plate panel of the top and lower steel hatch cover plating is to comply with the following formulae:

$$\left(\frac{|\sigma_x|C_{sf}}{\kappa_x\sigma_F}\right)^{e_1}+\left(\frac{|\sigma_y|C_{sf}}{\kappa_y\sigma_F}\right)^{e_2}-B\left(\frac{\sigma_x\sigma_yC_{sf}^2}{\sigma_F^2}\right)+\left(\frac{|\tau|C_{sf}\sqrt{3}}{\kappa_\tau\sigma_F}\right)^{e_3}\le 1.0$$

$$\left(\frac{|\sigma_x|C_{sf}}{\kappa_x\sigma_F}\right)^{e_1}\le 1.0$$

$$\left(\frac{|\sigma_y|C_{sf}}{\kappa_y\sigma_F}\right)^{e_2}\le 1.0$$

$$\left(\frac{|\tau|C_{sf}\sqrt{3}}{\kappa_\tau\sigma_F}\right)^{e_3}\le 1.0$$

where:

σ_x, σ_y = Membrane stress in the x-direction and the y-direction, in N/mm^2. In cases where the stresses are obtained from FEM and already contain the Poisson-effect, the following modified stress values may be used. Both stresses σ_x^* and σ_y^* are to be compressive stress in order to apply stress reduction according to the following formulae:

$$\sigma_x=(\sigma_x^*-0.3\sigma_y^*)/0.91$$
$$\sigma_y=(\sigma_y^*-0.3\sigma_x^*)/0.91$$

where:

σ_x^*, σ_y^* = Stresses containing the Poisson-effect. These values are to comply with the following formulae:

$\sigma_y=0$ and $\sigma_x=\sigma_x^*$ for $\sigma_y^*<0.3\sigma_x^*$

$\sigma_x=0$ and $\sigma_y=\sigma_y^*$ for $\sigma_x^*<0.3\sigma_y^*$

where:

τ = Shear stress in x-y plane, in N/mm^2

σ_F = Minimum yield stress of the material, in N/mm^2

Compressive and shear stresses are to be taken as positive values and tension stresses are to be taken as negative values.

C_{sf} = Safety factor taken as equal to:
= 1.25 for hatch covers when subjected to design vertical wave loads according to 17.2.4(a)
= 1.10 for hatch covers when subjected to loads according to 17.2.4(b) to (e)

F_1 = Correction factor for the boundary condition of stiffeners on the longer side of elementary plate panels according to Table II 17-6

e_1, e_2, e_3 and B = Coefficient obtained from Table II 17-7

κ_x, κ_y and κ_τ = Reduction factor obtained from Table II 17-8. However, these values are to comply with the following formulae:

κ_x = 1.0 for $\sigma_x \leq 0$ (tensile stress)
κ_y = 1.0 for $\sigma_y \leq 0$ (tensile stress)

a = Length, in mm, of the longer side of the partial plate field (x-direction)

b = Length, in mm, of the shorter side of the partial plate field (y-direction)

n = Number of the elementary plate panel breadths within the partial or total plate panel (see Fig. II 17-4)

α = Aspect ratio of a single plate field obtained from the following formula:

$$\alpha = \frac{a}{b}$$

λ = Reference degree of slenderness, taken as equal to:

$$\lambda = \sqrt{\frac{\sigma_F}{K\sigma_e}}$$

K = Buckling factor according to Table II 17-8

σ_e = Reference stress, in N/mm^2, taken as equal to:

$$\sigma_e = 0.9E\left(\frac{t}{b}\right)^2$$

E = Modulus of elasticity, in N/mm^2 of the material, taken as equal to:
= 2.06×10^5

t = Net thickness, in mm, of plate under consideration

Ψ = Edge stress ratio taken as equal to:

$$\Psi = \frac{\sigma_2}{\sigma_1}$$

σ_1 = Maximum compressive stress, in N/mm^2

σ_2 = Minimum compressive stress or tension stress, in N/mm^2

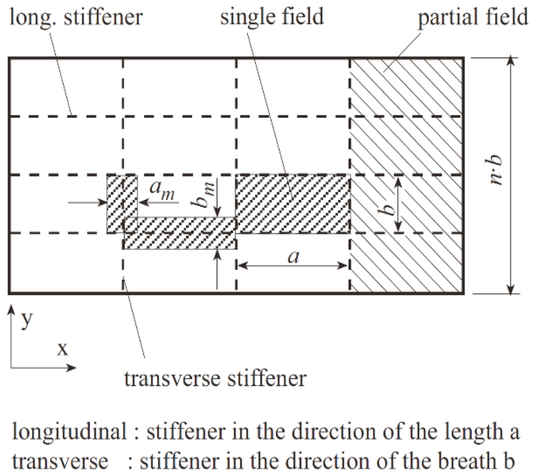

Fig. II 17-4
General Arrangement of Panels

(ii) The buckling strength of non-stiffened webs and the flanges of primary supporting members are to be according to the requirement of (i) above.

(iii) The buckling strength of partial and total fields included in the structural members of steel hatch covers is to comply with the following (1) to (5):

(1) The buckling strength of longitudinal and transverse secondary stiffeners is to comply with following (4) and (5). For U-type stiffeners, however, the requirements in (5) below may be omitted.

(2) When buckling calculation is carried out according to (4) and (5), the effective breadth of steel hatch cover plating may be in accordance with following a) and b):

a) The effective breadth a_m or b_m of attached plating may be determined by the following formulae (see Fig. II 17-4). However, the effective breadth of plating is not to be taken greater than the value obtained from 17.2.5(e).

$b_m = \kappa_x b$ for longitudinal stiffeners
$a_m = \kappa_y a$ for transverse stiffeners

where:

κ_x, κ_y = As obtained from Table II 17-8
a , b = As specified (i) above

b) The effective breadth e'_m of the stiffened flange plates of primary supporting members may be determined according to the following i) and ii). However, a_m and b_m for flange plates are in general to determined for $\Psi = 1$.

i) Stiffening parallel to the webs of primary supporting members (see Fig. II 17-5). For $b \geq e_m$, b and a have to be exchanged.

$b < e_m$
$e'_m = nb_m$

where:

n = Integer number of stiffener spacing b inside the effective breadth e_m according to 17.2.5(e), taken as equal to:
$n = \text{int}\left(\frac{e_m}{b}\right)$

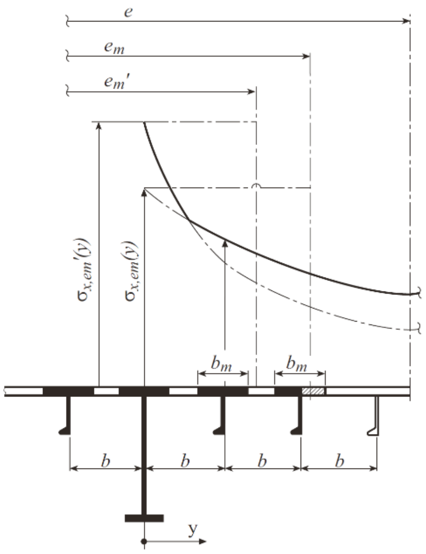

Fig. II 17-5
Stiffening Parallel to Web of Primary Supporting Member

ii) Stiffening perpendicular to the webs of primary supporting members (see Fig. II 17-6). For $a < e_m$, a and b have to be exchanged.

$a \geq e_m$
$e'_m = na_m < e_m$
$n = 2.7\frac{e_m}{a} \leq 1$

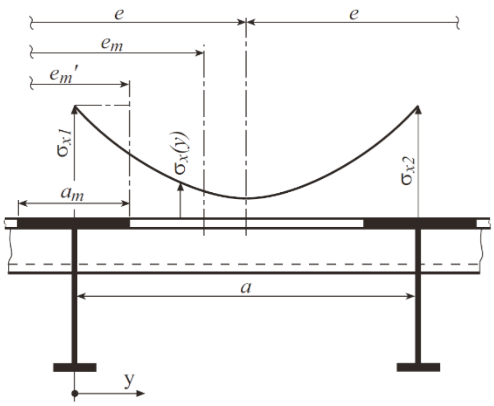

Fig. II 17-6
Stiffening Perpendicular to Web of Primary Supporting Member

(3) Stresses obtained from the calculation of the scantlings of plating and the stiffeners of steel hatch covers are to comply with the following:

a) The scantlings of plates and stiffeners are in general to be determined according to the maximum stresses $\sigma_x(y)$ at the webs of primary supporting members and stiffeners respectively.

b) For stiffeners with spacing b under compression arranged parallel to primary supporting members, no value less than $0.25\sigma_x$ is to be inserted for $\sigma_x(y = b)$.

c) The stress distribution between two primary supporting members may be obtained by the following formula:

$$\sigma_x(y) = \sigma_{x1}\left\{1 - \frac{y}{e}\left[3 + c_1 - 4c_2 - 2\frac{y}{e}(1 + c_1 - 2c_2)\right]\right\}$$

where:

c_1 = As given by the following formula:

$$c_1 = \frac{\sigma_{x1}}{\sigma_{x2}}, \text{however } 0 \le c_1 \le 1$$

c_2 = As given by the following formula:

$$c_2 = \frac{1.5}{e}\left(e''_{ml} + e''_{m2}\right) - 0.5$$

σ_{x1} and σ_{x2} = Normal stresses in the flange plates of adjacent primary supporting members 1 and 2 with spacing e, based on cross-sectional properties considering the effective breadth or effective width, as appropriate

e''_{ml} = Proportionate effective breadth e_{m1} or proportionate effective width e'_{ml} of primary supporting member 1 within the distance e, as appropriate

e''_{m2} = Proportionate effective breadth e_{m2} or proportionate effective width e'_{m2} of primary supporting member 2 within the distance e, as appropriate

d) The shear stress distribution in flange plates may be assumed to be linear.

(4) For lateral buckling, longitudinal and transverse stiffeners are to comply with following i) to iii):

a) Secondary stiffeners subject to lateral loads are to comply with the following criteria:

$$\frac{\sigma_a + \sigma_b}{\sigma_F} C_{sf} \le 1$$

where:

σ_a = Uniformly distributed compressive stress, in N/mm^2, in the direction of the stiffener axis, given by the following formula:

$\sigma_a = \sigma_x$ for longitudinal stiffeners

$\sigma_a = \sigma_y$ for transverse stiffeners

σ_b = Bending stress, in N/mm^2, in the stiffeners, given by the following formula:

$$\sigma_b = \frac{M_0 + M_1}{Z_{st}10^3} \text{ with } \sigma_x = \sigma_n \text{ and } \tau = \tau_{SF}$$

M_0 = Bending moment, in N-mm, due to deformation w of stiffener, given by the following formula:

$$M_0 = F_{Ki}\frac{p_z w}{c_f - p_z} \text{ with } (c_f - p_z) > 0$$

M_1 = Bending moment, in N-mm, due to lateral load P given by the following formula:

$$M_1 = \frac{pba^2}{24 \cdot 10^3} \quad \text{for longitudinal stiffeners}$$

$$M_1 = \frac{p(nb)^2}{8c_S 10^3} \quad \text{for transverse stiffeners}$$

Where n is to be taken as equal to 1 for ordinary transverse stiffeners

Z_{st} = Section modulus of stiffener, in cm^3, including the effective breadth of plating according to 17.2.5(f)(iii)

c_s = Factor accounting for the boundary conditions of the transverse stiffener taken as equal to:

= 1.0 for a stiffener that is simply supported stiffener

= 2.0 for a stiffener that is partially constrained

P = Lateral load, in N/mm^2, as specified in 17.2.4 according to the condition under consideration

F_{Ki} = Ideal buckling force, in N, of the stiffener given by the following formula:

= $F_{Kix} = \frac{\pi^2}{a^2} EI_x 10^4$ for longitudinal stiffeners

= $F_{Kiy} = \frac{\pi^2}{(nb)^2} EI_y 10^4$ for transverse stiffeners

I_x, I_y = Net moments of inertia, in cm^4, of the longitudinal or transverse stiffener, including the effective breadth of attached plating according to 17.2.5(f)(iii). I_x and I_y, are to comply with the following criteria:

$$I_x \geq \frac{bt^3}{12 \cdot 10^4}$$

$$I_y \geq \frac{at^3}{12 \cdot 10^4}$$

p_z = Nominal lateral load, in N/mm^2, of the stiffener due to σ_x, σ_y and τ

$$p_{zx} = \frac{t_a}{b}\left[\sigma_{x1}\left(\frac{\pi b}{a}\right)^2 + 2c_y\sigma_y + \tau_1\sqrt{2}\right] \quad \text{for longitudinal stiffeners}$$

$$p_{zy} = \frac{t_a}{b}\left[2c_x\sigma_{x1} + \sigma_y\left(\frac{\pi a}{nb}\right)^2\left(1 + \frac{A_y}{at_a}\right) + \tau_1\sqrt{2}\right] \quad \text{for transverse stiffeners}$$

t_a = Net thickness, in mm, of attached plate

c_x and c_y = Factor taking into account the stresses vertical to the stiffener's axis and distributed variable along the stiffener's length taken as equal to:

= $0.5(1 + \Psi)$ for $0 \leq \Psi \leq 1$

= $\frac{0.5}{1 - \Psi}$ for $\Psi < 0$

A_x and A_y = Net sectional area, in mm^2, of the longitudinal or transverse stiffener respectively without attached plating

$$\sigma_{x1} = \sigma_x\left(1 + \frac{A_x}{bt_a}\right)$$

$$\tau_1 = \left[\tau - t\sqrt{\sigma_F E\left(\frac{m_1}{a^2} + \frac{m_2}{b_2}\right)}\right] \geq 0$$

m_1 and m_2 = Coefficient given by the following formulae:

For longitudinal stiffeners:

$m_1 = 1.47 \quad m_2 = 0.49 \quad \text{for } \frac{a}{b} \geq 2.0$

$m_1 = 1.96 \quad m_2 = 0.37 \quad \text{for } \frac{a}{b} < 2.0$

For transverse stiffeners:

$m_1 = 0.37 \quad m_2 = \frac{1.96}{n^2} \quad \text{for } \frac{a}{nb} \geq 0.5$

$$m_1 = 0.49 \quad m_2 = \frac{1.47}{n^2} \quad \text{for } \frac{a}{nb} < 0.5$$

w = $w_0 + w_1$

w_0 = Assumed imperfection, in mm, taken as equal to:

$$w_0 = \min\left(\frac{a}{250}, \frac{b}{250}, 10\right) \quad \text{for longitudinal stiffeners}$$

$$w_0 = \min\left(\frac{a}{250}, \frac{nb}{250}, 10\right) \quad \text{for transverse stiffeners}$$

For stiffeners sniped at both ends w_0 is not to be taken as less than the distance from the mid-point of attached plating to the neutral axis of the stiffener calculated with the effective width of its attached plating

w_1 = Deformation of stiffener, in mm, at the mid-point of stiffener span due to lateral load P. In the case of uniformly distributed loads, the following values for w_1 may be used:

$$w_1 = \frac{Pba^4}{384 \cdot 10^7 EI_x} \quad \text{for longitudinal stiffeners}$$

$$w_1 = \frac{5Pa(nb)^4}{384 \cdot 10^7 EI_y c_s^2} \quad \text{for transverse stiffeners}$$

c_f = Elastic support, in N/mm², provided by the stiffener taken as equal to:

For longitudinal stiffeners:

$$c_f = F_{Kix} \frac{\pi^2}{a^2} \left(1 + c_{px}\right)$$

$$c_{px} = \frac{1}{1 + \frac{0.91\left(\frac{12 \cdot 10^4 I_x}{t^3 b} - 1\right)}{c_{xa}}}$$

c_{xa} = Coefficient taken as equal to:

$$c_{xa} = \left(\frac{a}{2b} + \frac{2b}{a}\right)^2 \quad \text{for } a \geq 2b$$

$$c_{xa} = \left[1 + \left(\frac{a}{2b}\right)^2\right]^2 \quad \text{for } a < 2b$$

For transverse stiffeners:

$$c_f = c_s F_{Kiy} \frac{\pi^2}{(n \cdot b)^2} \left(1 + c_{py}\right)$$

$$c_{py} = \frac{1}{1 + \frac{0.91\left(\frac{12 \cdot 10^4 I_y}{t^3 b} - 1\right)}{c_{ya}}}$$

c_{ya} = Coefficient taken as equal to:

$$c_{ya} = \left(\frac{nb}{2a} + \frac{2a}{nb}\right)^2 \quad \text{for } nb \geq 2a$$

$$c_{ya} = \left[1 + \left(\frac{nb}{2a}\right)^2\right]^2 \quad \text{for } nb < 2a$$

b) For stiffeners not subject to lateral loads, the bending moment σ_b is to be calculated at the mid-point of the stiffener.

c) When lateral loads are acting, stress calculations are to be carried out for both fibers of the stiffener's cross sectional area (if necessary for the biaxial stress field at the plating side).

(5) For torsional buckling, longitudinal and transverse stiffeners are to comply with the following i) and ii):

a) Longitudinal stiffeners are to comply with the following criteria:

$$\frac{\sigma_x}{\kappa_T \sigma_F} C_{sf} \leq 1.0$$

where:

κ_T = Coefficient taken as equal to:

$\kappa_T = 1.0$ for $\lambda_T \leq 0.2$

$$\kappa_T = \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_T^2}} \quad \text{for } \lambda_T > 0.2$$

$$\Phi = 0.5[1 + 0.21(\lambda_T - 0.2) + \lambda_T^2]$$

λ_T = Reference degree of slenderness taken as equal to:

$$\lambda_T = \sqrt{\frac{\sigma_F}{\sigma_{KiT}}}$$

$$\sigma_{KiT} = \frac{E}{I_p}\left(\frac{\pi^2 I_\omega 10^2}{a^2}\varepsilon + 0.385 I_T\right) \quad \text{N/mm}^2$$

I_P = Net polar moment of inertia of the stiffener, in cm^4, defined in Table II 17-9, and related to point C as shown in Fig. II 17-7

I_T = Net St. Venant's moment of inertia of the stiffener, in cm^4, defined in Table II 17-9

I_ω = Net sectorial moment of inertia of the stiffener, in cm^6, defined in Table II 17-9, related to point C as shown in Fig. II 17-7

ε = Degree of fixation taken as equal to:

$$\varepsilon = 1 + 10^{-3}\sqrt{\frac{a^4}{\frac{3}{4}\pi^4 I_w\left(\frac{b}{t^3} + \frac{4h_w}{3t_w^3}\right)}}$$

A_w = Net web area, in mm^2, equal to:
$A_w = h_w t_w$

A_f = Net flange area, in mm^2, equal to:
$Af = b_f t_f$

$$e_f = h_w + \frac{t_f}{2} \quad \text{mm}$$

h_w, t_w, b_f and t_f = Dimensions of stiffener, in mm, as specified in Fig. II 17-7

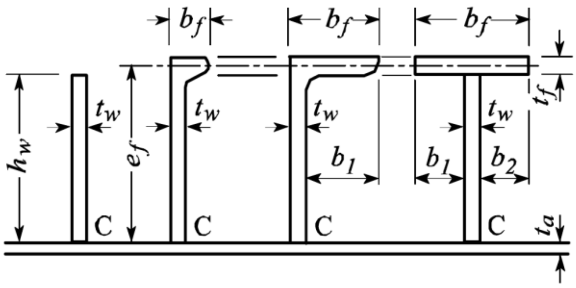

Fig. II 17-7
Dimensions of Stiffener

b) For transverse secondary stiffeners loaded by compressive stress which are not supported by longitudinal stiffeners, sufficient torsional buckling strength is to be performed analogously in accordance with a) above.

17.2.6 Additional Requirements for Steel Hatch Covers Carrying Cargoes

(a) Where concentrated loads, e.g. container loads, are acting on steel hatch covers, direct calculations deemed appropriate by the Society are required.

(b) The scantlings of sub structures subject to concentrated loads acting on steel hatch covers are to be determined taking into consideration the design cargo loads and permissible stresses specified in this section.

(c) The scantlings of top plates and stiffeners of steel hatch covers subject to wheel loads are determined by direct calculation or any other method which deemed appropriate by the Society.

17.2.7 Portable Beams, Hatchway Covers, Steel Pontoon Covers and Steel Weathertight Covers

(a) Portable beams are to comply with the following (i) to (vii):

(i) The carriers and sockets for portable beams are to be of substantial construction, having a minimum bearing surface of 75 mm, and are to be provided with means for the efficient fitting and securing of the beams.

(ii) Coamings are to be stiffened in way of carriers and sockets by providing stiffeners from these fittings to the deck or by equivalent strengthening.

(iii) Where beams of a sliding type are used, the arrangement is to ensure that the beams remain properly in position when the hatchway is closed.

(iv) The depth of portable beams and the width of their face plates are to be suitable to ensure the lateral stability of the beams. The depth of beams at their ends is not to be less than 0.40 times the depth at their mid-point or 150 mm, whichever is greater.

(v) The upper face plates of portable beams are to extend to the ends of the beams. The web plates are to be increased in thickness to at least twice that at the mid-point for at least 180 mm from each end or to be reinforced with doubling plates.

(vi) Portable beams are to be provided with suitable gear for releasing them from slings without the need for personnel to get on the beam.

(vii) Portable beams are to be clearly marked to indicate the deck, hatchway and position to which they belong.

(b) Hatchway covers are to comply with the following (i) to (v):

(i) Hatch rests are to be provided with at least a 65 mm bearing surface and are to be beveled, if required, to suit the slope of the hatchways.

(ii) Hatchway covers are to be provided with suitable hand grips according to their weight and size, except where such grips are unnecessary due to the cover’s construction.

(iii) Hatchway covers are to be clearly marked to indicate the deck, hatchway and position to which they belong.

(iv) The wood for hatchway covers is to be of good quality, straight grained and reasonably free from knots, sap and shakes.

(v) The ends of all wood covers are to be protected by an encircling steel band.

(c) Steel pontoon covers are to comply with the following (i) to (iii):

(i) The depth of steel pontoon covers at the supports is not to be less than one-third the depth at the mid-point or 150 mm, whichever is greater.

(ii) The width of the bearing surfaces for steel pontoon covers is not to be less than 75 mm.

(iii) Steel pontoon covers are to be clearly marked to indicate the deck, hatchway and position to which they belong.

(d) Steel weathertight covers are to comply with the following:

(i) The depth of steel weathertight covers at the supports is not to be less than 1/3 the depth at the mid-point or 150 mm, whichever is greater.

17.2.8 Tarpaulins and Securing Arrangements for Hatchways Closed by Portable Covers

(a) At least two layers of tarpaulins are to be provided for each exposed hatchway on the freeboard or superstructure decks and at least one layer of such a tarpaulin is to be provided for each exposed hatchway elsewhere.

(b) Battens are to be efficient for securing the tarpaulins and not to be less than 65 mm in width and 9 mm in thickness.

(c) Wedges are to be of tough wood or other equivalent materials. They are to have a taper not more than 1/6 and not to be less than 13 mm in thickness at the point.

(d) Cleats are to be set to fit the taper of the wedges. They are to be at least 65 mm wide and to be spaced not more than 600 mm from centre to centre; the cleats along each side are to be arranged not more than 150 mm apart from the hatch corners.

(e) For all hatchways in exposed freeboard and superstructure decks, steel bars or other equivalent means are to be provided in order to efficiently secure each section of the hatchway cover after the tarpaulins are battened down. Hatchway covers of more than 1.5 meters in length are to be secured by at least two such securing appliances. At all other hatchways in exposed positions on weather decks, ring bolts or other suitable fittings for lashing are to be provided.

17.2.9 Hatch Coaming Strength Criteria

(a) Height of coamings is to comply with following (i) to (iii):

(i) Height of coamings above the upper surface of the deck is to be at least 600 mm in Position 1 and 450 mm in Position 2.

(ii) For hatchways closed by weathertight steel hatch covers, the height of coamings may be reduced from that prescribed in (i) or omitted entirely subject to the satisfaction of the Society.

(iii) The height of hatchway coamings other than those provided in exposed portions of the freeboard or superstructure decks is to be to the satisfaction of the Society having regard to the position of hatchways or the degree of protection provided.

(b) Scantlings of hatch coamings are to be in accordance with the followings.

(i) The local net plate thickness, in mm, of the hatch coaming plating $t_{coam,net}$, is not to be less than that obtained from following formula:

$$t_{coam,net} = 14.2S\sqrt{\frac{P_H}{\sigma_{a,coam}}}, \text{but not to be less than } 6 + \frac{L'}{100}$$

where:

S = Secondary stiffener spacing, in m

P_H = As specified in 17.2.4(b)

$\sigma_{a,coam}$ = $0.95\sigma_F$

σ_F = Minimum upper yield stress or proof stress of the material, in N/mm^2.

L' = Length of ship L, in m. However, where L' exceeds 300 m, L' is to be taken as 300 m.

(ii) Where the hatch coaming secondary stiffener is snipped at both ends, the gross thickness $t_{coam,gross}$, in mm, of the coaming plate at the sniped stiffener end is not to be less than that obtained from the following formula:

$$t_{coam,gross} = 19.6\sqrt{\frac{P_H S(l - 0.5S)}{\sigma_F}}$$

where:

l = secondary stiffener span, in m, to be taken as the spacing of coaming stays

S, P_H and σ_F = As specified in (i) above

(iii) The net section modulus Z_{net}, in cm^3, and net shear area, in cm^2, of hatch coaming secondary stiffeners are not to be less than that obtained from the following formula. For snipped stiffeners at coaming corners, section modulus and shear area at the fixed support are to be increased by 35%.

$$Z_{net} = \frac{83Sl^2P_H}{\sigma_F}$$

$$A_{net} = \frac{10SlP_H}{\sigma_F}$$

where:

S, P_H and σ_F = As specified in (ii) above

(iv) Buckling strength assessment of hatch coaming is to be carried out by the method as deemed appropriate by the Society.

(v) The net scantlings of hatch coaming stays are to be in accordance with following (1) to (3):

(1) For hatch coaming stays considered to be simple beams (see Examples a. and b. of Fig. II 17-8 of this Chapter), the net section modulus Z_{net} (cm^3) of such stays at their deck connections and the net scantling t_{net} (mm) of their webs are not to be less than that obtained from following formulae:

$$Z_{net} = \frac{526 H_C^2 S P_H}{\sigma_F}$$

$$t_{w,net} = \frac{2 H_C S P_H}{\sigma_F h}$$

where:

H_C = Hatch coaming stay height, in m

h = Hatch coaming stay depth, in m

S = Hatch coaming stay spacing, in m

σ_F and P_H = As specified in (i) above

(2) For coaming stays other than those in (1) above (see Examples c. and d. of Fig. II 17-8 of this Chapter), stresses are generally to be determined through grillage analysis or FEM, and the calculated stresses are to satisfy the permissible stress criteria of 17.2.5 (a) of this Chapter.

(3) For calculating the net section modulus of coaming stays, the area of their face plates is to be taken into account only when it is welded with full penetration welds to the deck plating and an adequate underdeck structure is fitted to support the stresses transmitted by them.

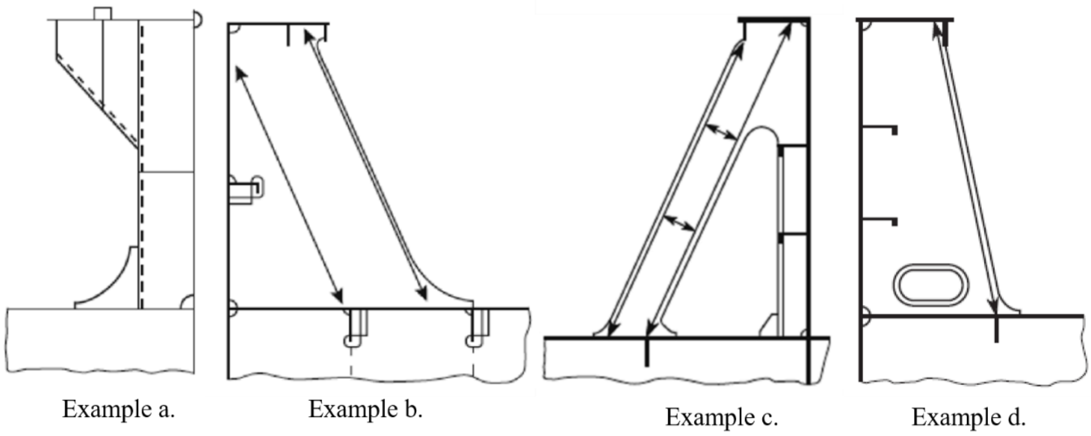

Fig. II 17-8
Examples of Coaming Stays

(c) The coamings for hatchways in Position 1 or coamings of 760 mm or more in height for hatchways in Position 2 are to be stiffened in a suitable position below the upper edge by a horizontal stiffener; the breadth of the horizontal stiffener is not to be less than 180 mm.

(d) Coamings are to be additionally supported by efficient brackets or stays provided from the horizontal stiffeners specified in (c) to the deck at intervals of approximately 3 meters.

(e) Coaming plates are to extend to the lower edge of the deck beams; moreover, they are to be flanged or fitted with face bars or half-round bars (see Fig. II 17-9 of this Part), except where specially approved by the Society.

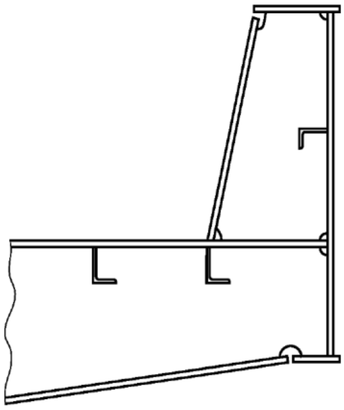

Fig. II 17-9
Example for the Extension of Coaming Plates

(f) Hatch coamings and hatch coaming stays are to comply with the following requirements:

(i) The local details of the structures are to be designed so as to transfer pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

(ii) Underdeck structures are to be checked against the load transmitted by the stays.

(iii) Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than $0.44t_{w,gross}$, where $t_{w,gross}$ is the gross thickness of the stay web.

(iv) The toes of stay webs are to be connected to deck plating with deep penetration double bevel welds extending over a distance not less than 15% of the stay width.

(v) On ships carrying cargoes such as timber, coal or coke on deck, stays are to be spaced not more than 1.5 m apart.

(vi) Hatch coaming stays are to be supported by appropriate substructures.

(vii) For hatch coamings that transfer friction forces at hatch cover supports, special consideration is to be given to fatigue strength.

(viii) Longitudinal hatch coamings with a length exceeding $0.1L_1$ are to be provided with tapered brackets or equivalent transitions and a corresponding substructure at both ends. At the end of the brackets, they are to be connected to the deck by full penetration welds of minimum 300 mm in length.

(ix) Hatch coamings and horizontal stiffeners on hatch coamings may be considered as a part of the longitudinal hull structure when designed according to the requirements for longitudinal strength and verified in cases deemed appropriate by the Society.

(x) Unless otherwise specified, the material and welding requirements for hatch coamings are to comply with the provisions of Part XI and XII of the Rules.

17.2.10 Closing Arrangements

(a) Securing devices

(i) Securing devices between covers and coamings and at cross-joints are to ensure weathertightness.

(ii) The means for securing and maintaining weathertightness by using gaskets and securing devices are to comply with the following (1) to (6). The means for securing and maintaining weathertightness of weathertight covers are to be to the satisfaction of the Society. Arrangements are to ensure that weathertightness can be maintained in any sea condition.

(1) The weight of covers and any cargo stowed thereon are to be transmitted to the ship structure through steel to steel contact.

(2) Gaskets and compression flat bars or angles which are arranged between covers and the ship structure and cross-joint elements are to be in compliance with the following a) to c):

a) Compression bars or angles are to be well rounded where in contact with the gaskets and are to be made of corrosion-resistant materials.

b) The gaskets are to be of relatively soft elastic materials. The material is to be of a quality suitable for all environmental conditions likely to be experienced by the ship, and is to be compatible with the cargoes carried.

c) A continuous gasket is to be effectively secured to the cover. The material and form of gasket selected are to be considered in conjunction with the type of cover, the securing arrangement and the expected relative movement between the cover and ship structure.

(3) Securing devices attached to hatchway coamings, decks or covers are to be in compliance with the following a) to e):

a) Arrangement and spacing of securing devices are to be determined with due attention to the effectiveness for weathertightness, depending upon the type and the size of hatch cover as well as to the stiffness of the cover edges between the securing devices.

b) The gross sectional area, in cm^2, of each securing device is not to be less than that obtained from the following formula. However, rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

$$A = 0.28\bar{a}p/f$$

where:

$\bar{a}$	=	Half the distance, in m, between two adjacent securing devices, measured along the hatch cover periphery (see Fig. II 17-3)
P	=	Packing line pressure, in N/mm, minimum 5 N/mm
f	=	As obtained from the following formula: $f=(\sigma_F/235)^e$
σ_F	=	Minimum upper yield stress, in N/mm^2, of the steel used for fabrication, but not to be taken greater than 70% of the ultimate tensile strength
e	=	Coefficient taken as equal to:
	=	1.0 for $\sigma_F \le 235$ N/mm^2
	=	0.75 for $\sigma_F > 235$ N/mm^2

c) Individual securing devices on each cover are to have approximately the same stiffness characteristics.

d) Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

e) Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

(4) A drainage arrangement equivalent to the standards specified in the following is to be provided.

a) Drainage is to be arranged inside the line of gaskets by means of a gutter bar or vertical extension of the hatch side and end coaming. If an application is made by the owner of a container carrier and the Society deems it to be appropriate, special consideration will be given to this requirement.

c) Drain openings are to be arranged at the ends of drain channels and are to be provided with effective means such as non-return valves or the equivalent for preventing the ingress of water from outside.

c) Cross-joints of multi-panel covers are to be arranged with a drainage channel for water from space above the gasket and a drainage channel below the gasket.

d) If a continuous outer steel contact between cover and ship structure is arranged, drainage from the space between the steel contact and the gasket is also to be provided for.

(5) It is recommended that ships with steel weathertight covers are supplied with an operation and maintenance manual which includes the following a) to e):

a) Opening and closing instructions

b) Maintenance requirements for packing, securing devices and operating items

c) Cleaning instructions for drainage systems

d) Corrosion prevention instructions

e) List of spare parts

(6) Securing devices of special design in which significant bending or shear stresses occur may be designed as anti-lifting devices according to (b) below.

(b) The securing devices of hatch covers, on which cargo is to be lashed, are to be designed for a lifting force resulting from the loads according to 17.2.4(d) of this Chapter (see Fig. II 17-10 of this Chapter). Unsymmetrical loading, which may occur in practice, is to be considered. Under such loading, the equivalent stress, in N/mm^2, in securing devices is not to be greater than that obtained from the following formula. Anti-lifting devices may be dispensed with at the discretion of the Society.

$$\sigma_E = \frac{150}{k_l}$$

where:

k_l = As obtained from the following formula:

$$k_l = \left(\frac{235}{\sigma_F}\right)^e$$

σ_F = Minimum upper yield stress or proof stress of the material, in N/mm^2

e = As given below:

= 0.75 for $\sigma_F > 235$

= 1.00 for $\sigma_F \leq 235$

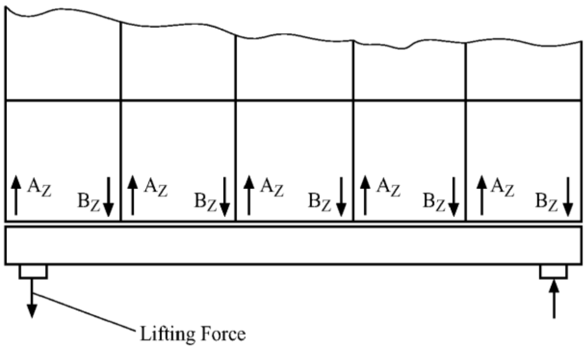

Fig. II 17-10
Lifting Forces at a Hatch Cover

17.2.11 Hatch Cover Supports, Stoppers and Supporting Structures

Hatch cover supports, stoppers and supporting structures subject to the provisions of 17.2 of this Chapter are to comply with the following (a) to (c):

(a) For the design of the securing devices for the prevention of shifting, the horizontal mass forces F obtained from the following formula are to be considered. Acceleration in the longitudinal direction, a_x, and in the transverse direction, a_y, does not need to be considered as acting simultaneously.

F = ma

where:

m = Sum of mass of cargo lashed on the hatch cover and mass of hatch cover

a = Acceleration obtained from the following formula:

= a_x=0.2g for longitudinal direction

= a_y=0.5g for transverse direction

(b) The design load for determining the scantlings of stoppers is not to be less than that obtained from 17.2.4(b) and (a), whichever is greater. Stress in the stoppers is to comply with the criteria specified in 17.2.5(a)(i).

(c) The details of hatch cover supporting structures are to be in accordance with the following (i) to (vii):

(i) The nominal surface pressure, in N/mm^2, of a hatch cover is not to be greater than that obtained from the following formula:

$p_{n\,max}$=dp_n in general

$p_{n\,max}$=3p_n for metallic supporting surface not subjected to relative displacements

where:

d	=	As given by the following formula. Where d exceeds 3, d is to be taken as 3.
	=	3.75-0.015L
d_{min}	=	1.0 in general
	=	2.0 for partial loading conditions
L	=	Length of ship specified in 1.2.1 of this Part.
p_n	=	As obtained from Table II 17-10

(ii) Where large relative displacements of the supporting surfaces are to be expected, the use of material having low wear and frictional properties is recommended.

(iii) Drawings of the supports are to be submitted. In these drawings, the permitted maximum pressure given by the material manufacturer related to long time stress is to be specified.

(iv) When the manufacturer of the vertical hatch cover support material can provide proof that the material is sufficient for the increased surface pressure, not only statically but under dynamic conditions, the permissible nominal surface pressure $p_{n\,max}$, as specified in (i) above, may be relaxed at the discretion of the Society. However, realistic long term distributions of spectra for vertical loads and relative horizontal motion between hatch covers and hatch cover stoppers are to be as deemed appropriate by the Society.

(v) Irrespective of the arrangement of stoppers, the supports are to be able to transmit the following force p_h in the longitudinal and transverse direction.

$$p_h = \mu \frac{p_v}{\sqrt{d}}$$

where:

p_v	=	Vertical supporting force
μ	=	Friction coefficient generally to be taken as 0.5. For non-metallic or low-friction materials, the friction coefficient may be reduced as appropriate by the Society. However, in no case μ is to be less than 0.35.

(vi) Stresses in supporting structures are to comply with the criteria specified in 17.2.5(a)(i).

(vii) For substructures and adjacent constructions of supports subjected to horizontal forces p_h, special consideration is to be given to fatigue strength.

17.2.12 Steel Hatchway Covers for Container Carriers

(a) For container carriers with unusually large freeboards, gaskets and securing devices for steel hatchway covers may be suitably dispensed with at the discretion of the Society upon request by the applicant for classification.

(b) Treatment of stowage and segregation of containers containing dangerous goods is to be at the discretion of the Society.

17.2.13 Additional Requirement for Small Hatches Fitted on Exposed Fore Deck

Small hatches located on exposed decks forward of $0.25L_1$ are to be of sufficient strength and weathertightness to resist green sea force if the height of the exposed deck in way of those hatches is less than $0.1L_1$ or 22 m above the designed maximum load line, whichever is smaller. The length L_1 is the length, in m, of ship as specified in 1.2.1 or 0.97 times the length of ship on the designed maximum load line, whichever is smaller.

17.3 Machinery Space Openings

17.3.1 Protection of Machinery Space Openings

Machinery space openings are to be enclosed by steel casings.

17.3.2 Exposed Machinery Space Casings

(a) Exposed machinery space casings are to have scantlings not less than that those required in 12.3 of this Part, taking the c-value as 1.0.

(b) The thickness of the top plating of exposed machinery space casings is not to be less than that obtained from the following formulae:

Position 1 = 6.3S + 2.5 mm
Position 2 = 6.0S + 2.5 mm

where:

S = Spacing of stiffeners, in m

17.3.3 Machinery Space Casings below Freeboard Deck or within Enclosed Spaces

The scantlings of machinery space casings below the freeboard deck or within enclosed superstructures or deckhouses are to comply with the following requirements:

(a) The thickness of the plating is to be at least 6.5 mm; where the spacing of stiffeners is greater than 760 mm, the thickness is to be increased at the rate of 0.5 mm per 100 mm excess in spacing. In accommodation spaces, the thickness of the plating may be reduced by 2 mm.

(b) The section modulus of stiffeners is not to be less than that obtained from the following formula:

$1.2Sl^3$ cm^3

where:

l = Tween deck height, in m.

S = Spacing of stiffeners, in m.

17.3.4 Access Openings to Machinery Spaces

(a) All access openings to machinery spaces are to be located in protected positions as far as possible and provided with steel doors capable of being closed and secured from both sides. Such doors in exposed machinery casings on the freeboard deck are to comply with the requirements in 12.4.2 and 12.4.3.

(b) The sills of doorways in machinery casings are not to be less than 600 mm in height above the upper surface of the deck in Position 1 and 380 mm in Position 2.

(c) In ships having a reduced freeboard, doorways in the exposed machinery casings on the freeboard or raised quarter deck are to lead to a space or passageway which is of a strength equivalent to that of the casing and is separated from the stairway to the machinery spaces by a second steel weathertight door of which the doorway sill is to be at least 230 mm in height.

17.3.5 Miscellaneous Openings in Machinery Casings

(a) Coamings of any fiddley, funnel and machinery space ventilator in an exposed position on the freeboard or superstructure deck are to be as high above the deck as reasonable and practicable.

(b) In exposed positions on the freeboard and superstructure decks, fiddley openings and all other openings in the machinery casings are to be provided with strong steel weathertight covers permanently fitted in their proper positions.

(c) Annular spaces around funnels and all other openings in the machinery casings are to be provided with a means of closing capable of being operated from outside the machinery space in case of fire.

17.3.6 Machinery Casings within Unenclosed Superstructures or Deckhouses

Machinery casings within unenclosed superstructures or deckhouses and doors provided thereon are to be constructed to the satisfaction of the Society, having regard to the degree of protection afforded by the superstructure or deckhouse.

17.4 Companionways and Other Deck Openings

17.4.1 Manholes and Flush Deck Openings

Manholes and flush deck openings in exposed positions on the freeboard and superstructure decks or within superstructures other than enclosed superstructures are to be closed by steel covers capable of being made watertight. These covers are to be secured by closely spaced bolts or to be permanently fitted.

17.4.2 Companionways

(a) Access openings in the freeboard deck are to be protected by enclosed superstructures, or by deckhouses or companionways of equivalent strength and weathertightness.

(b) Access openings in exposed superstructure decks or in the top of deckhouses on the freeboard deck which give access to a space below the freeboard deck or a space within an enclosed superstructure are to be protected by efficient deckhouses or companionways.

(c) Doorways in deckhouse or companionways such as specified in (a) and (b) are to be provided with doors complying with the requirements in 12.4.2 and 12.4.3.

(d) The sills of doorways in companionways specified in (a) to (c) are not to be less than 600 mm in height above the upper surface of the deck in Position 1 and 380 mm in Position 2.

(e) For deckhouses or superstructures which protect access openings to spaces below the freeboard deck, the height of sills of doorways on the freeboard deck are not to be less than 600 mm. However, where access is provided from the deck above as an alternative to access from the freeboard deck, the height of sills into a bridge or poop or deckhouse may be reduced to 380 mm.

(f) Where the access openings in superstructures and deckhouses which protect access openings to spaces below the freeboard deck do not have closing appliances in accordance with the requirements of 12.4.2 and 12.4.3, the openings to spaces below the freeboard deck are to be considered exposed.

17.4.3 Openings to Cargo Spaces

Access and other openings to cargo spaces are to be provided with a means of closing capable of being operated from outside the spaces in case of fire. Such closing means for any opening leading to any other space inboard the ship is to be of steel.

Table II 17-1
Corrosion Additions

Type of ship	Type of structural member		Corrosion addition t_c ,in mm
Container carriers and car carriers	Steel hatch covers		1.0
	Hatchway coamings		1.5
Ships other than those specified above and subject to the application of this section	Single plating type hatch cover		2.0
	Double plating type hatch cover	Top, side and bottom plating	1.5
		Internal structures	1.0
	Hatchway coamings, hatch coaming stays and stiffeners		1.5

Table II 17-2
Design Vertical Wave Load P_V(1), (2) (kN/m^2)

		$L_f \leq 100$m	$L_f > 100$m
Position 1	For 0.25L_f forward	$\frac{9.81}{76}\left[(4.28L_f + 28)\frac{x}{L_f} - 1.71L_f + 95\right]$(3)	For type B ships according to ICLL(4): $9.81\left[(0.0296L'_f + 3.04)\frac{x}{L_f} - 0.0222L'_f + 1.22\right]$ For type B-60 and B-100 ships according to ICLL(4): $9.81\left[(0.1452L'_f - 8.52)\frac{x}{L_f} - 0.1089L'_f + 9.89\right]$
	Elsewhere	$\frac{9.81}{76}(1.5L_f + 116)$	9.81×3.5
Position 2		$\frac{9.81}{76}(1.1L_f + 87.6)$	9.81×2.6(5)

Notes:

(1) L_f : Length of ship for freeboard defined in 1.2.10 of this Part, in m
L'_f: L_f, in m, however, where L_f exceeds 340 m, L'_f is to be taken as 340 m
x : Distance, in m, of the mid length of the hatch cover under examination from the aft end of L_f

(2) For exposed hatchways in positions other than Position 1 or 2, the value of each design wave load will be specially considered.

(3) Where a Position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, P_V may be taken as $\frac{9.81}{76}(1.5L_f + 116)$ kN/m^2.

(4) Where a Position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, P_V may be taken as 9.81×3.5 kN/m^2.

(5) Where a Position 1 hatchway is located at least one superstructure standard height higher than the Position 2 deck, P_V may be taken as 9.81×2.1 kN/m^2.

Table II 17-3
Minimum Value of P_H , in kN/m^2

	Unprotected front coamings and hatch cover skirt plates	others
$L \leq 250$	$25 + \frac{L_1}{10}$	$12.5 + \frac{L_1}{20}$
$L > 250$	50	25

Table II 17-4
Coefficient k_1 and k_2

k_1	$1+\dfrac{3.2\alpha-\gamma-0.8}{7\gamma+0.4}$	k_1 is not to be taken as less than 1.0 $\alpha=\dfrac{l_1}{l}$ $\beta=\dfrac{I_1}{I_0}$ $\gamma=\dfrac{Z_1}{Z_0}$
k_2	$1+8\alpha^3\dfrac{1-\beta}{0.2+3\sqrt{\beta}}$	

l = Overall length of portable beam, in m

l_1= Distance from the end of parallel part to the end of portable beam, in m

I_0= Moment of inertia at mid-span, in cm^4

I_1= Moment of inertia at ends, in cm^4

Z_0= Section modulus at mid-span, in cm^3

Z_1= Section modulus at ends, in cm^3

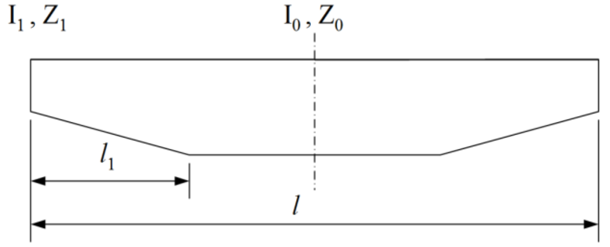

Table II 17-5
Effective Breadth e_m of Plating of Primary Supporting Members

l/e	0	1	2	3	4	5	6	7	≥ 8
e_{m1}/e	0	0.36	0.64	0.82	0.91	0.96	0.98	1.00	1.00
e_{m2}/e	0	0.20	0.37	0.52	0.65	0.75	0.84	0.89	0.90

Notes:

e_{m1} = Effective breadth, in mm, to be applied where primary supporting members are loaded by uniformly distributed loads or by not less than 6 equally spaced single loads

e_{m2} = Effective breadth, in mm, to be applied where primary supporting members are loaded by 3 or less single loads

l = Length between zero-points of bending moment curve taken equal to:
For simply supported primary supporting members: l_0
For primary supporting members with both ends constant: $0.6l_0$

l_0 = Unsupported length of the primary supporting members

e = Width of plating supported, measured from centre to centre of the adjacent unsupported fields

Table II 17-6
Correction Factor F_1

Boundary condition	F_1 (2)	Edge stiffener
Stiffeners sniped at both ends	1.00	
Guidance value(1) where both ends are effectively connected to adjacent structures	1.05	Flat bars
	1.10	Bulb sections
	1.20	Angles and tee-sections
	1.30	U-type sections(3) and girders of high rigidity

Notes:

(1) Exact values may be determined by direct calculations

(2) An average value of F_1 is to be used for plate panels having different edge stiffeners

(3) A higher value may be taken if it is verified by a buckling strength check of the partial plate field using non-linear FEA and deemed appropriate by the Society. However,such values are not to be greater than 2.0

Table II 17-7

Chapter 18

Machinery Casings

18.1 General

18.1.1 Machinery space openings in position 1 or 2 are to be properly framed and efficiently enclosed by steel casings of ample strength, and where the casings are not protected by other structures their strength are to be specially considered. Other openings in such casings are to be fitted with equivalent covers, permanently attached in their proper positions.

18.1.2 In general, ventilators necessary to continuously supply the machinery space are to have coamings of sufficient height to comply with 21.1.6(a) of this part, without having to fit weathertight closing appliances. Ventilators necessary to continuously supply the emergency generator room, if this is considered buoyant in the stability calculation or protecting opening leading below, are to have coamings of sufficient height to comply with 21.1.6(a) of this part, without having to fit weathertight closing appliances.

18.1.3 Where due to ship size and arrangement this is not practicable, lesser heights for machinery space and emergency generator room ventilator coamings, fitted with weathertight closing appliances in accordance with 21.1.6(b) of this part, may be permitted by the Society in combination with other suitable arrangements to ensure an uninterrupted, adequate supply of ventilation to these spaces.

18.2 Construction of Casings

18.2.1 The scantlings of plating and stiffeners of exposed casings protecting machinery openings are to be obtained as for superstructure end bulkheads and deckhouse walls specified in 12.3 of this Part.

18.2.2 For casings within open superstructures, the scantlings of plating and stiffeners are to be obtained from 12.4 of this Part as for an aft end bulkhead.

18.3 Skylights and Gratings

18.3.1 Skylights

(a) Skylights are to be substantially constructed and securely connected to coamings.

(b) Effective means is to be provided for closing and securing the hinged covers.

18.3.2 Gratings over stokehold openings are to be protected by hinged steel covers or the other effective means of closing.

Chapter 19

Machinery Spaces and Tunnels

19.1 General

19.1.1 The following features in the construction and the arrangement of the machinery space are to be carefully considered:

(a) Substantial construction and suitable arrangement of necessary openings in the machinery space.

(b) Adequate support for the deck.

(c) Suitable maintenance of the stiffness of the side and the bottom.

(d) Adequate distribution of the weight of the machinery.

19.1.2 The machinery space is to be sufficiently strengthened by means of web frames, web beams, and pillars or other equivalent arrangements.

19.1.3 All parts of the machinery, shafting, etc. are to be efficiently supported and the adjacent structure is to be adequately strengthened.

19.1.4 In ships of high power and in multiple screw ships, the structural construction and the efficiency of attachments of the machinery foundation and the adjacent structure are to be specially strengthened and plans are to be submitted for approval before the bottom construction is commenced.

19.2 Engine Seatings

19.2.1 In ships having a single bottom, the following applies:

(a) The main engines are to be seated upon thick rider plates laid across the top of deep floors or heavy foundation girders efficiently bracketed and stiffened and having sufficient strength in proportion to the power and size of the engines.

(b) The main lines of bolting that hold down the main engines to the rider plates mentioned in (a) are to pass through the rider plates into the girder plates provided underneath.

(c) In ships with longitudinal girders of not excessive spacing beneath the engine which is on the centre line of the hull, the centre keelson may be omitted for the section where the engine is located.

19.2.2 In ships having a double bottom in the machinery space, the following applies:

(a) Where engines are bolted directly to the inner bottom the thickness of plating under the engine is to be twice the rule thickness.

(b) Where built-up engine seatings of ample strength and stiffness are fitted above the inner bottom, transverse brackets are to be arranged over floors and, as far as practicable, longitudinal girders are to be under that in the seating.

19.2.3 Additional full depth longitudinal girders are to be fitted under the engine and the thrust block seating.

19.2.4 Installation of engine seating

(a) The various parts of the engine seating are to be accurately faired and properly closed before welding or riveting is commenced.

(b) Vertical web plates of the engine seating are to be made a hard bearing fit, top and bottom.

19.3 Boiler Bearers

19.3.1 Boilers are to be supported by deep saddle type floors or by transverse and longitudinal girders so arranged as to effectively distribute the weight.

19.3.2 Clearances

(a) Boilers are to be kept well clear of bunker and hold bulkheads, and sufficient spaces are to be allowed for proper access all around the boiler.

(b) Boilers are to be at least 460 mm clear of the tank top, the bunker wall, etc.

(c) Where the clear space is unavoidably less than that required by 19.3.2(b) above, the thickness of the adjacent structure is to be increased, or suitable insulating arrangements are to be made.

(d) Available clearances are to be indicated on the plan submitted for approval.

(e) Hold bulkheads and decks are to be kept well clear of the boilers and uptakes, or provided with suitable insulating arrangements.

(f) Side sparrings are to be provided on the bulkheads adjacent to the boilers, keeping suitable clearance on their hold sides.

19.3.3 Floors under boiler bearer

(a) In ships having a single bottom in the boiler space, the floor under the boiler bearer is to be increased in strength in compliance with 4.1 of this Part.

(b) In ships having a double bottom in the boiler space, the floor is to be increased in strength in compliance with 5.4 and 5.5 of this Part.

19.3.4 Decks under donkey boiler and coalfired boiler

(a) Decks under donkey boilers are to be increased 2 mm in thickness and protected under coal-fired boilers by not less than 50 mm of firebrick or cement.

(b) The requirements of 19.3.4(a) above are to be applied to any part of the deck on which the fire from the donkey boiler may be drawn.

19.4 Block and Auxiliary Foundations

19.4.1 Structure under thrust block

(a) Thrust blocks are to be bolted to efficient foundations extending well beyond thrust blocks and so arranged that the load is effectively distributed into adjacent structures.

(b) Additional intercostal girders with double attachments are to be fitted in way of block foundations as may be required.

19.4.2 Plumber blocks and auxiliary foundations are to be of substantial strength and efficiently stiffened both longitudinally and transversely.

19.5 Tunnels and Tunnel Recesses

19.5.1 Shaft Tunnels

(a) A watertight tunnel of sufficient size for examining and repairing the shafting is to be fitted in ships having machinery amidships, except in case of 19.5.1 (b) below.

(b) For ships intended to trade in sheltered waters, the watertight tunnel may be omitted provided that the shafting is otherwise protected and there is a recess at all times to the bearing and the packing gland, etc.

19.5.2 Doors and its closing appliances

(a) The watertight door is to be fitted at the fore end of the tunnel.

(b) For means of closing, and the construction of watertight doors, see 14.3 of this Part.

19.5.3 Escape trunks

(a) The escape trunk is to be provided in the tunnel at a suitable location as far as possible.

(b) The escape trunk is to be led to the bulkhead deck or above.

19.5.4 Thickness of flat side plating of tunnel

(a) The thickness of plating on flat sides of the tunnel is not to be less than that obtained from the following formula:

$$2.9S\sqrt{h} + 2.5 \quad \text{mm}$$

where:

S = Spacing of stiffeners, in m.

h = Vertical distance at the mid-length of each hold from the lower edge of the side wall plating to the bulkhead deck at the centre line of the ship, in m.

(b) The lowest strakes of the plating are to be increased by 1 mm above the value required by 19.5.4(a) above.

19.5.5 Top of tunnel

(a) Where the top of the tunnel is flat,

(i) The thickness of flat plating of the top of tunnels or tunnel recesses is not to be less than that obtained from the formula in 19.5.4(a) above, h being taken as the height from the top plates to the bulkhead deck at the centre line of the ship;

(ii) Where unsheathed in way of the hatchway the top plating is to be increased by 2.5 mm;

(iii) Where the top of the tunnel or the recess forms a part of a deck, the thickness of the plating is to be increased by at least one mm above that obtained from the requirements in (i) above, but it is not to be less than that required for the deck plating at the same position;

(b) Where the top or side of the tunnel is curved,

(i) The top plating may be of the thickness required in 19.5.4(a) above with a stiffener spacing 150 mm less than that actually adopted;

(ii) The crown plating in way of the hatchway is to be increased by 2 mm unless covered with wood sheathing not less than 50 mm thick.

(iii) The wood sheathing mentioned in (ii) above is to be so secured as to keep watertightness of the tunnel where it might be damaged by cargo. Similar consideration is to be taken where apparatus such as ladder steps are provided in the tunnels.

19.5.6 Where the tunnel forms the boundary of the deep tank, the thickness of the side plating is not to be less than that required for the deep tank boundary bulkhead.

19.5.7 Where the tunnel of circular form passes through the deep tank, the thickness of the plating in way of the tank is to be not less than that given by the following formula:

$9.1 + 0.134\ d_1\ h$ mm

where:

d_1 = The diameter of tunnel, in m.

h = Greater of the vertical distances given below:

Vertical distance (m) measured from the bottom of tunnel to the mid-point between the top of tanks and the top of overflow pipes; or

0.7 times the vertical distance (m) measured from the bottom of tunnel to the point 2.0 metres above the top of overflow pipes.

19.5.8 Stiffeners on tunnel

(a) The spacing of stiffeners on the tunnel is not to exceed 915 mm.

(b) The section modulus of stiffeners is not to be less than that obtained from the following formula:

$4.0Sh l^2$ cm^3

where:

l = Distance from the heel of the lower edge of the side wall to the top of the plate at side, in m.

S = Spacing of stiffeners, in m.

h = Vertical distance at mid-length of each hold from the mid-point of l to the bulkhead deck, in m.

(c) Where the ratio of the radius of the rounded tunnel top to the height of the tunnel is comparatively large, the section modulus of stiffeners is to be adequately increased over that specified in (b).

(d) The lower ends of stiffeners over 150 mm in depth are to be connected to parts such as the inner bottom plating by lug connections.

19.5.9 Additional strengthening is to be fitted under the heel of the pillar, the hatch end support or the mast stepped on the tunnel.

19.5.10 Where the top of tunnels or tunnel recesses forms part of the deck; beams, pillars and girders under the top are to be of the scantlings required for similar members of bulkhead recesses.

19.5.11 The ventilator and the escape trunk fitted in the tunnel or the tunnel recess are to be made watertight up to the bulkhead deck and to have the scantling suitable for the pressure to which they may be subjected.

19.5.12 Where watertight tunnels similar to shaft tunnels are provided, they are to be of similar construction to that of the shaft tunnels.

Chapter 20

Ceiling and Sparring

20.1 Ceiling

20.1.1 Close ceiling in single bottom

(a) The close ceiling is to be laid on floors and up to the upper turn of bilges.

(b) The close ceiling is to be arranged for easy removal for inspection of the bottom.

20.1.2 Ceiling in double bottom

(a) The ceiling is to be laid over the bilge and under the hatchway.
   (i) The ceiling over bilges is to be arranged with portable sections, which are readily removable.
   (ii) The ceiling under the hatchways may be omitted provided that the thickness of the inner bottom plating in way is increased by 2 mm.

(b) The ceiling where fitted on top of inner bottom plating, is to be laid either directly on the inner bottom plating embedded in a substantial body of mixed tar and cement or other suitable covering, or on the batten not less than 13 mm in thickness, providing a clear space of at least 12.5 mm for drainage.

20.1.3 The thickness of ceilings is not to be less than 63 mm.
Where covers or fittings of manholes of the inner bottom in cargo holds project above the plating, they are to be protected by a steel coaming around each manhole and fitted with hatches of wood or steel.

20.2 Sparring

20.2.1 In ships intended to carry general cargo, the sparring is to be fitted above the bilge ceiling, if any, in all cargo spaces.

20.2.2 Dimension of sparring

(a) The thickness of the sparring is not to be less than 50 mm finished thickness.

(b) The breadth of the sparring normally is to be 150 mm.

20.2.3 The clear space between adjacent rows of sparring is not to be more than 230 mm.

20.2.4 The sparring is to be fitted in the cleat or in the portable frame for convenience of removal.

20.2.5 The sparring may be omitted in bunker spaces and in holds exclusively used for the carriage of coal or other bulk cargoes, container and similar cargoes.

20.2.6 In ships intended to carry timbers, hold frames are to be specially protected. However, where it is obvious that the ship is not engaged in the carriage of log cargoes, the protection may be modified.

Chapter 21

Ventilators, Air and Sounding Pipes

21.1 Ventilators

21.1.1 Height of ventilator coaming

(a) The minimum height of the ventilator coaming above the upper surface of the deck exposed to the weather, measured above the sheathing, if fitted, is to be as follows:

900 mm in Position 1
760 mm in Position 2

(b) The minimum height of the coaming of the patent ventilator will be specially considered.

(c) Where the ship has an unusually large freeboard or where the ventilator serves spaces within unenclosed superstructures, the height of ventilator coamings may be suitably reduced.

21.1.2 The thickness of ventilator coamings in Positions I and II specified in 17.1.2 of this Part leading to spaces below the freeboard deck or within enclosed superstructures is not to be less than that given by Line 1 in Table II 21-1 of this Chapter. Where the height of the coamings is reduced by the provisions in 21.1.1, the thickness may be suitably reduced. Where ventilators pass through superstructures other than enclosed superstructures, the thickness of ventilator coamings in the superstructures is not to be less than that given by Line 2 in Table II 21-1 of this Chapter.

Table II 21-1
Thickness of Ventilator Coamings

Thickness of coaming plate (mm)	Outside diameter of ventilator (mm)		
	80 and under	160	230 and over but less than 330
Line 1	6	8.5	8.5
Line 2	4.5	4.5	6

Notes:
(1) For intermediate values of outside diameter of ventilator, the thickness of coaming plate is to be obtained by linear interpolation.
(2) Where the outside diameter of ventilator is over 330 mm, the thickness of coaming plate is to be in accordance with the discretion of the Society.

21.1.3 The coaming is to be effectively secured to properly stiffened deck plating of the sufficient thickness.

21.1.4 The ventilator coaming which exceeds 900 mm in height and is not supported by the adjacent structure is to be specially supported.

21.1.5 In particularly exposed positions the ventilator coaming height, scantlings and/or support may be required to be suitably increased above that given above.

21.1.6 Closing appliances

(a) Strong plugs and canvas covers or efficient metal covers which can be readily and effectively secured in place are to be provided for closing openings in coamings unless the height of the coaming is greater than 4.5 m above the deck in Position 1 and 2.3 m above the deck in Position 2.

(b) In ships of not more than 100 m in length for freeboard the closing appliances are to be permanently attached. Where not so provided in other ships they are to be conveniently stowed near ventilators to which they are to be fitted.

(c) Ventilators to cargo and machinery spaces are to be provided with a means for closing the openings that is capable of being operated from outside the spaces in case of fire. Furthermore, these ventilators are to be provided with an indicator that enables confirmation whether the shutoff is open or closed from outside of the ventilator as well as suitable means of inspection for closing appliances.

(d) All ventilator openings in exposed positions on the freeboard and superstructure decks are to be provided with efficient weathertight closing appliances. Where the coaming of any ventilator extends to more than 4.5 m above the surface of the deck in Position I or more than 2.3 m above the surface of the deck in Position II specified in 17.1.2 of this Part, such closing appliances may be omitted unless required in (c) above.

21.1.7 Machinery spaces

(a) Ventilators necessary to continuously supply the machinery spaces are to have coamings of height more than 4.5 m above the deck in Position 1 and 2.3 m above the deck in Position 2, without having to fit weathertight closing appliances. Ventilators to emergency generator rooms are to be so positioned that closing appliances are not required.

(b) Where due to vessel size and arrangement this is not practicable, lesser heights for machinery space ventilator coamings may be accepted with provision of weathertight closing appliances in combination with other suitable arrangements to ensure an uninterrupted, adequate supply of ventilation to these spaces.

21.1.8 Ventilator cowls are to be fitted closely to coamings and are to have housings of not less than 380 mm, except that a smaller housing may be permitted for ventilators of not greater than 200 mm in diameter.

21.1.9 The ventilators for the deckhouses which protect the companionways leading to spaces below the freeboard deck are to be equivalent to those for the enclosed superstructures.

21.1.10 The coamings of ventilators supplying the emergency generator room is to extend to more than 4.5 m above the surface of the deck in Position I, and more than 2.3 m above the surface of the deck in Position II specified in 17.1.2 of this Part. The ventilator openings are not to be fitted with weathertight closing appliances, except for those complying with IACS UR M75. However, where due to vessel size and arrangement this requirement is not practicable, the height of ventilator coamings is to be at the discretion of the Society.

21.1.11 The ventilators located on the exposed deck forward of 0.25L are to be of sufficient strength to resist green sea force if the height of the exposed deck in way of those ventilators is less than 0.1L or 22m above the designed maximum load line, whichever is smaller. The length L is specified in 1.2.1 of this Part. This requirement does not apply to the cargo tank venting systems and inert gas systems of tankers, ships carrying liquefied gases in bulk and ships carrying dangerous chemicals in bulk.

21.2 Air and Sounding Pipes

21.2.1 Air and soundings pipes are to be fitted in accordance with the requirements of Part VI and this Chapter.

21.2.2 Height of air pipes

(a) The height of the air pipe from the upper surface of the deck exposed to the weather, measured above sheathing, if fitted, is not to be less than:

760 mm on the freeboard deck (including raised quarter deck).
450 mm on the superstructure deck.

(b) Where these heights may interfere with the working of the ship, a lower height may be approved, provided that closing arrangements are provided and other circumference justifying a lower height are satisfactory.

21.2.3 All openings of air and sounding pipes are to be provided with permanently attached satisfactory means of closing to prevent the free entry of water. Air pipes are to be provided with automatic closing devices.

21.2.4 Striking plates of suitable thickness or equivalent are to be fitted under all sounding pipes.

21.2.5 Air and sounding pipes are to be well protected in all cargo spaces or other areas where damage might likely occur.

Chapter 22

Scuppers and Sanitary Discharges

22.1 Scuppers and Sanitary Discharges

22.1.1 Scuppers of sufficient number and size to provide effective drainage are to be fitted in all decks. However for the drainage of enclosed cargo spaces situated on the bulkhead deck of a passenger ship or on the freeboard deck of a cargo ship, the Society may permit the means of drainage to be dispensed with in any particular compartment of any ship or class of ship provided that the safety of the ship is considered not to be impaired by reasons coming from size or internal subdivision of those spaces.

22.1.2 Scuppers draining from the weather deck and spaces within the superstructure or the deckhouse not fitted with efficient weathertight doors are to be led overboard.

22.1.3 Scuppers and discharges draining from the space below the freeboard deck or the space within the superstructure or the deckhouse on the freeboard deck fitted with efficient weathertight doors may be led to the bilge, but may be led overboard provided that the space drained is above the load waterline, and pipes are fitted with efficient and accessible means of preventing water from passing inboard as required by 22.1.4 below.

22.1.4 Automatic non-return valves

(a) Non-return valves

Normally each separate discharge is to have one automatic non-return valve with positive means of closing it from a position above the freeboard deck. Where the inboard end of the discharge pipe is located at least 0.01L above the Summer Load Line, the discharge may have two automatic non-return valves without positive means of closing. Where that vertical distance exceeds 0.02L, a single automatic non-return valve without positive means of closing may be accepted. The means for operating the positive action valve are to be readily accessible and provided with an indicator showing whether the valve is open or closed.

(b) One automatic non-return valve and one sluice valve controlled from above the freeboard deck instead of one automatic non-return valve with a positive means of closing from a position above the freeboard deck, is acceptable.

(c) Where two automatic non-return valves are required, the inboard valve is always to be accessible for examination under service conditions (i.e., the inboard valve is to be above the level of the Tropical Load Line). If this is not practicable, the inboard valve need not be located above the Tropical Load Line, provided that a locally controlled sluice valve is fitted between the two automatic non-return valves.

(d) Where sanitary discharges and scuppers lead overboard through the shell in way of machinery spaces, a locally operated positive closing valve at the shell, together with a non-return valve inboard, is acceptable. The controls of the valves are to be in an easily accessible position.

(e) The position of the inboard end of discharges is to be related to the Summer Timber Load Line when a timber freeboard is assigned.

(f) The requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of a ship. For discharges which are to be kept closed at sea, a single screw down valve operated from the deck is acceptable.

(g) Table II 22-1 provides the acceptable arrangements of scuppers, inlets and discharges.

22.1.5 Scupper pipes from enclosed cargo spaces on the bulkhead deck of a passenger ship or on the freeboard deck of a cargo ship are to be in accordance with the following requirements.

(a) Where the freeboard to the bulkhead deck or the freeboard deck, respectively, is such that the deck edge is immersed when the ship heels more than 5°, the drainage shall be by means of a sufficient number of scuppers of suitable size discharging directly overboard, fitted in accordance with the requirements of SOLAS Regulation II-1/15 in the case of a passenger ship and the requirements for scuppers, inlets and discharges of the International Convention on Load Lines in force in the case of a cargo ship.

(b) Where the freeboard is such that the edge of the bulkhead deck or the edge of the freeboard deck, respectively, is immersed when the ship heels 5° or less, the drainage of the enclosed cargo spaces on the bulkhead deck or on the freeboard deck, respectively, shall be led to a suitable space, or spaces, of adequate capacity, having a high water level alarm and provided with suitable arrangements for discharge overboard. In addition, it is to be ensured that:

(i) the number, size and disposition of the scuppers are such as to prevent unreasonable accumulation of free water;

(ii) the pumping arrangements required for passenger ships or cargo ships, as applicable, take account of the requirements for any fixed pressure water-spraying fire-extinguishing system;

(iii) water contaminated with petrol or other dangerous substances is not drained to machinery spaces or other spaces where sources of ignition may be present; and

(iv) where the enclosed cargo space is protected by a carbon dioxide fire-extinguishing system, the deck scuppers are to be fitted with means to prevent the escape of the smothering gas.

22.1.6 Scuppers let through the shell from enclosed superstructures used for the carriage of cargo are to be permitted only where the edge of the freeboard deck is not immersed when the ship heels 5° either way. In other cases the drainage is to be led inboard in accordance with requirements of the International Convention for the Safety of Life at Sea in force.

22.1.7 In manned machinery spaces, main and auxiliary sea inlets and discharges in connection with the operation of machinery may be controlled locally. The controls are to be readily accessible and are to be provided with indicators showing whether the valves are open or closed.

22.1.8 Scuppers and discharge pipes originating at any level and penetrating the shell either more than 450 mm below the freeboard deck or less than 600 mm above the Summer Load Line are to be provided with a non-return valve at the shell. This valve, unless required by 22.1.4, may be omitted if the piping is of substantial thickness (see 22.1.9 below)

22.1.9 Scupper and discharge pipes

(a) For scupper and discharge pipes, where substantial thickness is not required:

(i) For pipes having an external diameter equal to or less than 155 mm, the thickness is not to be less than 4.5 mm;

(ii) For pipes having an external diameter equal to or more than 230 mm, the thickness is not to be less than 6 mm.

Intermediate sized are to be determined by linear interpolation.

(b) For scupper and discharge pipes, where substantial thickness is required:

(i) For pipes having an external diameter equal to or less than 80 mm, the thickness is not to be less than 7 mm;

(ii) For pipes having an external diameter of 180 mm, the thickness is not to be less than 10 mm;

(iii) For pipes having an external diameter equal to or more than 220 mm, the thickness is not to be less than 12.5 mm.

Intermediate sizes are to be determined by linear interpolation.

22.1.10 In all cargo spaces or other spaces where damage might likely occur, all scuppers and discharges including their valves, controls and indicators are to be well protected.

22.1.11 In cases where fixed pressure water-spraying systems are fitted in closed vehicle and ro/ro spaces and special category spaces, drainage systems are to comply with SOLAS Reg. II-2/20.6.1.4.

22.1.12 Discharges with inboard opening located lower than the ship's uppermost load line may be accepted when a loop of the pipe is arranged between the inboard opening and the outlet in hull. The top of the loop is to be regarded as the position of the inboard opening, and the pipeline shall be provided with valves according to Table II 22-1 of this Chapter.

22.1.13 Gravity discharges from top wing tanks may be arranged. The drop valves shall be of substantial construction and of ductile material, and they are to be closeable from an always accessible position. It is to be possible to blank-flange the discharge or to lock the valves in closed position when the tanks are used for carrying cargo. The thickness of the pipe or box leading from the tank through the shell is to comply with the requirements given for discharges.

22.1.14 Drainage from helicopter decks is to comply with the requirements for the class notation **Helideck-N**.

22.2 Rubbish and Ash Chutes

22.2.1 The inboard opening of each ash-shoot, rubbish-shoot, etc. is to be provided with an efficient cover.

22.2.2 If the inboard opening prescribed in 22.2.1 is situated below the bulkhead deck of passenger ships or the freeboard deck of cargo ships, the cover is to be watertight, and in addition an automatic non-return valve is to be fitted in the ash-shoot, rubbish-shoot, etc. at an easily accessible position above the deepest subdivision load line.

22.2.3 Two gate valves controlled from the working deck of the chute instead of the non-return valve with a positive means of closing from a positive above the freeboard deck which comply with the following requirements are acceptable:

(a) the lower gate valve is to be controlled from a position above the freeboard deck. An interlock system between the two valves is to be arranged;

(b) the inboard end is to be located above the waterline formed by an 8.5° heel to port or starboard at a draft corresponding to the assigned summer freeboard, but not less than 1,000 mm above the summer waterline. Where the inboard end exceeds 0.01L above the summer waterline, valve control from the freeboard deck is not required, provided the inboard gate valve is always accessible under service conditions; and

(c) Alternatively, the upper and lower gate valves may be replaced by a hinged weathertight cover at the inboard end of the chute together with a discharge flap. The cover and flap are to be arranged with an interlock so that the discharge flap cannot be operated until the hopper cover is closed.

22.2.4 The entire chute, including the cover, is to be constructed of material of substantial thickness. This implies that the entire chute is to be of at least equivalent strength as the hull it is penetrating.

22.2.5 The controls for the gate valves and/or hinged covers are to be clearly marked: "Keep closed when not in use".

22.2.6 Where the inboard end of the chute is below the freeboard deck of a passenger ship or the equilibrium waterlines of a cargo ship to which damage stability requirements apply, then:

(a) the inboard end hinged cover/valve is to be watertight;

(b) the valve is to be a screw-down non-return valve fitted in an easily accessible position above the deepest load line; and

(c) the screw-down non-return valve is to be controlled from a position above the bulkhead deck and provided with open/closed indicators. The valve control is to be clearly marked: “Keep closed when not in use”.

22.3 Materials for Valves and Pipes

22.3.1 All valves and shell fittings required by this Chapter are to be of steel, bronze or other approved ductile materials. Valves of ordinary cast iron or similar material are not acceptable.

22.3.2 All pipes to which this Chapter refers are to be of steel or other equivalent approved materials.

Chapter 23

Painting

23.1 Painting

23.1.1 Unless otherwise approved, all steel work is to be suitably coated with paint or equivalent except in side tanks intended for oil. Special requirements may be additionally made by the Society in accordance with the kind of ships, purpose of spaces, etc. However, where it is recognized by the Society that the spaces are effectively protected against corrosion of steel works by the means other than painting or due to quality of cargoes, etc., painting may be omitted. The surface of steel works is to be thoroughly cleaned and loose rust, oil and other injurious adhesives are to be removed before being painted. At least the outer surface of shell plating below the load line is to be sufficiently free from rust and mill scale before painting.

23.1.2 Steel work is to be suitably cleaned and cleared of mill scale. It is recommended that blast cleaning or other equally effective means be employed for this purpose.

23.1.3 When the mill scale is removed by methods less effective than shot blasting, it is desirable when several months elapse between launching and delivery, to dry-dock the ship immediately before entry into service.

23.1.4 All dedicated sea water ballast tanks in all types of ships of not less than 500 GT and double-side skin spaces of bulk carriers of 150m in length and upwards are to have protective coatings in compliance with the requirements of IMO Resolution MSC.215(82).

23.1.5 Corrosion protection of cargo oil tanks of crude oil tankers

(a) Cargo oil tanks of crude oil tankers of 5000 tonnes deadweight and above are to have protective coatings.

(b) The performance standard for protective coatings is to be in compliance with the requirements of IMO Resolution MSC.288(87) or alternative means by IMO Resolution MSC.289(87).

23.1.6 Tanks intended for oil or the holds of combination carriers intended for the carriage of dry bulk cargoes and oil cargoes need not be coated unless required by 23.1.6.

23.1.7 For cargo holds on bulk carriers including combination carriers, all internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of cargo holds, excluding the flat tank top areas and the hopper tank sloping plating up to approximately 300 mm below the side shell frame end brackets, are to have an epoxy or equivalent coating applied in accordance with the manufacturer's recommendations. Internal surface of cargo hold includes those surfaces of stiffening members of top wing tank bottom, where fitted on hold side, and deck plating and associated beams, girders, etc. facing holds such as those between the main hatchways. In the selection of coatings, due consideration is to be given by the Owner to the intended cargoes and conditions expected in service.

23.1.8 Tanks or holds for salt water ballast are to have a corrosion resistant hard type coating such as epoxy or zinc on all structural surfaces. Where a long retention of salt water ballast is expected due to the type of vessel or unit, special consideration for the use of inhibitors or sacrificial anodes may be given.

23.1.9 The use of aluminium coatings containing greater than 10 percent aluminium by weight in the dry film is prohibited in cargo tanks, cargo tank deck area, pump rooms, cofferdams or any other area where cargo vapour may accumulate in tankers and ships carrying dangerous chemicals in bulk intended to carry crude oil and petroleum products having a flashpoint not exceeding 60℃ and a Reid vapour pressure below atmospheric pressure or other liquid cargoes having similar fire hazards.

23.2 Cementing

23.2.1 The bottom in ships with single bottoms, the bilges in all ships and the double bottoms in the boiler spaces of all ships are to be efficiently protected by Portland cement or other equivalent materials which cover the plates and frames as far as the upper turn of bilge. However, cement protection may be dispensed with in the bottom of the space solely used for carriage of oil.

23.2.2 Portland cement is to be mixed with fresh water and sand or other satisfactory substances, in the proportion of about one part of cement to two of sand.

23.2.3 The thickness of cement is not to be less than 20 mm at the edges.

23.2.4 The top plating of tanks, where ceiled directly, is to be covered with good tar put on hot and well sprinkled with cement powder, or with other equally effective coatings.

Chapter 24

Rudders

24.1 General

24.1.1 The following requirements generally apply to:

(a) The rudder constructed as a double-plated stream line section, an ordinary shape and not more than two pintles, as shown in Fig. II 24-1 and Fig. II 24-2 of this Chapter, designed with a moving angle not more than 35° on each side without any special arrangement for increasing the rudder force, such as fins, flaps, steering propellers, etc. Rudders not confirming with the ordinary types are to be approved under special consideration by the Society.

(b) High-lift rudders described in Table II 24-1 of this Chapter, the rudder operating angle of which might be exceeding 35° on each side at maximum design speed.

(c) Other steering equipment other than rudders identified in this Chapter.

24.1.2 Materials

(a) Rudder stocks, pintles, flanges, coupling bolts, keys and cast parts of rudders are to be made of rolled, forged steel or cast carbon manganese steel conforming to the requirements of Part XI.

(b) Welded part of rudders are to be made of approval rolled hull materials.

(c) Material factor K for normal and high tensile steel plating may be taken into account when specified in each individual rule requirement. The material factor K is to be taken as defined in 1.5.2(a) of this Part, unless otherwise specified.

(d) For rudder stocks, pintles, keys and bolts the minimum yield stress is not to be less than 200 N/mm^2. The requirements in this Chapter are based on a material's yield stress of 235 N/mm^2. If material is used having a yield stress differing from 235 N/mm^2, the material factor K is to be determined as specified in 1.5.2 (c) of this Part.

(e) Before significant reductions in rudder stock diameter due to the application of higher tensile steels are granted, the evaluation of the large rudder stock deformations is to be submitted for consideration in order to avoid excessive edge pressure in way of bearings.

24.1.3 Effective means are to be provided for preventing the rudder from jumping and for supporting the weight of the rudder without excessive bearing pressure. They are to be arranged to prevent accidental unshipping or undue movement of the rudder which may cause damage to the steering gear.

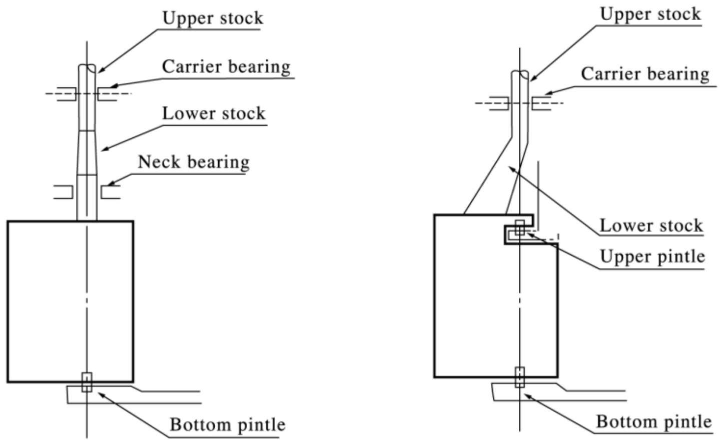

Fig. II 24-1
Shoe piece Supported Type Rudder

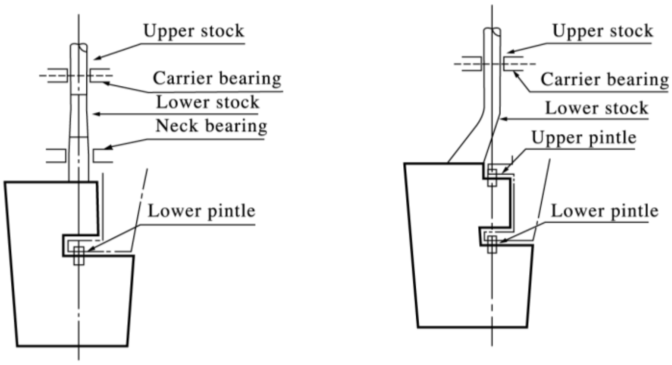

Fig. II 24-2
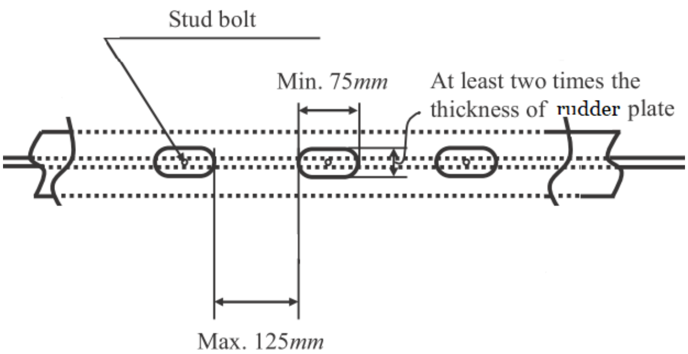
Horn Supported Type Rudder

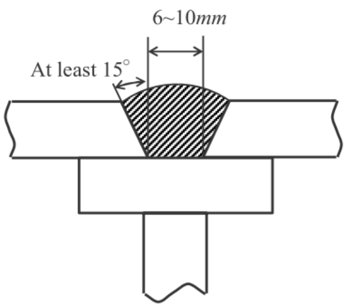
24.1.4 Welding and design details

(a) Slot-welding is to be limited as far as possible. Slot welding is not to be used in areas with large in-plane stresses transversely to the slots or in way of cut-out areas of semi-spade rudders.

When slot welding is applied, the length of slots is to be minimum 75 mm with breadth of 2 t, where t is the rudder plate thickness, in mm. The distance between ends of slots is not to be more than 125 mm. The slots are to be fillet welded around the edges and filled with a suitable compound, e.g. epoxy putty. Slots are not to be filled with weld.

Continuous slot welds are to be used in lieu of slot welds. When continuous slot welding is applied, the root gap is to be between 6-10 mm. The bevel angle is to be at least 15°.





(b) In way of the rudder horn recess of semi-spade rudders, the radii in the rudder plating are not to be less than 5 times the plate thickness, but in no case less than 100 mm. Welding in side plate are is to be avoided in or at the end of the radii. Edges of side plate and weld adjacent to radii are to be ground smooth.

(c) Welds between plates and heavy pieces (solid parts in forged or cast steel or very thick plating) are to be made as full penetration welds. In way of highly stressed areas e.g. cut-out of semi-spade rudder and upper part of spade rudder, cast or welding on ribs is to be arranged. Two sided full penetration welding is normally to be arranged. Where back welding is impossible welding is to be performed against ceramic backing bars or equivalent. Steel backing bars may be used and are to be continuously welded on one side to the heavy piece.

(d) Requirements for welding and design details of rudder trunks are described in 24.10 of this Chapter.

(e) Requirements for welding and design details when the rudder stock is connected to the rudder by horizontal flange coupling are described in 24.5.1 of this Chapter.

(f) Requirements for welding and design details of rudder horns are described in 2.2.5 of this Part.

24.1.5 Equivalence

(a) The Society may accept alternatives to requirements given in this Chapter, provided they are deemed to be equivalent.

(b) Direct analyses adopted to justify an alternative design are to take into consideration all relevant modes of failure, on a case by case basis. These failure modes may include, amongst others: yielding, fatigue, buckling and fracture. Possible damages caused by cavitation are also to be considered.

(c) If deemed necessary by the Society, lab tests, or full scale tests may be requested to validate the alternative design approach.

24.2 Rudder Force and Rudder Torque

24.2.1 Rudder blades without cut-outs

(a) The rudder force upon which the rudder scantlings are to be based is to be determined from the following formula:

$F = 132\, K_1\, K_2\, K_3\, A\, V^2$ N

where:

F	=	Rudder force, in N.
A	=	Area of rudder blade, in m^2.
V	=	Maximum service speed of ship, in knots, with the ship on summer load waterline, when the service speed ≥ 10 knots.
	=	$\frac{1}{3}(V + 20)$ when the service speed < 10 knots.
	=	Maximum astern speed for astern condition, however in no case less than 50% of maximum service speed, in knots.
K_1	=	Factor depending on the aspect ratio λ of the rudder area.
	=	$\frac{1}{3}(\lambda + 2)$
λ	=	$\frac{h^2}{A_t} \leq 2$
h	=	Mean height of rudder area, in m, as shown in Fig. II 24-3 of this Chapter.
A_t	=	Sum of rudder blade area A and area of rudder post or rudder horn, if any, within the mean height h, in m^2.
K_2	=	Factor depending on the rudder profile as specified in Table II 24-1 of this Chapter.

K_3	=	0.8 for rudders outside the propeller jet.
	=	1.15 for rudders behind a fixed propeller nozzle.
	=	1.0 otherwise.

(b) The rudder torque is to be calculated for both the ahead and astern condition from the following formula:

$Q = F\,r$ N-m

where:

Q	=	Rudder torque, in N-m.
r	=	$b(\alpha - k)$,in m,
	≥	0.1 b for ahead condition, in m.
b	=	Mean breadth of rudder area, in m, see Fig. II 24-3 of this Chapter.
α	=	0.33 for ahead condition.
	=	0.66 for astern condition.
k	=	Balance factor.
	=	$\frac{A_f}{A}$
A_f	=	Portion of the rudder blade area situated ahead of the center line of the rudder stock, in m^2.
A	=	As specified in (a) above.

24.2.2 Rudder blades with cut-outs (semispade rudders)

(a) The rudder force of each part may be taken as:

$$F_1 = F\frac{A_1}{A} \quad \text{N}$$

$$F_2 = F\frac{A_2}{A} \quad \text{N}$$

where:

A	=	As specified in 24.2.1 (a) above.
	=	$A_1 + A_2$ see Fig. II 24-4 of this Chapter.

(b) The total resulting torque may be taken as:

$Q = Q_1 + Q_2$ N-m

where:

Q	=	Total torque, in N-m.
	≥	$0.1F\left(\frac{A_1 b_1 + A_2 b_2}{A}\right)$ for ahead condition
Q_1	=	$F_1 r_1$ N-m
Q_2	=	$F_2 r_2$ N-m
r_1	=	$b_1(\alpha - k_1)$ lever of A_1, in m.
r_2	=	$b_2(\alpha - k_2)$ lever of A_2, in m.
b_1 and b_2	=	Mean breadth of partial areas A_1 and A_2.
α	=	0.33 for ahead condition.
	=	0.66 for astern condition.
	=	0.25 for ahead condition with concerned rudder part behind a fixed structure such as rudder horn
	=	0.55 for astern condition with concerned rudder part behind a fixed structure such as rudder horn.
k_1	=	$\frac{A_{1f}}{A_1}$
k_2	=	$\frac{A_{2f}}{A_2}$

Table II 24-1
Factor of K_2

Profile type	K_2	
	Ahead condition	Astern condition
NACA-00 series Göttingen 	1.10	0.80
Flat side 	1.10	0.90
Hollow 	1.35	0.90
High lift rudders 	1.70	to be specially considered; if not known: 1.30
Fish tail 	1.40	0.80
Single plate 	1.00	1.00
Mixed profiles (e.g. HSVA)	1.21	0.90

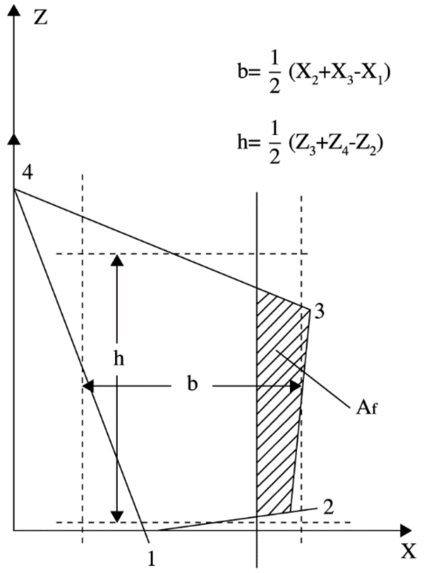


Fig. II 24-3
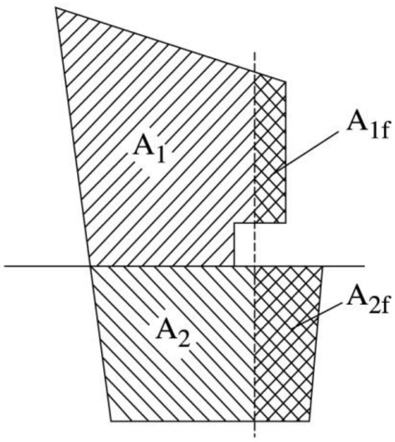
Rudder Blade without Cutout



A_1 and A_2 include A_{1f} and A_{2f} respectively

Fig. II 24-4
Rudder Blade with Cutout

24.2.3 Rudder strength calculation

(a) The rudder strength is to be sufficient against the rudder force and rudder torque as given in 24.2.1 and 24.2.2 above. When the scantling of each part of a rudder is determined, the following moments and forces are to be considered:

For rudder body: bending moment and shear force

For rudder stock: bending moment and torque

For pintle bearing and rudder stock bearing: supporting force

For rudder horn and heel piece: bending moment shear force and torques.

(b) The bending moments, shear forces and supporting forces to be considered are to be determined by a direct calculation or by an approximate simplified method as deemed appropriate by the Society. For rudder supported by shoe pieces or rudder horns, these structures are to be included in the calculation model in order to account for the elastic support of the rudder body.

24.2.4 Rudder blades with twisted leading-edge

(a) This kind of rudder has the leading edge twisted horizontally on the top and bottom of the section that is an extension of the center of the propeller shaft. For the purpose of calculating design force, twisted rudders may be distinguished in four categories:

Category	Description
1	The projected leading edge of twisted upper and lower blades not lineup to each other
2	The projected leading edge of twisted upper and lower blades form a straight line
3	Rudder with twisted leading edge combined with tail edge flap or fins
4	The twisted leading edge has a smooth continuous wavy contour (no deflector) or the rudder has multiple section profile types

Design force for rudder with twisted leading edge is obtained according to the following criteria:

(i) For Category 1 rudders as indicated in the above table, design force over upper and lower rudder blades are obtained from the following equations respectively:

$F_1 = 132\, K_1\, K_2\, K_3\, A_1 V^2$ N
$F_2 = 132\, K_1\, K_2\, K_3\, A_2 V^2$ N
$F = F_1 + F_2$ N

(ii) For Categories 2, 3, and 4, rudder design force indicated in 24.2.1(a) is applicable, that is:

$F = 132\, K_1\, K_2\, K_3\, AV^2$ N

where:

K_1, K_2, K_3, A, and V are as defined in 24.2.1(a), (for rudder has multiple section profile types, A is the whole projected areas).

A_1 and A_2 are the projected areas of upper and lower blades separated at the deflector cross section, respectively. Where the effective projected area of rudder bulb (if present) forward of rudder leading edge is significant and needs to be counted, the proportioned bulb effective areas are added to A_1 and A_2 accordingly.

Values of K_2 for ahead and astern conditions are determined from one of the methods below as applicable, if the type of basic rudder profile is not provided:

(i) K_2 is taken from Table II 24-1 of this Chapter for twisted rudders of Categories 1 & 2;

(ii) K_2 is taken from Table II 24-1 of this Chapter for twisted rudders of Category 3;

(iii) K_2 is subjected to special considerations for twisted rudders of Category 4;

(iv) Shipyard/rudder manufacturers' submitted K_2 obtained from testing data or calculations may be accepted subject to the Society's review of all the supporting documents;

(2) The rudder design torque, Q, for rudder scantling calculations, is to be in accordance with 24.2.1(a)or 24.2.2(b) of this Chapter as applicable.

24.3 Rudder Stock

24.3.1 The rudder stock diameter required for the transmission of the rudder torque is to be dimensioned such that the torsional stress will is not exceeding the following value:

$\tau_T = 68/K$ N/mm^2

The rudder stock diameter for the transmission of the rudder torque is therefore not to be less than:

$$d_t = 4.2\sqrt[3]{QK} \quad \text{mm}$$

where:

d_t	=	Rudder stock diameter for the transmission of the rudder torque in mm.
K	=	Material factor as specified in 1.5.2 (c) of this part.
Q	=	As specified in 24.2.1(b) and/or 24.2.2 above.

24.3.2 Rudder stock scantlings due to combined loads

If the rudder stock is subjected to combined torque and bending, the equivalent stress in the rudder stock is not to exceed 118/K, N/mm^2.

The equivalent stress is to be determined by the formula:

$$\sigma_c = \sqrt{\sigma_b^2 + 3\tau_t^2} \quad \text{N/mm}^2$$

Bending stress:

$$\sigma_b = 10.2 \times 10^3 M / d_c^3 \quad \text{N/mm}^2$$

Torsional stress:

$$\tau_t = 5.1 \times 10^3 Q / d_c^3 \quad \text{N/mm}^2$$

The stock diameter is therefore not to be less than:

$$d_c = d_t \sqrt[6]{1 + \frac{4}{3}(\frac{M}{Q})^2} \quad \text{mm}$$

where:

d_t	=	Rudder stock diameter for the transmission of the rudder torque, in mm, as given in 24.3.1 above.
M	=	Bending moment, at the section of the rudder stock considered, in N-m.
Q	=	As specified in 24.2.1(b) above.

24.3.3 Increase in Diameter of Rudder Stocks for Special Cases

(a) In ships which may be frequently steered at a large helm angle when sailing at their maximum speed, such as fishing vessels, the diameters of rudder stocks and pintles, as well as the section modulus of mainpieces, are not to be less than 1.1 times those required in this Chapter.

(b) In ships which might require quick steering, the diameter of rudder stocks is to be properly increased beyond the requirements in this Chapter.

24.3.4 Before significant reductions in rudder stock diameter due to the application of steels with yield stresses exceeding 235 N/mm^2 are granted, the Society may require the evaluation of the rudder stock deformations. Large deformations of the rudder stock are to be avoided in order to avoid excessive edge pressures in way of bearings.

24.4 Rudder Plates, Rudder Webs and Rudder Main Pieces

24.4.1 Permissible stresses

The section modulus and the web area of a horizontal section of the rudder blade made of ordinary hull structural steel are to be such that the following stresses will not be exceeded:

(a) Rudder blades without cut-outs (Fig. II 24-3 of this Chapter)

(i)	bending stress: σ_b	110/K	N/mm^2
(ii)	shear stress: τ	50/K	N/mm^2
(iii)	equivalent stress: $\sigma_c = \sqrt{\sigma_b^2 + 3\tau^2}$	120/K	N/mm^2

K = Material factor for the rudder plating as given in 1.5.2(a) of this Chapter

(b) Rudder blades with cut-outs (e.g. semi-spade rudders. Fig. II 24-4 of this Chapter)

(i)	bending stress: σ_b	75	N/mm^2
(ii)	shear stress in way of cut-outs: τ	50	N/mm^2
(iii)	equivalent stress: $\sigma_c = \sqrt{\sigma_b^2 + 3\tau^2}$	100	N/mm^2

Note: The stresses in (b) apply equally to high tensile and ordinary steels.

24.4.2 The thickness of the rudder side, top and bottom plating made of ordinary hull structural steel is not to be less than the value obtained from the following formula:

$$t = 5.5\, s\beta\sqrt{K}\sqrt{d_f + F \times 10^{-4}/A} + 2.5 \quad \text{mm}$$

where:

d_f	=	Summer loadline draught of the ship, in m.
F	=	Rudder force, in N.
A	=	Rudder area, in m^2.
β	=	$\sqrt{1.1 - 0.5\left(\frac{s}{b}\right)^2}$, max. 1.00 for $\frac{b}{s} \geq 2.5$
s	=	Smallest unsupported width of plating, in m.
b	=	Greatest unsupported width of plating, in m.
K	=	Material factor for the rudder plating as given in 1.5.2(a) of this Part.

24.4.3 The plating is to be suitably stiffened by vertical and horizontal webs. The thickness of web plates is not to be less than 70% of the rudder side plating, however, not less than 8 mm. For higher tensile steels the material factor according to 1.5.2(c) of this Part is to be used.

24.4.4 Mainpiece

(a) The thickness of the plating of the rudder with plate frames may require to be increased in way of vertical webs which replace the mainpiece.

(b) Horizontal webs and vertical webs not replacing the mainpiece are to have the same thickness as the rudder plating, but plates forming the top and the bottom of the rudder are to be of increased thickness.

(c) Vertical webs replacing the mainpiece may be required to be increased in thickness.

(d) The spacing of vertical webs are generally not to be larger than 1.5 times the horizontal web spacing.

24.4.5 Single plate rudder

(a) The mainpiece diameter is to be calculated according to 24.3.1 and 24.3.2 of this Chapter respectively. For spade rudders the lower third may taper down to 0.75 times stock diameter.

(b) The blade thickness, t_b, is not to be less than the value obtained from the following formula:

$t_b = 1.5sV\sqrt{K} + 2.5$ mm

where:

s	=	Spacing of stiffening arms, in m, not to exceed 1 m.
V	=	Speed, in knots, as specified in 24.2.1(a) of this Chapter.
K	=	Material factor for the rudder plating as given in 1.5.2(a) of this Part.

(c) The thickness of the arms, t_a, is not to be less than the blade thickness, t_b:

$t_a \geq t_b$

(d) The section modulus, Z, of each set of arms about the axis of the rudder stock is not to be less than the value obtained from the following formula:

$Z = 0.5\ s\ x^2\ V^2 K$ cm^3

where

s	=	Spacing of stiffening arms, in m, not to exceed 1 m.
V	=	Speed, in knots, as specified in 24.2.1(a) of this Chapter.
x	=	Horizontal distance from the aft edge of the rudder to the centerline of the rudder stock, in m.
K	=	Material factor as given in 1.5.2(a) or 1.5.2(c) of this Part respectively

24.4.6 Rudder Frame

(a) The rudder body is to be stiffened by horizontal and vertical rudder frames enabling it to withstand bending like a girder.

(b) The standard spacing of horizontal rudder frames is to be obtained from the following formula:

$0.2(L/100) + 0.4$ m

(c) The standard distance from the vertical rudder frame forming the rudder main piece to the adjacent vertical frame is to be 1.5 times the spacing of horizontal rudder frames.

(d) The thickness of rudder frames is not to be less than 8 mm or 70% of the thickness of the rudder plates as given in 24.4.2 of this Chapter, whichever is greater.

24.4.7 Connections of rudder blade structure with solid parts

(a) Solid parts in forged or cast steel, which house the rudder stock or the pintle, are normally to be provided with protrusions.

These protrusions are not required when the web plate thickness is less than:

- 10 mm for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders.
- 20 mm for other web plates.

(b) The solid parts are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates.

(c) Minimum section modulus of the connection with the rudder stock housing.

The section modulus of the cross-section of the structure of the rudder blade, in cm^3, formed by vertical web plates and rudder plating, which is connected with the solid part where the rudder stock is housed is to be not less than:

$$W_s = C_s d_c^3 \left[\frac{H_E - H_x}{H_E}\right] \frac{K}{K_s} 10^{-4} \qquad cm^3$$

where:

C_s = Coefficient, to be taken equal to:

1.0: if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate

1.5: if there is an opening in the considered cross-section of the rudder

d_c = Rudder stock diameter, in [mm], according to 24.3.2 of this Chapter

H_E = Vertical distance between the lower edge of the rudder blade and the upper edge of the solid part, in m

H_x = Vertical distance between the considered cross-section and the upper edge of the solid part, in m

K = Material factor for the rudder blade plating as given in 1.5.2(a) of this Part

K_s = Material factor for the rudder stock as given in 1.5.2(c) of this Part

The actual section modulus of the cross-section of the structure of the rudder blade is to be calculated with respect to the symmetrical axis of the rudder. The breadth of the rudder plating, in m, to be considered for the calculation of section modulus is to be not greater than:

$b = s_v + 2H_x / 3$ m

where:

s_v = Spacing between the two vertical webs, in m (see Fig. II 24-5 of this Chapter)

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are to be deducted.

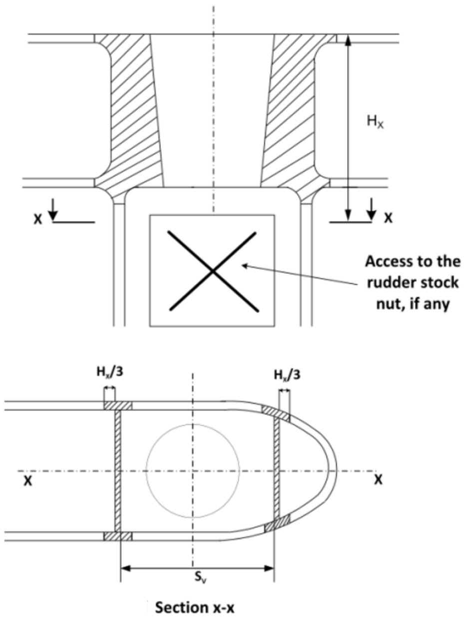


Fig. II 24-5
Cross-section of the Connection Between Rudder Blade Structure and Rudder Stock Housing

(d) The thickness of the horizontal web plates connected to the solid parts, in mm, as well as that of the rudder blade plating between these webs, is to be not less than the greater of the following values:

$t_H = 1.2\ t$ mm
$t_H = 0.045 d_s^2 / s_H$ mm

where:

t = Defined in 24.4.2 of this Chapter

d_s = Diameter, in mm, to be taken equal to:

d_c , as per 24.3.2 of this Chapter, for the solid part housing the rudder stock

d_p , as per 24.6.1 of this Chapter, for the solid part housing the pintle

s_H = Spacing between the two horizontal web plates, in mm

The increased thickness of the horizontal webs is to extend fore and aft of the solid part at least to the next vertical web.

(e) The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating under this solid part is to be not less than the values obtained, in mm, from Table II 24-2 of this Chapter.

Table II 24-2
Thickness of Side Plating and Vertical Web Plates

Type of rudder	Thickness of vertical web plates (mm)		Thickness of rudder plating (mm)	
	Rudder blade without opening	Rudder blade with opening	Rudder blade without opening	Area with opening
Rudder supported by sole piece	1.2t	1.6t	1.2t	1.4t
Semi-spade and spade rudders	1.4t	2.0t	1.3t	1.6t
t = thickness of the rudder plating, in mm, as defined in 24.4.2.				

The increased thickness is to extend below the solid piece at least to the next horizontal web.

24.5 Rudder Stock Couplings

24.5.1 Horizontal flange couplings

(a) Coupling bolts are to be reamer bolts. The diameter of the coupling bolts is not to be less than the value obtained from the following formula:

$$d_b = 0.62\sqrt{\frac{d^3 K_b}{neK_s}} \quad \text{mm}$$

where:

d = Stock diameter, in mm, the greater of the d_u or d_l as specified in 24.3.1 and 24.3.2 of this chapter.

n = Total number of reamer bolts, to be greater or equal to 6.

e = Mean distance of the bolt axes from the center of the bolt system, in mm.

K_b = Material factor for the bolt as specified in 1.5.2(c) of this Part.

K_s = Material factor for the stock as specified in 1.5.2(c) of this Part.

(b) The thickness of the coupling flanges is not to be less than the value obtained from the following formula:

$$t_f = d_b\sqrt{\frac{K_f}{K_b}} \quad \text{mm}$$

where:

t_f	=	Thickness of coupling flanges, in mm. $\geq 0.9\ d_b$
d_b	=	Bolt diameter, in mm, for a number of bolts not exceeding 8.
K_b	=	Material factor for the bolt as specified in 1.5.2(c) of this Part.
K_f	=	Material factor for the flange as specified in 1.5.2(c) of this Part.

(c) The width of material outside the bolt holes is not to be less than 0.67 d_b.

(d) The welded joint between the rudder stock and the flange is to be made in accordance with Fig. II 24-6 of this Chapter or equivalent.

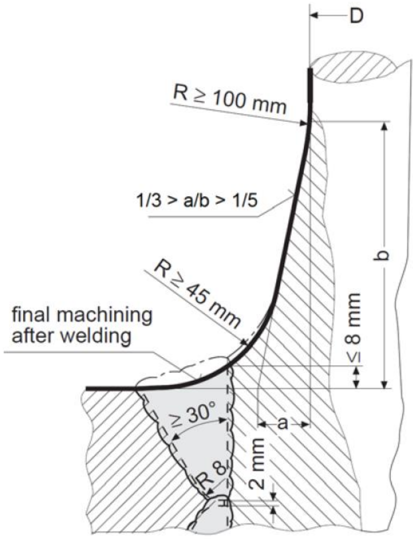

Fig. II 24-6
Welded Joint Between Rudder Stock and Coupling Flange

(e) Coupling bolts are to be fitted bolts and their nuts are to be locked effectively.

24.5.2 Cone couplings with key

(a) Cone couplings without hydraulic arrangements for mounting and dismounting the coupling should have a taper c on diameter of 1:8 - 1:12, where:

$c = (d_o - d_u) / l$ (see Fig. II 24-7 of this Chapter)

The cone coupling is to be secured by a slugging nut. The nut is to be secured, e.g. by a securing plate.

(b) The taper length, *l*, of rudder stocks fitted into the rudder blade and secured by a slugging nut is generally not be less than 1.5 times the rudder stock diameter, d_o, at the top of the rudder.

(c) For couplings between stock and rudder a suitable key is to be provided.

(d) The dimensions of the slugging nut are to be as follows:

External thread diameter:	$d_g \geq 0.65\ d_o$
Height	$h_n \geq 0.6\ d_g$
Outer diameter of nut:	$d_n \geq 1.2\ d_u$ or $1.5\ d_g$ whichever is greater.

(e) Cone couplings with hydraulic arrangements for mounting and dismounting the coupling are to have a taper on diameter of 1:12 to 1:20.

(f) The data of the push-up oil pressure and the push-up length based on a calculation is to be submitted by the shipyard.

(g) The nuts fixing the rudder stocks are to be provided with efficient locking devices.

(h) Couplings of rudder stocks are to be properly protected from corrosion.

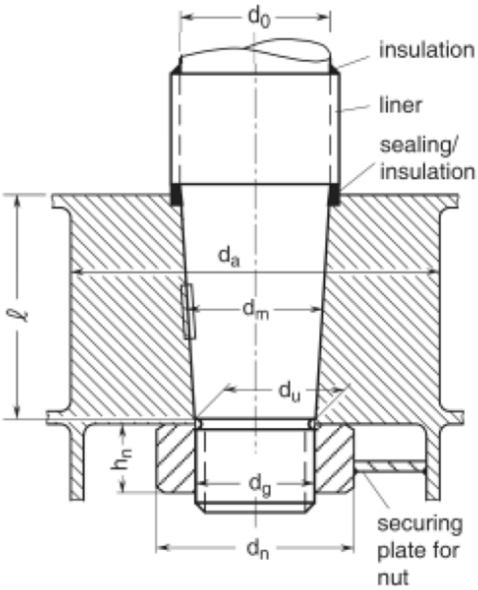

Fig. II 24-7
Cone Coupling with Key

(i) Dimensions of key

For couplings between stock and rudder a key is to be provided, the shear area of which, in cm^2 , is not to be less than:

$$a_s = \frac{17.55 Q_F}{d_k \sigma_{F1}}$$

where:

Q_F	=	design yield moment of rudder stock, in N·m
	=	$0.02664 \cdot d_t^3 / K$

Where the actual diameter d_{ta} is greater than the calculated diameter d_t , the diameter d_{ta} is to be used. However, d_{ta} applied to the above formula need not be taken greater than 1.145 d_t.

d_t	=	stock diameter, in mm, according to 24.3.1 of this Chapter
K	=	material factor for stock as given in 1.5.2(c) of this Part.
d_k	=	mean diameter of the conical part of the rudder stock, in mm, at the key
σ_{F1}	=	minimum yield stress of the key material, in N/mm^2

The effective surface area, in cm^2, of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_k = \frac{5 Q_F}{d_k \sigma_{F2}}$$

where:

σ_{F2}	=	minimum yield stress of the key, stock or coupling material, in N/mm^2, whichever is less.

24.5.3 Vertical flange couplings

(a) Coupling bolts are to be reamer bolts and their diameters are not to be less than the value obtained from the following formula:

$$d_b = 0.81d\sqrt{\frac{K_b}{nK_s}} \quad \text{mm}$$

where:

d	=	Stock diameter, in mm, as specified in 24.5.1 (a) of this Chapter.
n	=	Total number of bolts, which is not to be less than 8.
K_b	=	Material factor for the bolt as specified in 1.5.2 (c) of this Part.
K_s	=	Material factor for the stock as specified in 1.5.2 (c) of this Part.

(b) The first moment of area of the bolts about the center of the coupling, M, is to be not less than the value obtained from the following formula:

$$M = 0.00043\, d^3 \quad \text{cm}^3$$

(c) The thickness of the coupling flanges must be at least equal to the bolt diameter, and the width of the flange material outside the bolt holes is not to be less than 0.67 d_b.

(d) Coupling bolts are to be fitted bolts and their nuts are to be locked effectively.

24.5.4 Cone couplings with special arrangements for mounting and dismounting the couplings

(a) Where the stock diameter exceeds 200 mm, the press fit is recommended to be effected by a hydraulic pressure connection. In such cases the cone is to be more slender, c ≈1:12 to ≈1:20.

In case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle.

For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up pressure and the push-up length are to be determined according to 24.5.4(b) and 24.5.4(c) of this Chapter respectively.

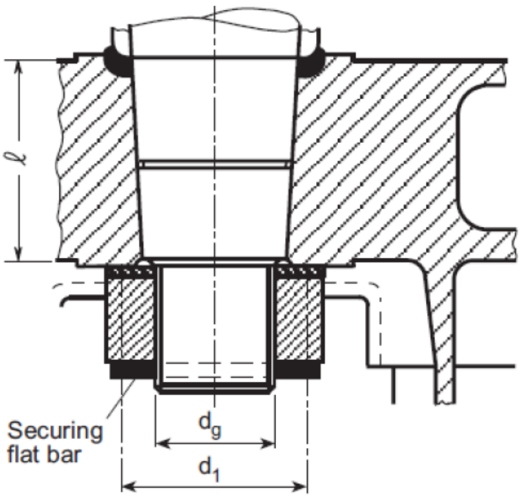

Fig. II 24-8
Cone Coupling without Key

(b) Push-up pressure

The push-up pressure, is not to be less than the greater of the two following values:

$$p_{req1} = \frac{2Q_F}{d_m^2 l \pi \mu_0} 10^3 \quad \text{N/mm}^2$$

$$p_{req2} = \frac{6M_b}{l^2 d_m} 10^3 \qquad N/mm^2$$

where:

Q_F	=	design yield moment of rudder stock, as defined in 24.5.2(i) of this Chapter, in Nm
d_m	=	mean cone diameter in mm, see Fig. II 24-7 of this Chapter
l	=	cone length in mm
μ_0	=	frictional coefficient, equal to 0.15
M_b	=	bending moment in the cone coupling (e.g. in case of spade rudders), in Nm

It has to be proved by the designer that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure, in N/mm², is to be determined by the following formula:

$$p_{perm} = \frac{0.8R_{eH}(1 - a^2)}{\sqrt{3 + a^4}} \qquad N/mm^2$$

where:

R_{eH}	=	minimum yield stress of the material of the gudgeon in N/mm^2
a	=	d_m / d_a
d_m	=	diameter, in mm, see Fig. II 24-7 of this Chapter
d_a	=	outer diameter of the gudgeon to be not less than 1.5 d_m, see Fig. II 24-7 of this Chapter

(c) Push-up length

The push-up length Δl, in mm, Δl is to comply with the following formula:

$$\Delta l_1 \le \Delta l \le \Delta l_2$$

where:

$$\Delta l_1 = \frac{p_{req} d_m}{E\left(\frac{1 - a^2}{2}\right) c} + \frac{0.8 R_{tm}}{c} \qquad mm$$

$$\Delta l_2 = \frac{1.6 R_{eH} d_m}{E c \sqrt{3 + a^4}} + \frac{0.8 R_{tm}}{c} \qquad mm$$

R_{tm}	=	mean roughness, in mm taken equal to 0.01
c	=	taper on diameter according to 24.5.4(a) of this Chapter
E	=	Young's modulus of the material of the gudgeon, in N/mm^2 (kgf/mm^2)

d_m, R_{eH}, a, p_{req} = As specified in 24.5.4(b) above.

Notwithstanding the above, the push up length is not to be less than 2 mm.

Note: In case of hydraulic pressure connections the required push-up force P_e, in N, for the cone may be determined by the following formula:

$$P_e = p_{req} d_m \pi l \left(\frac{c}{2} + 0.02\right)$$

The value 0.02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed. Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by the Society.

24.6 Pintles

24.6.1 The minimum pintle diameter is to be as follows:

$$d_p = 0.35\sqrt{BK_p} \qquad \text{mm}$$

where:
B = The reaction force in bearing, in N.
K_p = Material factor for the pintle as specified in 1.5.2(c) of this Part.

24.6.2 Pintles are to have a conical attachment to the cast part of rudder with a taper on diameter of:

1:8 to 1:12 for keyed and other manually assembled pintles applying locking by slugging nut.
1:12 to 1:20 for pintles mounted with oil injection and hydraulic nut.

24.6.3 The length of the taper is not to be less than the minimum pintle diameter d_p in 24.6.1 above.

24.6.4 The minimum dimensions of threads and nuts are to be determined according to 24.5.2(d) of this Chapter.

24.6.5 Push-up pressure for pintle bearings
The required push-up pressure p_{req} for pintle bearings, in N/mm², is to be determined by the following formula:

$$p_{req} = 0.4\frac{B_1 d_0}{d_m^2\, l}$$

where:
B_1 = Supporting force in the pintle bearing, in N
d_0 = Pintle diameter, in mm, see Fig. II 24-7 of this Chapter

The push up length is to be calculated similarly as in 24.5.4(c) of this Chapter, using required push-up pressure and properties for the pintle bearing.

24.7 Rudder Stock Bearings, Rudder Shaft Bearing and Pintle Bearings

24.7.1 Bearing surface

(a) The bearing surface, A_b, defined as the projected area: length x outside diameter of sleeve, is not to be less than the value obtained from the following formula:

$$A_b = \frac{B}{q_a} \qquad \text{mm}^2$$

where:
B = Reaction force, in N as specified in 24.6 above.
q_a = Allowable surface pressure as listed in Table II 24-3 of this Chapter.

(b) An adequate lubrication is to be ensured.

24.7.2 The length/diameter ratio of the bearing surface is not to be less than 1.0 or greater than 1.2, unless calculations are submitted and approved which show the clearance at both ends of the bearing is acceptable.

24.7.3 Metal bearings clearances are not to be less than $\frac{d_{bs}}{1000} + 1.0$ mm on the diameter. Where d_{bs}: Inter diameter of bush, in mm. If nonmetallic bearing material is applied, the bearing clearance is to be specially determined considering the materials swelling and thermal expansion properties. This clearance is not to be taken less than 1.5 mm on bearing diameter unless a smaller clearance is supported by the manufacturer’s recommendation and there is documented evidence of satisfactory service history with a reduced clearance.

24.7.4 Liners and bushes

(a) Rudder stock bearing

Liners and bushes are to be fitted in way of bearings. The minimum thickness of liners and bushes is to be equal to:

t_{min} = 8 mm for metallic materials and synthetic material
t_{min} = 22 mm for lignum material

(b) Pintle bearing

The thickness of any liner or bush, in mm, is neither to be less than:

$$t = 0.01\sqrt{B}$$

where:
B = Relevant bearing force, in N

nor than the minimum thickness defined in 24.7.4(a) of this Chapter.

Table II 24-3
Allowable Surface Pressure, q_a

Bearing material	q_a (N/mm^2)
Lignum-vitae	2.5
White metal, oil lubricated	4.5
Synthetic material with hardness between 60 and 70 Shore D(1)	5.5(2)
Steel(3) and bronze and hot-pressed bronze-graphite materials	7.0

Notes:
(1) Indentation hardness test at 23°C and 50% moisture, according to a recognized standard. Synthetic bearing materials are to be of an approved type.
(2) Surface pressures exceeding 5.5 N/mm^2 may be accepted in accordance with bearing manufacturer's specification and tests, but in no case more than 10 N/mm^2.
(3) Stainless and wear-resistant steel in an approved combination with stock liner. Higher values than given in the Table may be taken if they are verified by tests.

24.8 Rudder Carriers

Suitable rudder carriers are to be provided according to the form and the weight of the rudder, and care is to be taken to provide efficient lubrication at the support.

24.9 Prevention of Jumping

A suitable arrangement is to be provided to prevent the rudder from jumping due to wave shocks.

24.10 Rudder Trunk

24.10.1 Materials, welding and connection to hull

This requirement applies to both trunk configurations (extending or not below stern frame).

The steel used for the rudder trunk is to be of weldable quality, with a carbon content not exceeding 0.23% on ladle analysis and a carbon equivalent C_{EQ} not exceeding 0.41.

Plating materials for rudder trunks are in general not to be of lower grades than corresponding to class II as defined in 1.5 of this Part.

The weld at the connection between the rudder trunk and the shell or the bottom of the skeg is to be full penetration.

The fillet shoulder radius r, in mm (see Fig. II 24-9 of this Chapter) is to be as large as practicable and to comply with the following formulae:

r = 60	mm	when $\sigma \geq 40 / K$	N/mm^2
r = 0.1 d_l without being less than 30	mm	when $\sigma < 40 / K$	N/mm^2

where:

d_c = Rudder stock diameter axis defined in 24.3.2 of this Chapter.

σ = Bending stress in the rudder trunk in N/mm^2.

K = Material factor as given in 1.5.2(a) or 1.5.2(c) of this Chapter respectively.

The radius may be obtained by grinding. If disk grinding is carried out, score marks are to be avoided in the direction of the weld. The radius is to be checked with a template for accuracy. Four profiles at least are to be checked. A report is to be submitted to the Surveyor.

Rudder trunks comprising of materials other than steel are to be specially considered by the Society.

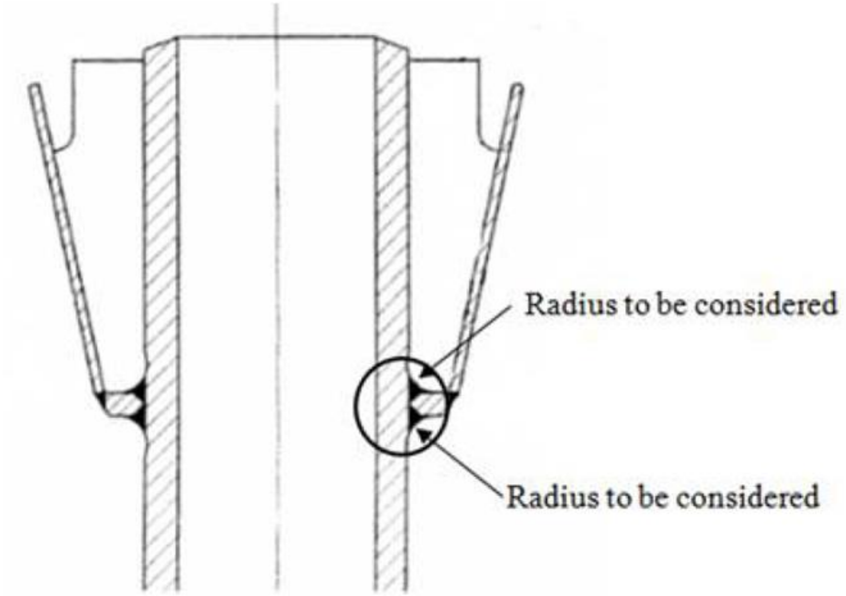

Fig. II 24-9
Fillet Shoulder Radius

24.10.2 Scantlings

Where the rudder stock is arranged in a trunk in such a way that the trunk is stressed by forces due to rudder action, the scantlings of the trunk are to be such that:

- the equivalent stress due to bending and shear does not exceed 0.35 σ_F ,
- the bending stress on welded rudder trunk is to be in compliance with the following formula:

$$\sigma \leq \frac{80}{K} \quad \text{N/mm}^2$$

with:

σ = Bending stress in the rudder trunk, as defined in 24.10.1 of this Chapter

K = Material factor as given in 1.5.2(a) or 1.5.2(c) of this Chapter respectively, , not to be taken less than 0.7

σ_F = Yield stress (N/mm^2) of material used

For calculation of bending stress, the span to be considered is the distance between the mid-height of the lower rudder stock bearing and the point where the trunk is clamped into the shell or the bottom of the skeg.

24.11 Guidelines for Calculating of Bending Moment and Shear Force Distribution

The evaluation of bending moments, shear forces and support forces for the system rudder–rudder stock may be carried out for some basic rudder types as outlined in IACS UR S10 Annex "Guidelines for calculation of bending moment and shear force distribution". Moments and forces on rudders of different types or shapes than those shown are to be calculated using alternative methods and will be considered based on submitted documents and calculations supporting the review.

Chapter 25

Equipment

25.1 General

25.1.1 All ships are to be provided with a complete equipment of the anchor, the chain, the towline and the mooring rope in accordance with the following requirements. The letter **E** will be placed after the symbol of classification of hull in the Register Book as **CR100 ✠ E**.

25.1.2 In the case of ships classed for a special or restricted service, if approved by the Society that requirements of the Rules are not necessary to apply, no equipment symbol is to be affixed.

25.1.3 The number and mass of anchors and the length and the size of the chain, the towline, and the mooring rope for a classed ship are to be determined from Table II 25-1. For ships having equipment numbers not more than 50 or more than 16,000, the number and mass of anchors, chain cables and mooring lines are to be determined by the Society.

25.1.4 Where 3 anchors are given in Table II 25-1, the third anchor is included as a spare bower anchor and is listed for guidance only, and is not required as a condition of classification.

25.1.5 The anchor, the chain, and the steel wire rope are to be tested and inspected in the presence of the Surveyor to the Society in accordance with the requirements of Part XI.

25.2 Equipment Number

25.2.1 The equipment given in Table II 25-1 is based on the "Equipment Number", EN, which is to be calculated as follows:

$$EN = \Delta^{\frac{2}{3}} + 2BH + 0.1A$$

Where:

Δ	=	Molded displacement to the summer load waterline, in ton.
B	=	Breadth of ship, in m, as specified in 1.2.2.
H	=	a + Σh, in m.
a	=	Vertical distance amidships from the summer load line to the top of uppermost continuous deck beam at side, in m.
Σh	=	Sum of the heights, in m, at centerline of superstructure and each tier of deck-houses having a breadth greater than 0.25B.
A	=	Sum of the profile area, in m^2, of the hull above summer load waterline, superstructures and deckhouses having a breadth greater than 0.25B, which are within the length of ship L.

(a) In calculation of H, sheer, camber and trim may be neglected. Where a deckhouse having a breadth greater than 0.25B is located above a deckhouse with a breadth of 0.25B or less, the wide deckhouse is to be included, but the narrow deckhouse ignored.

(b) Screens and bulwarks more than 1.5 m in height are to be regarded as parts of superstructure or deckhouse when calculating H and A. Where a screen or bulwark is of varying height, the portion exceeding 1.5 m in height is to be included.

25.2.2 Equipment for tug

For tugs, the term 2BH specified in 25.2.1 for calculating "Equipment Number", EN, is to be substituted by the following formula:

$$2\,(a\,B + \Sigma\,h\,b)$$

Where:

a	=	As specified 25.2.1 of this Chapter.
B	=	As specified 25.2.1 of this Chapter.
h	=	As specified 25.2.1 of this Chapter.
b	=	The breadth, in m, of the superstructure or deckhouse of each tier having a breadth greater than 0.25B.

25.2.3 For dredgers of unrestricted service having normal ship shape of underwater part of the hull, bucket ladders and gallows are not to be included in calculating for the "Equipment Number".

25.2.4 Equipment for Offshore Service Units

The requirements herein are intended for temporary mooring of a unit within a harbor or other areas of sheltered water. The "Equipment Number" equation is based on 2.5 m/s current, 25 m/s wind and a scope of 6 through 10, the scope being the ratio of length of chain paid out to the water depth. Anchors and chains are to be in accordance with Table II 25-1 and the numbers, mass and sizes of these are to be regulated by the equipment number (EN) obtained from the following equation:

$$\mathrm{Equipment\ Number} = hk\left(\frac{\Delta}{h}\right)^{\frac{2}{3}} + m\sum qC_sC_hA_f + n\sum qC_sC_hA_p$$

where

k	=	1.0
m	=	2
n	=	0.1
h	=	Number of hulls or pontoons of the unit
Δ	=	Molded displacement of the unit in metric tons, excluding appendages, taken at the transit draft
$\sum qC_sC_hA_f$	=	Total frontal area exposed to the wind in m^2 at the transit draft
q	=	1.0 for hull, superstructure and deckhouses
	=	0.3 for other wind areas
C_s	=	Shape coefficient, as shown in Table III 13-1 of Part III of the Rules
C_h	=	Height coefficient as shown in Table III 13-2 of Part III of the Rules
A_f	=	Frontal projected area of each major element exposed to the wind, in m^2, including columns, upper structure, deck members, superstructures and deck houses, trusses, large cranes, derrick substructure and drilling derrick as well as the portion of the hull above the transit waterline, as applicable to the type of unit. Wind shielding in accordance with acceptable methods may be considered.
$\sum qC_sC_hA_p$	=	Total profile area exposed to the wind in m^2 at the transit draft
A_p	=	Profile area of each major element exposed to the wind, in m^2, including columns, upper structure, deck members, superstructure and deck houses, trusses, large cranes, derrick substructure and drilling derrick as well as the portion of the hull above the transit waterline, as applicable to the type of unit. Wind shielding in accordance with acceptable methods may be considered.

In calculating the wind areas, the following conditions are to be considered:

(a) Tiers of superstructures or deck houses having a breadth at any point no greater than 0.25B, where B is the molded breadth of the unit, may be excluded, provided that their projected area is less than 1/100 of the total projected area of the unit.

(b) Screens and bulwarks more than 1.5 m in height are to be included.

(c) In the case of units with columns, the projected areas of all columns are to be included (i.e. no shielding allowance is to be taken). However, a shape coefficient of 0.5 may be used for the column's cylindrical surfaces.

(d) The block projected area of a clustering of deck houses may be used in lieu of calculating each individual area. In this case, the shape coefficient is to be taken as 1.1.

(e) Large isolated structures such as cranes and derricks are to be calculated individually using the appropriate shape coefficients from Table III 13-1 of Part III of the Rules.

(f) Small isolated structures with a projected area less than 1/100 of the total projected area of the unit may be excluded.

(g) Open truss work commonly used for derrick towers, booms and certain types of masts may be approximated by taking 30% of the projected block areas of both the front and back sides (i.e., 60% of the projected block area of one side for double sided truss work). The shape coefficient is to be taken in accordance with Table III 13-1 of Part III of the Rules.

Note: Lateral wind areas (larger side) of open truss work in dual derrick towers may be approximated by taking 25% of the projected block areas of both the front and back sides. In all open truss derrick towers, the wind areas in the V-door levels may be approximated by taking 20% of the projected block areas of both the front and back sides.

Alternatively, the effective wind areas may be calculated by using the results of wind tunnel tests or recognized computational fluid dynamics (CFD) software with a representative model of the unit or designated item, including all the elements that can contribute to the wind resistance, and subjected to the wind conditions equivalent to 25 m/s or over. Documentation and calculations demonstrating the effective wind areas by the alternative methodology are to be submitted for review.

Note: When the effective wind areas are obtained from the results of wind tests or CFD analysis and the percentage of wind area related to hull, superstructures and deckhouses cannot be estimated, a value not less than 75% (frontal) and 50% (profile) of the resulting effective wind areas may be used in the equipment numeral equation in lieu of the total frontal area and the total profile area, respectively.

For mobile offshore units where the temporary mooring system is arranged to face the wind in a direction other than the bow of the unit, special consideration will be made to adapt the calculation of the Equipment Number and the required anchors and chains to the specific mooring conditions.

Units with **DPS-II** or **DPS-III** notation intended for deep water operations may be provided with a single bower anchor installed onboard and half of the chain cable length given in Table II 25-1. When a unit with single bower anchor arrangement is anchored for periods longer than 21 days, additional means of anchoring or external assistance such as a stand-by towing vessel will need to be provided and instructions in this regard are to be included in the Operating Manual.

Means are to be provided for stopping each cable as it is paid out, and the windlass should be capable of heaving in either cable.

The length of chain cable required by Table II 25-1 can be equally distributed between the two bower anchors connected and ready for use. Where the chain is arranged so that one anchor has a longer length for mooring it is to be verified that the windlass has sufficient capability for heaving in the longer length of chain.

Suitable arrangements are to be provided for securing the anchors and stowing the cables.

25.3 Anchors

25.3.1 Anchors are to be of stocked or stockless type of approved design and to be made in compliance with the requirements given in Chapter 12 of Part XI.

25.3.2 The mass of anchors given in Table II 25-1 is for the stockless type. Where the stocked anchor is used, the mass excluding the stock is to be 80% of the tabular mass for the stockless anchor.

25.3.3 The mass of each bower anchor given in Table II 25-1 is for anchors of equal mass. The mass of individual anchors may be ± 7% of the table mass provided that the total mass of all anchors is not less than that required for anchors of equal mass.

25.3.4 Where a special type of anchor with approved superior holding ability is used, the mass of the anchor less than the Table requirement, up to a maximum of 25% reduction for high holding power anchor and 50% for super high holding power anchors may be approved by the Society. However, supper high holding power anchor mass is not to exceed 1,500kg.

25.3.5 For tugs with service restricted, when approved by the Society, the mass of bower anchor specified in Table II 25-1 may be reduced:

(a) to correspond to that required for equipment number 0.5EN for Protected Waters Service.

(b) to correspond to two Equipment numeral below that required for EN for other service restriction.

25.3.6 For ships with length less than 90 m and with service restricted, mass of one of the two anchors may be reduced to 85% of the mass required in Table II 25-1.

25.4 Anchor Cables

25.4.1 Bower anchor cables are to be stud link chains of Grades E1, E2 or E3 corresponding to the nominal diameter of the chain and equipment number given in Table II 25-1. In the case of superior holding ability anchor, the Grade E1 chain is not to be used.

25.4.2 Stream anchor cables

(a) Stream anchor cables are to be of stud link chains, short link chains or steel wire ropes. When the steel wire rope is used, its construction is not to be less than 72 wires made up into 6 strands.

(b) The breaking strength of stream anchor cables corresponding to the construction and nominal diameter of cables as specified in relation to Chapters of Part XI is not to be less than that given in Table II 25-1.

25.4.3 Chains and steel wire ropes for anchors are to be made in compliance with the requirements given in Chapters 13 and 14 of Part XI respectively.

25.4.4 For tugs with service restricted, when approved by the Society, the diameter of chain cable required in Table II 25-1 may be reduced:

(a) to correspond to that required for equipment number 0.5EN for Protected Waters Service.

(b) to correspond to two Equipment numeral below that required for EN for other service restriction.

25.4.5 For tugs with service restriction of Protected Waters Service, the length of chain cable may be reduced to 50% of the requirement for equipment number 0.5EN in Table II 25-1.

25.5 Towlines and Mooring Ropes

25.5.1 Material

(a) Towlines and mooring ropes may be of steel wires, natural fibre or synthetic fibre ropes. The breaking strength of the towline and the mooring rope is given in Table II 25-1.

(b) Irrespective of the breaking strength, the diameter of the fibre rope is not to be less than 20 mm.

(c) Where it is proposed to use the synthetic fibre rope, the size and construction are to be specially considered.

25.5.2 The length of the individual mooring rope may be reduced by 7% of the Table length, provided that the total length of the mooring rope is not less than that obtained from the Table.

25.5.3 Towlines are not be required as a condition of classification. The towlines listed in Table II 25-1 are intended as a guide.

25.5.4 Steel wire ropes used for the towline or mooring rope are to be of a flexible construction. Where wire ropes in construction of 6×12 and 6×24 are used, the diameter of the rope is not to be more than 25 mm and 33 mm respectively, however, the construction of 6×30 and 6×37, any diameter is permitted.

25.5.5 For ships having an A/EN ratio greater than 0.9, the number of mooring ropes given in Table II 25-1 is to be increased by the number given below:

A/EN Ratio	Increase No. of Mooring Rope
1.1 ≥ A/EN > 0.9	1
1.2 ≥ A/EN > 1.1	2
A/EN > 1.2	3

Where:

A = The profile area defined in 25.2 of this Chapter.

EN = Equipment number determined by 25.2 of this Chapter.

25.5.6 It is the responsibility of the owner to replace or make good towlines and mooring ropes as opportunity occurs.

25.6 Arrangements for Working and Stowing of Anchors and Cables

25.6.1 The windlass is to be of substantial construction and sufficient power suitable for the size of the chain and the mass of the anchor and the chain.

25.6.2 The windlass is to be securely bolted to a substantial bed on the deck which is to be reinforced and suitably supported to the Surveyor’s satisfaction.

25.6.3 Care is to be taken to ensure an easy lead of the cable from the windlass to the anchor and the chain locker.

25.6.4 Hawse pipe

(a) The hawse pipe is to be of ample strength and suitable size to house the anchor.

(b) The hawse pipe is to have substantial chafing lips and the easiest possible lead for minimizing the nip on the cable.

(c) The hawse pipe for the stockless anchor is to be provided with ample clearances to satisfy the Surveyor that there is no risk of the anchor jamming in the hawse pipe, when the anchor is shipped and unshipped.

25.6.5 The shell plating and framing in way of the hawse pipe are to be properly strengthened.

25.6.6 The hawse pipe, when in position, is to be thoroughly tested for watertightness by means of a hose in which the water pressure is not to be less than 0.2 MPa.

25.6.7 Chain locker

(a) The chain locker is to be divided into two parts of sufficient capacity for separate stowage of the port and starboard chain cables.

(b) The chain locker is to provide an easy direct lead for the chain cable into the hawse pipe when the total length of the chain cable is stowed.

(c) The chain locker is to have provisions for securing the inboard ends of the cable to the structure.

(d) Chain locker and chain pipe are to be watertight up to the weather deck. Chain pipes through which anchor cables are led are to be provided with closing appliances to minimize water ingress, such as steel plates with cutouts to accommodate chain links or canvas hood with a lashing arrangement that maintains the cover in the secured position.

(e) Where a means of access to chain pipes or cable lockers is located below the weather deck, the access cover and its securing arrangements are to be in accordance with recognized standards or equivalent for watertight manhole covers. Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.

25.7 Emergency Towing Arrangements

25.7.1 Tankers, including oil tankers, chemical tankers and gas carriers, of 20,000 t deadweight and above are to be fitted with an emergency towing arrangement at both ends complying with Maritime Safety Committee Resolution MSC. 35(63) as amended. The forecastle or poop deck in way of strong points is to have a minimum thickness of 15 mm and is to be suitable reinforced to resist horizontal loads.

25.7.2 Emergency towing arrangements approved by the Society are classified into two types, one of which is 1,000 kN type and the other as 2,000 kN type corresponding to deadweight (DWT) of the ship.

(a) 50,000 tons > DWT ≥ 20,000 tons 1,000 kN type

(b) DWT ≥ 50,000 tons 2,000 kN type

25.7.3 Details of the structural arrangements and scantling in way of strong points are to be submitted for approval.

25.8 Emergency Towing Procedures

25.8.1 Ships are to be provided with a ship-specific emergency towing procedure that describes the towing procedure to be used in emergency situation.

25.8.2 The procedure specified in 25.8.1 is to be based on existing arrangements and equipment available on board the ship and is to include the following information:

(a) drawings of fore and aft deck showing possible emergency towing arrangements;

(b) inventory of equipment on board that can be used for emergency towing;

(c) means and methods of communication; and

(d) sample procedures to facilitate the preparation for and conducting of emergency towing operations.

25.9 Towing and Mooring Fittings

25.9.1 General

(a) The requirements in this section apply to shipboard fittings used for normal towing and normal mooring and their supporting hull structures.

(b) Ships are to be adequately provided with towing and mooring fittings.

(c) The scantlings of supporting structures are to be built at least with the gross scantlings obtained by adding the corrosion addition specified in 25.9.2(e) and 25.9.3(e) to the net scantlings obtained by applying the criteria specified in this section.

(d) The scantlings of supporting structures are to be in accordance with the relevant chapters or sections in addition to this section.

25.9.2 Towing Fittings

(a) Arrangement of Towing Fittings

(i) Towing fittings are to be located on longitudinals, beams or girders, which are parts of the deck construction so as to facilitate efficient distribution of the towing load.

(ii) When towing fittings cannot be located as specified in (i), towing fittings are to be arranged on reinforced members.

(b) Design Load

Design load, see Fig. II 25-1, for towing fittings and their supporting structures are to be as specified in (i) to (vi) below:

(i) For normal towing operations (e.g. harbour / manoeuvring), the design load on the line (see Fig. II 25-1) is to be 1.25 times the intended maximum towing load.

(ii) For other types of towing (e.g. escort), the design load on the line is to be the breaking strength of the towing line specified in Table II 25-1 according to the equipment number determined in 25.2 of this Chapter.

(iii) The design load on fittings is to take into account all acting loads.

(iv) The point where the towing force acts on towing fittings is to be taken as the attachment point of the towing line.

(v) The design load on fittings is to take into account the total design load on the line specified in (i) and (ii), but need not exceed twice the design load on the line.

(vi) If the design load on fittings specified in (ii) to (v) is less than the intended towing load stipulated in the construction specifications for the towing fittings and their supporting structures used for towing operations specified in (ii), the design load on fittings is to be not less than the intended towing load.

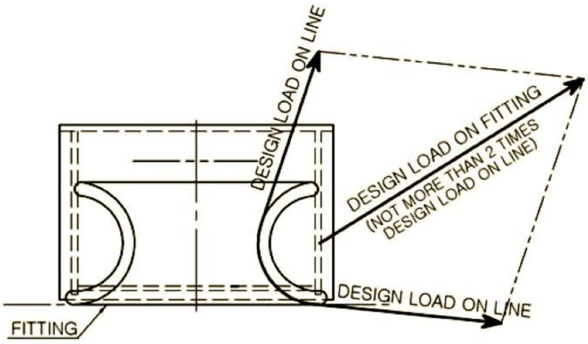

Fig. II 25-1
Design load

(c) Selection of Towing Fittings

Towing fittings are generally to be specified according to standards approved by the Society.

(d) Allowable stresses of supporting structures are not to be more than below:

(i) Normal stress: 100% of the specified yield point for the material used

(ii) Shearing stress: 60% of the specified yield point for the material used

(e) The corrosion addition of supporting structures is not to be less than the following values:

(i) IACS Common Structural Rules, if applicable.

(ii) The value will be considered by the Society, but is not to be less than 2mm

(f) Safe Working Load (SWL)

(i) For towing fittings and their supporting structures used for towing operations specified in (b)(i), the SWL is not to exceed 80% of the design load on fittings specified in (b)(i), (iii), (iv), and (v).

(ii) For towing fittings and their supporting structures used for towing operations specified in (b)(ii), the SWL is not to exceed the design load on fittings specified in (b)(ii) to (vi).

(iii) For towing fittings and their supporting structures used for towing operations specified in both (b)(i) and (b)(ii), the SWL is not to exceed the greater of the design loads.

(iv) The SWL of each fitting is to be marked by weld beads or equivalent on the fitting.

25.9.3 Mooring Fittings

(a) Arrangement of Mooring Fittings

(i) Mooring fittings are to be located on longitudinals, beams or girders, which are parts of the deck construction so as to facilitate efficient distribution of the mooring load.

(ii) When mooring fittings cannot be located as specified in (i), the mooring fittings are to be arranged on reinforced members.

(b) Design Load

Design load, see Fig. II 25-1, for mooring fittings and their supporting structures are to be as specified in (i) to (vii) below:

(i) The design load on the line (see Fig. II 25-1) is to be 1.25 times the breaking strength of the mooring line specified in Table II 25-1 according to the equipment number determined in 25.2.

(ii) The design load on fittings is to take into account all acting loads.

(iii) The point where the mooring force acts on mooring fittings is to be taken as the attachment point of the mooring line.

(iv) The design load on fittings is to take into account the total design load on the line specified in (i) (see Fig. II 25-1), but need not exceed twice the design load on the line.

(v) If the design load on fittings specified in (i) to (iv) is less than 1.25 times the intended mooring load stipulated in the construction specifications for the mooring fittings and their supporting structures used for mooring operations specified in (i), the design load on the fittings is to be at least 1.25 times the intended mooring load.

(vi) The design load applied to supporting hull structures for mooring winches is to be 1.25 times the intended maximum brake holding load.

(vii) The design load applied to supporting hull structures for capstans is to be 1.25 times the intended maximum hauling-in force.

(c) Selection of Mooring Fittings

Mooring fittings are generally to be specified according to standards approved by the Society.

(d) Allowable stresses of supporting structures are not to be more than below:

(i) Normal stress: 100% of the specified yield point for the material used

(ii) Shearing stress: 60% of the specified yield point for the material used

(e) The corrosion addition of supporting structures is not to be less than the following values:

(i) IACS Common Structural Rules, if applicable.

(ii) The value will be considered by the Society, but is not to be less than 2mm

(f) Safe Working Load (SWL)

(i) The SWL is not to exceed 80% of the design load on fittings specified in (b)(i) to (v) or the design load specified in (b)(vi) or (vii).

(ii) The SWL of each fitting, excluding mooring winches and capstan, is to be marked by weld beads or equivalent on the fitting.

25.10 Towing and Mooring Arrangements Plan

25.10.1 The SWL for the intended use for each shipboard fitting should be noted in the towing and mooring arrangements plan available on board for the guidance of the Master.

25.10.2 Information provided on the plan should include in respect of each shipboard fitting:

(a) location on the ship

(b) fitting type

(c) SWL

(d) purpose (mooring/harbour towing/escort towing)

(e) method of applying load of towing or mooring line including limiting fleet angles.

Table II 25-1
Anchor, Chain Cable and Ropes

Equipment number		Equipment numeral	Bower anchor		Stream anchor		Stud link chain cable for bower anchors				Wire rope or chain for stream anchor		Tow line (1 length per ship)		Mooring ropes		
			Number	Mass per anchor	Number	Mass per anchor	Total length	Nominal diameter (mm)			Length	Breaking strength	Length	Breaking Strength	Number	Length of each rope	Breaking strength
Over	Up to			kg		kg	m	Grade E1	Grade E2	Grade E3	m	kN	m	KN		m	kN
50	70	E51	2	180	1	60	220	14	12.5		80	65	180	98	3	80	34

Chapter 26
Navigation Bridge Visibility

26.1 General

The requirements in this Chapter apply to ships of not less than 55 m in length overall (L_{OA}).

26.2 View of the Sea Surface

The view of the sea surface from the conning position shall not be obscured by more than two ship length overall or 500 m, whichever is less, forward of the bow to 10° on either side under all conditions of the ship’s draught, trim and deck cargo.

26.3 Blind Sectors

Each blind sector caused by cargo, cargo gear or other obstructions outside of the wheelhouse forward of the beam obstructing the view of the sea surface as seen from the conning position is not to exceed 10°. The total arc of blind sectors shall not exceed 20 degrees. The clear sectors between blind sectors shall be at least 5 degrees. However, in the view described in 26.2, each individual blind sector shall not exceed 5 degrees.

26.4 Horizontal Field of Vision

26.4.1 The horizontal field of vision from the conning position is to extend over an arc of not less than 225° , that is from more than 22.5°abaft the beam on one side, through forward, to more than 22.5° abaft the beam on the other side.

26.4.2 From each bridge wing the horizontal field of vision is to extend over an arc from at least 45° on the opposite bow through right ahead and then aft to 180° from dead ahead.

26.4.3 From main steering position the horizontal filed of vision is to extend over an arc from right ahead to at least 60°on each side.

26.5 Ship's Side

The ship's side is to be visible from the bridge wing. The arrangement of bridge may refer to IMO MSC.1/Circ. 1350.

26.6 Bridge Front Windows

26.6.1 The height of the lower edge of bridge front windows above the deck is to kept as low as possible.

26.6.2 The upper edge of the bridge front windows is to allow a forward view of the horizon when the ship is pitching in heavy seas for a person with an eye height of 1800 mm above bridge deck at the conning position. The Society, if satisfied that a 1800 mm height of eye is unreasonable and impractical, may allow reduction of the height of eye but not to less than 1600 mm.

26.6.3 To help avoid reflections, the bridge front windows are to be inclined from the vertical plane top out, at an angle of not less than 10° and not more than 25°.

26.6.4 At all times, regardless of weather conditions, at least two of the bridge front windows are to provide a clear view and, depending on the bridge layout, an additional number of clear view windows are to be provided.

26.7 Windows

26.7.1 Framing between bridge windows is to be kept to minimum and is not to be installed immediately forward of any workstation.

26.7.2 Polarized and tinted windows are not to be fitted.

26.8 Ships of Unconventional Design

26.8.1 With ships of unconventional design which, in the opinion of the society, the arrangements are to be provided to achieve a level of visibility that is as near as practical to those prescribed in this Chapter.

26.9 Navigation Bridge Visibility during Ballast Water Exchange

26.9.1 During the intermediate stages of ballast water exchange, navigation bridge visibility need not comply with 26.2 and 26.4.

Chapter 27

Strength and Securing of Small Hatches, Fore Deck Fittings and Equipment on the Exposed Fore Deck

27.1 General

27.1.1 This Chapter provides strength requirements to resist green sea forces for the small hatches and securing devices fitted on the exposed fore deck, air pipes, ventilator pipes and their closing devices, and the securing of windlasses located within the forward quarter length.

27.1.2 Small hatches in these requirements are hatches designed for access to spaces below the deck and are capable of being closed weather-tight or watertight, as applicable. Their opening is normally 2.5 square meters or less.

27.1.3 Hatches designed for use of emergency escape are to comply with these requirements, except 27.4.2(a)(i) and (ii), 27.4.3(c) and 27.4.4.

27.1.4 For windlasses, these requirements are additional to those appertaining to the anchor and chain performance criteria of the Society.

27.1.5 Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.

27.2 Application

27.2.1 For ships that are contracted for construction on or after 1 January 2004 on the exposed deck over the forward 0.25L, applicable to:

All ship types of sea going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0.1L or 22 m above the summer load waterline, whichever is the lesser.

27.2.2 For ships that are contracted for construction prior to 1 January 2004 only for hatches, air pipes, ventilator pipes and their closing devices on the exposed deck giving access to or serving spaces forward of the collision bulkhead, and to spaces which extend over this line aft-wards, applicable to:

Bulk carriers, ore carriers, combination carriers (e.g. OBO ships, Ore/Oil Carriers, etc.) and general dry cargo ships (excluding container vessels, vehicle carriers, Ro-Ro ships and woodchip carriers), of length 100 m or more.

27.2.3 The ship length L is as defined in 1.2.1.

27.3 Implementation

27.3.1 Ships that are described in 27.2.1 that are contracted for construction on or after 1 January 2004 are to comply by the time of delivery.

27.3.2 Ships described in 27.2.2 that are contracted for construction prior to 1 January 2004 are to comply:

(a) for ships which will be 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

(b) for ships which will be 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

(c) for ships which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1 January 2004 cannot be used to postpone compliance.

However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.

27.4 Small Hatches

27.4.1 Strength

(a) For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with Table II 27-1, and Fig. II 27-1. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in 27.4.3(a), see Fig. II 27-1. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, see Fig. II 27-2.

(b) The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 170 to 190 mm from the upper edge of the coamings.

(c) For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to provide strength and stiffness equivalent to the requirements for small rectangular hatches specified in 27.4.

(d) For small hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

27.4.2 Primary securing devices

(a) Small hatches located on exposed fore deck subject to the application of these requirements are to be fitted with primary securing devices such that their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:

(i) Butterfly nuts tightening onto forks (clamps),

(ii) Quick acting cleats, or

(iii) Central locking device.

(b) Dogs (twist tightening handles) with wedges are not acceptable.

27.4.3 Requirements for primary securing

(a) The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Fig. II 27-1, and of sufficient capacity to withstand the bearing force.

(b) The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.

(c) For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is not to be less than 16 mm. An example arrangement is shown in Fig. II 27-2.

(d) For small hatch covers located on the exposed deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

(e) On small hatches located between the main hatches, for example between Nos. 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

27.4.4 Secondary securing device

Small hatches on the fore deck are to be fitted with an independent secondary securing device e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

Table II 27-1
Scantlings for Small Steel Hatch Covers on the Fore Deck

Nominal size (mm x mm)	Cover plate thickness (mm)	Primary stiffeners	Secondary stiffeners
		Flat Bar(mm x mm); number	
630 x 630	8	-	-
630 x 830	8	100 x 8 ; 1	-
830 x 630	8	100 x 8 ; 1	-
830 x 830	8	100 x 10 ; 1	-
1030 x 1030	8	120 x 12 ; 1	80 x 8 ; 2
1330 x 1330	8	150 x 12 ; 2	100 x 10 ; 2

27.5 Fore Deck Fittings and Equipment

27.5.1 Applied loading

(a) Air pipes, ventilator pipes and their closing devices

(i) The pressures p, in kN/m^2 acting on air pipes, ventilator pipes and their closing devices may be calculated from:

$$p = 0.5 \rho V^2 C_d C_s C_p$$

where:

ρ	=	Density of sea water (1.025 t/m^3).
V	=	Velocity of water over the fore deck (13.5 m/sec).
C_d	=	Shape coefficient,
	=	0.5 for pipes,
	=	1.3 for air pipe or ventilator heads in general,
	=	0.8 for an air pipe or ventilator head of cylindrical form with its axis in the vertical direction.
C_s	=	Slamming coefficient (3.2).
C_p	=	Protection coefficient,
	=	0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle,
	=	1.0 elsewhere and immediately behind a bulwark.

(ii) Forces acting in the horizontal direction on the pipe and its closing device may be calculated from 27.5.1(a)(i) using the largest projected area of each component.

(b) Windlasses

(i) The following pressures and associated areas are to be applied (see Fig. II 27-3):

(1) 200 kN/m^2 normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction,

(2) 150 kN/m^2 parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction, where f is defined as:

$f = 1 + B/H$, but not greater than 2.5.

where:

B = Width of windlass measured parallel to the shaft axis.

H = Overall height of windlass.

(ii) Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by N bolt groups, each containing one or more bolts, see Fig. II 27-4.

(iii) The axial force R_i in bolt group (or bolt) i, positive in tension, may be calculated from:

$$R_{xi} = \frac{P_x h x_i A_i}{I_x}$$

$$R_{yi} = \frac{P_y h y_i A_i}{I_y}$$

$$R_i = R_{xi} + R_{yi} - R_{si}$$

where:

P_x = Force (kN) acting normal to the shaft axis,

P_y = Force (kN) acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group i,

h = Shaft height (cm) above the windlass mounting,

x_i, y_i = x and y coordinates of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force (cm),

A_i = Cross sectional area (cm^2) of all bolts in group i,

I_x = $\Sigma A_i x_i^2$ for N bolt groups,

I_y = $\Sigma A_i y_i^2$ for N bolt groups,

R_{si} = Static reaction at bolt group i, due to weight of windlass.

(iv) Shear forces F_{xi}, F_{yi} applied to the bolt group i, and the resultant combined force F_i may be calculated from:

$$F_{xi} = \frac{P_x - \alpha g M}{N}$$

$$F_{yi} = \frac{P_y - \alpha g M}{N} \text{ and}$$

$$F_i = \left(F_{xi}^2 + F_{yi}^2\right)^{0.5}$$

where:

α = Coefficient of friction (0.5),

M = Mass of windlass (t),

g = Gravity acceleration (9.81 m/sec^2),

N = Number of bolt groups.

(v) Axial tensile and compressive forces in 27.5.1(b)(iii) and lateral forces in 27.5.1(b)(iv) are also to be considered in the design of the supporting structure.

27.5.2 Strength requirements

(a) Air pipes, ventilator pipes and their closing devices

(i) Bending moments and stresses in air and ventilator pipes are to be calculated at critical positions: at penetration pieces, at weld or flange connections, at toes of supporting brackets. Bending stresses in the net section are not to exceed 0.8 σ_y, where σ_y is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2.0 mm is then to be applied.

(ii) For standard air pipes of 760 mm height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table II 27-2. Where brackets are required, three or more radial brackets are to be fitted. Brackets are to be of gross thickness 8 mm or more, of minimum length 100 mm, and height according to Table II 27-2 but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported.

(iii) For other configurations, loads according to 27.5.1(a) are to be applied, and means of support determined in order to comply with the requirements of 27.5.2(a)(i). Brackets, where fitted, are to be of suitable thickness and length according to their height. Pipe thickness is not to be taken less than as required in 21.1.

(iv) For standard ventilators of 900 mm height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table II 27-3. Brackets, where required are to be as specified in 27.5.2(a)(ii).

(v) For ventilators of height greater than 900 mm, brackets or alternative means of support are to be fitted according to the requirements of 27.5.2(a)(i) above. Brackets, where fitted, whose thickness and length are to be suitable for their height. Pipe thickness is not to be taken less than as required in 21.1.

(vi) All component parts and connections of the air pipe or ventilator are to be capable of withstanding the loads defined in 27.5.1(a).

(vii) Rotating type mushroom ventilator heads are unsuitable for application in the areas defined in 27.2.

(b) Windlass mounts

(i) Tensile axial stresses in the individual bolts in each bolt group i are to be calculated. The horizontal forces F_{xi} and F_{yi} are normally to be reacted by shear chocks. Where "fitted" bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations. The safety factor against bolt proof strength is to be not less than 2.0.

(ii) The stresses of above deck framing and hull structure supporting the windlass and its securing bolt loads are not to exceed the following values:

Bending stress: 85% of the yield strength of the material.
Shearing stress: 60% of the yield strength of the material.

Table II 27-2
760 mm Air Pipe Thickness and Bracket Standards

Nominal pipe diameter (mm)	Minimum fitted gross thickness, (mm)	Maximum projected area of head (cm^2)	Height[(1)] of brackets (mm)
40A[(3)]	6.0	-	520
50A[(3)]	6.0	-	520
65A	6.0	-	480
80A	6.3	-	460
100A	7.0	-	380
125A	7.8	-	300
150A	8.5	-	300
175A	8.5	-	300
200A	8.5[(2)]	1900	300[(2)]
250A	8.5[(2)]	2500	300[(2)]
300A	8.5[(2)]	3200	300[(2)]
350A	8.5[(2)]	3800	300[(2)]
400A	8.5[(2)]	4500	300[(2)]

(1) (see 27.5.2(a)(ii)) need not extend over the joint flange for the head.
(2) Brackets are required where the as fitted (gross) thickness is less than 10.5 mm, or where the tabulated projected head area is exceeded.
(3) Not permitted for new ships.
Note: For other air pipe heights, the relevant requirements of 27.5.2 are to be applied.

Table II 27-3
900 mm Ventilator Pipe Thickness and Bracket Standards

Nominal pipe diameter (mm)	Minimum fitted gross thickness, (mm)	Maximum projected area of head (cm^2)	Height of brackets (mm)
80A	6.3	-	460
100A	7.0	-	380
150A	8.5	-	300
200A	8.5	550	-
250A	8.5	880	-
300A	8.5	1200	-
350A	8.5	2000	-
400A	8.5	2700	-
450A	8.5	3300	-
500A	8.5	4000	-

Note: For other ventilator heights, the relevant requirements of 27.5.2 are to be applied.

Chapter 28

Means of Access

28.1 General Rules

28.1.1 General

(a) Peak tanks, deep tanks, cofferdams, cargo oil tanks, cargo holds with relative high bilge hopper tanks and other similar enclosed spaces are to be provided with means of access, i.e., stages, ladders, steps or other similar facilities for internal examinations in safety. However, such means are not required in aft peak tanks and deep tanks which are exclusively loaded fuel oil or lubrication oil.

(b) Notwithstanding the above (a), spaces specified in 28.2 are to apply the requirements of 28.2 in place of this 28.1.

28.1.2 Means of Access to Spaces

(a) Safe access to peak tanks, deep tanks, cofferdams, cargo oil tanks, cargo holds and other similar enclosed spaces is to be, in general, direct from the open deck and served by at least one access hatchway of manhole and ladder.

(b) Notwithstanding the above (a), safe access to lower spaces of spaces divided in vertically, may be from other spaces, subject to consideration of ventilation aspects.

(c) Notwithstanding the above (a), for each space of ships of less than 300 gross tonnage and space which is not greater than 1.5 m in height from the bottom to the top of the open deck, the provision of fixed ladders is not required.

28.1.3 Means of Access within Spaces

(a) Peak tanks, deep tanks, cofferdams, cargo oil tanks, cargo holds and other similar enclosed spaces are to be provided with means of access to hull structures for examination.

(b) Where it is unavoidable to go over obstructions such as hull structural members of 600 mm or more in height for the access to hull structures within the space, appropriate facilities such as ladders, steps, etc. are to be fitted.

28.1.4 Specifications of Means of Access and Ladders

(a) Means of access are to ensure safety in use.

(b) Permanent means of access are to be of robust construction.

28.1.5 Plans for Means of Access

Plans showing arrangement for means of access to peak tanks, deep tanks, cofferdams, cargo oil tanks, cargo holds with relative high bilge hopper tanks and other similar enclosed spaces are to be kept on board.

28.2 Special Requirements for Oil Tankers and Bulk Carriers

28.2.1 Application

This section of 28.2 applies to each space within the cargo area and fore peak tanks of oil tankers as defined in 2.1.2(c) of Part I, of 500 gross tonnage and over and bulk carriers, as defined in 2.1.2(d)(i) of Part I, of 20,000 gross tonnage and over, constructed on or after 1 January 2006, in place of the requirements of 28.1. Notwithstanding the above, the provision in this section except 28.2.3(a) and (b) and 28.2.5(e), (f) and (g) in relation to access to tanks/spaces, needs not apply to the cargo tanks of combined oil/chemical tankers which are to be complying with the requirements for ships carrying dangerous chemicals in bulk.

28.2.2 General

Each space within the cargo area and fore peak tanks are to be provided with means of access to enable overall and close-up examinations and thickness measurements of the ship's structures to be carried out in safety.

28.2.3 Means of Access to Spaces

(a) Safe access to each space within the cargo area and fore peak tanks is to be direct from the open deck and in accordance with the following (i) to (iii) corresponding to the kind of the space.

(i) Tanks, cofferdams and subdivisions of tanks and cofferdams, having a length of 35 m or more, are to be fitted with at least two access hatchways or manholes and ladders, as far apart as practicable.

(ii) Tanks and cofferdams less than 35 m in length are to be served by at least one access hatchway or manhole and ladder.

(iii) Each cargo hold is to be fitted with at least two access hatchways or manholes and ladders as far apart as practicable. In general, these access are to be arranged diagonally, for example one access near the forward bulkhead on the port side, the other one near the aft bulkhead on the starboard side. At least one of the required two ladders is to be of inclined one except as specified in (c) below.

(b) Notwithstanding the above (a), safe access to double bottom spaces, to forward ballast tanks or to lower spaces of sections divided in vertically, may be from a pump-room, deep cofferdam, pipe tunnel, cargo hold, double hull space or similar compartment not intended for the carriage of oil or hazardous cargoes, subject to consideration of ventilation aspects.

(c) The uppermost entrance section from deck of the ladder providing access to a tank is to be vertical not less than 2.5 m but not exceed 3.0 m measured clear of the overhead obstructions in way of tank entrance, and to comprise a ladder linking platform which is to be displaced to one side of a vertical ladder. However, the uppermost section of the vertical ladder may be reduced to 1.6 m below the deck head, if the vertical ladder lands on a longitudinal or athwartship permanent means of access fitted within 1.6 m and 3 m below the deck head.

(d) For oil tankers, access ladders to cargo tanks and other spaces in the cargo area (excluding fore peak tanks) are to be in accordance with the followings.

(i) Where two access hatchways or manholes and ladders are required in (a)(i) above, at least one ladder is to be of the inclining type. However, the uppermost entrance section from deck of the ladder is to be vertical in accordance with the provisions of (c) above.

(ii) Where ladders not required to be of the inclined type as specified in (i) above, maybe of a vertical type. Where the vertical distance is more than 6 m, vertical ladders are to be connected by one or more ladder linking platforms, generally spaced not more than 6 m apart vertically and displaced to one side of the ladder. The uppermost entrance section from deck of the ladder is to be in accordance with the provisions of (c) above.

(iii) Where one access hatchways or manholes and ladder is required in (a)(ii) above, for this access, an inclined ladder is to be used in accordance with the provisions of (i) above.

(iv) In spaces of less than 2.5 m width, the access to the space may be by means of vertical ladders that comprise of one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder. The uppermost entrance section from deck of the ladder is to be in accordance with the provisions of (c) above.

(v) Access from deck to a double bottom space may be by means of vertical ladders through a trunk. The vertical distance from the deck to a resting platform, between resting platforms or a resting platform and the tank bottom is not to be more than 6 m unless otherwise approved by the Society.

(e) For bulk carries, access ladders to cargo holds and other spaces in the cargo area are to be in accordance with the followings.

(i) Where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is not more than 6 m, either a vertical ladder or an inclined ladder.

(ii) Where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is more than 6 m, an inclined ladder or series of inclined ladders at one end of the cargo hold, except the uppermost 2.5 m of a cargo space measured clear of overhead obstructions and the lowest 6 m may have vertical ladders, provided that the vertical extent of the inclined ladder or ladders connecting the vertical ladders is not less than 2.5 m.

(iii) Means of access at the end of the cargo hold other than those specified in (ii) above, may be formed of a series of staggered vertical ladders, which is to comprise of one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder. The uppermost entrance section of the ladder directly exposed to a cargo hold is to be vertical for a distance of 2.5 m measured clear of overhead obstructions and connected to a ladder-linking platform.

(iv) A vertical ladder may be used as a means of access to topside tanks, where the vertical distance is 6 m or less between the deck and the longitudinal means of access in the tank or the stringer or the bottom of the space immediately below the entrance. The uppermost entrance section from deck of the vertical ladder of the tank is to be vertical for a distance of 2.5 m measured clear of overhead obstructions and comprise a ladder linking platform, unless landing on the longitudinal means of access, the stringer or the bottom within the vertical distance, displaced to one side of a vertical ladder.

(v) Unless allowed in (iv) above, an inclined ladder is to be used for access to a tank or a space where the vertical distance is grater than 6 m between the deck and a stringer immediately below the entrance, between stringers, or between the deck or a stringer and the bottom of the space immediately below the entrance.

(vi) In case of (v) above, the uppermost entrance section from deck of the ladder is to be vertical for a distance of 2.5 m clear of overhead obstructions and connected to a landing platform and continued with an inclined ladder. The heights of inclined ladders are not to be more than 9 m in actual length and the vertical height is not normally to be more than 6 m. The lowermost section of the ladders may be vertical for a distance of 2.5 m.

(vii) In double-side skin spaces of less than 2.5 m width, the access to the space may be by means of vertical ladders that comprise of one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder.

(viii) A spiral ladder may be considered acceptable as an alternative for inclined ladders. In this regard, the uppermost 2.5 m can continue to be comprised of the spiral ladder and need not change over to vertical ladders.

28.2.4 Means of Access within Spaces

(a) For oil tankers, cargo oil tanks and water ballast tanks except those specified in (b) and (h) are to be provided with means of access in accordance with the following (i) to (iv).

(i) For tanks of which the height is 6 m and over permanent means of access are to be provided in accordance with (1) to (6).

(1) continuous athwartship permanent access arranged at each transverse bulkhead on the stiffened surface, at a minimum of 1.6 m to a maximum of 3 m below the deck head;

(2) at least one continuous longitudinal permanent means of access at each side of the tank. One of these accesses is to be at a minimum of 1.6 m to a maximum of 6 m below the deck head and the other is to be at a minimum of 1.6 m to a maximum of 3 m below the deck head;

(3) access between the arrangements specified in (1) and (2) and from the main deck to either (1) or (2);

(4) continuous longitudinal permanent means of access which are integrated in the structural member on the stiffened surface of a longitudinal bulkhead, in alignment, where possible, with horizontal girders of transverse bulkheads are to be provided for access to the transverse webs unless permanent fittings are installed at the uppermost platform for use of alternative means deemed as appropriate by the Society, for inspection at intermediate heights;

(5) for ships having cross-ties which are 6 m or more above tank bottom, a transverse permanent means of access on the cross-ties providing inspection of the tie flaring brackets at both sides of the tank, with access from one of the longitudinal permanent means of access in (4); and

(6) alternative means deemed as appropriate by the Society may be provided for small ship as an alternative to (4) for cargo oil tanks of which the height is less than 17 m.

(ii) For tanks of which the height is less than 6 m, alternative means deemed as appropriate by the Society or portable means may be utilized in lieu of the permanent means of access.

(iii) Notwithstanding the above (i) and (ii), tanks not containing internal structures need not to be provided with permanent means of access.

(iv) For the access to under deck structures, transverse webs and cross-ties outside the reach of permanent means of access, as required in (i) and (ii) above, alone or in combination with portable means, means deemed appropriate by the Society are to be provided.

(b) For oil tankers, water ballast wing tanks of less than 5 m width forming double side spaces and their bilge hopper sections are to be provided with means of access in accordance with the following (i) to (iii).

(i) For double side spaces above the upper knuckle point of the bilge hopper sections, permanent means of access are to be provided in accordance with (1) to (3):

(1) where the vertical distance between horizontal uppermost stringer and deck head is 6 m or more, one continuous longitudinal permanent means of access is to be provided for the full length of the tank with a means to allow passing through transverse webs installed at a minimum of 1.6 m to a maximum of 3 m below the deck head with a vertical access ladder at each end of the tank;

(2) continuous longitudinal permanent means of access, which are integrated in the structure, at a vertical distance not exceeding 6 m apart; and

(3) plated stringers are, as far as possible, to be in alignment with horizontal girders of transverse bulkheads.

(ii) For bilge hopper sections of which the vertical distance from the tank bottom to the upper knuckle point is 6 m and over, one longitudinal permanent means of access is to be provided for the full length of the tank in accordance with the following (1) and (2). It is to be accessible by vertical permanent means of access at each end of the tank.

(1) The longitudinal continuous permanent means of access may be installed at a minimum 1.6 m to a maximum 3 m from the top of the bilge hopper section. In this case, a platform extending the longitudinal continuous permanent means of access in way of the web frame may be used to access the identified structural critical areas.

(2) Alternatively, the continuous longitudinal permanent means of access may be installed at a minimum of 1.2 m below the top of the clear opening of the web ring allowing a use of portable means of access to reach identified structural critical areas.

(iii) Where the vertical distance referred to in (ii) is less than 6 m, alternative means deemed as appropriate by the Society or portable means of access may be utilized in lieu of the permanent means of access. To facilitate the operation of the alternative means of access, in-line openings in horizontal stringers are to be provided. The openings are to be of an adequate diameter and are to have suitable protective railings.

(c) For bulk carriers, means of access to the overhead structure of the cross deck are to be fitted in accordance with the following (i) to (v).

(i) Permanent means of access are to be fitted to provide access to the overhead structure at both sides of the cross deck and in the vicinity of the centerline. Each means of access is to be accessible from the cargo hold access or directly from the main deck and installed at a minimum of 1.6 m to a maximum of 3 m below the deck.

(ii) An athwartship permanent means of access fitted on the transverse bulkhead at a minimum 1.6 m to a maximum 3 m below the cross deck head is accepted as equivalent to (i).

(iii) Access to the permanent means of access to overhead structure of the cross deck may also be via the upper stool.

(iv) Ships having transverse bulkheads with full upper stools with access from the main deck which allows monitoring of all framing and plate from inside do not require permanent means of access of the cross deck.

(v) Alternatively, movable means of access may be utilized for access to the overhead structure of the cross deck if its vertical distance is 17 m or less above the tank top.

(d) For cargo holds of bulk carriers, means of access are to be fitted in accordance with the following (i) to (vi).

(i) Permanent means of vertical access are to provided in all cargo holds and built into the structure to allow for an inspection of a minimum of 25% of the total number of hold frames port and starboard equally distributed throughout the hold including at each end in way of transverse bulkheads. But in no circumstance, this arrangement is to be less than 3 permanent means of vertical access fitted to each side (fore and aft ends of hold and mid-span). Permanent means of vertical access fitted between two adjacent hold frames is counted for an access for the inspection of both hold frames. A portable means of access may be used to gain access over the sloping plating of lower hopper ballast tanks.

(ii) In addition to (i), portable or movable means of access are to be utilized for access to the remaining hold frames up to their upper brackets and transverse bulkheads.

(iii) Portable or movable means of access may be utilized for access to hold frames up to their upper bracket in place of the permanent means required in (i). These means of access are to be carried on board the ship and readily available for use.

(iv) The width of vertical ladders for access to hold frames is to be at least 300 mm, measured between stringers.

(v) A single vertical ladder over 6 m in length is acceptable for the inspection of the hold side frames in a single skin construction.

(vi) For double-side skin construction no vertical ladder for the inspection of the cargo hold surfaces is required. Inspection of this structure is to be provided from within the double hull space.

(e) For topside tanks of bulk carriers, means of access are to be fitted in accordance with the following (i) to (iv).

(i) For each topside tank of which the height is 6 m and over, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.6 m to maximum of 3 m below deck with a vertical access ladder in the vicinity of each access to that tank.

(ii) If no access holes are provided through the transverse webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs / grab rails are to be provided to allow safe access over each transverse web frame ring.

(iii) Three permanent means of access, fitted at the end bay and middle bay of each tank, are to be provided spanning from tank base up to the intersection of the sloping plate with the hatch side girder. The existing longitudinal structure, if fitted on the sloping plate in the space may be used as part of this means of access.

(iv) For topside tanks of which the height is less than 6 m, alternative means deemed as appropriate by the Society or portable means may be utilized in lieu of the permanent means of access.

(f) For bilge hopper tanks of bulk carriers, means of access are to be fitted in accordance with the following (i) to (iii).

(i) For each bilge hopper tank of which the height is 6 m and over, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.2 m below the top of the clear opening of the web ring in accordance with (1) to (3), with a vertical access ladder in the vicinity of each access to the tank.

(1) An access ladder between the longitudinal continuous permanent means of access and the bottom of the space are to be provided at each end of the tank.

(2) Alternatively, the longitudinal continuous permanent means of access can be located through the upper web plating above the clear opening of the web ring, at a minimum of 1.6 m below the deck head, when this arrangement facilitates more suitable inspection of identified structurally critical areas. An enlarged longitudinal frame can be used for the purpose of the walkway.

(3) For double-side skin bulk carriers, the longitudinal continuous permanent means of access may be installed within 6 m from the knuckle point of the bilge, if used in combination with alternative methods to gain access to the knuckle point.

(ii) If no access holes are provided through the transverse ring webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safety access over each transverse web frame ring.

(iii) For bilge hopper tanks of which the height is less than 6 m, alternative means deemed as appropriate by the Society or portable means may be utilized in lieu of the permanent means of access. Such means of access are to be demonstrated that they can be deployed and made readily available in the areas where needed.

(g) For double-side skin tanks of bulk carriers, permanent means of access are to be provided in accordance with the requirements in (a) or (b), as applicable.

(h) For fore peak tanks with a depth of 6 m or more at the centerline of the collision bulkhead, a suitable means of access are to be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure in accordance with the following (i) and (ii).

(i) Stringers of less than 6 m in vertical distance from the deck head or a stringer immediately above are considered to provide suitable access in combination with portable means of access.

(ii) In case the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is 6 m or more, alternative means of access deemed as appropriate by the Society are to be provided.

(i) Where a permanent means of access may be susceptible to damage during normal cargo loading and unloading operations or where it is impracticable to fit permanent means of access, deemed by the Society, alternative means of access deemed as appropriate by the Society may be utilized in lieu of those specified in (a) to (h) above, provided that the means of attaching, rigging, suspending or supporting the such means of access forms a permanent part of the ship's structure.

28.2.5 Specifications for Means of Access and Ladders

(a) Permanent means of access are, as far as possible, to be integral to the structure of the ships, thus ensuring that they are robust.

(b) Elevated passageways forming sections of a permanent means of access, where fitted, are to have a minimum clear width of 600 mm, except for going around vertical webs where the minimum clear width may be reduced to 450 mm, and have guard rails over the open side of their entire length.

(c) Sloping structures where provided in part of the access are to be a non-skid construction.

(d) Elevated passageways forming sections of a permanent means of access, are to be provided with guard rails of 1,000 mm in height and consist of a rail and an intermediate bar 500 mm in height and of substantial construction, with stanchions not more than 3 m apart, on the open side. Guardrail stanchions are to be attached to the permanent means of access.

(e) For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is not to be less than 600 mm × 600 mm. When access to a cargo hold is arranged through the cargo hatch, the top of the ladder is to be placed as close as possible to the hatch coaming. Access hatch coamings having a height greater than 900 mm are also to have steps on the outside in conjunction with the ladder.

(f) For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum 600 mm × 800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other foot holds are provided.

(g) For oil tankers of less than 5,000 tonnes deadweight, smaller dimensions for the openings referred to in (e) and (f) may be approved by the Society in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Society.

(h) Access to permanent means of access and vertical openings from the ship’s bottom is to be provided by means of easily accessible passageways, ladders or treads. Treads are to be provided with lateral support for the foot. Where the rungs of ladders are fitted against a vertical surface, the distance from the center of the rungs to the surface is to be at least 150 mm. Where vertical manholes are fitted higher than 600 mm above the walking level, access is to be facilitated by means of treads and hand grips with platform landings on both sides.

(i) For ladders or similar facilities forming sections of a permanent means of access, their specifications are to be satisfaction of the Society.

28.2.6 Ship Structure Access Manual

(a) For every ship, means of access to carry out overall and close-up inspections and thickness measurements are to be described in a Ship Structure Access Manual approved by the Society, any change of contents of which is to be updated and an updated copy of which is to be kept on board. The Ship Structure Access Manual is to be include the following for each space.
   - (i) Plans showing the means of access to the space, with appropriate technical specifications and dimensions;
   - (ii) Plans showing the means of access within each space to enable an overall inspection to be carried out, with appropriate technical specifications and dimensions. The plans are to indicate from where each area in the space can be inspected;
   - (iii) Plans showing the means of access within the space to enable close-up inspections to be carried out, with appropriate technical specifications and dimensions. The plans are to indicate the positions of critical structural areas, whether the means of access is permanent or portable and from where each area can be inspected;
   - (iv) Instructions for inspecting and maintaining the structural strength of all means of access and means of attachment, taking into account any corrosive atmosphere that may be within the space;
   - (v) Instructions for safety guidance when rafting is used for close-up inspections and thickness measurements;
   - (vi) Instructions for the rigging and use of any portable means of access in a safety manner;
   - (vii) An inventory of all portable means of access; and

(viii) Records of periodical inspections and maintenance of the ship's means of access.

(b) Where alternative means of access are adapted in accordance with the provisions of 28.2.4, means for safety operation and rigging of such alternative means to and from and within the spaces are to be clearly described in the Ship Structure Access Manual.

Chapter 29

Damage Control for Cargo Ships

29.1 Application

29.1.1 The requirements in this chapter are applied to the cargo vessels of 500 gross tonnage and over which are engaged in international voyage.

29.2 Damage Control

29.2.1 Watertight Doors

(a) Watertight doors in watertight bulkhead, except those permanently closed at sea, are to be provided with position indicators showing whether the doors are open or closed on the bridge and at all operating positions.

(b) Electrical installations for watertight doors specified in (a) except waterproof type approved by the Society are not to be provided with under freeboard deck.

29.2.2 Cargo Ports and Other Similar Openings

For bow door, stern door or shell door required to be watertight, indicators which indicate whether the doors are opened or closed are to be provided on the navigation bridge. However, in case where it is to be deemed as appropriate by the Society, this requirement may be dispensed with.

29.3 Booklet and Plan for Damage Control

29.3.1 Booklet

(a) Booklet is to contain the information shown in the damage control plan.

(b) Booklet is to be provided at a suitable place which is made available to the officers of ships.

(c) The Booklet is recommended to be prepared in the working language of the ship. Where the language used in preparation of the Booklet is not English, a translation into English is to be included.

29.3.2 Damage Control Plan

(a) Damage control plan approved by the Society is to be permanently exhibited or readily available on the navigating bridge, for the guidance of the officer in charge of the ship.

(b) The damage control plan is to show clearly for the each deck and hold the boundaries of the watertight compartments, the openings therein with means of closure (including the position of any controls thereof), and the arrangements for the correction of any list due to flooding.

(c) The damage control plan is recommended to be prepared in the working language of the ship. Where the language used in preparation of the plan is not English, a translation into English is to be included.

29.3.3 Damage Stability Information

Ships subject to Chapter 30A of this Part are to be provided with damage stability information deemed appropriate by the Society.

Chapter 30
Intact Stability

30.1 Application

30.1.1 The requirements on intact stability (hereinafter referred to as "stability" in this chapter) in this chapter apply to ships which are 24 meters in length for freeboard and over. However, fishing vessels, mobile offshore drilling units and dynamically supported craft may be excepted.

30.1.2 Special consideration may be given to the ships registered for a restricted service.

30.1.3 In case of the ships considered inadequate to be fully and/or directly applied the requirements in this chapter because of some special reasons (e.g. novel design features, unusual form of ships), stability will be individually determined by the Society.

30.1.4 "Timber deck cargo" means a cargo of timber carried on an uncovered part of a freeboard or superstructure deck. The term does not include wood pulp or similar cargo.

30.1.5 "Down flooding angle" refers to the angle of heel at which openings in the hull, superstructures or deckhouses which cannot be closed weathertight immerse.

30.1.6 The Society may make special requirements as instructed by the flag governments of ships or the governments of the sovereign nations in which ships navigate.

30.2 Stability Information

30.2.1 Stability Information Booklet

Ships are to be provided with a stability information booklet approved by the Society, to ensure the enough stability of the ship under varying conditions of service. Such booklet is to include principal particulars regarding the ship's stability, the results of stability experiments and information as necessary by the master to verify the ship's stability.

30.2.2 Stability Computer

Where a computer for stability calculation is on board the ship as a supplement to the stability information booklet, such computer is to be approved by the Society. The computer is to be provided with an operation manual.

30.2.3 Special Requirements for Bulk Carriers

(a) Bulk carriers as defined in SOLAS Chapter XII, of less than 150 m in length L but not less than 500 gross tonnage are to be fitted with a stability computer approved by the Society, as a supplement to the stability information booklet.

(b) Notwithstanding the provisions of preceding (a), for bulk carriers not engaged on international voyages, where deemed appropriate by the Society taking account of various conditions of such ships related to the navigation, the requirements of the loading computers need not to be applied to.

30.2.4 Draft Marks

Every ship is to have scales of drafts marked clearly at the bow and stern. In the case where the draft marks are not located where they are easily readable, or operational constraints for a particular trade make it difficult to read the draft marks, then the ship is also to be fitted with a reliable draft indicating system by which the bow and stern drafts can be determined.

30.3 Stability Requirement

30.3.1 Stability curves and heeling moment curves are to be prepared by the method deemed appropriate by the Society for all designed loading conditions and they are to be verified to comply with the requirements in 30.5 and 30.6.

30.3.2 Excessive stability is to be avoided, since it may produce a greater acceleration which may have adverse effects in hull structures, cargoes, etc.

30.3.3 For the ships navigating in the areas where icing is expected to occur, it is to be considered that the projected area against wind is increased and the position of centre of gravity is heightened due to icing on the structures.

30.3.4 In cases where anti-rolling devices are installed in a ship, the requirements given in 30.5 and 30.6 are to be satisfied when such devices are in operation and when there is either a failure of power supply to the devices or a failure of the devices.

30.3.5 Provisions are to be made for a safe margin of stability at all stages of the voyage, regard being given to additions of weight, such as those due to the absorption of water and icing as well as to losses of weight such as those due to the consumption of fuel and stores.

30.3.6 Curves or tables of minimum operational metacentric height (GM) or maximum centre of gravity (VCG) are to extend over the full range of operational trims.

30.4 Calculation on Stability

Stability is to be calculated under the following conditions:

30.4.1 In preparing stability curves, the position center of gravity is to be determined on the basis of the data obtained at inclining test required in 1.16 of Part I.

30.4.2 Free surface effects of liquid in tanks are to be of what the stability during navigation under the relevant design loading condition is most severely affected.

30.4.3 Where anti-rolling devices are installed in a ship, the requirements in 30.5 are to be satisfied whether the devices are in operation or not.

30.5 General Stability Criteria

30.5.1 For ships without timber deck cargoes, the stability curves are to comply with the following requirements in Fig. II 30-1.

(a) A_1 is not to be less than 0.055 m · rad.

(b) A_2 is not to be less than 0.03 m · rad.

(c) $(A_1 + A_2)$ is not to be less than 0.09 m · rad.

(d) GZ is to be at least 0.20 m at an angle of heel equal to or greater than 30°.

(e) θ_{max} is not to be less than 25°.

(f) G_0M is not to be less than 0.15 m.

30.5.2 For ships loaded with timber deck cargoes, the stability curves are to comply with the following requirements in Fig. II 30-1.

(a) $(A_1 + A_2)$ is not to be less than 0.08 m · rad.

(b) GZ_{max} is not to be less than 0.25 m .

(c) G_0M is not to be less than 0.10 m during navigation.

(d) The value of all symbols in this Part is to be one in relevant loading condition except the case that it is particularly specified.

where:

A_1 = Area under stability curve between 0° and 30° (m · rad).

A_2 = Area under stability curve between 30° and θ_u (m · rad).

θ_u = Heeling angle (degree) to be taken of whichever is less, down flooding angle in relevant loading condition or 40°.

GZ_{max} = Maximum righting lever (m)

θ_{max} = Heeling angle at which righting arm reaches maximum (degree).

G_0M = Initial metacentric height corrected by free surface effect (m).

30.6 Stability Criteria in Wind and Waves

30.6.1 Stability curves and wind-heeling moment lever curves of ships are to comply with the following requirements in Fig. II 30-2.

(a) Heeling angle caused by steady wind is to be less than 16° or an angle corresponding to 80% of immersing angle of deck edge, whichever is less.

(b) Area "b" is not to be less than area "a".

where:

l_{w1} = Heeling moment lever caused by steady wind (m) given by the following formula:

$$= \frac{0.0514AZ}{W}$$

A = Projected lateral area of hull and cargoes on deck above waterline (m^2).

Z = Vertical distance between the centre of “A” and the centre of underwater projected lateral area of hull (m). In general, the centre of underwater projected lateral area may be approximated to locate at half the draught.

W = Displacement (ton).

l_{w2} = Heeling moment lever caused by gust (m) given by the following formula:

$= 1.5 l_{w1}$

a = Area encircled by stability curve, l_{w2} and θ_r (m · rad).

b = Area encircled by stability curve, l_{w2} and θ_2 (m · rad).

θ_r = Angle of rolling stop motion (degree). In general, it may be given by the formula $(\theta_0 - \theta_1)$.

θ_c = Heeling angle at the second intersection between heeling moment lever (l_{w2}) and stability curve (degree).

θ_2 = Heeling angle (degree) to be taken of whichever is the least, down flooding angle, θ_c or 50°.

θ_0 = Angle of heel under action of steady wind (degree).

θ_1 = Angle of roll to windward due to wave action (degree) given by the following formula :

$= 109 x_1 x_2 k \sqrt{rs}$

x_1 = Values obtained from Table II 30-1 according to the value of B/d. In case the value of B/d becomes intermediate, values are to be determined by interpolation.

x_2 = Values obtained from Table II 30-2 according to the value of C_b. In case the value of C_b becomes intermediate, values are to be determined by interpolation.

C_b = Block coefficient given by the following formula :

$$= \frac{W}{1.025LBd}$$

L = Length of the ship at waterline (m)

k = Values determined as follows;

= 1.0 for round-bilged ships having neither bilge keels nor bar keels,

= 0.7 for ships with sharp bilges,

For ships with bilge keel and/or bar keels: Values obtained from Table II 30-3 according to the value of $\frac{100A_k}{LB}$.

In case $\frac{100A_k}{LB}$ becomes intermediate, values are to be determined by interpolation.

A_k = Total area of bilge keels, projected lateral area of bar keels or sum of those areas (m^2).

r = Values obtained from the following formula.
However, the value of r need not be taken over 1.0.

$$= 0.73 + 0.6\frac{OG}{d}$$

OG = Distance between the centre of gravity and the waterline (m), and is taken as positive when the centre of gravity is above waterline.

s = Values obtained from Table II 30-4 according to the value of T. In case T becomes intermediate, values are to be determined by interpolation.

T = Rolling period (seconds) obtained from the following formula,

$$= \frac{2B}{\sqrt{G_0M}}\left(0.373 + 0.023\frac{B}{d} - 0.043\frac{L}{100}\right)$$

G_0M = As specified in 30.5.

30.6.2 Where the requirements specified in 30.6.1 apply to the ships registered as restricted service, the values of l_{w1} and s may be modified by the Society.

Chapter 30A

Subdivision and Damage Stability

30A.1 General

30A.1.1 Ships of applicable size, type and service are to have subdivision and damage stability as required by the International Convention for the Safety of Life at Sea (SOLAS), 1974, as amended, as follows:

(a) Cargo ships: Regulation II-1/4 to 7-3.

(b) Passenger ships: Regulation II-1/4 to 8-1.

Chapter 31

Ship Recycling

31.1 General

31.1.1 Application

The requirement in this chapter is applicable to new and existing ships for which the optional Ship Recycling notation **SRE** and/or **SRE-EU** has been requested. Obtaining this notation will assist in complying with regulation 5 of the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ship, 2009 (SR/CONF/45) and/or Article 5 of EU 1257/2013. Furthermore, to achieve the goal of safe and environmentally sound recycling of ship, the ship recycling facility selected is to be the one authorized by the Competent Authority, taking into consideration the certification of ISO 30000 series standards.

31.1.2 Notation

Ships which have had the ship details and Part 1 of the Inventory of their "Statement on Inventory of Hazardous Materials" (hereinafter referred to as the Statement, refer to 31.2.1 of this chapter) prepared and certified to the requirements of this chapter to the satisfaction of the Surveyors to the Society will be eligible to receive the notation **SRE** and/or **SRE-EU** (Ship Recycling).

31.1.3 Definitions

(a) Inventory – an itemized listing, specifying the type, location and approximate quantity of hazardous materials used in the ship's construction and equipment.

(b) Hazardous Materials(Hazmat) – materials or substances that are known to have the potential to harm human health and/or the environment.

(c) New Ship – means a ship for which either:
   (i) the building contract is placed on or after the date of application of this Hong Kong Convention / EU Regulation;
   (ii) in the absence of a building contract, the keel is laid or the ship is at a similar stage of construction six months after the date of application of this Hong Kong Convention / EU Regulation or thereafter; or
   (iii) the delivery takes place thirty months after the date of application of this Hong Kong Convention / EU Regulation or thereafter;

(d) Existing Ship – means a ship not complying with the above definition of a new ship.

(e) Shipowner – means the person or persons or company registered as the Owner of the ship or, in the absence of registration, the person or persons or company owning the ship. However, in the case of a ship owned by a State and operated by a company which in the State is registered as the ship's operator, "Owner" shall mean such company.

(f) Supplier – vendors which provide products, in support of the ship's construction and outfitting. This group includes equipment manufacturers and material providers.

(g) Threshold Level – is defined as the concentration value in homogeneous materials.

(h) Homogeneous Material – means a material of uniform composition throughout that cannot be mechanically dis-jointed into different materials, meaning that the materials cannot, in principle, be separated by mechanical action such as unscrewing, cutting, crushing, grinding, and abrasive processes.

31.2 Statement on Inventory of Hazardous Materials (the Statement)

The Statement for ships comply with Hong Kong Convention / EU Regulation is comprised of two components as follows.

(a) Ship Details

The first component of the Statement is referred to as the "Ship Details", and includes the following:

(i) Name of ship

(ii) Distinctive number or letters

(iii) Port of registry

(iv) Gross tonnage

(v) IMO number

(vi) Name and address of Shipowner

(vii) IMO registered Owner identification number

(viii) IMO company identification number

(ix) Date of construction

Refer to 31.5.5 of this chapter for an acceptable equivalent to the above.

(b) Inventory of Hazardous Materials (IHM)

The second component of the Statement is the actual inventory of the hazardous materials, containing the loca-tion, the approximate quantity/volume of each identified material on board the ship. This inventory is divided into the following parts.

(i) Part 1: Hazardous or potentially hazardous materials/substances utilized in the ship’s structure and equip-ment/systems.

(ii) Part 2: Operationally generated waste

(iii) Part 3: Stores

Preparation of Part 1 is to be based on the listing of those materials/substances considered to be hazardous or potentially hazardous as found in Sections A and B of Table II 31-2. Refer to 31.3.3 and 31.4.2 of this chapter. Part 2 and Part 3 are to be prepared by the Shipowner prior to or during the final voyage to the recycling facility and are out-side the scope of the class notation.

Table II 31-5 of this chapter is a representative format for the inventory component of the Statement.

31.3 Requirement for New Ships

31.3.1 General

Throughout a ship’s design and construction, designers and builders are to exercise environmental judgment in the selection of all materials and substances to be incorporated into the ship’s structure and equipment.

31.3.2 Prohibited or Restricted Materials

Substances known to be hazardous which are prohibited or restricted by national regulation and various interna-tional agreements and conventions are not to be used in the construction. Examples of these substances and the cor-responding statutory instruments are detailed in Table II 31-1.

31.3.3 Part 1 of the Inventory of Hazardous Materials

Upon completion of the material selection process, Part 1 of the IHM is to be prepared by the shipbuilder. Where the substances listed in Sections A and B of Table II 31-2 have been added to the vessel above the threshold levels specified in Table II 31-4, their identity, location and quantity are to be incorporated into Part 1 of the Inventory.

Documentation in the form of drawings or tables noting the use of hazardous materials, quantity, and location are to be submitted to the Society for review. At the ship builders option each drawing submitted is to be annotated in such a manner as to detail the use of hazardous or potentially hazardous materials thereon.

31.3.4 Vendor Supplied Equipment and Materials

Shipbuilders are to work closely with all their suppliers such that all equipment provided is environmentally safe or specifically itemized on the inventory. These suppliers are to confirm and declare whether or not the substances identified in Tables II 31-2 and 31-3 of this Chapter are present above the threshold level specified in Table II 31-4 of this Chapter, using the "supplier's declaration" approach established by the IMO Guidelines.

The approach consists of two declarations, as follows:

(a) Material Declaration (MD)

A declaration prepared by the suppliers, including the upstream suppliers in the equipment/system supply chain, detailing the specific substances including the system/item, the substance, and amount of substance. For detailed ex-planation and information requirements for the form, refer to MEPC.269(68) Section 6 and Appendix 3.

(b) Supplier's Declaration of Conformity (SDoC)

A declaration by the supplier to confirm conformity of the delivered product and related Material Declaration to the law and compliance with appropriate management/control requirements on the chemical substance contained in the product. Refer to MEPC.269(68) Section 7.

Shipbuilders are to request their suppliers to submit the above declaration forms for the products at the time of purchase. This collection of information, particularly the materials declarations, is to be used to prepare Part 1 of the Inventory.

31.4 Requirement for Existing Ships

31.4.1 General

Many materials and substances which were previously assumed to be non hazardous and selected for installation onboard ships, are no longer being utilized, or have since been identified as being hazardous. To assist in safeguarding the ship's crew, and workers involved in ship recycling, as well as the marine environment, documenting the location and approximate volume/quantity of materials currently classified as hazardous or potentially hazardous is to be achieved to the greatest degree possible.

It is recognized that it is often not possible to accurately define, identify, or locate specific hazardous or potentially hazardous materials onboard existing ships due to their concealment or unknown locations.

31.4.2 Part 1 of the Inventory of Hazardous Materials

Development of Part 1 of the IHM for an exiting vessel is the responsibility of the Shipowner.

The development of the IHM is to be prepared in accordance with Regulation 5.2 of Hong Kong Convention and/or Article 5.2 of EU 1257/2013, taking into account the development guidelines given in MEPC.269(68) Section 4.2 and Appendix 5.

It is required to identify the prohibited materials listed in Section A of Table II 31-2 of this Chapter contained in the ship's structure and equipment, their identity, location, and approximate quantity in the Inventory. Hazardous materials listed in Section B of Table II 31-2 of this Chapter and contained in the ship's structure and equipment are to be identified as far as practical.

The determination of hazardous materials present onboard existing ships is, as far as practical, to be conducted as prescribed for new ships. Alternative procedure for hazardous materials determination through a visual/sampling check process as prescribed in MEPC.269(68) Section 4.2 can be applied. But this procedure is not to be used for any new installation resulting from the conversion or repair of existing ships after the initial preparation of the Inventory.

This alternative procedure consists of the following steps:

(a) Collection of Necessary Information (Step 1)

The information collection process is to be made taking into account the guidance in MEPC.269(68) Subsection 4.2.5 and Appendix 5 Section 2.

Often the ship's crew can provide assistance as to the location of hazardous or potentially hazardous materials onboard as a result of their in depth ship-specific knowledge developed from carrying out or witnessing repairs and maintenance. Additionally the crew may provide valuable information associated with equipment replacement or modifications. Thus, shipowners may want to consider interviewing the ship's crew for information.

(b) Assessment of Collected Information (Step 2)

The information collected in Step 1 is to be assessed with the purpose of determining the existence of hazardous materials in the ship's structure, equipment, and systems by classifying each item as "contained", "not contained", "unknown" or "potentially containing hazmat" and to work out a suitable scope of the hazmat investigation by visu-al/sampling checks. Guidance for this step can be found in MEPC.269(68) Subsection 4.2.6 and Appendix 5 Section 3. The assessment and investigation are to cover all materials listed in Section A of Table II 31-2 of this Chapter. The substances in Section B of Table II 31-2 of this Chapter are to be identified and listed as far as practical.

(c) Preparation of Visual/Sampling Check Plan (Step 3)

Based on the assessment results of the previous step, a detailed survey and sampling check plan is to be developed. The goal of the survey and sampling is to assist in confirming if hazardous or potentially hazardous materials are present and where they are located.

Specific guidelines on how to decide on when to apply visual check or sample check are given in MEPC.269(68) Subsection 4.2.7 and Appendix 5 section 4.

A copy of the visual/sampling check plan is to be submitted to the Society for review before conducting the on-board survey and sampling checks.

(d) Onboard Visual/Sampling Check (Step 4)

The onboard visual/sample check is to be carried out in accordance with the visual/sampling check plan. Guid-ance on the conduct of the visual survey and sampling checks is given in MEPC.269(68) Subsection 4.2.8 and Ap-pendix 5 Section 5.

When a sampling check is carried out, the sample is to be forwarded to a recognized laboratory for testing and the records of the sample taken, the sampling point marked on the ship plan, and the laboratory test results are to be retained for record and reference.

An external specialist having specific knowledge in the means of how to take material samples and preventative measures to be taken to avoid cross contamination may be retained by the shipowner.

(e) Preparation of Part 1 of the Inventory and related documentation (Step 5)

Development of Part 1 of the IHM for existing ships is to be made by the shipowner, based on results of the Owner's evaluation/analysis of available hazmat information, results of visual surveys and any hazmat/substance testing reports. For any equipment, system, and/or area that is classed as either "containing hazardous material" (CHM) or "potentially containing hazardous material" (PCHM), their identity and location together with the hazmat identity and approximate quantity are to be listed in Part 1 of the Inventory.

Any limitations regarding the scope of laboratory reports or prepared inventory are to be stated or noted in the "Remarks" column of the Inventory.

Development of a location diagram of the hazardous materials identified and listed in the inventory is recom-mended in order to help the ship's crew gain a visual understanding of the Inventory and the onboard auditing survey by an CR Surveyor.

Expert assistance is required for the performance of the procedural steps of collecting and assessing the necessary hazardous materials information, preparing a visual/sample check plan, and performing the visual and sampling checks. The shipowner may consider employing a qualified and experienced hazardous material expert for the hazmat review and sampling, and contracting an accredited test laboratory for chemical analysis of samples.

31.4.3 New Installations

New installations containing hazardous materials listed in Section A of Table II 31-2 are prohibited, as for those containing hydrochloroflurorocarbons(HCFCs), which are permitted until January 1, 2020, except ships flying the flag of EU Member States or apply **SRE-EU** notation of the Society.

In relation to the IHM, any installation of materials and changes in ship structure and equipment resulting from the conversion or repair of existing ships after the initial approval are to be documented in a similar procedure as prescribed for new ships, based on MDs and SDoCs. Refer to 31.3.3 and 31.3.4 of this chapter for applicable requirements. The alternative procedure as prescribed in 31.4.2 above is not applicable for new installations.

Part 1 of the Inventory is to be properly updated reflecting the new installations containing hazardous materials listed in Table II 31-2 and relevant changes in ship's structure and equipment.

31.5 Certification, Maintenance and Survey

31.5.1 Introduction

The inventory of hazardous and potentially hazardous materials for ships of new constriction and existing ships, are to be developed by the shipyard or shipowner respectively, and submitted to the Society for review.

The hazardous or potentially hazardous materials/substances are to be suitably marked on board the ship to alert all parties of their presence and to facilitate random verification of the submitted documentation by an CR Surveyor.

31.5.2 Certification

Upon completion of the verification surveys, the Statement is issued and the **SRE** and/or **SRE-EU** notation is then assigned to the ship.

31.5.3 Survey

(a) Initial Survey

Once an inventory for a vessel has been developed, an onboard auditing survey by an CR Surveyor is to be carried out to generally verify that the locations and the approximate quantity/volume of hazardous material detailed on the inventory reflect those found on the vessel.

Upon successful completion of the initial survey, the Statement will be issued for a period not exceed five years.

(b) Annual Survey

An annual survey is also to be conducted to confirm that the Inventory reflects any modifications, repairs, or changes to the vessel that involve the removal or addition of hazardous materials.

Upon successful completion of the annual survey, the Statement will be endorsed.

(c) Renewal Survey

A renewal survey is to be carried out at intervals not exceeding five years. This survey is to verify that Part I of the IHM is properly maintained and updated to reflect changes in ship structure and equipment.

A new Statement is to be issued by the Society after successful completion of the renewal survey.

(d) Additional Survey

An additional survey, either general or partial, according to the circumstances, may be made at the request of the shipowner after a change, replacement, or significant repair of the structure, equipment, systems, fittings, arrangements and material. The survey is to ensure that any such change, replacement, or significant repair has been made in the way that the ship continues to comply with the requirements of this chapter, and that Part I of the Inventory is amended as necessary.

Upon successful completion of the additional survey, the Statement will be endorsed.

31.5.4 Maintenance of the Statement

Part 1 of the IHM is to be maintained throughout the ship's life and placed on board the ship. The removal, re-placement, or repair of existing equipment or substances previously detailed in Part 1 or the addition of relevant new equipment or substances is to be carefully tracked and is to be specified in the Inventory and suitably marked on board. Any changes to Part 1 of the Inventory are to be recorded so as to provide the current information together with a history of the changes.

An annual verification survey is to be carried out in the course of completing other periodical surveys. Any changes to the materials in the IHM is to be noted by the ship's crew and verified by the attending Surveyor. Upon satisfactory review and verification, the Statement will be endorsed.

31.5.5 Retention of Statement

The Statement is to be retained on board the ship and is to be presented to each subsequent Owner, including those instances where the flag, or type of service changes. Any changes relating to the ship details are to be recorded and updated accordingly. The Continuous Synopsis Record, as detailed in SOLAS Reg. XI-1/5, when combined with the Certificate of Build, as produced by the ship builder are considered as equivalent to the ship details section of the Statement, provided a copy is attached to the Inventory.

Table II 31-1
List of Materials Prohibited or Restricted on New Ships or New Installation

Substances	Agreement/Convention
Asbestos	1974 SOLAS – 2009 Amendments (Reg. II-1/3-5)
Organotin Compounds which act as biocides in antifouling systems (tributyltins (TBT's), Triphenyltins (TET's) and tributyltins Oxide (TBTO's))	International Convention on the Control of Harmful Anti-Fouling Systems on Ships 2001
Ozone Depleting Substances, Chlorofluorocarbons (CFC's)	MARPOL Annex VI Reg. 12 & Montreal Protocol
Polychlorinated biphenyls (PCB's)	Stockholm Convention on Persistent Organic Pollutants (POP's) (Part II)
Perfluorooctane sulfonic acid (PFOS) and its derivatives *	EU 1257/2013
Brominated Flame Retardant (HBCDD) *	EU 1257/2013

* Only apply to ships flying the flag of EU Member States or apply **SRE-EU** notation of the Society.

Table II 31-2
List of Hazardous Wastes and Substances that are Relevant to Ship Recycling

No.	*Materials*		*Inventory Part 1*	*Inventory Part 2*	*Inventory Part 3*
A. Obligatory for New and Existing Ships					
1	Asbestos		X		
2	Polychlorinated Biphenyls (PCBs)		X		
3	Ozone Depleting Substances	CFCs	X		
		Halons	X		
		Other fully halogenated CFCs	X

54		Spare parts which contain materials listed in Table II 31-2: A or B			X

Note:

(1) Definition of "Garbage" is identical with that of MARPOL Annex V. However, "Incinerator Ash" is classified separately because it may include hazardous substances or heavy metals.

Table II 31-4
Threshold Levels of Chemical Substances to be Listed in the Inventory

No.	*Materials*		*Threshold Level*
A. Obligatory for New and Existing Ships			
1	Asbestos		0.1%[(1)]
2	Polychlorinated Biphenyls (PCBs)		50 mg/kg[(2)]
3	Ozone Depleting Substances	CFCs	No threshold level[(3)]
		Halons	
		Other fully halogenated CFCs	
		Carbon Tetrachloride	
		1,1,1-Trichloroethane (Methyl Chloroform)	
		Hydrochlorofluorocarbons	
		Hydrobromofluorocarbons	
		Methyl Bromide	
		Bromochloromethane	
4	Organotin Compounds	Tributyl Tins	2500 mg/kg[(4)]
		Triphenyl Tins	
		Tributyl Tin Oxide (TBTO)	
5	Perfluorooctane sulfonic acid (PFOS) and its derivatives[(5)]		10 mg/kg (0.001% m/m)[(6)]
B. Obligatory for New Ships and New Installations; Voluntary for Existing Ships			
1	Cadmium and Cadmium Compounds		100 mg/kg[(7)]
2	Hexavalent Chromium and Hexavalent Chromium Compounds		1000 mg/kg[(7)]
3	Lead and Lead Compounds		1000 mg/kg[(7)]
4	Mercury and Mercury Compounds		1000 mg/kg[(7)]
5	Polybrominated Biphenyl (PBBs)		50 mg/kg[(8)]
6	Polybrominated Dephenyl Ethers (PBDEs)		1000 mg/kg[(7)]
7	Polychloronaphthalanes (more than 3 chlorine atoms)		50 mg/kg[(9)]
8	Radioactive Substances		No threshold level[(10)]
9	Certain Shortchain Chlorinated Paraffins (Alkanes, C10-C13, chloro)		1%[(11)]
10	Brominated Flame Retardant (HBCDD)[(5)]		100 mg/kg

Note:

(1) In accordance with regulation 4 of the Convention, for all ships, new installation of materials which contain asbestos are to be prohibited. According to the UN recommendation "Globally Harmonized System of Classification and Labelling of Chemicals (GHS)" adopted by the United Nations Economic and Social Council's Sub-Committee of Experts on the Globally Harmonized System of Classification and Labelling of Chemicals (UNSCEGHS), the UN's Sub-Committee of Experts, in 2002 (published in 2003), carcinogenic mixtures classified as Category 1A (including asbestos mixtures) under the GHS are required to be labelled as carcinogenic if the ratio is more than 0.1%. However, if 1% is applied, this threshold value should be recorded in the Inventory and, if available, the Material Declaration and can be applied not later than five years after the entry into force of the Convention. The threshold value of 0.1% need not be retroactively applied to those Inventories and Material Declarations.

(2) In accordance with regulation 4 of the Convention, for all ships, new installation of materials which contain PCBs are to be prohibited. The Organization set 50 mg/kg as the threshold value referring to the concentration level at which wastes, substances and articles containing, consisting of or contaminated with PCB are characterized as hazardous under the Basel Convention.

(3) "No threshold value" is in accordance with the Montreal Protocol for reporting ODS. Unintentional trace contaminants should not be listed in the Material Declarations and in the Inventory.

(4) This threshold value is based on the Guidelines for brief sampling of anti-fouling systems on ships (resolution MEPC.104(49)).

(5) Only apply to ships flying the flag of EU Member States or ships assigned **SRE-EU** notation by the Soecity.

(6) Concentrations of PFOS above 10 mg/kg (0.001% by weight) when it occurs in substances or in preparations or concentrations of PFOS in semi-finished products or articles, or parts thereof equal to or above than 0.1% by weight calculated with reference to the mass of structurally or micro-structurally distinct parts that contain PFOS or for textiles or other coated materials, if the amount of PFOS is equal to or above than 1 μg/m² of the coated material.

(7) The Organization set this as the threshold value referring to the Restriction of Hazardous Substances (RoHS Directive 2011/65/EU, Annex II).

(8) The Organization set 50 mg/kg as the threshold value referring to the concentration level at which wastes, substances and articles containing, consisting of or contaminated with PBB are characterized as hazardous under the Basel Convention.

(9) The Organization set 50 mg/kg as the threshold value referring to the concentration level at which wastes, substances and articles containing, consisting of or contaminated with PCN are characterized as hazardous under the Basel Convention.

(10) All radioactive sources should be included in the Material Declaration and in the Inventory. Radioactive source means radioactive material permanently sealed in a capsule or closely bonded and in a solid form that is used as a source of radiation. This includes consumer products and industrial gauges with radioactive materials. Examples are listed in MEPC.269(68) appendix 10.

(11) The Organization set 1% as the threshold value referring to the EU legislation that restricts Chlorinated Paraffins from being placed on the market for use as substances or as constituents of other substances or preparations in concentrations higher than 1% (EU Regulation 1907/2006, Annex XVII Entry 42 and Regulation 519/2012).

Table II 31-5
Standard Format of the Inventory of Hazardous Materials

Part 1 Hazardous materials contained in the ship's structure and equipment

1.1 Paints and coating systems containing materials listed in A and B of Table II 31-2

No.	*Application of Paint*	*Name of Paint*	*Location*	*Materials*	*Approx. Quantity*	*Remarks*
1	Anti-drumming compound	Primer, xx Co., xx Primer #300	Hull part	Lead	30 kg	
2	Antifouling	xx Co. xx coat #100	Underwater parts	TBT	20 kg	

1.2 Equipment and machinery containing materials listed in A and B of Table II 31-2

No.	*Name of Equipment and Machinery*	*Location*	*Materials*	*Parts of Use*	*Approx. Quantity*	*Remarks*
1	Switchboard	Engine Control Room	Lead	Solder and electric contact	200 mg	
			Mercury	Heat gauge	10 mg	
~~2~~	~~Diesel Engine, xx Co., xx #150~~	~~Engine Room~~	~~Lead Cadmium~~	~~Bearing Starter for blower~~	~~50 mg~~	
3	Diesel Engine, xx Co., xx #200	Engine Room	Lead	Starter for blower	10 mg	Revised by XXX on Oct. XX, 2008 (revoking No. 2)
4	Diesel generator (x 3)	Engine Room	Lead	Ingredient of copper compounds	0.01 kg	
5	Radioactive level gauge	No. 1 Cargo tank	Radioactive substances	Gauge	5 Ci (1.8E+11) (Bq)	Radionuclides: ^{60}Co

1.3 Structure and hull containing materials listed in A and B of Table II 31-2

No.	*Name of Structural Element*	*Location*	*Materials*	*Parts of Use*	*Approx. Quantity*	*Remarks*
1	Wall Panel	Accommodation	Asbestos	Insulation	2 t	
2	Wall Insulation	Engine Control Room	Lead	Perforated plate	200 mg	Cover of insulation material
			Asbestos	Fire protection	25 kg	Under lead containing plates

Part 2 Operationally generated waste

No.	*Location*(1)	*Name of Item and Detail (if any) of the Item*	*Approx. Quantity*	*Remarks*
1	Garbage Locker	Garbage (FOOD Waste)	30 kg	
2	Bilge Tank	Bilge Water	10 m^3	
3	No. 1 Cargo Hold	Dry Cargo Residues (Iron ore)	100 kg	
4	No. 2 Cargo Hold	Waste Oil (Sludge) (Crude)	100 kg	
5	No. 1 Ballast Tank	Ballast Water	100 m^3	
		Sediments	200 kg	

Table II 31-5
Standard Format of the Inventory of Hazardous Materials (continued)

Part 3 Stores

3.1 Stores

No.	*Location*(1)	*Name of Item*	*Unit Quantity*	*Figure*	*Approx. Quantity*	*Remarks*(2)
1	No. 1 Fuel Oil Tank	Fuel Oil (Heavy Fuel Oil)	---	---	100 m^3	
2	CO_2 Room	CO_2	100 kg	50 pcs	5000 kg	
3	Workshop	Propane	20 kg	10 pcs	200 kg	
4	Medicine Locker	Miscellaneous Medicines	---	---	---	Details are shown in the attached list
5	Paint Stores	Paint, xx Co., #600	20 kg	5 pcs	100 kg	Cadmium containing

3.2 Liquids sealed in ship's machinery and equipment

No.	*Type of Liquids*	*Name of Machinery or Equipment*	*Location*(1)	*Approx. Quantity*	*Remarks*
1	Hydraulic Oil	Deck crane hydraulic oil system	Upper Deck	100 ltr	
		Deck machinery hydraulic oil system	Upper Deck and Bosun Store	2000 ltr	
		Steering gear hydraulic oil system	Steering Gear Room	500 ltr	
2	Lubricating Oil	Main engine system	Engine Room	50 ltr	
3	Boiler Water Treatment	Boiler	Engine Room	10 ltr	

3.3 Gases sealed in ship's machinery and equipment

No.	*Type of Gases*	*Name of Machinery or Equipment*	*Location*	*Approx. Quantity*	*Remarks*
1	HFC	AC system	AC Room	100 kg	
		Refrigerated provision chamber machine	AC Room	50 kg	

3.4 Regular consumable goods

No.	*Location*(1)	*Name of Item*	*Manufacturer*	*Quantity*	*Remarks*
1	Accommodation	Refrigerators	xx Co.	1	
2	Accommodation	Personal computers	xxx Co.	2	
3	Accommodation	Vacuum cleaners	xxxx Co.	1	
4	Accommodation	Office chairs	xxxxx Co.	1	

Notes:

(1) About Locations of Part 2 and Part 3, each item should be entered in order based on its location from a lower level to an upper level and from a fore part to an aft part for respective subparts. The location of Part 1 items is recommended to be described similarly, as far as practicable.

(2) About Remarks of Part 3, if hazardous materials are integrated in products, the approximate amount of the contents should be shown as far as possible.

Chapter 32

Pollution Prevention Notations For Vessels

32.1 General

32.1.1 Application

Additional class notations **PP** ,**BWM** and **EEDI** may be assigned to ships so designed and equipped as to control and limit the emission of polluting substances in the sea and the air, in accordance with the requirements given in this chapter.

32.1.2 Certificates

The certificates to be submitted prior to the delivery of the additional class notations **PP** ,**BWM** and **EEDI** are listed in Table II 32-1.

32.2 PP Notation

32.2.1 Control of discharges into the sea

This section addresses requirements aimed towards the prevention of pollution to the sea environment discharged from vessels.

(a) Oil discharges

This subsection aimed at reducing the potential adverse effects on the sea environment by oil discharges from vessels.

(i) Machinery spaces

Vessels are to hold and maintain a valid IOPP Certificate with Form A in accordance with the requirements of MARPOL Annex I, Regulations for the Prevention of Pollution by Oil.

(ii) Cargo area

Vessels designed or adapted to carry a cargo of oil and/or oil product in bulk are to hold and maintain a valid IOPP Certificate with Form B in accordance with the requirements of MARPOL Annex I.

(b) Noxious liquid substances

This subsection aimed towards the prevention of pollution to the sea environment by noxious liquid substances (NLS) from vessels.

Vessels designed or adapted to carry a cargo of NLS in bulk are to hold and maintain a valid NLS Certificate in accordance with the requirements of MARPOL Annex II, Regulations for the Control of Pollution by Noxious Liquid Substances in Bulk.

(c) Sewage

This subsection aimed at reducing the potential adverse effects on the sea environment by sewage from vessels.

Vessels are to comply with the requirements of MARPOL Annex IV, Regulations for the Prevention of Pollution by Sewage from Ships.

(d) Garbage

This subsection aimed towards the prevention of pollution to the sea environment by garbage discharges from vessels.

Vessels are to comply with the requirements of MARPOL Annex V, Regulations for the Prevention of Pollution by Garbage from Ships.

(e) Anti-fouling systems

This subsection aimed at reducing the potential adverse effects of introducing organotin compounds to the sea environment by anti-fouling systems of vessels. Vessels of 400 gross tons and above are to hold and maintain a valid IAFS Certificate in accordance with the requirements of the AFS Convention. Vessels of 24 meters or more in length, but less than 400 gross tons, are to hold and maintain a valid Declaration on Anti-Fouling System in accordance with the requirements of the AFS Convention.

32.2.2 Control of discharges into the Air

This section addresses requirements aimed towards the prevention of pollution to the air environment discharged from vessels.

(a) Nitrogen Oxides (NOx) emission

This subsection aimed towards the prevention of pollution to the air environment by nitrogen oxides from vessels.

Vessels are to comply with the requirements of Regulation 13 of MARPOL Annex VI, Regulations for the Prevention of Air Pollution from Ships, and the NOx Technical Code, 2008.

(b) Sulfur Oxides (SOx) emission

This subsection aimed towards the prevention of pollution to the air environment by sulfur oxides from vessels.

Vessels are to comply with the requirements of Regulation 14 and 18 of MARPOL Annex VI.

(c) Incinerators

This subsection aimed towards the prevention of pollution to the air environment from vessels by incinerators.

Where installed onboard, incinerators are to be type-approved in accordance with IMO Resolution MEPC.244(66), Standard Specification for Shipboard Incinerators.

Onboard incineration is to conform to Regulation 16 of MARPOL Annex VI.

Incineration of any garbage, as defined by Annex V, excluding those contain more than traces of heavy metals, is to be recorded in the Garbage Record Book in accordance with MARPOL Annex V.

(d) Ozone depleting substances (ODS)

This subsection aimed towards the prevention of pollution to the air environment by ozone depleting substances from vessels.

Vessels are to comply with the requirements of Regulation 12 of MARPOL Annex VI.

(i) Refrigerant Systems

The requirements of this subsection are applicable to refrigerant systems onboard vessels, excluding permanently sealed equipment, where there are no refrigerant charging connections or potentially removable components containing ozone depleting substances. Refrigerant systems are to be provided with environmentally friendly refrigerants in accordance with the requirements of Regulation 12 of MARPOL Annex VI. Furthermore, the use of refrigerants with global warming potential (GWP) greater than 3000 are prohibited. Annual refrigerant leakage is to be not more than 10% of the total refrigerant charge of each system. An appropriate leak detection system is to be provided to continuously monitor spaces into which the refrigerant could leak. Further, an alarm is to be given in a manned location when the refrigerant concentration exceeds a predetermined limit (for example, 25 ppm for ammonia or 300 ppm for halogenated fluorocarbons).

(ii) Fire-fighting Systems

This subsection addresses requirements aimed at reducing the potential adverse effects on the air environment by fire-fighting systems onboard vessels. The use of Halons or perfluorocarbon mediums is not permitted in fixed fire extinguishing systems or portable fire extinguishers. Alternative mediums to Halons or perfluorocarbons may be acceptable, provided they contain no ozone depleting substances or have a GWP less than 4000.

32.3 BWM Notation

This subsection aimed towards the prevention of transporting harmful aquatic organisms and pathogens via water ballast from vessels. Vessels are to comply with the relevant requirements of International Convention for the Control and Management of Ships Ballast Water and Sediments, 2004.

32.4 EEDI and SEEMP Notations

This subsection aimed towards the prevention of pollution to the air environment by excessive carbon dioxide from vessels. Vessels are to comply with the requirements of Regulation 19 to 22 of MARPOL Annex VI.

Table II 32-1
Required Certificates

Certificates	**In accordance with:**	**PP ,BWM, EEDI and SEEMP notations**
IOPP certificate	Annex I of MARPOL 73/78	R
Certificates of type approval for: •15 ppm bilge separator •15 ppm bilge alarm	IMO Resolution MEPC.107(49): •Appendix 1 •Appendix 2	 R R
NLS certificate	Annex II of MARPOL 73/78	R, where applicable
ISPP certificate	Annex IV of MARPOL 73/78	R
Type approval certificate of the sewage system	IMO Resolution MEPC.227(64)	R
Incinerator type approval certificate	IMO Resolution MEPC.244(66) as amended by resolution MEPC.93(45) Annex VI of MARPOL 73/78	R(1)
IAPP certificate	Annex VI of MARPOL 73/78	R
EIAPP certificate	NOx Technical Code, 2008	R
IAFS certificate or Declaration on AFS	International Convention on the control of harmful anti-fouling systems on ships, 2001	R
International Energy Efficiency (IEE) Certificate	Annex VI of MARPOL 73/78	R
BWM certificate	International Convention for the Control and Management of Ships Ballast Water and Sediments, 2004	R

Note:
"R" means that a certificate is required.
(1) Shipboard incinerator is not required. However, when fitted onboard, it is to be type-approved.

Chapter 33
Sloshing

33.1 General

33.1.1 This Chapter applies to all liquid cargo, ballast tanks and other tanks with volume exceeding 100 m^3, but does not apply to the water ballast cargo hold of bulk carriers.

33.1.2 The sections 33.2 to 33.5 in this Chapter apply to steel hull structures for ships with length 100 meters and above. The section 33.6 applies to steel hull structures for ships with length less than 100 meters.

33.1.3 Sloshing is the phenomenon occurring in the partially filled tank due to liquid motion in the tank. The phenomenon may cause impulsive local load and cause critical damage on tank structure.

33.2 Design Loads for Sloshing

33.2.1 The sloshing pressures given in 33.2.2, 33.2.3 and 33.2.6 are to be considered together with the general structural strength formulae given in 33.3, 33.4 and 33.5. The impact pressures p_i given in 33.2.4 to 33.2.7 are to be used together with impact structural strength formulae given in 33.5.6.

33.2.2 General

(a) Tanks for crude oil or bunkers are normally to be designed for liquids of density equal to that of sea water, taken as $\rho = 1.025$ t/m^3. Tanks for heavier liquids may be approved after special consideration.

(b) The minimum sloshing pressure on web frames and girder panels in cargo and ballast tanks, except ballast tanks in double side and double bottom, is to be taken as 20 kN/m^2. In double side and double bottom ballast tanks, the minimum sloshing pressure is to be taken as 12 kN/m^2. In long or wide tanks with many web frames or girders, the sloshing pressure on the frames or girders located within $0.25 l_s$ ($0.25 b_s$) from the wash or end bulkheads is to be taken as:

$$p = p_{bhd-lng}\left(1 - \frac{s}{l_s}\right)^2 \quad kN/m^2 \quad \text{for web frames}$$

$$p = p_{bhd-t}\left(1 - \frac{s}{b_s}\right)^2 \quad kN/m^2 \quad \text{for longitudinal girders}$$

where:

$p_{bhd-lng}, p_{bhd-t}$	=	Longitudinal and transverse sloshing pressure on wash or end bulkheads as given in 33.2.3
s	=	Distance, in m, from bulkhead to web frame or girder considered.
l_s	=	As given in 33.2.3.
b_s	=	As given in 33.2.3.

(c) Tanks with free sloshing breadth $b_s > 0.56B$ will be subject to specified restrictions on maximum GM. In addition such tanks and/or tanks with a sloshing length such that $0.13L < l_s < 0.16L$ may be designed for specified restrictions in filling height. where b_s and l_s are as given in 33.2.3.

33.2.3 Sloshing pressure on bulkheads

The sloshing pressure in way of transverse bulkheads including wash bulkheads due to longitudinal liquid motion, $p_{bhd-lng}$, in kN/m^2, for a particular filling level, is to be taken as: (including top of tank located within $0.25l_s$ from the wash or end bulkheads) (see Fig. II 33-3)

$$p_{bhd-lng} = \rho g_0 l_s k_f \left[0.4 - \left(0.39 - \frac{1.7l_s}{L}\right)\frac{L}{350}\right] \quad kN/m^2$$

The sloshing pressure in way of longitudinal bulkheads including wash bulkheads due to transverse liquid motion, p_{bhd-t}, in kN/m^2, for a particular filling level, is to be taken as: (including top of tank located within $0.25b_s$ from the wash or end bulkheads) (see Fig. II 33-3)

$$p_{bhd-t} = 7\rho g_0 k_f \left(\frac{b_s}{B} - 0.3\right) GM^{0.75} \quad kN/m^2$$

where:

g_0 = 9.81 m/s^2, standard acceleration of gravity

k_f = $1 - 2\left(0.7 - \frac{h}{H}\right)^2$, maximum $= 1$, and $\left(\frac{h}{H}\right)_{max} = 1$

h = Filling height, in m

H = Tank height. in m, within 0.15 l_s or 0.15 b_s

GM = Maximum GM including correction for free surface effect. $GM_{minimum}$ = 0.12 B (m)

l_s = Effective sloshing length, in m, given as:

= $\frac{(1+n_t\alpha_t)(1+\beta_t n_2)l}{(1+n_t)(1+n_2)}$ for end bulkheads

= $\frac{[1+\alpha_t(n_t-1)](1+\beta_t n_2)l}{(1+n_t)(1+n_2)}$ for wash bulkheads

b_s = Effective sloshing breadth, in m, given as:

= $\frac{(1+n_1\alpha_1)(1+\beta_1 n_4)b}{(1+n_1)(1+n_4)}$ for tank sides

= $\frac{[1+\alpha_1(n_1-1)](1+\beta_1 n_4)b}{(1+n_1)(1+n_4)}$ for wash bulkhead

l = Tank length, in m

b = Tank breadth, in m

n_t = Number of transverse wash bulkheads in the tank with $\alpha_t < 0.5$

α_t = Ratio between openings in transverse wash bulkhead and total transverse area in the tank below considered filling height, see Fig. II 33-1.
If no restriction to filling height, h is taken as 0.7 H.

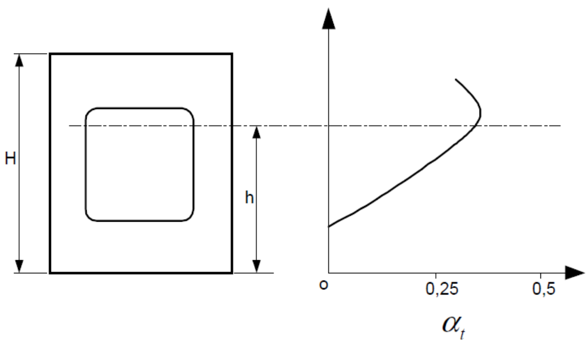

Fig. II 33-1
Wash Bulkhead Coefficient

n_2	=	$\frac{l}{1+n_t}$, number of transverse web-ring frames in the tank over the length.
β_t	=	Ratio between openings in web-ring frames and total transverse area in the tank below considered filling height, see Fig. II 33-2. If no restriction to filling height, h is taken as 0.7 H.
n_l	=	Number of longitudinal wash bulkheads in the tank with $\alpha_l < 0.5$
α_l	=	Similar to α_t but taken for longitudinal wash bulkhead.
n_4	=	$\frac{b}{1+n_l}$, number of longitudinal ring-girders in the tank between the breadth.
β_l	=	Similar to β_t taken for longitudinal ring-girders.

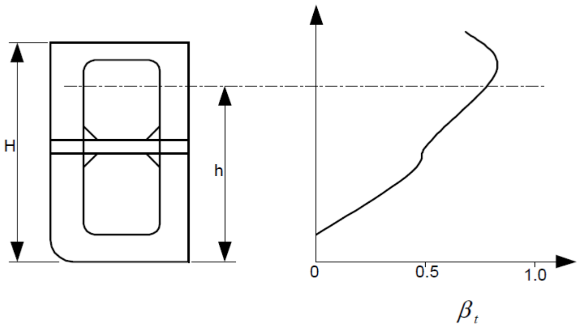

Fig. II 33-2
Webframe Coefficient

33.2.4 Impact pressure in upper part of tanks

Tanks with free sloshing length $0.13L < l_s < 0.16L$ or with free sloshing breadth $b_s > 0.56B$ will generate an impact pressure on horizontal and inclined surfaces adjacent to vertical surfaces in upper part of the tank due to high liquid velocities meeting these surfaces. For horizontal or inclined panels (deck, horizontal stringers etc.), the impact pressure on upper parts of the tank may be taken as:

Within $0.15l_s$ from transverse wash or end bulkheads:

$$p_i = \rho g_0 k_f \left(\frac{220 l_s}{L} - 7.5\right) \sin^2\gamma \quad kN/m^2 \qquad \text{for } \frac{l_s}{L} \le \frac{350+L}{3550}$$

$$p_i = \rho g_0 k_f \left(25 + \frac{L}{13}\right)\left(0.5 + \frac{l_s}{L}\right) \sin^2\gamma \quad kN/m^2 \qquad \text{for } \frac{l_s}{L} > \frac{350+L}{3550}$$

Within 0.15 b_s from longitudinal wash bulkheads and tank sides:

$$p_i = \frac{240 \rho g_0 k_f}{B}\left(\frac{b_s}{B} - 0.3\right) GM^{1.5} \sin^2\gamma \qquad kN/m^2$$

Outside $0.15l_s$ and $0.15b_s$ the pressure may be reduced to zero at $0.3l_s$ and $0.3b_s$, respectively, see Fig. II 33-3. In tank corners within 0.15 l_s and 0.15 b_s the impact pressure is not to be taken smaller than p_i (transversely) or p_i (longitudinally) + 0.4 p_i (transversely).

The reflected impact pressure on vertical surfaces adjacent to horizontal or inclined surfaces above will have an impact pressure linearly reduced to 50% of the pressure above, 0.1 l_s or 0.1 b_s (m) below. l_s, b_s and GM are as given in 33.2.3.

k_f	=	$1 - 4\left(0.6 - \frac{h}{H}\right)^2$, maximum = 1, and $\left(\frac{h}{H}\right)_{max} = 1$
h	=	Maximum allowable filling height, in m
H	=	Tank height, in m, within 0.15 l_s or 0.15 b_s
γ	=	Angle between considered panel and the vertical.

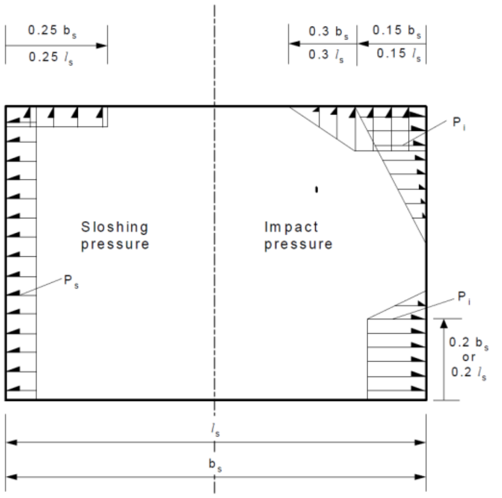

Fig. II 33-3
Pressure Distribution

33.2.5 Impact pressure in lower part of smooth tanks

In larger tanks (l_s > 0.13 L or b_s > 0.56 B) with double bottom and which have no internal transverse or longitudinal girders restraining the liquid movement at low minimum filling heights (2 < h < 0.2 l_s or 2 < h < 0.2 b_s) the impact pressure on vertical and inclined tank surfaces is not to be taken less than:

$p_i = 1.42\rho g_0 k l_s \sin^2\delta$ kN/m^2 on transverse bulkheads up to a height of $0.2l_s$
$p_i = 1.5\rho g_0 b_s \sin^2\delta$ kN/m^2 on longitudinal bulkheads up to a height of $0.2b_s$

The impact pressure may be reduced to zero 1 meter above the heights given, see Fig. II 33-3.

In tank corners at outermost side of transverse bulkheads the impact pressure within 0.15 b_s is not to be taken smaller than:

$p_i(\text{longitudinally}) + 0.4p_i(\text{transversely})$

If the tank is arranged with a horizontal stringer within the height h < 0.2 l_s or h < 0.2 b_s a reflected impact pressure of the same magnitude as on adjacent transverse or longitudinal bulkhead is to be used on the under side of the stringer panel.

l_s and b_s are free sloshing length and breadth, in m, at height considered, as given in 33.2.3.

k	=	1	for L < 200
	=	1.4 – 0.002L	for L > 200
δ	=	Angle between the lower boundary panel and the horizontal.	

33.2.6 For tanks with upper panels higher than L/20 m above lowest seagoing waterline the sloshing and impact pressures given in 33.2.3 and 33.2.4 are to be multiplied by the following magnification factors:

1 + 6 z_e/L for longitudinal sloshing
1 + 7.5 z_e GM/B^2 for transverse sloshing
1 + 18 z_e/L for longitudinal impact
1 + 17.5 z_e GM/B^2 for transverse impact

where:

z_e	=	$z_t - T_s - L/20$	m
z_t	=	Distance from baseline to panel consider, in m	

T_s = Lowest seagoing draught, in m, $T_s = 0.50$ T may normally be used.
T = Mean moulded summer draught ,in m.

33.2.7 For tanks with smooth boundaries (no internal structural members) with tank bottom higher than the D/2, the low filling impact pressure as given in 33.2.5 is to be multiplied by the following magnification factor:

$$\left(1+\frac{2z_i\theta}{l_s}\right)^2 \quad \text{in longitudinal direction}$$
$$\left(1+\frac{2z_i\phi}{b_s}\right)^2 \quad \text{in transverse direction}$$

z_i = Distance from panel considered to D/2, in m
D = Moulded depth defined as the vertical distance in m from baseline to moulded deckline at the uppermost continuous deck measured amidships.
θ = Pitch angle in radian.
ϕ = Rolling angle in radian.

The roll angle (single amplitude) is given by:

$$\phi = \frac{50c}{B+75} \quad \text{rad}$$

where:

c	=	$(1.25 - 0.025\,T_R)\,k$	
	=	1.2	for ships without bilge keel
k		1.0	for ships with bilge keel
		0.8	for ships with active roll damping facilities
T_R	=	The period of roll, not to be taken greater than 30	
k_r	=	Roll radius of gyration, in m	
GM	=	Metacentric height, in m.	
T_R	=	$\frac{2k_r}{\sqrt{GM}}$ sec	

The values of k_r and GM to be used are to give the minimum realistic value of T_R for the load considered.
In case k_r and GM have not been calculated for such condition, the following approximate design values may be used:

k_r	=	0.39 B	for ships with even transverse distribution of mass
		0.35 B	for tankers in ballast
		0.25 B	for ships loaded with ore between longitudinal bulkheads
GM	=	0.07 B	in general
		0.12 B	for tankers and bulk carriers.
		0.05 B	for container ship with B < 32.2 m
		0.08 B	for container ship with B > 40.0 m
		with interpolation for B in between.	

The pitch angle is given by:

$$\theta = 0.25\frac{a_0}{C_b} \quad \text{rad}$$

where:

a_0 = A common acceleration parameter is given by:
= $\frac{3C_1}{L} + C_V C_{V1}$
C_1 = 0.0792 L for $L \le 90$, Coefficient of ship length as specified in 3.2.2 of this Part.
C_V = $\frac{\sqrt{L}}{50}$, maximum 0.2

$C_{V1} = \frac{V}{\sqrt{L}}$, minimum 0.8

33.3 Side Structures Subjected to Sloshing

33.3.1 Design Load for Sloshing

The design load of side structures for sloshing is not to be less than that obtained from the formula as given in 33.2.3.The sloshing pressure defined in 33.2.3 is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 H_{max} to 0.95 H_{max}, in 0.05 H_{max} increments.

For tanks with free breadth b_s > 0.56B, the design pressure will be specially considered according to 33.2.2(c).

33.3.2 Side plating

The thickness requirement corresponding to lateral pressure is given by:

$$t = \frac{15.8 k_a s \sqrt{p}}{\sqrt{\sigma}} + t_c \quad \text{mm}$$

where:

p = Design load for sloshing as given in 33.3.1

t_c = Corrosion addition, plates, stiffeners and girders in tanks for water ballast and or cargo oil is to be given a corrosion addition t_c as stated in Table 33-1.

k_a = Correction factor for aspect ratio of plate field

= $(1.1 – 0.25\ s/\ l)^2$

= maximum 1.0 for s/ l = 0.4

= minimum 0.72 for s/ l = 1.0

l = stiffener span, in m

s = Stiffener spacing, in m, measured along the plating

σ = 140/K for longitudinally stiffened side plating at neutral axis, within 0.4 L amidship

120/K for transversely stiffened side plating at neutral axis, within 0.4 L amidship.

Above and below the neutral axis, the σ-values are to be reduced linearly to the values for the deck and bottom plating, assuming the same stiffening direction and material factor K as for the plating considered.

160/K within 0.05 L from F.P. and 0.1 L from A.P.

K = The material factor K as specified in 1.5.2(a) of this Part.

Between specified regions the σ-value may be varied linearly.

33.3.3 Longitudinals

The section modulus requirement is given by:

$$Z = \frac{83 l s p w_k}{\sigma} \quad \text{cm}^3, \text{minimum } 15 \text{ cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

l = Stiffener span, in m

s = Stiffener spacing, in m, measured along the plating

w_k = Section modulus corrosion factor in tanks

For stiffeners where formulae are given in the rules with the w_k increase in section modulus for compensation of the corrosion addition (t_c).

For rolled sections the section modulus requirement may be multiplied by a corrosion factor w_k, given by the following approximation:

w_k = Section modulus corrosion factor in tanks

	=	$1 + 0.05(t_{kw} + t_{kf})$ for flanged sections
	=	$1 + 0.06t_{kw}$ for bulbs
t_{kw}	=	Corrosion addition t_c as given in 33.3.2 with respect to the profile web
t_{kf}	=	Corrosion addition t_c as given in 33.3.2 with respect to the profile flange.

For flat bars the corrosion addition t_c may be added directly to the thickness.

σ	=	Allowable stress within 0.4 L amidships is given by:
	=	$\frac{225}{K} - 130f_2\frac{z_n - z_a}{z_n}$, maximum $\frac{160}{K}$
	=	$160/K$ for others

Between specified regions the σ-value may be varied linearly.

z_n	=	Vertical distance, in m, from the baseline or deck line to the neutral axis of the hull girder, whichever is relevant.
z_a	=	Vertical distance, in m, from the baseline or deck line to the point in question below or above the neutral axis, respectively.
f_2	=	Stress factor f_{2b} below the neutral axis of the hull girder, depending on surplus in midship section modulus and maximum value of the actual still water bending moments:
f_{2b}	=	$\frac{5.7(M_S + M_W)}{Z_B}$
f_2	=	Stress factor f_{2d}, above the neutral axis of the hull girder, depending on surplus in midship section modulus and maximum value of the actual still water moments:
f_{2d}	=	$\frac{5.7(M_S + M_W)}{Z_D}$
Z_B	=	Midship section modulus, in cm^3, at bottom as built
Z_D	=	Midship section modulus, in cm^3, at deck as built
M_S	=	Normally to be taken as the largest design still water bending moment, in kNm.
M_W	=	Rule wave bending moment, in kNm, is given in 3.2.2 of this Part.

33.3.4 Main frames

(a) Main frames are frames located outside the peak tanks, connected to the floors, double bottom or hopper tanks and extended to the lowest deck, stringer or top wing tank on the ship side.

(b) The section modulus re quirement is given by:

$$Z = KCl^2spw_k \quad cm^3$$

where:

p	=	Design load for sloshing as given in 33.2.2(b)
C	=	0.43
l	=	Corresponding to full length of frame including brackets, in m.
s	=	Stiffener spacing, in m, measured along the plating

(c) The requirement given in (b) is based on the assumption that effective brackets are fitted at both ends. The length of brackets is not to be less than:

— 0.12 *l* for the lower bracket.
— 0.07 *l* for the upper bracket.

The section modulus of frame, including bracket, at frame ends is not to be less than as given in 33.3.4(b) with *l* equal to total span of frame including brackets and applying C-factors as given below.

Upper end:
C = 0.64 when internal pressure (p) is used.
Lower end:
C = 0.86 when internal pressure (p) is used.

When the length of the free edge of the bracket is more than 40 times the plate thickness, a flange is to be fitted, the width being at least 1/15 of the length of the free edge.

For single deck vessels e.g. gas carriers, the end connection of main frames may alternatively be based on a direct calculation where the rotation of upper and lower ends are taken into account.

33.3.5 Tween deck frames and vertical peak frames

(a) Tween deck frames are frames between the lowest deck or the lowest stringer on the ship's side and the uppermost superstructure deck between the collision bulkhead and the after peak bulkhead.

(b) The section modulus is not to be less than the greater of:

$$Z = 0.55Kl^2spw_k \quad cm^3$$
$$= \frac{k}{\sqrt{KL}} \quad cm^3$$

Where:
k = 6.5 for peak frames
= 4.0 for tween deck frames
p = Design load for sloshing as given in 33.2.2(b)
w_k = Section modulus corrosion factor in tanks as given in 33.3.3

33.3.6 Girders

The section modulus requirement is given by:

$$Z = \frac{100S^2bpw_k}{\sigma} \quad cm^3$$

where:
p = Design load for sloshing as given in 33.2.2(b)
b = Loading breadth, in m
$\sigma = \frac{190}{K} - 130f_2\frac{z_n - z_a}{z_n}$, maximum $\frac{160}{K}$ for continuous longitudinal girders within 0.4L amidships
= 160/K for other girders.

Between specified regions the σ-value may be varied linearly.

f_2 = Stress factor f_{2b} as given in 33.3.3
= Stress factor f_{2d} as given in 33.3.3

The above requirement applies about an axis parallel to the ship's side.
z_a , z_n and w_k = As given in 33.3.3

33.3.7 Strengthening against liquid impact pressure in larger tanks

If the ship side forms boundary of larger ballast or cargo tanks with free sloshing length l_s > 0.13 L and or breadth b_s > 0.56 B, the side structure is to have scantlings according to 33.5.6 for impact loads referred to in 33.2.1.

33.4 Deck Structures Subjected to Sloshing

33.4.1 Design Load for Sloshing

When Deck as tank boundary in tanks and located less than 0.25 b_s away from tank sides ,the design load of deck structures for sloshing is not to be less than that obtained from the formula as given in 33.2.3.

For tanks with free breadth (no longitudinal wash bulkheads) $b_s > 0.56B$, the design pressure will be specially considered according to 33.2.2(c).

When Deck as tank boundary in tanks and located less than 0.25 l_s away from tank ends ,the design load of deck structures for sloshing is not to be less than that obtained from the formula as given in 33.2.3.

For tanks with free length (no transverse wash bulkheads or transverse web frames in narrow tanks) $l_s > 0.13L$, the design pressure will be specially considered according to 33.2.2(c).

The sloshing pressure defined in 33.2.3 is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 H_{max} to 0.95 H_{max}, in 0.05 H_{max} increments.

33.4.2 Strength deck plating

The thickness requirement corresponding to lateral pressure is given by:

$$t = \frac{15.8 k_a s \sqrt{p}}{\sqrt{\sigma}} + t_c \qquad \text{mm}$$

where:

p	=	Design load for sloshing as given in 33.4.1
σ	=	Allowable stress within 0.4 L, given by:
	=	$\frac{175}{K} - 120 f_{2d}$, maximum $\frac{120}{K}$ for transversely − stiffened
	=	120/K for longitudinally-stiffened
	=	160/K within 0.1 L from the perpendiculars and within line of large deck openings. Between specified regions the σ-value may be varied linearly.
K	=	The material factor K as specified in 1.5.2(a) of this Part.
f_{2d}	=	Stress factor above the neutral axis as given in 33.3.3

33.4.3 Longitudinals

The section modulus requirement is given by:

$$Z = \frac{83 l^2 s p w_k}{\sigma} \qquad \text{cm}^3, \text{minimum } 15 \text{ cm}^3$$

where:

p	=	Design load for sloshing as given in 33.2.2(b)
w_k	=	Section modulus corrosion factor in tanks as given in 33.3.3
σ	=	Allowable stress, within 0.4 L midship given in Table 33-2
	=	160/K for continuous decks within 0.1L from the perpendiculars and for other deck longitudinals in general. Between specified regions the σ-value is to be varied linearly.

33.4.4 Transverse beams

The section modulus requirement is given by:

$$Z = 0.63 K l^2 s p w_k \qquad \text{cm}^3, \text{minimum } 15 \text{ cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

33.4.5 Girders

(a) The section modulus requirement for simple girders is given by:

$$Z = \frac{100S^2 bpw_k}{\sigma} \quad cm^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

b = Loading breadth, in m

σ = $\frac{190}{K} - 130f_{2d}\frac{z_n - z_a}{z_n}$, maximum $\frac{160}{K}$, for continuous longitudinal girders within 0.4L amidships

= 160/K or transverse girders and longitudinal girders

Between specified regions the σ-value may be varied linearly

(b) The web area requirement (after deduction of cut-outs) at the girder ends is given by:

$$A = 0.07KSbp + 10ht_k \quad cm^2$$

where:

p = As given in 33.4.5(a)

b = As given in 33.4.5(a)

h = Girder height, in m.

The web area at the middle of the span is not to be less than 0.5A.

33.4.6 Strengthening against liquid impact pressure in larger tanks

If the deck forms boundary of larger ballast or cargo tanks with free sloshing length l_s > 0.13 L and or breadth b_s > 0.56 B, the deck structure is to have scantlings according to 33.5.5 for impact loads referred to in 33.2.1.

33.5 Bulkhead Structures Subjected to Sloshing

33.5.1 Design Load for Sloshing

(a) When Longitudinal bulkheads as well as transverse bulkheads at sides in wide tanks and be located less than 0.25 b_s away from tank sides, the sloshing load pressure of bulkhead structures is not to be less than that obtained from the formula as given in 33.2.3.

For tanks with free breadth (no longitudinal wash bulkheads) b_s > 0.56B, the design pressure will be specially considered according to 33.2.2(c).

The sloshing pressure defined in 33.2.3 is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 H_{max} to 0.95 H_{max}, in 0.05 H_{max} increments.

(b) When Transverse bulkheads and longitudinal bulkheads at ends in long tanks and be located less than 0.25 l_s away from tank ends, the sloshing load pressure of bulkhead structures is not to be less than that obtained from the formula as given in 33.2.3.

For tanks with free length (no transverse wash bulkheads or transverse web frames in narrow tanks) l_s > 0.13L, the design pressure will be specially considered according to 33.2.2(c).

The sloshing pressure defined in 33.2.3 is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 H_{max} to 0.95 H_{max}, in 0.05 H_{max} increments.

33.5.2 Bulkhead plating

(a) The thickness requirement corresponding to lateral pressure is given by:

$$t = \frac{15.8 k_a s \sqrt{p}}{\sqrt{\sigma}} + t_c \quad \text{mm}$$

where:

p = Design load for sloshing as given in 33.5.1

σ = 160/K, for longitudinally stiffened longitudinal bulkhead plating at neutral axis irrespective of ship length.

= 140/K for transversely stiffened longitudinal bulkhead plating at neutral axis within 0.4 L amidships, may however be taken as 160/K.
Above and below the neutral axis the σ-values is to be reduced linearly to the values for the deck and bottom plating, assuming the same stiffening direction and material factor as for the plating considered.

= 160/K for longitudinal bulkheads outside 0.05 L from F.P. and 0.1 L from A.P. and for transverse bulkheads in general.
Between specified regions the σ-value may be varied linearly.

K = The material factor K as specified in 1.5.2(a) of this Part.

(b) In corrugated bulkheads formed by welded plate strips, the thickness in flange and web plates may be differing. The thickness requirement then is given by the following modified formula:

$$t = \sqrt{\frac{500 s^2 p}{\sigma} - t_n^2} + t_c \quad \text{mm}$$

where:

t_n = Thickness, in mm, of neighboring plate (flange or web), not to be taken greater than t as given in (a).

33.5.3 Longitudinals

The section modulus requirement for stiffeners and corrugations is given by:

$$Z = \frac{83 l^2 s p w_k}{\sigma} \quad \text{cm}^3\text{, minimum 15 cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

w_k = Section modulus corrosion factor in tanks as given in 33.3.3

σ = $\frac{225}{K} - 130 f_2 \frac{z_n - z_a}{z_n}$, maximum $\frac{160}{K}$, within 0.4L amidships

= 160/K within 0.1 L from perpendiculars.
Between specified regions the σ-value is to be varied linearly.

f_2 = Stress factor f_{2b} as given in 33.3.3

= Stress factor f_{2d} as given in 33.3.3

33.5.4 Vertical and transverse stiffeners on tank, wash, dry bulk cargo, collision and watertight bulkheads

(a) Transverse bulkheads for ballast and bulk cargo holds are normally built with strength members only in the vertical direction (corrugations or double plane bulkheads), having unsupported spans from deck to inner bottom.

(b) The section modulus requirement for simple stiffeners and corrugations is given by:

$$Z = \frac{1000 l^2 s p w_k}{m\sigma} \quad cm^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)
σ = 160/K for tank, cargo and collision bulkheads
= 220/K for watertight bulkheads
m = 7.5 for vertical stiffeners simply supported at one or both ends
= 10 for transverse stiffeners and vertical stiffeners which may be considered fixed at both ends
= 10 for horizontal corrugations fixed at ends
= 13 for vertical corrugation, upper end if fixed
= 20 for vertical corrugation, upper end if flexible
= m_s for vertical corrugation, lower end to stool
= $\frac{8m_s}{m_s - 4}$ for vertical corrugation at middle of span, $m(max.) = 13$

m_s = $7.5\left[1 + \frac{4b_c\left(H_s + \frac{h_{db}}{2}\right)}{b_s l_{db}}\right]$

b_c = Breadth of stool, in m, where corrugation is welded in
b_s = Breadth of stool, in m, at inner bottom
H_s = Height of stool, in m
h_{db} = Height of double bottom, in m
l_{db} = Length of cargo hold double bottom between stools, in m, not to be taken larger than $6H_s$ or $6h_{db}$ if no stool.

33.5.5 Girders

(a) The section modulus requirement for simple girders is given by:

$$Z = \frac{100 S^2 b p w_k}{\sigma} \quad cm^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)
b = Loading breadth, in m
σ = $\frac{190}{K} - 130 f_2 \frac{z_n - z_a}{z_n}$, maximum $\frac{160}{K}$, for continuous longitudinal girders within 0.4L amidships
= 160/K for other girders.
Between specified regions the σ-value may be varied linearly.
= 160/K, for longitudinals girders in any case
f_2 = Stress factor f_{2b} as given in 33.3.3
= Stress factor f_{2d} as given in 33.3.3

(b) The web area requirement (after deduction of cut-outs) at the girder ends is given by:

$A = ckSbpK + 10ht_k \quad cm^2$

where:

p	=	As given in 33.2.2(b)
k	=	0.06 for stringers and upper end of vertical girders
	=	0.08 for lower end of vertical girders
c	=	1.0
b	=	Loading breadth, in m
h	=	Girder height, in m.

The web area at the middle of the span is not to be less than 0.5 A.

33.5.6 Strengthening against liquid impact pressure in larger tanks

(a) For tanks with free sloshing length l_s > 0.13 L and/or breadth b_s > 0.56 B, structures are to be strengthened for the impact pressure as given in 33.2.1 using following formulae.

(b) Plating subjected to impact pressure p_i. The thickness is not to be less than:

$$t = 0.9k_a s\sqrt{p_i K} + t_c \quad mm$$

(c) Stiffeners supporting plating subjected to impact pressure p_i. The section modulus is not to be taken less than:

$$Z = 0.5 l l_p s p_i k_p w_k K \quad cm^3$$

The shear area at each end is not to be less than:

$$A_s = \frac{0.5 l (l_p - s) s p_i k_p K}{l_p} + 10ht_k \quad cm^3$$

where:

l_p	=	Loaded length of stiffener, maximum l, but need not be taken greater than 0.1 l_s or 0.1 b_s, respectively, for longitudinal or transverse impact pressure
k_p	=	Correction factor for resulting impact pressure
	=	$1.1 - 10\frac{l}{l_s'}$, minimum 0.35
l_s'	=	l_s or b_s as defined in 33.2.3
h	=	Height of stiffener, in m.

If the impact pressure is acting on the stiffener side, the stiffener web thickness is not to be less than:

$$t = 5 + \frac{s p_i K}{100} + t_c \quad mm$$

The leg length of continuous fillet welding of the stiffener to the plating when impact pressure is acting on the stiffener side is not be less than:

$$t = \sqrt{2}\left(\frac{s p_i}{120} + \frac{t_c}{2}\right) \quad mm$$

The net connection area of continuous stiffeners at girders is to satisfy the following expression:

$$2A_s = 1.7A_F + A_W \qquad cm^2$$

where:

A_F = Connection area at flange, in cm^2
A_W = Connection area at web, in cm^2

(d) Girders supporting stiffeners subjected to impact pressure p_i:

The section modulus is not to be less than:

$$Z = 0.5SS_p b p_i k_p w_k K \qquad cm^3$$

The shear area at each end is not to be taken less than:

$$A_s = 0.05Sbp_i k_p K + 10ht_k \qquad cm^3$$

where:

S_p = Loaded length of girder, maximum S, but need not be taken greater than 0.1 l_s or 0.1 b_s, respectively, for longitudinal or transverse impact pressure.
k_p = Correction factor for impact pressure.
= $1.1 - 10\frac{b}{l'_s}$, minimum 0.25 for horizontals
= $1.1 - 10\frac{S_p}{l'_s}$, minimum 0.25 for verticals
l'_s = l_s or b_s as defined in 33.2.3.
h = Height of girder web, in m.
b = Loading breadth of girder, in m.

The web thickness is in no case to be less than:

$$t = 6.5 + 0.2\sqrt{p_i K} + t_c \qquad mm$$

The throat thickness of continuous fillet welding of girder webs to the plating subjected to impact pressure acting on the girder web side is not to be less than:

$$t = \sqrt{2}\left(\frac{sp_i}{120} + \frac{t_c}{2}\right) \qquad mm$$

The spacing of stiffeners on the web plate for girders in the tank where impact pressure occurs is not to be taken greater than:

$$s = \frac{1.2(t - t_c)}{\sqrt{p_i}} \qquad m$$

where:

p_i = Impact pressure at panel near girder.

33.6 Design Sloshing Load for Ships with Length less than 100 Meters

33.6.1 Design Load for Sloshing

Side, deck structures and Transverse bulkheads at ends in tanks with $10 < l_s < 0.13$ L and located less than 0.25 l_s away from tank ends, the sloshing load pressure is to be considered and not to be less than that obtained from the formula as given in 33.2.3:

When $l_s > 0.13$ L, the design pressure will be specially considered according to 33.2.2(c).

The sloshing pressure defined in 33.2.3 is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 H_{max} to 0.95 H_{max}, in 0.05 H_{max} increments.

33.6.2 Side Structures Subjected to Sloshing

(a) Side plating, general

The thickness requirement corresponding to lateral pressure is given by:

$$t = \frac{15.8 k_a s \sqrt{p}}{\sqrt{\sigma}} + t_c \qquad \text{mm}$$

where:

p	=	Design load for sloshing as given in 33.6.1
t_c	=	Corrosion addition, as stated in Table II 33-1.
σ	=	As given in Table II 33-3.

(b) Longitudinals

The section modulus requirement is given by:

$$Z = \frac{83 l^2 s p w_k}{\sigma} \qquad \text{cm}^3, \text{minimum } 15\ \text{cm}^3$$

where:

p	=	Design load for sloshing as given in 33.2.2(b)
w_k	=	Section modulus corrosion factor in tanks as given in 33.3.3
σ	=	95 at deck or bottom within 0.4 L when $Z_A = Z_R$
	=	160 at deck or bottom within 0.4 L when $Z_A \geq 2\ Z_R$
	=	160 within 0.25 D above and below the neutral axis
	=	160 within 0.1 L from the perpendiculars.
		Between specified regions the σ-value may be varied linearly.
Z_A	=	Midship section modulus, in cm^3, as built at deck or bottom respectively.
Z_R	=	Rule midship section modulus, in cm^3, as given in 3.2.2 of this Part.

(c) Main frames

(i) Main frames are frames located outside the peak tanks, connected to the floors or the double bottom and extending to the lowest deck or stringer on the ship's side.

(ii) The section modulus requirement is given by the greater of:

Z	=	$0.5 l^2 s p w_k$ $\quad$ cm^3
	=	$6.5\sqrt{L}$ $\quad$ cm^3
p	=	Design load for sloshing as given in 33.2.2(b)
l	=	Corresponding to full length of frame including brackets, in m.

(iii) The requirement given in (b) is based on the assumption that effective brackets are fitted at both ends. The length of brackets is not to be less than:

— 0.12 l for the lower bracket.
— 0.07 l for the upper bracket.

The section modulus of frame including bracket is not to be less than:

— 2 Z at lower end
— 1.7 Z at upper end

Z = As given in 33.6.2(c)(ii)

When the length of the free edge of the bracket is more than 40 times the plate thickness, a flange is to be fitted, the width being at least 1/15 of the length of the free edge.

(d) Tween deck frames and vertical peak frames

(i) Tween deck frames are frames between the lowest deck or the lowest stringer on the ship's side and the uppermost superstructure deck between the collision bulkhead and the after peak bulkhead.

(ii) The section modulus is not to be less than the greater of:

Z	=	$0.55l^2spw_k$	cm^3
	=	$k\sqrt{L}$	cm^3
k	=	6.5 for peak frames	
	=	4.0 for tween deck frames	
p	=	Design load for sloshing as given in 33.2.2(b)	

(e) Girders

(i) The section modulus requirement is given by:

$$Z = \frac{100S^2bpw_k}{\sigma} \quad cm^3$$

where:

p	=	Design load for sloshing as given in 33.2.2(b)
b	=	Loading breadth, in m
σ	=	As given in 33.6.2(b) for continuous longitudinal girders
	=	160/K for other girders.

The above requirement apply about an axis parallel to the ship's side.

(ii) The web area requirement (after deduction of cut-outs) at the girder ends is given by:

$$A = kSbp + 10ht_k \quad cm^2$$

where:

k	=	0.06 for continuous horizontal girders and upper end of vertical girders
	=	0.08 for lower end of vertical girders
b	=	As given in (i)
h	=	Girder height, in m
p	=	Design load for sloshing as given in 33.2.2(b)

The web area at the middle of the span is not to be less than 0.5 A.

The above requirement apply when the web plate is perpendicular to the ship's side.

For oblique angles the requirement is to be increased by the factor 1/cos θ, where θ is the angle between the web plate of the girder and the perpendicular to the ship's side.

33.6.3 Deck Structures Subjected to Sloshing

(a) Strength deck plating

The thickness requirement corresponding to lateral pressure is given by:

$$t = \frac{15.8 k_a s \sqrt{p}}{\sqrt{\sigma}} + t_c \qquad \text{mm}$$

where:

p = Design load for sloshing as given in 33.6.1

σ = As given in Table II 33-4.

(b) Longitudinals

The section modulus requirement is given by:

$$Z = \frac{83 l^2 s p w_k}{\sigma} \qquad \text{cm}^3, \text{minimum 15 cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

σ = 95 within 0.4 L midship when $Z_D = Z_R$

= 160 within 0.4 L midship when $Z_D \geq 2\ Z_R$

= 160 within 0.1 L from the perpendiculars.

Between specified regions the σ-value may be varied linearly.

(c) Transverse beams

The section modulus requirement is given by:

$$Z = 0.63 l^2 s p w_k \qquad \text{cm}^3, \text{minimum 15 cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

(d) Simple girders

(i) The section modulus requirement for simple girders is given by:

$$Z = \frac{100 S^2 b p w_k}{\sigma} \qquad \text{cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)

b = Loading breadth, in m

σ = Allowable stress as given in 33.6.2(b) for longitudinal girders

= 160 for other girders.

(ii) The web area requirement (after deduction of cut-outs) at the girder ends is given by:

$$A = 0.06 S b p + 10 h t_k \qquad \text{cm}^2$$

where:

p = As given in 33.6.3(d)(i)
b = As given in 33.6.3(d)(i)
h = Girder height, in m.

The web area at the middle of the span is not to be less than 0.5 A.

33.6.4 Bulkhead Structures Subjected to Sloshing

(a) Bulkhead plating

The thickness requirement corresponding to lateral pressure is given by:

$$t = \frac{15.8 k_a s \sqrt{p}}{\sqrt{\sigma}} + t_c \qquad \text{mm}$$

where:

p = Design load for sloshing as given in 33.6.1
σ = As given in Table II 33-5.

(b) Longitudinals

The section modulus requirement for stiffeners and corrugations is given by:

$$Z = \frac{83 l^2 s p w_k}{\sigma} \qquad \text{cm}^3\text{, minimum 15 cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)
σ = 95 at deck or bottom within 0.4 L when $Z_A = Z_R$
= 160 at deck or bottom within 0.4 L when $Z_A \geq 2\, Z_R$
= 160 within 0.25 D above and below the neutral axis
= 160 within 0.1 L from the perpendiculars.
Between specified regions the σ-value may be varied linearly.

(c) Vertical and transverse stiffeners on tank bulkheads

(i) Transverse bulkheads for ballast are normally built with strength members only in the vertical direction (corrugations or double plane bulkheads), having unsupported spans from deck to inner bottom.

(ii) The section modulus requirement for simple stiffeners and corrugations is given by:

$$Z = \frac{6.25 l^2 s p w_k}{m} \qquad \text{cm}^3$$

where:

p = Design load for sloshing as given in 33.2.2(b)
m = 7.5 for vertical stiffeners simply supported at one or both ends
= 10 for transverse stiffeners and vertical stiffeners which may be considered fixed at both ends.

(d) Stiffeners on watertight bulkheads and wash bulkheads

(i) The section modulus requirement is given by:

$$Z = \frac{1000 l^2 spw_k}{m\sigma} \quad cm^3$$

where:

p	=	Design load for sloshing as given in 33.2.2(b)
σ	=	160 for other watertight bulkheads
	=	220 for other watertight bulkheads
m	=	16 for member fixed at both ends
	=	12 for member fixed at one end (lower) and simply supported at the other
	=	8 for member simply supported at both ends.

The m-value may be adjusted for members with boundary conditions not corresponding to the above specification.

(e) Girders

(i) The section modulus requirement for simple girders is given by:

$$Z = \frac{100 S^2 bpw_k}{\sigma} \quad cm^3$$

where:

p	=	Design load for sloshing as given in 33.2.2(b)
b	=	Loading breadth, in m
σ	=	As given in 33.6.4(b) for continuous longitudinal girders
	=	160 for other girders.

(ii) The web area requirement (after deduction of cut-outs) at the girder ends is given by:

$$A = kSbp + 10ht_k \quad cm^2$$

where:

p	=	As given in 33.6.4(e)(i)
k	=	0.06 for stringers and upper end of vertical girders
	=	0.08 for lower end of vertical girders
b	=	As given in 33.6.4(e)(i)
h	=	Girder height, in m.

The web area at the middle of the span is not to be less than 0.5 A.

Table II 33-1
Corrosion Addition t_c in mm

Internal members and plate boundary between spaces of the given category	Tank / hold region	
	Within 1.5 m below weather deck tank or hold top	Elsewhere
Ballast tank(1)	3.0	1.5
Cargo oil tank only	2.0	1.0 (0) (2)
Plate boundary between given space categories	Tank / hold region	
	Within 1.5 m below weather deck tank or hold top	Elsewhere
Ballast tank(1) / Cargo oil tank only	2.5	1.5 (1.0) (2)
Ballast tank(1) / Hold of dry bulk cargo carrier	2.0	1.5
Ballast tank(1) / Other category space(3)	2.0	1.0
Cargo oil tank only / Other category space(3)	1.0	0.5 (0) (2)

Note:

(1) The term ballast tank also includes combined ballast and cargo oil tanks, but not cargo oil tanks which may carry water ballast according to MARPOL 73/78 Annex I Reg. 18.

(2) The value in brackets refers to non-horizontal surfaces.

(3) Other category space denotes the hull exterior and all spaces other than water ballast and cargo oil tanks and holds of dry bulk cargo carriers.

Table II 33-2
Allowable Stresses

Position of deck longitudinals	Allowable stress σ (N/mm²)
Strength deck, long superstructures and effective deckhouses above strength deck	$\frac{225}{K} - 130f_{2d}$, maximum $\frac{160}{K}$
Continuous decks below strength deck	$\frac{225}{K} - 130f_{2d}\frac{z_n - z_a}{z_n}$, maximum $\frac{160}{K}$

Table II 33-3
Allowable Stresses

Structural system	Allowable stress σ (N/mm²) (1)
Transverse stiffening	120 within 0.4 L at neutral axis $60Z_A/Z_R$, maximum 120 within 0.4 L at deck or bottom 160 within 0.1 L from the perpendiculars
Longitudinal stiffening	140 within 0.4 L at neutral axis 120 within 0.4 L at deck or bottom 160 within 0.1 L from the perpendiculars

Note:

(1) Between specified regions the σ-value may be varied linearly.

Table II 33-4
Allowable Stresses

Structural system	Allowable stress σ (N/mm^2) (1)
Transverse stiffening	$60Z_D/Z_R$, maximum 120 within 0.4 L 160 within 0.1 L from the perpendiculars
Longitudinal stiffening	120 within 0.4 L 160 within 0.1 L from the perpendiculars
Note: (1) Between specified regions the σ-value may be varied linearly.	

Table II 33-5
Allowable Stresses

Bulkhead	Allowable stress σ (N/mm^2) (1)
Longitudinal bulkhead	Transverse stiffening: 140 within 0.4 L at neutral axis $60Z_A/Z_R$, at deck or bottom 160 within 0.1 L from perpendiculars
	Longitudinal stiffening: 160 within 0.4 L at neutral axis 120 within 0.4 L at deck or bottom 160 within 0.1 L from perpendiculars
Transverse tank bulkheads	160
Collision bulkheads	160
Watertight bulkheads	220
Note: (1) Between specified regions the σ-value may be varied linearly.	

Chapter 34

Noise Levels on Board Ships

34.1 General

34.1.1 Application

(a) The requirement in this chapter is intended to provide standards to prevent the occurrence of potentially hazardous noise levels on board ships and to provide standards for an acceptable environment for seafarers. Ships which comply with the limits for noise levels of the code on noise levels on board ships (hereinafter referred to as "the Noise Code") adopted by resolution MSC.337(91), as given in Table II 34-1, will be assigned the notation **NR**. Where **NR** means the noise restricted by the noise level limits which quantify the comfort rating of noise for the vessel.

(b) Ships not engaged on international voyages may apply **NR** notation voluntarily, except in case where specified by the Administration.

34.1.2 Notation

(a) Ships of a gross tonnage of 1,600 and above but less than 10,000, which fulfill the requirements of 34.2.1 and 34.2.4 of this chapter and meet the limits for noise levels of Level I given in Table II 34-1, will be eligible to receive the notation **NR-I**.

(b) Ships of a gross tonnage of 10,000 and above, which fulfill the requirements of 34.2.1 and 34.2.4 of this chapter and meet the limits for noise levels of Level II given in Table II 34-1, will be eligible to receive the notation **NR-II**.

(c) Ships of a less gross tonnage than those categories given in (a) and (b) above may apply for a higher Level of noise limits at Owners' discretion.

34.1.3 Definitions

(a) Noise – Audible air pressure fluctuations generated by ship machinery, systems or structure, i.e. in the frequency range 20 to 20 000 Hz.

(b) dB(A) – A-weighted global value of the sound pressure level.

(c) Other definitions are to be in accordance with the Section 1.4 Definitions of the Noise Code.

34.2 Noise on Board ships

34.2.1 For the condition of assigning the notation **NR**, the provisions in the following Chapters of the Noise Code are to be conformed.

(a) Chapter 2 Measuring equipments.

(b) Chapter 3 Measurement.

(c) Chapter 6 Acoustic insulation between accommodation spaces.

34.2.2 For the classification purpose of assigning the notation **NR**, the confirmation to the provisions in the following Chapters of the Noise Code are not included.

(a) Chapter 5 Noise exposure limits.

(b) Chapter 7 Hearing protection and warning information.

34.2.3 Noise level limits

The noise level limits are categorized into two Levels, Level I and Level II, given in Table II 34-1.

34.2.4 Survey report

(a) A noise survey report is to be made for each ship. The report is to comprise information on the noise levels in the various spaces on board. The report is to show the reading at each specified measuring point. The points are to be marked on a general arrangement plan, or on accommodation drawings attached to the report, or otherwise are to be identified.

(b) The format for noise survey reports is set out in Appendix 1 of the Noise Code.

(c) The noise survey report is to be always carried on board and be accessible for the crew.

Table II 34-1
Limits for Noise Levels (dB(A))

Designation of rooms and spaces	Level I	Level II
	Ship size	
	1,600 up to 10,000 GT	≥10,000 GT
Work spaces		
Machinery spaces(1)	110	110
Machinery control rooms	75	75
Workshops other than those forming part of machinery spaces	85	85
Non–specified work spaces(2) (other work areas)	85	85
Navigation spaces		
Navigating bridge and chartrooms	65	65
Look-out posts, incl. navigating bridge wings(3) and windows	70	70
Radio rooms (with radio equipment operating but not producing audio signals)	60	60
Radar rooms	65	65
Accommodation spaces		
Cabin and hospitals(4)	60	55
Messrooms	65	60
Recreation rooms	65	60
Open recreation areas (external recreation areas)	75	75
Offices	65	60
Service spaces		
Galleys, without food processing equipment operating	75	75
Serveries and pantries	75	75
Normally unoccupied spaces		
Holds, deck areas and other spaces(5)	90	90

Note:

(1) If the maximum noise levels are exceeded when machinery is operating, stay should be limited to very short periods or not allowed at all.

(2) Examples are open deck workspaces that are not machinery spaces, and open deck workspaces where communication is relevant.

(3) Reference is made to the Recommendation on methods of measuring noise levels at listening posts (resolution A.343(IX)) which also applies.

(4) Hospitals: treatment rooms with beds.

(5) Measurements shall be taken in all locations with unusually high noise levels where seafarers may be exposed, even for relatively short periods, and at intermittently used machinery locations.
In order to restrict the number of measurements and recordings, noise levels need not be measured for normally unoccupied spaces, holds, deck areas and other spaces which are remote from sources of noise.
In cargo holds, at least three microphone positions in parts of holds where personnel are likely to carry out work shall be used. Also refer to 3.14 of resolution MSC.337(91).

Appendix 1
Guidance on Conditions for Loading Manual

A1.1 General

The Loading Manual should contain the design loading and ballast conditions, subdivided into departure and arrival conditions, and ballast exchange at sea conditions, where applicable, upon which the approval of the hull scantlings is based.

A1.2 Guidance on Loading Condition

In particular the following loading conditions should be included:

A1.2.1 Cargo Ships, Container Ships, Roll-on/Roll-off and Refrigerated Carriers, Ore Carriers and Bulk Carriers

(a) Homogeneous loading conditions at maximum draught

(b) Ballast conditions

(c) Special loading conditions, e.g. container or light load conditions at less than the maximum draught, heavy cargo, empty holds or non-homogeneous cargo conditions, deck cargo conditions, etc., where applicable

(d) Short voyage or harbor conditions, where applicable

(e) Docking condition afloat

(f) Loading and unloading transitory conditions, where applicable

A1.2.2 Oil Tankers

(a) Homogeneous loading conditions (excluding dry and clean ballast tanks) and ballast or part-loaded conditions for both departure and arrival

(b) Any specified non-uniform distribution of loading

(c) Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions

(d) Docking condition afloat

(e) Loading and unloading transitory conditions

A1.2.3 Chemical Tankers

(a) Conditions as specified for oil tankers

(b) Conditions for high density or heated cargo and segregated cargo where these are included in the approved cargo list

A1.2.4 Liquefied Gas Carriers

(a) Homogeneous loading conditions for all approved cargoes for both departure and arrival

(b) Ballast conditions for both departure and arrival

(c) Cargo condition where one or more tanks are empty or partially filled or where more than one type of cargo having significantly different densities is carried, for both departure and arrival

(d) Harbor condition for which an increased vapour pressure has been approved

(e) Docking condition afloat

A1.2.5 Combination Carriers

(a) Conditions as specified in A1.2.1 and A1.2.2 above.

Acronyms

AIS	Automatic Identification System
ANTS	Automatic Navigation and Track-keeping System
ARPA	Automatic Radar Plotting Aid
BC Code	Code of Safe Practice for Solid Bulk Cargoes
BNWAS	Bridge Navigational Watch Alarm System
CA	Controlled Atmosphere
CDI	Chemical Distribution Institute
COW	Crude Oil Washing
CPA	Closest Point of Approach
CPP	Controllable Pitch Propeller
CSC	International Convention for Safe Containers
CSR	Common Structural Rules
CTOD	Crack Tip Opening Displacement
ECDIS	Electronic Chart Display and Information System
EEBD	Emergency Escape Breathing Devices
ENC	Electronic Navigational Chart
ESP	Enhance Survey Plan
ETA	Emergency Towing Arrangement
FEU	Forty-foot Equivalent Unit
FMEA	Failure Mode & Effect Analysis
FRP, GRP	Fibreglass Reinforced Plastics
FTP Code	International Code for Application of Fire Test Procedures
GBS	Goal-Based ship construction Standards
GDC	General Dry Cargo
GLONASS	Global Navigation Satellite System
GMDSS	Global Maritime Distress and Safety System
GPS	Global Positioning System
HAZ	Heat Affected Zone
HHP anchor	High Holding Power anchor
HSC	High Speed Craft

HTS	High Tensile Steel
IACS	International Association of Classification Societies
IBC Code	International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk
ICS	The International Chamber of Shipping
IEC	International Electrotechnical Commission
IGC Code	International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk
ILO	International Labour Organization
IMDG Code	International Maritime Dangerous Goods Code
IMO	International Maritime Organization
ISO	International Standards Organization
LAN	Local Area Network
LCS	Loading Computer System
LEL	Lower Explosive Limit
LRIT	Long-range Identification and Tracking of ships
MARPOL	International Convention for the Prevention of Pollution from Ships
MARVS	Maximum Allowable Relief Valve Setting
MEPC	Marine Environment Protection Committee
MLC	Maritime Labour Convention
MSC	Maritime Safety Committee
NDT	Nondestructive Testing
OCIMF	The Oil Companies International Marine Forum
OOW	Officer Of the Watch
PA	Public Address
PMA	Permanent Means of Access
PMS	Planned Machinery Maintenance Scheme
RH	Relative Humidity
PSPC	Performance Standard for Protective Coating
SENC	System Electronic Navigational Chart

SHHP anchor	Super High Holding Power anchor
SOLAS	International Convention for the Safety of Life at Sea
SRE	Ship Recycling
STCW	International Convention on Standards of Training, Certification and Watch-keeping for Seafarers
STS operation	Ship-To-Ship operation
S-VDR	Simplified Voyage Data Recorder
TCPA	Time to CPA
TEU	Twenty-foot Equivalent Unit
THD	Total Harmonic Distortion
TMCP	Thermo-Mechanical Controlled Processing
UPS	Uninterruptible Power Supply
VDR	Voyage Data Recorder
VEC	Vapor Emission Control

RULES FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS
2019

PART III
SPECIAL SERVICE AND TYPE OF SHIPS

CONTENTS

Chapter 1

Bulk or Ore Carriers

1.1 General

1.1.1 For bulk carriers of 90 m in length or greater, excluding ore and combination carriers, classed with the Society and that enters into the scope of application of the IMO Resolution MSC.290(87) Goal-Based Ships construction standards for bulk carriers and oil tankers, or upon specific ship owner's request, the structural requirements are to be in accordance with IACS's Common Structural Rules for Bulk Carriers and Oil Tankers. For regions of the structure, which IACS's Common Structural Rules do not cover, the relevant requirements of the Society's Rules are to be applied, with appropriate consideration to related provisions of the Common Structural Rules. For bulk carriers other than described above, the requirements of this chapter are applicable.

1.1.2 This Chapter applies to ships classed in accordance with the provisions in Chapter 1 of Part I and built for the purpose of carrying bulk or ore cargoes. Where the ship is specifically reinforced for the carriage of heavy density ore cargoes and/or special loading arrangements, it is to be distinguished in the classification symbol and the Register with an additional notation describing which cargo holds may be empty and if required what kind of cargo is intended to be carried. Full particulars of the loading conditions and the maximum density of the cargo to be intended for are to be specified on the basic construction drawings.

1.1.3 Except otherwise provided by this Chapter, the requirements for the construction of general ships given in Part II of the rules are to apply.

1.1.4 Arrangement

(a) This Chapter is intended to apply to the single deck carrier with machinery aft and having a double bottom.

(b) The bottom and the deck are to be framed longitudinally.

(c) The carrier may also have topside wing tanks and side tanks, or two continuous longitudinal bulkheads.

1.1.5 Bulk or ore carriers to which freeboards are assigned based on the subdivision requirements of the International Convention on Load Lines, 1996, are to comply with those regulations.

1.1.6 Longitudinal Strength

(a) The longitudinal strength of bulk carriers is to comply with the requirements in Chapter 3 of Part II of the Rules.

(b) In addition to the requirements in (a) above, all bulk carriers of 150 m in length and above, intending to carry cargoes having bulk density of 1.0 t/m^3, or above are to be in accordance with the requirements in 1A.4.

1.2 Harmonised Notations and Corresponding Design Loading Conditions

1.2.1 A bulk carrier may in actual operation be loaded differently from the design loading conditions specified in the loading manual, provided limitations for longitudinal and local strength as defined in the loading manual and loading instrument onboard and applicable stability requirements are not exceeded.

1.2.2 Application

(a) The requirement of 1.2 is applicable to "Bulk Carrier" of usual form, having single deck, machinery aft, bilge hopper tanks and topside tanks, and also double bottoms under cargo holds, and deck and bottoms with longitudinal framing, and length, as defined in 1.2.1, Part II of the Rules, of 150 m or above and contracted for new construction on or after 1 July 2003.

(b) The loading conditions listed under 1.2.4 of this Chapter are to be used for the checking of rules criteria regarding longitudinal strength as required in Chapter 3, Part II of the Rules and Chapter1A of this Part, local strength, capacity and disposition of ballast tanks and stability. The loading conditions listed under 1.2.5 are to be used for the checking of rule criteria regarding local strength.

(c) For the purpose of applying the conditions given in this requirement, maximum draught is to be taken as moulded summer load line draught.

1.2.3 Harmonized notations and annotations

(a) Bulk Carriers are to be assigned one of the following notations:

BC-A : for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to **BC-B** conditions.

BC-B : for bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to **BC-C** conditions.

BC-C : for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.

(b) The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design in the following cases:

(i) Additional notations

{**Maximum cargo density (t/m^3)**} for notations **BC-A** and **BC-B** if the maximum cargo density is less than 3.0 t/m^3 ; {**No MP**} for all notations when the ship has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in 1.2.5(c).

(ii) Annotations

{Allowed combination of specified empty holds} for notation **BC-A**.

(c) The additional class notation **GRAB [X]** may be assigned to ships**,** of which the holds are to be designed for loading/unloading by grabs having a maximum specific weight **X** equal to or greater than 20 tons.

1.2.4 Design loading conditions (General)

(a) **BC-C**

Homogeneous cargo loaded condition where the cargo density corresponds to all cargo holds, including hatchways, being 100% full at maximum draught with all ballast tanks empty.

(b) **BC-B**

As required for **BC-C**, plus:

Homogeneous cargo loaded condition with cargo density 3.0 t/m^3, and the same filling rate (cargo mass/hold cubic capacity) in all cargo holds at maximum draught with all ballast tanks empty.

In cases where the cargo density applied for this design loading condition is less than 3.0 t/m^3, the maximum density of the cargo that the vessel is allowed to carry is to be indicated with the additional notation {**Maximum cargo density x.y t/m^3**}.

(c) **BC-A**

As required for **BC-B**, plus:

At least one cargo loaded condition with specified holds empty, with cargo density 3.0 t/m^3, and the same filling rate (cargo mass/hold cubic capacity) in all loaded cargo holds at maximum draught with all ballast tanks empty.

The combination of specified empty holds is to be indicated with the annotation {**Holds a, b,⋯. may be empty}**.

In such cases where the design cargo density applied is less than 3.0 t/m^3 , the maximum density of the cargo that the vessel is allowed to carry is to be indicated within the annotation, e.g. {**Holds a, b,⋯. may be empty, with maximum cargo density x.y t/m^3**}.

(d) Ballast conditions (applicable to all notations)

(i) Ballast tank capacity and disposition

All bulk carriers are to have ballast tanks of sufficient capacity and so disposed to at least fulfill the following requirements.

(1) Normal ballast condition

Normal ballast condition for the purpose of this requirement is a ballast (no cargo) condition where:

a) the ballast tanks may be full, partially full or empty. Where partially full option is exercised, calculations for the intermediate condition just before and just after ballasting and/or de-ballasting any ballast tank are to be submitted and, where approved, included in the loading manual for guidance,

b) any cargo hold or holds adapted for the carriage of water ballast at sea are to be empty,

c) the propeller is to be fully immersed, and

d) the trim is to be by the stern and is not to exceed 0.015L, where L is the length between perpendiculars of the ship. In the assessment of the propeller immersion and trim, the draughts at the forward and after perpendiculars may be used.

(2) Heavy ballast condition

Heavy ballast condition for the purpose of this requirement is a ballast (no cargo) condition where:

a) the ballast tanks may be full, partially full or empty. Where partially full option is exercised, calculations for the intermediate condition just before and just after ballasting and/or de-ballasting any ballast tank are to be submitted and where approved included in the loading manual for guidance,

b) at least one cargo hold adapted for carriage of water ballast at sea, where required or provided, is to be full,

c) the propeller immersion I/D is to be at least 60%, where

I = The distance from propeller centerline to the waterline,

D = Propeller diameter, and

d) the trim is to be by the stern and is not to exceed 0.015L, where L is the length between perpendiculars of the ship,

e) the moulded forward draught in the heavy ballast condition is not to be less than the smaller of 0.03L or 8 m.

(ii) Strength requirements

All bulk carriers are to meet the following strength requirements:

(1) Normal ballast condition

a) the structures of bottom forward are to be strengthened in accordance with the Rules of the Society against slamming for the condition of 1.2.4(d)(i)(1) at the lightest forward draught,

b) the longitudinal strength requirements are to be met for the condition of 1.2.4(d)(i)(1), and

c) in addition, the longitudinal strength requirements are to be met with all ballast tanks 100 % full.

(2) Heavy ballast condition

a) the longitudinal strength requirements are to be met for the condition of 1.2.4(d)(i)(2),

b) in addition to the conditions in 1.2.4(d)(ii)(2)(A), the longitudinal strength requirements are to be met under a condition with all ballast tanks 100 % full and one cargo hold adapted and designated for the carriage of water ballast at sea, where provided, 100 % full, and

c) where more than one hold is adapted and designated for the carriage of water ballast at sea, it will not be required that two or more holds be assumed 100 % full simultaneously in the longitudinal strength assessment, unless such conditions are expected in the heavy ballast condition. Unless each hold is individually investigated, the designated heavy ballast hold and any/all restrictions for the use of other ballast hold(s) are to be indicated in the loading manual.

(e) Departure and arrival conditions

Unless otherwise specified, each of the design loading conditions defined in 1.2.4(a) to 1.2.4(d) is to be investigated for the departure and arrival conditions as defined below.

Departure condition = with bunker tanks not less than 95 % full and other consumables 100 %
Arrival condition = with 10% of consumables.

1.2.5 Design loading conditions (for local strength)

(a) Definitions

The maximum allowable or minimum required cargo mass in a cargo hold, or in two adjacently loaded holds, is related to the net load on the double bottom. The net load on the double bottom is a function of draft, cargo mass in the cargo hold, as well as the mass of fuel oil and ballast water contained in double bottom tanks.

The following definitions apply:

M_H : the actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught.

M_{Full} : the cargo mass in a cargo hold corresponding to cargo with virtual density (homogeneous mass/hold cubic capacity, minimum 1.0 t/m^3) filled to the top of the hatch coaming. M_{Full} is in no case to be less than M_H.

M_{HD} : the maximum cargo mass allowed to be carried in a cargo hold according to design loading condition(s) with specified holds empty at maximum draft.

(b) General conditions applicable for all notations

(i) Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.

(ii) Any cargo hold is to be capable of carrying minimum 50% of M_H, with all double bottom tanks in way of the cargo hold being empty, at maximum draught.

(iii) Any cargo hold is to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at the deepest ballast draught.

(c) Condition applicable for all notations, except when notation {**No MP}** is assigned

(i) Any cargo hold is to be capable of carrying M_{FULL} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of maximum draught.

(ii) Any cargo hold is to be capable of being empty with all double bottom tanks in way of the cargo hold being empty, at 83% of maximum draught.

(iii) Any two adjacent cargo holds are to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of the maximum draught. This requirement to the mass of cargo and fuel oil in double bottom tanks in way of the cargo hold applies also to the condition where the adjacent hold is filled with ballast, if applicable.

(iv) Any two adjacent cargo holds are to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at 75% of maximum draught.

(d) Additional conditions applicable for **BC-A** notation only

(i) Cargo holds, which are intended to be empty at maximum draught, are to be capable of being empty with all double bottom tanks in way of the cargo hold also being empty.

(ii) Cargo holds, which are intended to be loaded with high density cargo, are to be capable of carrying M_{HD} plus 10% of M_H, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty in way of the cargo hold, at maximum draught. In operation the maximum allowable cargo mass is to be limited to M_{HD}.

(iii) Any two adjacent cargo holds which according to a design loading condition may be loaded with the next holds being empty, are to be capable of carrying 10% of M_H in each hold in addition to the maximum cargo load according to that design loading condition, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught. In operation the maximum allowable mass is to be limited to the maximum cargo load according to the design loading conditions.

(e) Additional conditions applicable for ballast hold(s) only

Cargo holds, which are designed as ballast water holds, are to be capable of being 100% full of ballast water including hatchways, with all double bottom tanks in way of the cargo hold being 100% full, at any heavy ballast draught. For ballast holds adjacent to topside wing, hopper and double bottom tanks, it is to be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty.

(f) Additional conditions applicable during loading and unloading in harbour only

(i) Any single cargo hold is to be capable of holding the maximum allowable seagoing mass at 67% of maximum draught, in harbour condition.

(ii) Any two adjacent cargo holds are to be capable of carrying M_{Full} ,with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of maximum draught, in harbour condition.

(iii) At reduced draught during loading and unloading in harbour, the maximum allowable mass in a cargo hold may be increased by 15% of the maximum mass allowed at the maximum draught in sea-going condition, but is not to exceed the mass allowed at maximum draught in the sea-going condition. The minimum required mass may be reduced by the same amount.

(g) Hold mass curves

Based on the design loading criteria for local strength, as given in 1.2.5(b) to 1.2.5(f) (except 1.2.5(e)) above, hold mass curves are to be included in the loading manual and the loading instrument, showing maximum allowable and minimum required mass as a function of draught, in sea-going condition as well as during loading and unloading in harbour.

At other draughts than those specified in the design loading conditions above, the maximum allowable and minimum required mass is to be adjusted for the change in buoyancy acting on the bottom. Change in buoyancy is to be calculated using water plane area at each draught.

Hold mass curves for each single hold, as well as for any two adjacent holds, are to be included.

1.3 Shell and Deck Plating

1.3.1 The thickness of the shell plating and the deck plating is not to be less than required by Chapters 3, 7 and 11 of Part II, with the exception of 7.2.1, 7.2.2 and 7.3.1(b) of Part II that are not applicable to Bulk Carriers. The thickness of shell plating is also to comply with the following requirements.

(a) Shell plating

The thickness of the shell plating including bottom and side shell is not to be less than the value obtained from the following formula.

$$t = 0.0176 \cdot \alpha_p \cdot 1000b\sqrt{\frac{|P|}{C_a \sigma_y}} \quad \text{mm}$$

$$\alpha_p = 1.2 - \frac{b}{2.1a}$$

Where:

a = The longest edge of the panel, in m.

b = The shortest edge of the panel, in m.

σ_y = The yield stress of the plating material, in N/mm^2.

P = $10.06(d + 0.038L')$

Where:

d is the scantling draft in m, L' is the rule length in m not taken greater than 230 m.

C_a = Permissible bending stress coefficient for plate taken equal to:

= $\beta - \alpha\frac{\left|\frac{\sigma_{hg}}{0.9}\right|}{\sigma_y}$, not to be greater than C_{a-max}

Where:

Structural member	β	α	C_{a-max}
Longitudinally stiffened plating	1.05	0.5	0.95
Transversally stiffened plating	1.05	1.0	0.95

σ_{hg} the maximum hull girder stress in N/mm^2 over the hogging and sagging conditions calculated at the lower or upper end of the panel under consideration located above or below the horizontal neutral axis respectively, as defined in CR Pt.II 3.2 (Hull girder bending strength).

(b) Side shell plating

The thickness of the side shell plating is not to be less than $\sqrt{L}$ or the value required in 1.3.1(a), whichever is greater.

1.3.2 Where it is intended to load the cargo so that some holds remain empty and abnormal hull girder shear stress occurs, the thickness of the side shell plating in way is required to be increased as required by 3.3 of Part II.

1.4 Double Bottoms

1.4.1 In general, the double bottom is to be constructed in accordance with Chapter 5 of Part II except that side girders are to be spaced approximately 3 m apart and solid floors are to be spaced not more than 3 m apart.

1.4.2 The depth of the center girder is to be same as double bottom height as required by 1.4.4(c). The thickness of center girder plate amidships is not to be less than the value obtained from the following formula.

$t = 0.055L + 5.9$ mm

where:
L = Length of ship, in m, as specified in 1.2.1 of Part II.

1.4.3 Where it is intended to load the cargo with specified or alternate holds empty, the depth of the center girder and the scantlings of plate floors and plate girders may be required to be increased.

1.4.4 Inner bottom plating

(a) The thickness of the inner bottom plating throughout holds is not to be less than the greater of as required by Chapter 5 of Part II and the following formula.

$t = 4.55s\sqrt{\gamma h K}$ mm

Where:

s	=	Spacing of longitudinals, in m.
h	=	Vertical distance from the top of inner bottom plating to the upper deck at the centreline, in m.
γ	=	Cargo deadweight divided by the total volume of the holds excluding hatchways or, in specific cases, is the cargo deadweight of a particular hold divided by the volume of the hold excluding hatchway, in ton/m^3.
K	=	$\mathrm{MAX}\left\{0.66; \frac{235}{\sigma_y}\right\}$ Where: σ_y = Specific minimum yield stress in N/mm^2.

(b) Where ore cargo or cargoes handled by grabs is to be carried, the thickness of the inner bottom plating is not to be less than 1.4.4(a) or the value obtained from the following formula, whichever is greater.

$$t_{grab} = 0.65 \times \sqrt{1000sK} \times \left(\frac{M_{GR}}{20}\right)^{0.25} \quad \text{mm}$$

where:

s	=	Spacing of inner bottom stiffeners, in m.
K	=	Material factor in accordance with 1.5.2(a) of Part II.
M_{GR}	=	Mass of unladen grab, in ton.

(c) Double bottom height

The height of the double bottom is not to be less than the lesser of :

$d_{DB} = B/20 \text{ or } 2\text{ m}$

However d_{DB} is not to be less than 0.76 m measured vertically from the plane parallel with keel line to inner bottom.

1.4.5 Inner bottom longitudinals

(a) The section modulus of inner bottom longitudinals is not to be less than required by the following formula:

$$Z = \frac{(100KCshl^2)}{24 - 12f_B K} \quad cm^3$$

where:
s = Spacing of inner bottom longitudinals, in m.
K = Material factor in accordance with 1.5.2(a) of Part II.
C = Coefficient as follows:
Where the struts are not provided midway between floors: γ, but C is not to be less than 0.9.
Where the struts are provided midway between floors: 0.6γ, but C is not to be less than 0.54.
h = Vertical distance from the top of inner bottom plating to the upper deck at the centreline, in m.
f_B = Ratio of the section modulus of transverse section of hull required in Chapter 3 of Part II when mild steel is used, to the actual section modulus of transverse section of hull at the bottom.
l = Bending span between floors, in m.

(b) The section modulus of inner bottom longitudinals, however, is not to be less than 75% of that required for bottom longitudinals.

1.4.6 Bottom longitudinals
The section modulus of bottom longitudinals is not to be less than that obtained from the following formula:

$$Z = \frac{100sKCl^2}{24 - 15.5f_B K} \times (d + 0.026L') \quad cm^3$$

Where:
s = Spacing of inner bottom longitudinals, in m.
K = Material factor in accordance with 1.5.2(a) of Part II.
C = Coefficient as follows:
a) Where the struts are not provided midway between floors, C is not to be less than 1.0.
b) Where the struts specified in 31.2.6 are provided midway between floors:
- 0.625 (for lower parts of deep tanks and holds which become empty in fully loaded condition)
- 0.3γ+0.2 (elsewhere)
- C is not to be less than 0.50. Furthermore, where the width of vertical stiffeners provided on floors and that of struts are especially large, the coefficient may be properly reduced.

f_B = Ratio of the section modulus of transverse section of hull, refer to 1.4.5(a).
γ = As specified in 1.4.4(a).
l = Bending span between floors, in m.
d = As specified in 1.3.1(a).
L' = As specified in 1.3.1(a).

1.5 Lower Wing Tanks

1.5.1 The thickness of the closely spaced floor or transverse fitted in the lower wing tank is to be as required by 5.3.1 (a) of Part II.

1.5.2 Tank bulkhead plating

(a) The thickness of the lower wing tank plating is not to be less than as required by Chapter 16 of Part II where the depth h, in m, is to be measured from the lower edge of the plate to the point midway between the half-depth of the tank and the top of the overflow pipe, nor less than as required by the formula given in 1.4.4 (b) above where h may be reduced by the height measured from the lower edge of the plate to the inner bottom plating.

(b) Where the lower wing tank sloping bulkhead plating within or near the hatchway, the thickness of the plating of that part may be required to be suitably increased.

1.5.3 Stiffeners in lower wing tanks

(a) The section modulus of members in lower wing tanks is not to be less than:

$$C\,sh l^2 \qquad cm^3$$

where:

C = 7.80 for vertical side shell frames and vertical bulkhead stiffeners.
= 7.41 for side shell longitudinals.
= 7.02 for longitudinal stiffeners on bulkhead.

h = For side shell members, the distance from the longitudinal or from the middle of vertical members, to the load line, or to a point located 2/3 of the distance from the keel to the bulkhead or freeboard deck, whichever is greater, in m.
= For bulkhead stiffeners, the distance from the middle of stiffener to a point located 2/3 of the distance from the top of the tank to the top of the overflow pipe, in m.

s = Spacing of the members, in m.

l = Unsupported span, in m.

(b) The scantling of bilge longitudinals is to be graduated between those required for bottom longitudinals and lowest side shell longitudinals.

1.5.4 Transverse Webs

(a) The section modulus of transverse webs, where fitted, is not to be less than that required by 1.5.3 (a) where C is to be taken as 7.11 for webs on side shell, bottom shell and wing tank bulkhead.

(b) Transverse webs are to be in line with the solid floors and are to have depths of not less than 0.145 of span l. In general, the depth is to be not less than twice the depth of the slot.

1.6 Hold Frames

1.6.1 The section modulus of hold frames is to be as required by Chapter 6 of Part II and not to be less than that obtained from the following equation.

$$Z = 3.5\,sh\,l^2 \qquad cm^3$$

where:

s = Frame spacing, in m

l = Unsupported span of frames, in m

h = $h_v + C_1 (1.09 - 0.65 h_v /d)$ in m
h_v = Vertical distance from the middle of l to the load line, in m
C_1 = As defined in 3.2 of part II
d = Molded draft, in m

1.6.2 The thickness of web and upper end brackets of hold frames is not to be less than the value obtained from the following formula. And the thickness of lower end brackets of hold frames is not to be less than 2 mm greater than the value given in the following formula:

$0.03L + 7.0$ mm

where:
L = Length of ship, in m.
Where, however, L exceeds 200 m, L is to be taken as 200 m.

1.6.3 For decks supported by longitudinal beams and topside wing tank sloping bulkheads stiffened by longitudinal stiffeners in association with widely spaced deep transverses in topside wing tanks, h for ordinary hold frames between deep transverses may be taken as zero.

1.7 Topside Wing Tanks

1.7.1 The thickness of the sloping bulkheads is not to be less than as required in Chapter 11 of Part II for 2nd deck, but at least in compliance with the requirements of Chapter 16 of Part II.

1.7.2 Stiffeners in topside wing tanks

(a) The section modulus of members in topside wing tanks is not to be less than:

$C\,sh l^2$ cm^3

where:
C = 7.41 for side shell longitudinals.
= 7.02 for bulkhead longitudinals.
= 7.8 for vertical side frames and bulkhead stiffeners.
= 8.19 for deck longitudinals.
s = Spacing of members, in m.
h = Distance from the middle of l to a point 2/3 of the distance from the top of the tank to the top of the overflow pipe except for deck members where h is not to be less than that given in row 1 of Table II 9-1, in m.
l = Unsupported span, in m.

(b) When sloping bulkheads and the side shell in way of topside wing tanks are framed transversely, stiffeners of sloping bulkheads are to be as required by Chapter 16 of Part II and frames of the side shell are to be as required by 6.6 of Part II.

1.7.3 The section modulus of deck longitudinals is not to be less than as required by 9.3 of Part II.

1.7.4 Transverse webs

(a) The section modulus of transverse webs, where fitted, in topside wing tanks is not to be less than that required by 1.7.2(a) where C is to be taken as 7.11 for shell and sloping-bulkhead webs and deck transverses.

(b) The depth of webs is not to be less than 1/12 of the span *l* and the thickness is not to be less than 1% of the depth plus 4 mm, but is not to be less than 8 mm and need not exceed 11 mm.

(c) In general, the depth of webs is not to be less than twice the depth of the slot.

1.8 Double Side Tanks

In general, the double side tanks are to be constructed in accordance with Chapter 3 of Part II for hull girder strength.

1.8.1 Longitudinal bulkhead plating

(a) The thickness of the longitudinal bulkhead plating is not to be less than the value derived from 16.2.2 of Part II with the distance h multiplied by K, the material factor, or the value obtained by the following formula, whichever is greater:

$$t = Cs\sqrt{Kh} + 2.5 \quad \text{mm}$$

Where:

s = Spacing of longitudinal stiffeners, in m.

h = Vertical distance from the lower end of the panel under consideration to the upper deck at the centreline, in m.

K = Material factor in accordance with 1.5.2(a) of Part II.

C = Coefficient given by the following formula, is not to be taken less than 3.2 :

= $4.25ab\sqrt{\gamma}$

a = As given by the following formula:

= $0.615 + 0.11\frac{l}{s}$, when $1.0 \le \frac{l}{s} < 3.5$

= 1.0, when $3.5 \le \frac{l}{s}$

l = Spacing between transverse webs, in m.

b = As given by the following formula:

= 1.0, when $\beta \le 40°$

= $1.4 - 0.01\beta$, when $40° < \beta \le 80°$

= 0.6, when $80° \le \beta$

β = Angle of inclination (degrees) of the bulkhead plating under consideration to the horizontal plane

γ = As specified in 1.4.4(a).

(b) Where ore cargo or cargoes handled by grabs is to be carried, the thickness of the lower strake of the longitudinal bulkhead is not to be less than the value obtained from the following formula:

$$t_{grab} = 0.52\sqrt{1000sK} \times \left(\frac{M_{GR}}{20}\right)^{0.25} + 2.5 \quad \text{mm}$$

Where:

s = Spacing of longitudinals on longitudinal bulkhead, in m.

K = Material factor in accordance with 1.5.2(a) of Part II.

M_{GR} = Mass of unladen grab, in ton.

1.8.2 Longitudinal bulkhead stiffeners

The section modulus of the longitudinal bulkhead stiffeners is not to be less than the value derived from 14.2.3 of Part II multiplied by K, the material factor, or the value obtained from the following formula, whichever is greater.

$$Z = C_1 C_2 s h l^2 \quad \text{cm}^3$$

Where:

s = Spacing of longitudinal stiffeners, in m.

h = Vertical distance from the stiffener under consideration to the upper deck at the centreline, in m.

l = Bending span between transverse webs, in m.

C_1 = Coefficient given in below according to the values of β and γ specified in 1.8.1(a).

Angle β	C_1
β≤40˚	130γ
40˚<β≤ 80˚	(214-2.1β) γ
β≥ 80˚	46γ

β = Angle of inclination of the bulkhead plating under consideration to the horizontal plane, in degrees

γ = As specified in 1.4.4(a).

C_2 = Coefficient given by the following formula:

$$= \frac{K}{24 - \alpha K}$$

K = Material factor in accordance with 1.5.2(a) of Part II.

α = Either α_1 or α_2 according to the value of z,

when $z > z_B, \alpha_1 = 15.5 f_D \frac{(z - z_B)}{z_0}$

when $z \le z_B, \alpha_2 = 15.5 f_B \left(1 - \frac{z}{z_B}\right)$

f_B = Ratio of the section modulus of the transverse section of the hull on the basis of mild steel in accordance with Chapter 3 of Part II to the actual section modulus of the transverse section of the hull at the bottom.

z = Vertical distance from the top of the keel to the longitudinal under consideration, in m.

z_B = Vertical distance from top of the keel amidship to the horizontal neutral axis of the transverse section of the hull, in m.

z_0 = Vertical distance from the neutral axis to the top of the strength deck beam at the side of the ship or obtained from the following formula, in m, whichever is greater.

$$= Y\left(0.9 + 0.2\frac{X}{B}\right)$$

X = Horizontal distance from the top of continuous strength member to the centre line of the ship, in m.

Y = Vertical distance from the neutral axis to the top of the continuous strength member, in m.

B = Breadth of ship, in m.

f_D = Ratio of the section modulus of the transverse section of the hull on the basis of mild steel in accordance with Chapter 3 of Part II to the actual section modulus of the transverse section of the hull at the strength deck.

1.8.3 Horizontal stringers of side tanks

The plating thickness of the double side tank's horizontal stringers is to comply with the requirements of Table II 16-1 of Part II.

1.9 Transverse Bulkhead in Cargo Hold

1.9.1 Transverse bulkhead in ballast hold

The scantlings of the transverse bulkhead in ballast hold is to comply with the requirements specified in 16.2 of Part II. Alternatively, the transverse corrugated bulkhead scantlings may be determined by direct calculations that are to be submitted for review.

1.9.2 Transverse bulkhead in non-ballast hold

In general, the scantlings of the transverse bulkhead in non-ballast hold is to comply with the requirements given in Chapter 14 of Part II with the exception of 14.2.4(b). The section modulus of transverse bulkhead vertical corrugated bulkhead in non-ballast hold is not to be less than the value obtained from following formula.

$$Z = \frac{1000SKh l_e^2}{71(\omega_1 + \omega_2 + 2)} \quad cm^3$$

Where:

S = Half-pitch length of the corrugation, in m.

K = Material factor in accordance with 1.5.2(b) of Part II.

h = Vertical distance taken from the mid-effective length l_e as specified in Fig. III 1-1, to the upper deck at the centreline, in m.

l_e = Effective length of stiffening member, in m, and for bulkhead stiffeners, it is to be taken as $l - e_1 - e_2$, as specified in Fig. III 1-1.

$$e_i = MIN\{\alpha l; a_i\}$$

Where:

a_i and l specified in Fig. III 1-1

$\alpha = 0$ for $\mu \leq 1.0$

$\alpha = 0.5 - \frac{1}{\sqrt{2\mu + 2}}$ for $\mu > 1.0$

and

$$\mu = 10Z_s/M_2$$

Where:

Z_s = section modulus, in cm^3, of horizontal section of stool adjacent to deck or tank top over corrugated half-pitch length S.

$$M_2 = \frac{500Sl^3}{71}$$

ω_1, ω_2 = An end constraint factor, see Fig. III 1-1

$$\omega_i = MIN\left\{1.0; \frac{\delta \cdot t_{s,i}}{t_{m,i}}\right\}$$

Where:

$t_{m,i}$ and $t_{s,i}$ are the thickness in mm of the corrugated panel flange and that of the attached stool plating at the considered connection (see Fig. III 1-1), respectively.

$$\delta = \frac{0.932\sqrt{K}}{\xi}$$

$$\xi = MAX\{1.0; \eta + 0.333\}$$

$$\eta = \mathrm{MIN}\left\{1.0; \frac{50 t_m \sqrt{K}}{a}\right\}, \text{for welded section}$$

$$\eta = \mathrm{MIN}\left\{1.0; \frac{60 t_m \sqrt{K}}{a}\right\}, \text{for cold form section}$$

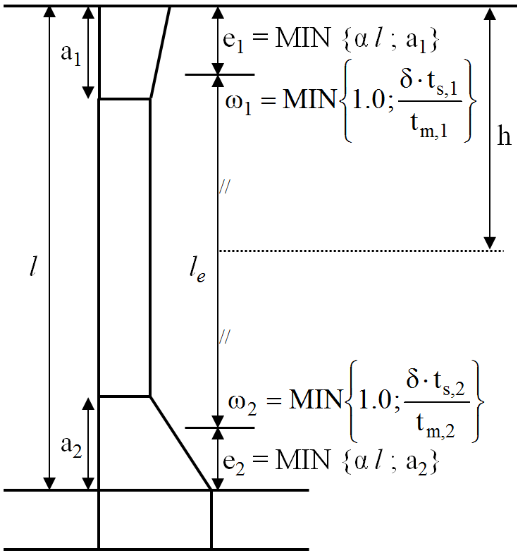

Fig. III 1-1
End Connection of Watertight Transverse Bulkhead

1.9.3 Transverse bulkhead in cargo hold with iron ore cargo loading in alternate condition

In general, the scantlings of the transverse bulkhead in cargo hold with iron ore cargo loading in alternate condition is to comply with the requirements specified in 1.9.1 and 1.9.2 as applicable, and those in 16.2 of Part II, which the vertical distance h given in 16.2.2 is to be substituted by 0.426γh or 0.639h, whichever is greater.

Alternatively, the scantlings of the transverse corrugated bulkhead in cargo hold with iron ore loading in alternate condition may be determined by direct calculations that are to be submitted for review.

1.9.4 Lower strake of transverse bulkhead in cargo hold

Where ore cargo or cargoes handled by grab is to be carried, the thickness of lower strake of the transverse bulkhead in hold is not to be less than the value obtained from the following formula:

$$t_{grab} = 0.55\sqrt{1000sK} \times \left(\frac{M_{GR}}{20}\right)^{0.25} + 2.5 \qquad \text{mm}$$

Where:

s = Spacing of longitudinals on lower strake, in m.

K = Material factor in accordance with 1.5.2(a) of Part II.

M_{GR} = Mass of unladen grab, in ton.

1.10 Requirements for the Fitting of a Forecastle

1.10.1 Application and definitions

These requirements, apply to all bulk carriers, ore carriers and combination carriers, as defined in 2.1.2, Part I of the Rules and this Chapter, which are contracted for construction on or after 1 January 2004.

Such ships are to be fitted with an enclosed forecastle on the freeboard deck. The required dimensions of the forecastle are defined in 1.8.2.

The structural arrangements and scantlings of the forecastle are to comply with the relevant requirements of the Rules.

1.10.2 Dimensions

The forecastle is to be located on the freeboard deck with its aft bulkhead fitted in way or aft of the forward bulkhead of the foremost hold, as shown in Fig. III 1-2.

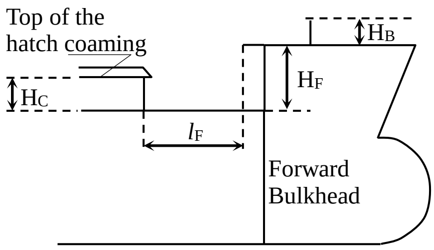

Fig. III 1-2
Forecastle

The forecastle height H_F above the main deck is to be not less than:

- the standard height of a superstructure as specified in the International Convention on Load Line 1966 and its Protocol of 1988, or

- H_C + 0.5 m, where H_C is the height of the forward transverse hatch coaming of cargo hold No.1,

whichever is the greater.

All points of the aft edge of the forecastle deck are to be located at a distance l_F :

$$l_F \leq 5\sqrt{H_F - H_C}$$

from the hatch coaming plate in order to apply the reduced loading to the No.1 forward transverse hatch coaming and No.1 hatch cover in applying 1A.7.4(a) and 1A.7.5(b) of Part II.

A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centre line is not less than HB/tan20° forward of the aft edge of the forecastle deck, where HB is the height of the breakwater above the forecastle (see Fig. III 1-2).

1.10.3 If the requirements of 1.10.2 hinders hatch cover operation, the aft bulkhead of the forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7% of ship length abaft the forward perpendicular where the ship length and forward perpendicular are defined in the International Convention on Load Line 1966 and its Protocol 1988.

1.11 Coating

Protective coatings of cargo holds are to comply with the requirements in 23.1.6 of Part II.

Chapter 1A

Additional Requirement for Bulk Carriers

1A.1 General

1A.1.1 This requirements in this chapter apply to sea-going single deck bulk carriers of single or double side skin, with a double bottom, hopper side tanks and top side tanks fitted below the upper deck.

1A.1.2 Unless otherwise stated in this chapter, the requirements as given in this chapter apply to bulk carriers with length of 150 m and above and intended to carry cargoes having bulk density of 1.0 t/m^3 or above.

1A.2 Loading Manuals and Loading Instruments for Bulk Carriers

1A.2.1 Application

Bulk carriers, Ore Carriers and Combination Carriers of 150 m length and above, are to be provided with an approved Loading Manual and approved computer-based Loading Instrument, in accordance with 1A.2.2, through 1A.2.5.

1A.2.2 Loading manual

Loading manual is a document which describes:

(a) the loading conditions on which the design of the ship has been based, including permissible limits of still water bending moments and shear forces;

(b) the results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional loads;

(c) for single skin bulk carriers, envelope results and permissible limits of still water bending moments and shear forces in the hold flooded condition according to 1A.4;

(d) the cargo hold(s) or combination of cargo holds that might be empty at full draught. If no cargo hold is allowed to be empty at full draught, this is to be clearly stated in the loading manual;

(e) maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of the draught at mid-hold position;

(f) maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold position;

(g) maximum allowable tank top loading together with specification of the nature of the cargo for cargoes other than bulk cargoes;

(h) maximum allowable load on deck and hatch covers. If the vessel is not approved to carry load on deck or hatch covers. This is to be clearly stated in the loading manual;

(i) the maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

1A.2.3 Loading instrument

A loading instrument is an instrument, which is either analog or digital, by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces, and the still water torsional moments and lateral loads, where applicable, in any load or ballast condition will not exceed the specified permissible values. In addition to above requirements, it is to ascertain as applicable that:

(a) the mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position;

(b) the mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds;

(c) the still water bending moment and shear forces in the hold flooded conditions according to 1A.4 are within permissible values.

1A.2.4 Conditions of approval of loading manuals

The approved Loading Manual is to be based on the final data of the ship. The Manual is to include the design loading and ballast conditions upon which the approval of the hull scantlings is based. In case of modifications resulting in changes to the main data of the ship, a new approved Loading Manual is to be issued. The Loading Manual must be prepared in a language understood by the users. If this language is not English, a translation into English is to be included. In addition to above requirements, the following conditions, subdivided into departure and arrival conditions as appropriate, are to be included in the Loading Manual:

(a) alternate light and heavy cargo loading conditions at maximum draught, where applicable;

(b) homogeneous light and heavy cargo loading conditions at maximum draught;

(c) ballast conditions. For vessels having ballast holds adjacent to topside wing, hopper and double bottom tanks, it is to be strength-wise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty. Partial filling of the peak tanks is not acceptable in the design ballast conditions, unless effective means are provided to prevent accidental overfilling;

(d) short voyage conditions where the vessel is to be loaded to maximum draught but with limited amount of bunkers;

(e) multiple port loading/unloading conditions;

(f) deck cargo conditions, where applicable;

(g) typical loading sequences where the vessel is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions are also to be included. The typical loading/unloading sequences are to be developed to not exceed applicable strength limitations. The typical loading sequences are also to be developed paying due attention to loading rate and the deballasting capability;

(h) typical sequences for change of ballast at sea, where applicable.

1A.2.5 Conditions of approval of loading instrument

(a) The loading instrument is subjected to approval, which is to include:

(i) verification of type approval, if any
(ii) verification that the final data of the ship has been used
(iii) acceptance of number and position of read-out points
(iv) acceptance of relevant limits for all read-out points
(v) checking of proper installation and operation of the instrument on board, in accordance with agreed test conditions, and that a copy of the operation manual is available.

(b) In addition to above requirements, the approval is to include followings:
(i) acceptance of hull girder bending moment limits for all read-out points
(ii) acceptance of hull girder shear force limits for all read-out points
(iii) acceptance of limits for mass of cargo and double bottom contents of each hold as a function of draught
(iv) acceptance of limits for mass of cargo and double bottom contents in any two adjacent holds as a function of draught.

1A.3 Side Structures

1A.3.1 Application

These requirements apply to the side structures within the cargo area of all single side skin bulk carriers.

1A.3.2 Scantlings of side structures

The thickness of the side shell plating and the section modulus and area of side frames are to be determined according to 1.3 and 1.6 in Part III. The scantlings of side hold frames immediately adjacent to the collision bulkhead are to be increased in order to prevent excessive imposed deformation on the shell plating. As an alternative, supporting structures are to be fitted which maintain the continuity of forepeak stringers within the foremost hold.

1A.3.3 Minimum thickness of frame webs

The thickness of frame webs within the cargo area is not to be less than $t_{w,\,min}$, in mm, given by:

$$t_{w,\,min} = 7.0+0.03L$$

Where L is the ship length, in m, as defined in 1.2.1 of Part II but need not be taken greater than 200 m.
The minimum thickness of frame webs in way of the foremost hold is not to be less than $t_{w1,\,min}$ in mm, given by:

$$t_{w1,\,min} = 1.15\ t_{w,\,min}$$

1A.3.4 Lower and upper brackets

The thickness of the frame lower bracket is not to be less than the greater of t_w and $t_{w,\,min}$+2 mm, where t_w is the fitted thickness of the side frame web. The thickness of the frame upper bracket is not to be less than the greater of t_w and $t_{w,\,min}$. The section modulus SM of the frame and bracket or integral bracket, and associated shell plating, at the locations shown in Fig. III 1A-1, is not to be less than twice the section modulus SM_F required for the frame midspan area. The dimensions of the lower and upper brackets are not to be less than those shown in Fig. III 1A-2. Structural continuity with the upper and lower end connections of side frames is to be ensured within topsides and hopper tanks by connecting brackets as shown in Fig. III 1A-3. The brackets are to be adequately stiffened against buckling. The section modulus of the side longitudinals and sloping bulkhead longitudinals which support the connecting brackets are to be determined according to 1.5.3 and 1.7.2 in this Part by using the spacing S as shown in Fig. III 1A-3 with the span taken between transverses.

1A.3.5 Side frame sections

Frames are to be fabricated symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes. The side frame flange is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature is not to be less than r, in mm, given by:

$$r = \frac{0.4 b_f^2}{t_f}$$

Where b_f and t_f are the flange width and thickness of the brackets, respectively, in mm. The end of the flange is to be sniped. In ships less than 190 m in length, mild steel frames may be asymmetric and fitted with separate brackets. The face plate or flange of the bracket is to be sniped at both ends. Brackets are to be arranged with soft toes. The web depth to thickness ratio of frames is not to exceed the following values:

- $60 \cdot K^{0.5}$ for symmetrically flanged frames
- $50 \cdot K^{0.5}$ for asymmetrically flanged frames

where K=1.0 for ordinary hull structural steel and K < 1 for higher tensile steel according to 1.5.2(a) in Part II.
The outstanding flange is not to exceed $10 \cdot K^{0.5}$ times the flange thickness.

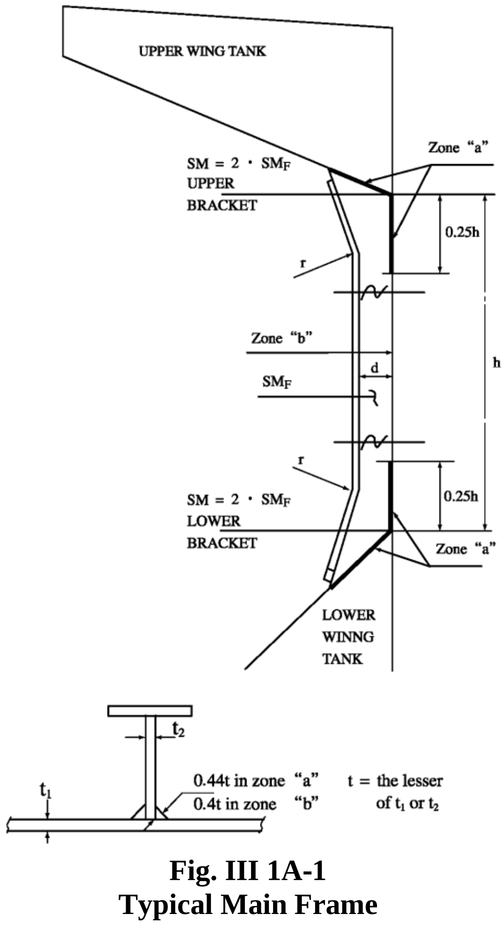

Fig. III 1A-1
Typical Main Frame

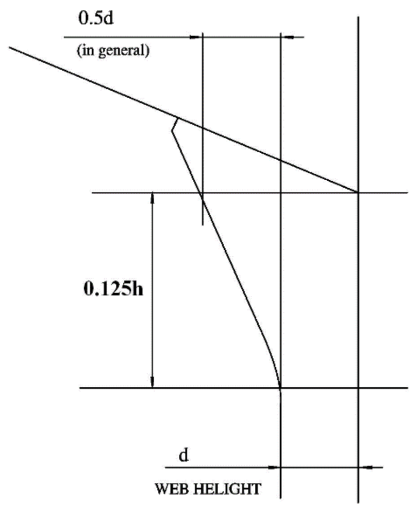

Fig. III 1A-2
Minimum Dimension of Brackets

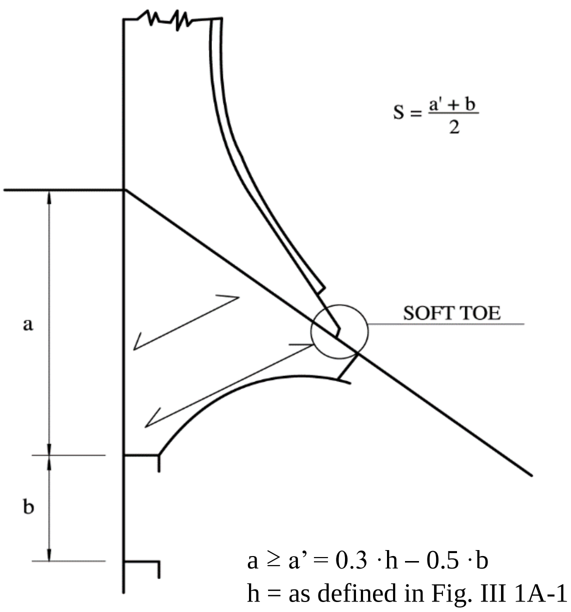

Fig. III 1A-3
Connecting Bracket

1A.3.6 Tripping brackets

In way of the foremost hold, side frames of asymmetrical section are to be fitted with tripping brackets at every two frames, as shown in Fig. III 1A-4.

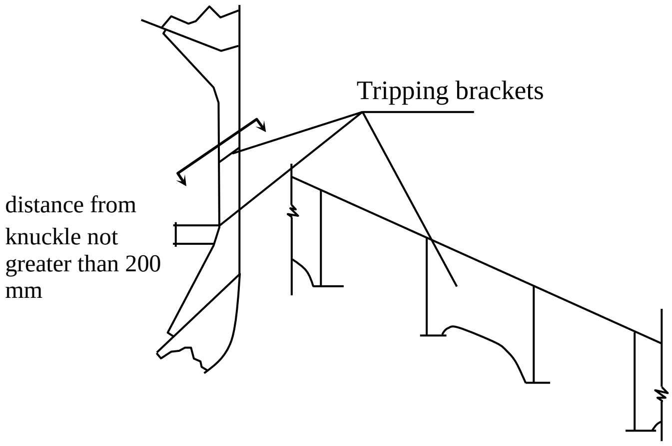

Fig. III 1A-4
Tripping Bracket

1A.3.7 Weld connections of frames and end brackets

Double continuous welding is to be adopted for the connections of frames and brackets to side shell. Hopper and upper wing tank plating and web to face plates. For this purpose, the weld throat is to be (see Fig. III 1A-1).

- 0.44t in zone "a"
- 0.4t in zone "b"

Where t is the thinner of the two connected members.

Where the hull form is such to prohibit an effective fillet weld, edge preparation of the web of frame and bracket may be required, in order to ensure the same efficiency as the weld connection stated above.

1A.3.8 Minimum thickness of side shell plating

The thickness of side shell plating located between hopper and upper wing tanks is not to be less than $t_{p,min}$ in mm, given by:

$$t_{p.min} = \sqrt{L}$$

1A.4 Longitudinal Strength of Hull Girder in Flooded Condition

1A.4.1 Application and definitions

These requirements of 1A.4 are to be complied with in respect of the flooding of any cargo hold of bulk carriers with notation **BC-A**, **BC-B**, as defined in 1.2. Such ships are to have their hull girder strength checked for specified flooded conditions, in each of the following cargo and ballast loading conditions:

(a) ballast condition (at departure and arrival),

(b) homogeneous loading condition (at departure and arrival),

(c) all specific non-homogeneous loading condition (at departure and arrival),

(d) the other loading condition which are deemed necessary by the Society.

1A.4.2 Flooding conditions

(a) Floodable holds

Each cargo hold is to be considered individually flooded up to the equilibrium waterline, except that cargo holds of double side skin construction of not less than 1000 mm breadth at any location within the hold length, measured perpendicular to the side shell in ships need not be considered flooded.

(b) Loads

The still water loads in flooded conditions are to be calculated for the above cargo and ballast loading conditions. The wave loads in the flooded conditions are assumed to be equal to 80% of the most probable maximum lifetime wave load, as given in 3.2.2, Part II of the Rules.

1A.4.3 Flooding criteria

To calculate the weight of ingressed water, the following assumptions are to be made:

(a) The permeability of empty cargo spaces and volume left in loaded cargo spaces above any cargo is to be taken as 0.95.

(b) Appropriate permeabilities and bulk densities are to be used for any cargo carried. For iron ore, a minimum permeability of 0.3 with a corresponding bulk density of 3.0 t/m³ is to be used. For cement, a minimum permeability of 0.3 with a corresponding bulk density of 1.3 t/m³ is to be used. In this respect, "permeability" for solid bulk cargo means the ratio of the floodable volume between the particles, granules or any larger pieces of the cargo, to the gross volume of the bulk cargo. For packed cargo conditions (such as steel mill products), the actual density of the cargo is to be used with a permeability of zero.

1A.4.4 Stress assessment

The actual hull girder bending stress σ_{fld}, in N/mm², at any location is given by:

$$\sigma_{fld} = \frac{M_{sf} + 0.8M_w}{W_Z} \cdot 10^3$$

where:

M_{sf} = Still water bending moment, in kN·m, in the flooded conditions for the section under consideration.

M_w = Wave bending moment, in kN·m, as given in 3.2.2, Part II of the Rules for the section under consideration.

W_Z = Section modulus, in cm^3, for the corresponding location in the hull girder.

The actual hull girder shear stress τ_{fld}, in N/mm^2, at any location is given by:

$$\tau_{fld} = \frac{0.5(F_{sf} \cdot f_{sfc} + 0.8F_w) \cdot m}{I \times t} \cdot 10^2$$

where:

F_{sf} = Still water shear force, in kN, in the flooded conditions for the section under consideration.

F_w = Wave shear force, in kN, as given in 3.3, Part II of the Rules for the section under consideration.

f_{sfc} = Still water shear force correction factor for loading condition with empty holds, to be determined at the discretion of the Society.

I, m = As defined in 3.3, Part II of the Rules.

t = Thickness of plating, in mm.

1A.4.5 Strength criteria

The damaged structure is assumed to remain fully effective in resisting the applied loading. The calculated hull girder bending and shear stresses, in N/mm^2, are not to exceed the allowable values given below:

in bending : σ_a = 175/K
in shear : τ_a = 110/K

K is as defined in 1.5.2(a) of Part II of the Rules. Axial stress buckling strength is to be in accordance with acceptable criteria.

1A.5 Evaluation of Scantlings of Corrugated Transverse Watertight Bulkheads in Flooded Hold

1A.5.1 Application and definitions

These requirements apply to all single side skin bulk carriers, of 150 m in length and above, intended for the carriage of solid bulk cargoes having bulk density of 1.0 t/m³,or above with vertically corrugated transverse watertight bulkheads. The net thickness t_{net} is the thickness obtained by applying the strength criteria given in 1A.5.4. The required thickness is obtained by adding the corrosion addition t_s, given in 1A.5.6 to the net thickness t_{net}. In this requirement, homogeneous loading condition means loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, does not exceed 1.20, to be corrected for different cargo densities.

1A.5.2 Load model

(a) General

The loads to be considered as acting on the bulkheads are those given by the combination of the cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under examination. In any case, the pressure due to the flooding water alone is to be considered. The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of each bulkhead, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions;
- non-homogeneous loading conditions;

considering the individual flooding of both loaded and empty holds. The specified design load limits for the cargo holds are to be represented by loading conditions defined by the Designer in the loading manual. Non-homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not to be considered according to these requirements. Holds carrying packed cargoes are to be considered as empty holds for this application. Unless the ship is intended to carry, in non-homogeneous conditions, only iron ore or cargo having bulk density equal or greater than 1.78 t/m³, the maximum mass of cargo which may be carried in the hold is also to be considered to fill that hold up to the upper deck level.

(b) Bulkhead corrugation flooding head

The flooding head h_f (see Fig. III 1A-5) is the distance, in m, measured vertically with the ship in the upright position, from the calculation point to a level located at a distance d_f, in m, from the baseline equal to:

(i) in general

- D for the foremost transverse corrugated bulkhead.
- 0.9 D for the other bulkheads.

Where the ship is to carry cargoes having bulk density less than 1.78 t/m³ in non- homogenous loading conditions, the following values can be assumed:

- 0.95 D for the foremost transverse corrugated bulkhead.
- 0.85 D for the other bulkheads.

(ii) for ships less than 50,000 tons deadweight with Type B freeboard

- 0.95 D for the foremost transverse corrugated bulkhead.
- 0.85 D for the other bulkheads.

Where the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions, the following values can be assumed:

- 0.9 D for the foremost transverse corrugated bulkhead.
- 0.8 D for the other bulkheads.

D is the distance, in m, from the baseline to the freeboard deck at side amidship (see Fig. III 1A-5).

(c) Pressure in the non-flooded bulk cargo loaded holds
At each point of the bulkhead, the pressure P_c, in kN/m^2, is given by:

$$P_c = \rho_c \cdot g \cdot h_1 \cdot \tan^2\gamma$$

where:

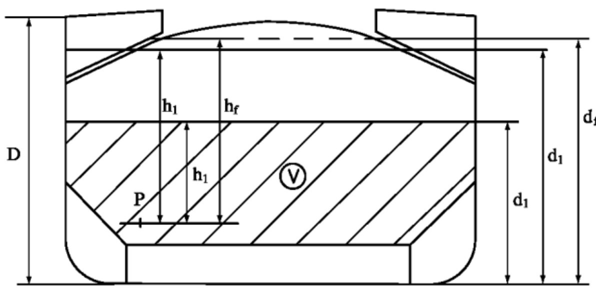
ρ_c = Bulk cargo density, in t/m^3.
g = 9.81 m/s^2, gravity acceleration.
h_1 = Vertical distance, in m, from the calculation point to horizontal plane corresponding to the volume of the cargo (see Fig. III 1A-5), located at a distance d_1, in m, from the baseline.
γ = 45°-(φ/2)
φ = Angle of repose of the cargo, in degrees, that may generally be taken as 35° for iron ore and 25° for cement.

The force F_c, in kN, acting on a corrugation is given by:

$$F_c = \rho_c \cdot g \cdot S_1 \cdot \frac{(d_1 - h_{DB} - h_{LS})^2}{2} \cdot \tan^2\gamma$$

where:

ρ_c, g, d_1, γ = As given above.
S_1 = Spacing of corrugations, in m (see Fig III 1A-6).
h_{LS} = Mean height of the lower stool, in m, from the inner bottom.
h_{DB} = Height of the double bottom, in m.



V = Volume of cargo
P = Calculation point

Fig. III 1A-5
Definition of h_1 and d_1

(d) Pressure in the flooded holds

(i) Bulk cargo holds

Two cases are to be considered, depending on the values of d_1 and d_f.

(1) $d_f \geq d_1$

At each point of the bulkhead located at a distance between d_1 and d_f from the baseline, the pressure $P_{c,f}$ in kN/m², is given by:

$$P_{c,f} = \rho \cdot g \cdot h_f$$

where:

ρ = Sea water density, in t/m^3.

g = As given in 1A.5.2(c).

h_f = Flooding head as defined in 1A.5.2(b).

At each point of the bulkhead located at a distance lower than d_1 from the baseline, the pressure $P_{c,f,}$ in kN/m², is given by:

$$P_{c,f} = \rho \cdot g \cdot h_f + [\rho_c - \rho \cdot (1 - perm)] \cdot g \cdot h_1 \cdot \tan^2 \gamma$$

where:

ρ, g, h_f = As given above.

ρ_c, h_1, γ = As given in 1A.5.2(c).

perm = Permeability of cargo, to be taken as 0.3 for ore (corresponding bulk cargo density for iron ore may generally be taken as 3.0 t/m³), coal cargoes and for cement (corresponding bulk cargo density for cement may generally be taken as 1.3 t/m³).

The force $F_{c,f}$, in kN, acting on a corrugation is given by:

$$F_{c,f} = S_1 \cdot \left[\rho \cdot g \cdot \frac{(d_f - d_1)^2}{2} + \frac{\rho \cdot g(d_f - d_1) + (P_{c,f})_{le}}{2} \cdot (d_1 - h_{DB} - h_{LS}) \right]$$

where:

ρ = As given above.

S_1, g, d_1 , h_{DB}, h_{LS} = As given in 1A.5.2(c).

d_f = As given in 1A.5.2(b).

$(P_{c,f})_{le}$ = Pressure, in kN/m^2 , at the lower end of the corrugation.

(2) $d_f < d_1$

At each point of the bulkhead located at a distance between d_f and d_1 from the baseline, the pressure $P_{c,f}$, in kN/m², is given by:

$$P_{c,f} = \rho_c \cdot g \cdot h_1 \cdot \tan^2 \gamma$$

where:

ρ_c, g, h_1, γ = Given in 1A.5.2(c).

At each point of the bulkhead located at a distance lower than d_f from the baseline, the pressure $P_{c,f,}$ in kN/m^2, is given by:

$$P_{c,f} = \rho \cdot g \cdot h_f + [\rho_c \cdot h_1 - \rho \cdot (1 - perm) \cdot h_f] \cdot g \cdot \tan^2 \gamma$$

where:

ρ, h_f, perm = As given above.
ρ_c, g, h_1, γ = As given 1A.5.2 (c).
The force $F_{c,f}$, in kN, acting on a corrugation is given by:

$$F_{c,f} = S_1 \cdot \left[\rho \cdot g \cdot \frac{(d_1 - d_f)^2}{2} \cdot \tan^2\gamma + \frac{\rho_c \cdot g(d_1 - d_f) \cdot \tan^2\gamma + (P_{c,f})_{le}}{2} \cdot (d_f - h_{DB} - h_{LS}) \right]$$

where:
S_1, ρ_c, g, d_1, γ, h_{DB}, h_{LS} = As given in 1A.5.2(c).
D_f = As given in 1A.5.2(b).
$(P_{c,f})_{le}$ = Pressure, in kN/m^2, at the lower end of the corrugation.

(ii) Pressure in empty holds due to flooding water alone

At each point of the bulkhead, the hydrostatic pressure P_f induced by the flooding head h_f is to be considered.

The force F_f ,in kN, acting on a corrugation is given by:

$$F_f = S_1 \cdot \rho \cdot g \cdot \frac{(d_f - h_{DB} - h_{LS})^2}{2}$$

where:
S_1, g, h_{DB}, h_{LS} = As given in 1A.5.2(c).
ρ = As given in 1A.5.2(d)(i)(1).
d_f = As given in 1A.5.2(b).

(e) Resultant pressure and force

(i) Homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure P, in kN/m^2, to be considered for the scantlings of the bulkhead is given by:

$$P = P_{c,f} - 0.8P_c$$

The resultant force F, in kN, acting on a corrugation is given by:

$$F = F_{c,f} - 0.8F_c$$

(ii) Non-homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure P in kN/m^2, to be considered for the scantlings of the bulkhead is given by:

$$P = P_{c,f}$$

The resultant force F, in kN, acting on a corrugation is given by:

$$F = F_{c,f}$$

1A.5.3 Bending moment and shear force

The bending moment M and the shear force Q in the bulkhead corrugations are obtained using the formulae given in (a) and (b) below. The M and Q values are to be used for the checks in 1A.5.4(e)

(a) Bending moment

The design bending moment M, in kN·m, for the bulkhead corrugations is given by:

$$M = \frac{F \cdot l}{8}$$

where:

F = Resultant force, in kN, as given in 1A.5.2(e),

l = Span of the corrugation, in m, to be taken according to Fig. III 1A-6 and Fig. III 1A-7.

(b) Shear force

The shear force Q, in kN, at the lower end of the bulkhead corrugations is given by:

$$Q = 0.8 \cdot F$$

where:

F = As given in 1A.5.2(e).

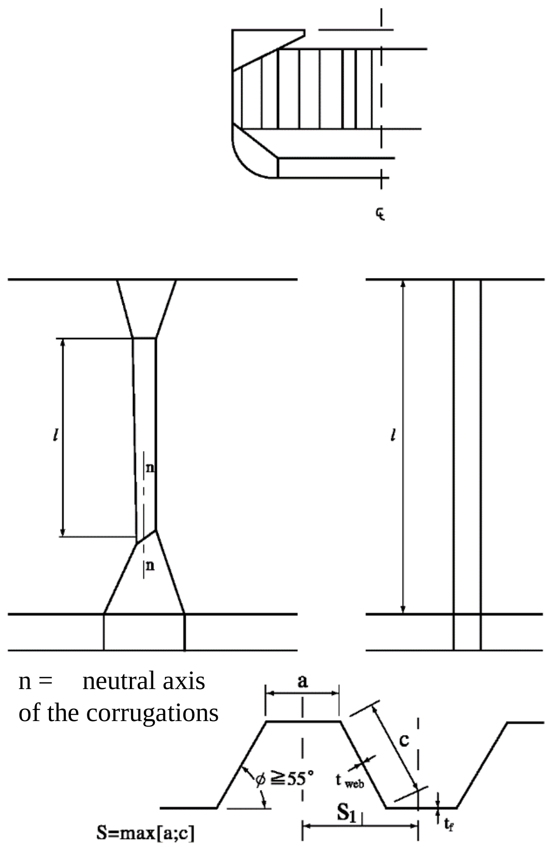


Fig. III 1A-6
Spacing of Corrugation

1A.5.4 Strength criteria

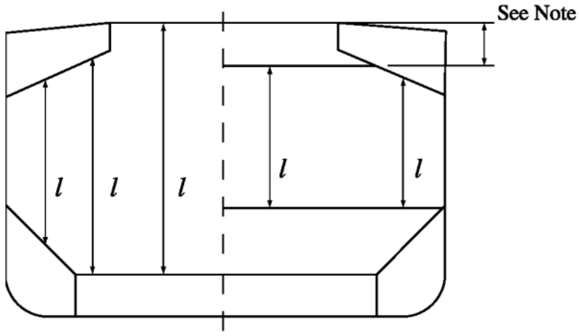
(a) General

The following criteria are applicable to transverse bulkheads with vertical corrugations (see Fig. III 1A-6, 7). For ships of 190 m of length and above, these bulkheads are to be fitted with a bottom stool, and generally with a top stool below deck. For smaller ships, corrugations may extend from inner bottom to deck.

The corrugation angle ϕ shown in Fig. III 1A-6 is not to be less than 55°.

Requirements for local net plate thickness are given in 1A.5.4(g).

In addition, the criteria as given in 1A.5.4(b) and 1A.5.4(c) are to be complied with. The thickness of the lower part of corrugations, considered in the application of 1A.5.4(b) and 1A.5.4(c) are to be maintained for a distance from the inner bottom or the top of the lower stool not less than 0.15*l*. The thickness of the middle part of corrugations, considered in the application of 1A.5.4(b) and 1A.5.4(d) are to be maintained for a distance from the deck or the bottom of the upper stool not greater than 0.3*l*. The section modulus of the corrugation in the remaining upper part of the bulkhead is not to be less than 75% of that required for the middle part, corrected for different yield stresses.



Note : For the definition of *l*, the internal end of the upper stool not to be taken more than a distance from the deck at the center line equal to:

(1) 3 times the depth of corrugations, in general.

(2) 2 times the depth of corrugations, for rectangular stool.

Fig. III 1A-7
Definition of *l*

(i) Lower stool

The height of the lower stool is generally to be not less than 3 times the depth of the corrugations. The thickness and material of the stool top plate is not to be less than those required for the bulkhead plating above. The thickness and material of the upper portion of vertical or sloping stool side plating within the depth equal to the corrugation flange width from the stool top is not to be less than the required flange plate thickness and material to meet the bulkhead stiffness requirement at lower end of corrugation. The thickness of the stool side plating and the section modulus of the stool side stiffeners is not to be less than those required by 14.2 in part II on the basis of the load model in 1A.5.2. The ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool.

The distance from the edge of the stool top plate to the surface of the corrugation flange is to be not less than 1.5 times the corrugation flange plate thickness. The stool bottom is to be installed in line with double bottom floors and is to have a width not less than 2.5 times the mean depth of the corrugation. The stool is to be fitted with diaphragms in line with the longitudinal double bottom girder for effective support of the corrugated bulkhead. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided. Where corrugations are cut at the bottom stool, corrugations and stool side plating are generally to be connected to the stool top plate by full penetrations welds. The plating of the lower stool and supporting floors is generally to be connected to the inner bottom by full penetration welds.

(ii) Upper stool

The upper stool, where fitted, is to have a height generally between 2 and 3 times the depth of corrugations. Rectangular stools are to have a height generally equal to 3 times the depth of corrugations, measured from the deck level and at hatch side girder. The upper stool is to be properly supported by girders or deep brackets between the adjacent hatch-end beams. The width of the stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non-rectangular stool bottom plate are to be the same as those of the bulkhead plating below. The thickness of the lower portion of stool side plating is not to be less than 80% of that required plating and the section modulus of the stool side stiffeners is not to be less than those required by on the basis of the load model in 1A.5.2. The ends of stool side stiffeners are to be attached to brackets at upper and lower end of the stool. Diaphragms are to be fitted inside the stool in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders for effective support of the corrugated bulkhead. Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

(iii) Alignment

At deck, if no stool is fitted, two transverse reinforced beams are to be fitted in line with the corrugation flanges.

At bottom, if no stool is fitted, the corrugation flanges are to be in line with the supporting floors,. Corrugations and floors are generally to be connected to the inner bottom plating by full penetration welds. The thickness and material properties of the supporting floors are to be at least equal to those provided for the corrugation flanges. Moreover, the cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors are to be connected to each other by suitably designed shear plates. Stool side plating is to align with the corrugation flanges and stool side vertical stiffeners and their brackets in lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. Stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top.

(b) Bending capacity and shear stress

The bending capacity is to comply with the following relationship:

$$10^3 \cdot \frac{M}{0.5 \cdot Z_{le} \cdot \sigma_{a,le} + Z_m \cdot \sigma_{a,m}} \leq 0.95$$

where:

M = Bending moment, kN/m as given in 1A.5.3(a).

Z_{le} = Section modulus, in cm³, at the lower end of corrugations, to be calculated according to 1A5.4(c).

Z_m = Section modulus, in cm³, at the mid-span of corrugations, to be calculated according to 1A.5.4(d).

$\sigma_{a,le}$ = Allowable stress, in kN/m², as given in 1A.5.4 (e) for the lower end of the corrugations.

$\sigma_{a,m}$ = Allowable stress, in kN/m², as given in 1A.5.4 for the mid-span of the corrugations.

In no case Z_m is to be taken greater than the lesser of $1.15Z_{le}$ and $1.15Z'_{le}$ for calculation of the bending capacity, Z'_{le} being defined below.

In case shedders plates are fitted which:

- are not knuckled;
- are welded to the corrugations and the top of the lower stool by one penetration welds or equivalent;
- are fitted with a minimum slope of 45°their lower edge is in line with the stool side plating;
- have thicknesses not less than 75% of that provided by the corrugation flange;
- and material properties at least equal to those provided by the flanges.

or gusset plates are fitted which:

- are in combination with shedder plates having thickness, material properties and welded connections in accordance with the above requirements;
- have a height not less than half of the flange width;
- are fitted in line with the stool side plating;
- are generally welded to the top of the lower stool by full penetration welds and to the corrugations and shedder plates by one side penetration welds or equivalent;
- have thickness and material properties at least equal to those provided for the flanges.

The section modulus Z_{le}, in cm³, is to be taken not larger than the value Z'_{le}, in cm³, given by:

$$Z'_{le} = Z_g + 10^3 \cdot \frac{Q \cdot h_g - 0.5 \cdot h_g^2 \cdot S_1 \cdot P_g}{\sigma_a}$$

where:

Z_g = Section modulus, in cm³, of the corrugations calculated according to 1A.5.4(d) in way of the upper end of shedder or gusset plates, as applicable,

Q = Shear force, in kN, as given in 1A.5.3(b).

h_g = Height, in m, of shedders or gusset plates, as applicable (see Fig. III 1A-8,9,10 and 11).

S_1 = As given in 1A.5.2(c).

P_g = Resultant pressure, in kN/m², as defined in 1A.5.2(e), calculated in way of the middle of the shedder or gusset plates, as applicable.

σ_a = Allowable stress, in kN/mm², as given in 1A.5.4(e).

Stresses τ are obtained by dividing the shear force Q by the shear area. The shear area is to be reduced in order to account for possible non-perpendicularity between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by (sin φ), φ being the angle between the web and the flange.

When calculating the section modulus and the shear area, the net plate thicknesses are to be used.

The section modulus of corrugations are to be calculated on the basis of the following requirements given in 1A.5.4(c) and 1A.5.4(d).

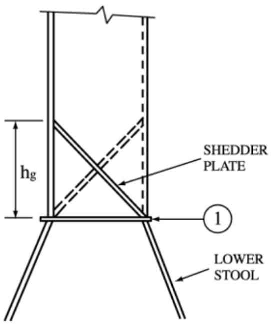


Fig. III 1A-8
Symmetric Shedder Plate

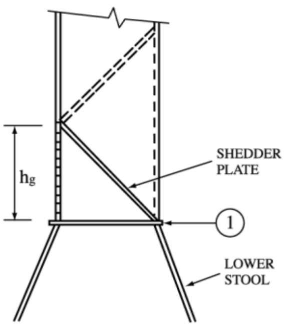

Fig. III 1A-9
Asymmetric Shedder Plates

(c) Section modulus at the lower end of corrugations

The section modulus is to be calculated with the compression flange having an effective flange width, b_{ef}, not larger than as given in 1A.5.4(f). If the corrugation webs are not supported by local brackets below the stool top (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30% effective.

(i) Provided that effective shedder plates, as defined in 1A.5.4(b), are fitted (see Fig. III 1A-8, 9), when calculating the section modulus of corrugations at the lower end (cross-section ① in Fig. III 1A-8, 9), the area of flange plates, in cm² may be increased by:

$$\left(2.5 \cdot a \cdot \sqrt{t_f \cdot t_{sh}}\right)$$

(not to be taken greater than $2.5 \cdot a \cdot t_f$)

where:

a = Width, in m, of the corrugation flange (see Fig. III 1A-6).

t_{sh} = Net shedder plate thickness, in mm.

t_f = Net flange thickness, in mm.

(ii) Provided that effective gusset plates, as defined in 1A.5.4(b), are fitted (see Fig. III 1A-10, 11), when calculating the section modulus of corrugations at the lower end (cross-section ① in Fig. III 1A-10, 11), the area of flange plates, in cm², may be increased by $(7 \cdot h_g \cdot t_f)$,

where:

h_g = Height of gusset plate, in m, see Fig. III 1A-10,11, not to be taken greater than $\frac{10}{7} \cdot S_{gu}$
S_{gu} = Width of the gusset plates, in m.
t_f = Net flange thickness, in mm, based on the as built condition.

(iii) If the corrugation webs are welded to a sloping stool top plate, which have an angle not less than 45º with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. In case effective gusset plates are fitted, when calculating the section modulus of corrugations the area of flange plates may be increased as specified in (ii) above. No credit can be given to shedder plates only. For angles less than 45º, the effectiveness of the web may be obtained by linear interpolation between 30% for 0º and 100% for 45º.

(d) Section modulus of corrugations at cross-sections other than the lower end

The section modulus is to be calculated with the corrugation webs considered effective and the compression flange having an effective flange width, b_{ef}, not larger than as given in 1A.5.4(f)(i).

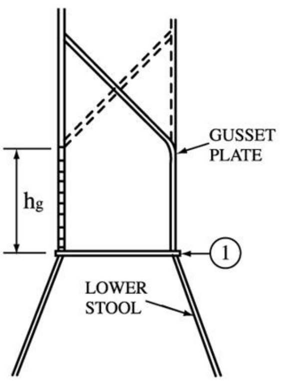

Fig. III 1A-10
Symmetric Gusset/Shedder Plates

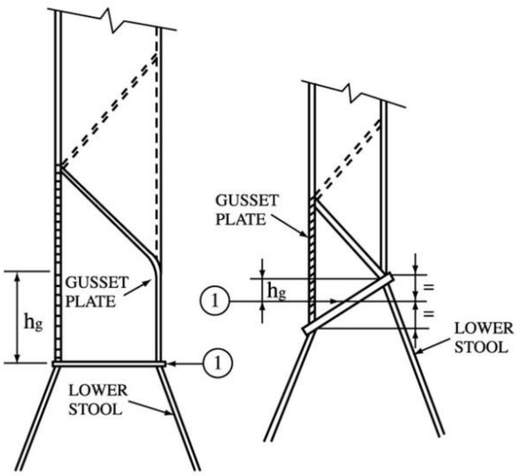

Fig. III 1A-11
Asymmetric Gusset/Shedder Plates

(e) Allowable stress check

The normal and shear stresses σ and τ are not to exceed the allowable values σ_a and τ_a, in N/mm², given by:

σ_a = σ_F
τ_a = $0.5\sigma_F$
σ_F = The minimum upper yield stress, in N/mm², of the material.

(f) Effective compression flange width and shear buckling check

(i) Effective width of the compression flange of corrugations

The effective width b_{ef}, in m, of the corrugation flange is given by:

$$b_{ef} = C_e \cdot a$$

where:

$$C_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \qquad \text{for } \beta > 1.25$$
$$C_e = 1.0 \qquad \text{for } \beta \leq 1.25$$

$$\beta = 10^3 \cdot \frac{a}{t_f} \cdot \sqrt{\frac{\sigma_F}{E}}$$

t_f = Net flange thickness, in mm.
a = Width, in m, of the corrugation flange (see Fig. III 1A-6).
σ_F = Minimum upper yield stress, in N/mm^2, of the material.
E = Modulus of elasticity of the material, in N/mm^2, to be assumed equal to $2.06 \cdot 10^5$ for steel.

(ii) Shear

The buckling check is to be performed for the web plates at the corrugation ends.

The shear stress τ is not to exceed the critical value τ_c, in N/mm^2 obtained by the following:

$$\tau_c = \tau_E \quad \text{when} \quad \tau_E \le \frac{\tau_F}{2}$$
$$= \tau_F \left(1 - \frac{\tau_F}{4\tau_E}\right) \quad \text{when} \quad \tau_E > \frac{\tau_F}{2}$$

where:

$$\tau_F = \frac{\sigma_F}{\sqrt{3}}$$

σ_F = Minimum upper yield stress, in N/mm², of the material.

$$\tau_E = 0.9 k_t E \left(\frac{t}{1000c}\right)^2 \quad \text{N/mm}^2$$

k_t , E, t and c are given by :
k_t = 6.34
E = Modulus of elasticity of material as given in (i) above.
t = Net thickness, in mm, of corrugation web.
c = Width, in m, of corrugation web (see Fig. III 1A-6).

(g) Local net plate thickness

The bulkhead local net plate thickness t, in mm, is given by:

$$t = 14.9 \cdot S_w \sqrt{\frac{1.05 \cdot P}{\sigma_F}}$$

where:
S_w = Plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is the greater (See S in Fig. III 1A-6).
P = Resultant pressure, in kN/m², as defined in 1A.5.2(e), at the bottom of each strake of plating; in all cases, the net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, or at the inner bottom, if no lower stool is fitted or at the top of shedders, if shedder or gusset/shedder plates are fitted.
σ_F = Minimum upper yield stress, in N/mm², of the material.

For built-up corrugation bulkheads, when the thicknesses of the flange and web are different, the net thickness of the narrower plating is to be not less than t_n, in mm, given by:

$$t_n = 14.9 \cdot S_n \sqrt{\frac{1.05 \cdot P}{\sigma_F}}$$

S_n = The width, in m, of the narrower plating.

The net thickness of the wider plating, in mm, is not to be taken less than the maximum of the following:

$$t_w = 14.9 \cdot S_w \sqrt{\frac{1.05 \cdot P}{\sigma_F}} \text{ and}$$

$$t_w = \sqrt{\frac{440 \cdot S_w^2 \cdot 1.05 \cdot P}{\sigma_F} - t_{np}^2}$$

where:

$t_{np} \leq$ actual net thickness of narrower plating and not to be greater than:

$$14.9 \cdot S_w \sqrt{\frac{1.05 \cdot P}{\sigma_F}}$$

1A.5.5 Local details

The design of local details is to maintain the continuity of structural members for the purpose of transferring the corrugated bulkhead forces and moments to the boundary structures, in particular to the double bottom and cross-deck structures. In particular, the thickness and stiffening of effective gusset and shedder plates, as defined in 1A.5.4(c), is to comply with chapter 14 of Part II on the basis of the load model in 1A.5.2. Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with chapter 14 of Part II.

1A.5.6 Corrosion addition and steel renewal

The corrosion addition t_s is to be taken equal to 3.5 mm.

Steel renewal is required where the gauged thickness is less than t_{net} + 0.5 mm.

Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

1A.6 Evaluation of Allowable Hold Loading Considering Hold Flooding

1A.6.1 Application and definitions

These requirements apply to single side skin bulk carriers of 150 m in length and above, intending to carry cargoes having bulk density 1.0 t/m^3, or above. The loading in each hold is not to exceed the allowable hold loading in flooded condition, calculated as per 1A.6.4, using the loads given in 1A.6.2 and the shear capacity of the double bottom given in 1A.6.3. In no case is the allowable hold loading, considering flooding, to be taken greater than the design hold loading in intact condition.

1A.6.2 Loading model

(a) General

The loads to be considered as acting on the double bottom are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of the hold which the double bottom belongs to.

The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions;
- non-homogenous loading conditions;
- packed cargo conditions (such as steel mill products).

For each loading conditions, the maximum bulk cargo density to be carried is to be considered in calculating the allowable hold loading limit.

(b) Inner bottom flooding head

The flooding head h_f (see Fig. III 1A-5) is the distance, in m, measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance d_f, in m, from the baseline equal to:

(i) in general:

(1) D for the foremost hold,

(2) 0.9D for the other holds.

(ii) for ships less than 50,000 tons deadweight with Type B freeboard:

(1) 0.95D for the foremost hold,

(2) 0.85D for the other holds.

D is the distance, in m, from the baseline to the freeboard deck at side amidships (see Fig. III 1A-5).

1A.6.3 Shear capacity of the double bottom

The shear capacity C of the double bottom is defined as the sum of the shear strength at each end of

- all floors adjacent to both hoppers, less one half of the strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted (see Fig. III 1A-12).

- all double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted.

Where in the end holds, girders of floors run out and are not directly attached to the boundary stool or hopper girder, their strength is to be evaluated for the one end only.

Note that the floors and girders to be considered are those inside the hold boundaries formed by the hoppers and stools (or transverse bulkheads if no stool is fitted). The hopper side girders and the floors directly below the connection of the bulkhead stools (or transverse bulkheads if no stool is fitted) to the inner bottom are not to be included.

The hopper side girders and the floors directly below the connection of the bulkhead stools (or transverse bulkheads if no stool is fitted) to the inner bottom are not to be included.

When the geometry and/or the structural arrangement of the double bottom are such to make the above assumptions inadequate, the shear capacity C of double bottom may be specially considered by the Society.

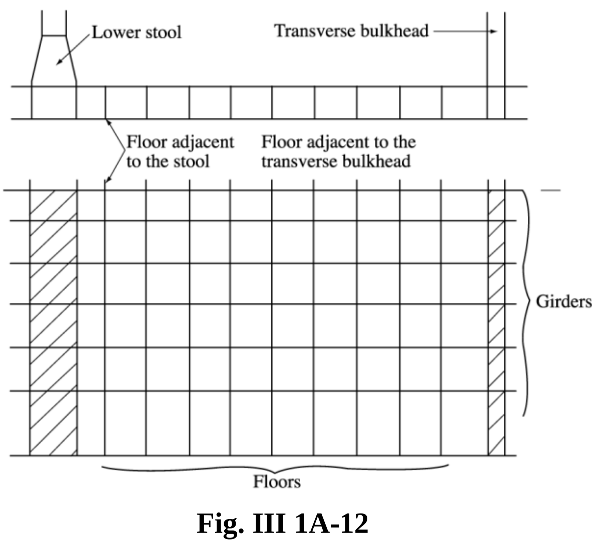

Fig. III 1A-12
Arrangement of Double Bottom

In calculating the shear strength, the net thickness of floors and girders is to be used. The net thickness t_{net}, in mm, is given by:

$t_{net} = t - 2.5$

where:

t = Thickness, in mm, of floors and girders.

(a) Floor shear strength

The floor shear strength in way of the floor panel adjacent to hoppers S_{f1}, in kN, and the floor shear strength in way of the openings in the outmost bay (i.e. that bay which is closer to hopper) S_{f2}, in kN, are given by the following expressions:

$$S_{f1} = 10^{-3} \cdot A_f \cdot \frac{\tau_a}{\eta_1}$$
$$S_{f2} = 10^{-3} \cdot A_{f,h} \cdot \frac{\tau_a}{\eta_2}$$

where:

A_f = Sectional area, in mm^2, of the floor panel adjacent to hoppers.

$A_{f,h}$ = Net sectional area, in mm^2, of the floor panels in way of the openings in the outmost bay (i.e. that bay which is closer to hopper)

τ_a = Allowable shear stress, in N/mm^2, to be taken equal to lesser of $\tau_a = \frac{162 \cdot \sigma_F^{0.6}}{\left(\frac{S}{t_{net}}\right)^{0.8}}$ and $\frac{\sigma_F}{\sqrt{3}}$

For floors adjacent to the stools or transverse bulkheads, as identified in 1A.6.3 above, τ_a may be taken $\frac{\sigma_F}{\sqrt{3}}$.

σ_F = Minimum upper yield stress, in N/mm^2, of the material.

S = Spacing of stiffening members, in mm, of panel under consideration.

η_1 = 1.10

η_2 = 1.20

η_2 may be reduced, down to 1.10 where appropriate reinforcement, the fitted around openings.

(b) Girder shear strength

The girder shear strength in way of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted) S_{gl}, in kN, and the girder shear strength in way of the largest opening in the outmost bay (i.e. that bay which is closer to stool, or transverse bulkhead, if no stool is fitted) S_{g2}, in kN, are given by:

$$S_{g1} = 10^{-3} \cdot A_g \cdot \frac{\tau_a}{\eta_1}$$
$$S_{g2} = 10^{-3} \cdot A_{g,h} \cdot \frac{\tau_a}{\eta_2}$$

where:

A_g = Minimum sectional area, in mm^2, of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted).

$A_{g,h}$ = Net sectional area, in mm^2, of the girder panel in way of the largest opening in the outmost bay (i.e. that bay which is closer to stool, or transverse bulkhead, if no stool is fitted).

τ_a = Allowable shear stress, in N/mm^2, as given in (a)above.

η_1 = 1.10

η_2 = 1.15

η_2 may be reduced, down to 1.10 where appropriate reinforcements are fitted around openings.

1A.6.4 Allowable hold loading

The allowable seize loading W, in tons, is given by:

$$W = \rho_c \cdot V \cdot \frac{1}{F}$$

where:

F = 1.1 in general,
1.05 for steel mill products,

ρ_c = Bulk cargo density, in t/m^3,

V = Volume, in m^3, occupied by cargo at a level h_1,

$$h_1 = \frac{X}{\rho_c g}$$

X = The lesser of X_1 and X_2 given by :

$$X_1 = \frac{Z + \rho \cdot g \cdot (E - h_f)}{1 + \frac{\rho}{\rho_c}\ (\text{perm} - 1)}$$

$$X_2 = Z + \rho \cdot g \cdot (E - h_r \cdot \text{perm})$$

ρ = Sea water density, in t/m^3.

g = 9.81 m/s^2, gravity acceleration.

E = d_f −0.1D , ship immersion in m for flooded hold condition,

d_f, D = As given in 1A.6.2(b).

h_f = Flooding head, in m, as defined in 1A.6.2(b).

perm = Cargo permeability, (i.e. the ratio between the voids within the cargo mass and the volume occupied by the cargo); it needs not be taken greater than 0.3 and is to be taken equal to zero for steel mill products.

Z = The lesser of Z_1 and Z_2 given by:

$$Z_1 = \frac{C_h}{A_{DB,h}}$$

$$Z_2 = \frac{C_e}{A_{DB,e}}$$

C_h = Shear capacity of the double bottom, in kN, as defined in 1A.6.3, considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} (see 1A.6.3(a)) and , for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see 1A 6.3(b)).

C_e = Shear capacity of the double bottom, in kN, as defined in 1A.6.3, considering, for each floor, the shear strength S_{f1} (see 1A.6.3(a)) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see 1A.6.3(b)).

$$A_{DB,h} = \sum_{i=1}^{i=n} S_i \cdot B_{DB,i}$$

$$A_{DB,e} = \sum_{i=1}^{i=n} S_i \cdot (B_{DB} - S_1)$$

n = Number of floors between stools (or transverse bulkheads, if no stool is fitted).

S_i = Space of ith-floor, in m.

$B_{DB,i}$ = $B_{DB} - S_1$ for floors whose shear strength is given by S_{f1} (see 1A.6.3(a)).

$B_{DB,i}$ = $B_{DB,h}$ for floors whose shear strength is given by S_{f2} (see 1A.6.3(a)).

B_{DB} = Breadth of double bottom, in m, between hoppers (see Fig. III 1A-13).

$B_{DB,h}$ = Distance, in m, between the two considered opening (see Fig. III 1A-13).

S_1 = Spacing, in m, of double bottom longitudinals adjacent to hoppers.

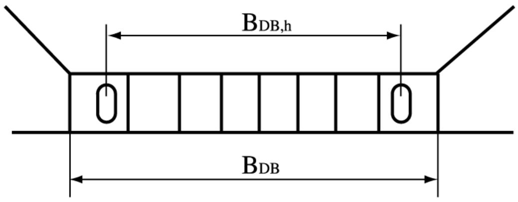

Fig. III 1A-13
Dimensions of Double Bottom

1A.7 Hatch Covers and Hatch Coamings of Cargo Holds

1A.7.1 Application and definitions

(a) These requirements apply to all bulk carriers, ore carriers and combination carriers, and are for all cargo hatch covers and hatch forward and side coamings on exposed decks in position 1, as defined in 17.1.2 of Part II. The requirements of 1A.7 apply to ships contracted for construction on or after 1 January 2004.

(b) The strength requirements are applicable to hatch covers and hatch coamings of stiffened plate construction. The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to provide sufficient load carrying capacity.

(c) The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed 1/3 of the span of primary supporting members.

(d) The secondary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

(e) The net minimum scantlings of hatch covers are to fulfill the strength criteria given in:

- (i) 1A.7.3(c), for plating.
- (ii) 1A.7.3(d), for secondary stiffeners.
- (iii) 1A.7.3(e), for primary supporting members, the critical buckling stress, check in 1A.7.3(f) and the rigidity criteria given in 1A.7.3(g), adopting the load model given in 1A.7.2.

(f) The net minimum scantlings of hatch coamings are to fulfill the strength criteria given in:

- (i) 1A.7.4(b), for plating.
- (ii) 1A.7.4(c), for secondary stiffeners.
- (iii) 1A.7.4(d), for coaming stays, adopting the load model given in 1A.7.4(a).

(g) The net thicknesses, t_{net}, are the member thicknesses necessary to obtain the minimum net scantlings required by 1A.7.3 and 1A.7.4.

(h) The required gross thicknesses are obtained by adding the corrosion additions, t_s, given in 1A.7.6, to t_{net}. Material for the hatch covers and coamings is to be steel according to the requirements for ship’s hull.

1A.7.2 Hatch cover load model

The pressure p, in kN/m^2, on the hatch covers panels is given by:

(a) For ships of 100 m in length and above and for hatch ways located at the freeboard deck:

$$p = 34.3 + \frac{P_{FP} - 34.3}{0.25} \cdot \left(0.25 - \frac{X}{L_f}\right) \geq 34.3$$

where:

P_{FP}	=	49.1 + (L_f -100)a , pressure at the forward perpendicular,
a	=	0.0726 for type B freeboard ships,
	=	0.356 for ships with reduced freeboard.
L_f	=	Freeboard length, in m, as defined in 1.2.10, Part II of the Rules to be taken not greater than 340 m.
X	=	Distance, in m, of the mid length of the hatch cover under examination from the forward end of L_f.

Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, the pressure p may be 34.3 kN/m^2.

For ships less than 100 m in length and for hatch ways located at the freeboard deck:

$$p = 15.8 + \frac{L_f}{3} \cdot \left(1 - \frac{5}{3} \cdot \frac{X}{L_f}\right) - 3.6 \cdot \frac{X}{L_f} \geq 0.195 L_f + 14.9$$

Where two or more panels are connected by hinges, each individual panel is to be considered separately.

1A.7.3 Hatch cover strength criteria

(a) Allowable stress checks

The normal and shear stresses σ and τ in the hatch cover structures are not to exceed the allowable values, σ_a and τ_a, in N/mm^2, given by:

$\sigma_a = 0.8\ \sigma_F$
$\tau_a = 0.46\ \sigma_F$

where:

σ_F being the minimum upper yield stress, in N/mm^2, of the material.

The normal stress in compression of the attached flange of primary supporting members is not to exceed 0.8 times the critical buckling stress of the structure according to the buckling check as given in 1A.7.3(f). The stresses in hatch covers that are designed as a grillage of longitudinal and transverse primary supporting members are to be determined by a grillage or a FE analysis. When a beam or a grillage analysis is used, the secondary stiffeners are not to be included in the attached flange area of the primary members. When calculating the stresses σ and τ, the net scantlings are to be used.

(b) Effective cross-sectional area of panel flanges for primary supporting members

The effective flange area A_f, in cm^2, of the attached plating, to be considered for the yielding and buckling checks of primary supporting members, when calculated by means of a beam or grillage model, is obtained as the sum of the effective flange areas of each side of the girder web as appropriate:

$$A_f = \sum_{nf} (10 b_{ef} t)$$

where:

nf = 2 if attached plate flange extends on both sides of girder web,
a = 1 if attached plate flange extends on one side of girder web only.
t = Net thickness of considered attached plate, in mm.
b_{ef} = Effective breadth, in m, of attached plate flange on each side of girder web,
= b_p , but not to be taken greater than 0.165l,
b_p = Half distance, in m, between the considered primary supporting member and the adjacent one.
l = Span, in m, of primary supporting members.

(c) Local net plate thickness

The local net plate thickness t, in mm, of the hatch cover top plating is not to be less than:

$$t = F_p 15.8 s \sqrt{\frac{p}{0.95\sigma_F}}$$

but to be not less than 1% of the spacing of the stiffener or 6 mm if that be greater.

where:

F_p = Factor for combined membrane and bending response,
= 1.50 in general,
= 1.90 σ/σ_a, for $\sigma/\sigma_a \geq 0.8$, for the attached plate flange of primary supporting members,
s = Stiffener spacing, in m.
p = Pressure, in kN/m^2 , as defined in 1A.7.2.
σ = As defined in 1A.7.3(e).
σ_a = As defined in 1A.7.3(a).

(d) Net scantlings of secondary stiffeners

The required minimum section modulus, Z, in cm^3, of secondary stiffeners of the hatch cover top plate, based on stiffener net member thickness, are given by:

$$Z = \frac{1000 l^2 sp}{12\sigma_a}$$

where:

l = Secondary stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all secondary stiffener spans, the secondary stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10% of the gross span, for each bracket.
s = Secondary stiffener spacing, in m.
p = Pressure, in kN/m^2 , as defined in 1A.7.2.
σ_a = As defined in 1A.7.3(a).

The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

(e) Net scantlings of primary supporting members

The section modulus and web thickness of primary supporting members, based on member net thickness, are to be such that the normal stress σ in both flanges and the shear stress τ, in the web, do not exceed the allowable values σ_a and τ_a, respectively, defined in 1A.7.3(a).

The breadth of the primary supporting member flange is to be not less than 40% of their depth for laterally unsupported spans greater than 3.0 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members.

The flange outstand is not to exceed 15 times the flange thickness.

(f) Critical buckling stress check

(i) Hatch cover plating

The compressive stress σ in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{C1}, to be evaluated as defined below:

$\sigma_{C1} = \sigma_{E1}$ when $\sigma_{E1} \leq \sigma_F /2$

$= \sigma_F [1 - \sigma_F/(4\sigma_{E1})]$ when $\sigma_{E1} > \sigma_F /2$

where:

σ_F = Minimum upper yield stress, in N/mm^2, of the material.

σ_{E1} = $3.6E\left(\frac{t}{1000s}\right)^2$

E = Modulus of elasticity, in N/mm^2,

= $2.06 \cdot 10^5$ for steel.

t = Net thickness, in mm, of plate panel.

s = Spacing, in m, of secondary stiffeners.

The mean compressive stress σ in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{C2}, to be evaluated as defined below:

$\sigma_{C2} = \sigma_{E2}$ when $\sigma_{E2} \leq \sigma_F /2$

$= \sigma_F [1 - \sigma_F/(4\sigma_{E2})]$ when $\sigma_{E2} > \sigma_F /2$

where:

σ_F = Minimum upper yield stress, in N/mm^2, of the material.

σ_{E2} = $0.9mE\left(\frac{t}{1000s_s}\right)^2$

m = $c\left[1 + \left(\frac{s_s}{l_s}\right)^2\right]^2 \frac{2.1}{\Psi + 1.1}$

E = Modulus of elasticity, in N/mm^2.

= $2.06 \cdot 10^5$ for steel.

t = Net thickness, in mm, of plate panel.

s_s = Length, in m, of the shorter side of the plate panel.

l_s = Length, in m, of the longer side of the plate panel.

Ψ = Ratio between smallest and largest compressive stress.

c = 1.3 when plating is stiffened by primary supporting members,

= 1.21 when plating is stiffened by secondary stiffeners of angle or T type,

= 1.1 when plating is stiffened by secondary stiffeners of bulb type,

= 1.05 when plating is stiffened by flat bar.

The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model, is to be determined at the discretion of the Society as deemed equivalent to the above criteria.

(ii) Hatch cover secondary stiffeners

The compressive stress σ in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0.8 times the critical buckling stress σ_{CS}, to be evaluated as defined below:

$\sigma_{CS} = \sigma_{ES}$ when $\sigma_{ES} \leq \sigma_F /2$

$= \sigma_F [1 - \sigma_F/(4\sigma_{ES})]$ when $\sigma_{ES} > \sigma_F /2$

where:

σ_F = Minimum upper yield stress, in N/mm^2, of the material.

σ_{ES} = Ideal elastic buckling stress, in N/mm^2, of the secondary stiffener,

= Minimum between σ_{E3} and σ_{E4}.

σ_{E3} = $\dfrac{0.001EI_a}{Al^2}$

E = Modulus of elasticity, in N/mm^2,

= $2.06\cdot10^5$ for steel.

I_a = Moment of inertia, in cm^4, of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners.

A = Cross-sectional area, in cm^2, of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners.

l = Span, in m, of the secondary stiffener.

σ_{E4} = $\dfrac{\pi^2 EI_w}{10^4 I_p l^2}\left(m^2+\dfrac{K}{m^2}\right)+0.385E\dfrac{I_t}{I_p}$

$K=\dfrac{Cl^4}{\pi^4 EI_w}10^6$

m = Number of half waves, given by the following table:

	$0 < K \le 4$	$4 < K \le 36$	$36 < K \le 144$	$(m-1)^2m^2 < K \le m^2(m+1)^2$
m	1	2	3	m

I_w = Sectorial moment of inertia, in cm^6, of the secondary stiffener about its connection with the plating,

= $\dfrac{h_w^3 t_w^3}{36}10^{-6}$ for flat bar secondary stiffeners,

= $\dfrac{t_f b_f^3 h_w^2}{12}10^{-6}$ for "Tee" secondary stiffeners,

= $\dfrac{b_f^3 h_w^3}{12(b_f+h_w)}\left[t_f\left(b_f^2+2b_f h_w+4h_w^2\right)+3t_w b_f h_w\right]\cdot10^{-6}$ for angles and bulb secondary stiffener.

I_p = Polar moment of inertia, in cm^4, of the secondary stiffener about its connection with the plating,

= $\dfrac{h_w^3 t_w}{3}10^{-4}$ for flat bar secondary stiffeners,

= $\left(\dfrac{h_w^3 t_w}{3}+h_w^2 b_f t_f\right)10^{-4}$ for flanged secondary stiffeners.

I_t = St. Venant's moment of inertia, in cm^4, of the secondary stiffener without top flange,

= $\dfrac{h_w t_w^3}{3}10^{-4}$ for flat bar secondary stiffeners,

= $\dfrac{1}{3}\left[h_w t_w^3+b_f t_f^3\left(1-0.63\dfrac{t_f}{b_f}\right)\right]10^{-4}$ for flanged secondary stiffeners.

h_w, t_w = Height and net thickness, in mm, of the secondary stiffener, respectively.

b_f, t_f = Width and net thickness, in mm, of the secondary stiffener bottom flange, respectively.

C = Spring stiffness exerted by the hatch cover top plating,

= $\dfrac{k_p E t_p^3}{3s\left(1+\dfrac{1.33k_p h_w t_p^3}{1000 s t_w^3}\right)}10^{-3}$

s = Spacing, in m, of secondary stiffeners.

k_p = $1-\eta_p$ to be taken not less than zero; for flanged secondary stiffeners, k_p need not be taken less than 0.1.

η_p = σ/σ_{E1}

σ = As defined in 1A.7.3(e).

σ_{E1} = As defined in 1A.7.3(f)(i).

t_p = Net thickness, in mm, of the hatch cover plate panel.

For flat bar secondary stiffeners and buckling stiffeners, the ratio h/t_W is to be not greater than $15\cdot K^{0.5}$, where:

h, t_W = Height and net thickness of the stiffener, respectively.
K = $235/\sigma_F$
σ_F = Minimum upper yield stress, in N/mm^2, of the material.

(iii) Web panels of hatch cover primary supporting members

This check is to be carried out for the web panels of primary supporting members, formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate. The shear stress τ in the hatch cover primary supporting members web panels is not to exceed 0.8 times the critical buckling stress τ_C, to be evaluated as defined below:

$$\tau_C = \tau_E \quad \text{when} \quad \tau_E \le \tau_F/2$$
$$\quad = \tau_F[1 - \tau_F / (4\tau_E)] \quad \text{when} \quad \tau_E > \tau_F/2$$

where:

σ_F = Minimum upper yield stress, in N/mm^2, of the material.
τ_F = $\dfrac{\sigma_F}{\sqrt{3}}$
τ_E = $0.9k_tE\left(\dfrac{t_{pr,n}}{1000d}\right)^2$
E = Modulus of elasticity, in N/mm^2.
= $2.06 \cdot 10^5$ for steel.
$t_{pr,n}$ = Net thickness, in mm, of primary supporting member.
k_t = $5.35 + 4.0/(a/d)^2$
a = Greater dimension, in m, of web panel of primary supporting member.
d = Smaller dimension, in m, of web panel of primary supporting member.

For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered. For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C. In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

(g) Deflection limit and connections between hatch cover panels

Load bearing connections between the hatch cover panels are to be fitted with the purpose of restricting the relative vertical displacements. The vertical deflection of primary supporting members is to be not more than 0.0056 *l*, where *l* is the greatest span of primary supporting members.

1A.7.4 Hatch coamings and local details

(a) Load model

The pressure p_{coam}, in kN/m^2, on the No. 1 forward transverse hatch coaming is given by:

p_{coam} = 220, when a forecastle is fitted in accordance with 1.8 of this Part,
= 290, in the other cases.

The pressure p_{coam}, in kN/m^2, on the other coamings is given by:

p_{coam} = 220

(b) Local net plate thickness

The local net plate thickness t, in mm, of the hatch coaming plating is given by:

$$t = 14.9s\sqrt{\frac{p_{coam}}{\sigma_{a,coam}}S_{coam}}$$

where:

s = Secondary stiffener spacing, in m.

p_{coam} = Pressure, in kN/m^2, as defined in 1A.7.4(a).

S_{coam} = Safety factor to be taken equal to 1.15.

$\sigma_{a,coam}$ = $0.95\sigma_F$

The local net plate thickness is to be not less than 9.5 mm.

(c) Net scantlings of longitudinal and transverse secondary stiffeners

The required section modulus Z, in cm^3, of the longitudinal or transverse secondary stiffeners of the hatch coamings, based on net member thickness, is given by:

$$Z = \frac{1000 S_{coam} l^2 s p_{coam}}{m c_p \sigma_{a,coam}}$$

where:

m = 16 in general,

= 12 for the end spans of stiffeners sniped at the coaming corners.

S_{coam} = Safety factor to be taken equal to 1.15.

l = Span, in m, of secondary stiffeners.

s = Spacing, in m, of secondary stiffeners.

p_{coam} = Pressure in kN/m^2 as defined in 1A.7.4(a).

c_p = Ratio of the plastic section modulus to the elastic section modulus of the secondary stiffeners with an attached plate breadth, in mm, equal to 40 t, where t is the plate net thickness,

= 1.16 in the absence of more precise evaluation.

$\sigma_{a,coam}$ = $0.95\sigma_F$

(d) Net scantlings of coaming stays

The required minimum section modulus, Z, in cm^3, and web thickness, t_w, in mm of coamings stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (see Fig. III 1A-14 and 15) at their connection with the deck, based on member net thickness, are given by:

$$Z = \frac{1000 H_c^2 s p_{coam}}{2\sigma_{a,coam}}$$

$$t_w = \frac{1000 H_c s p_{coam}}{h \tau_{a,coam}}$$

where:

H_c = Stay height, in m.

s = Stay spacing, in m.

h = Stay depth, in mm, at the connection with the deck.

p_{coam} = Pressure, in kN/m^2, as defined in 1A.7.4(a).

$\sigma_{a,coam}$ = $0.95\sigma_F$

$\tau_{a,coam}$ = $0.5\ \sigma_F$

For calculating the section modulus of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it. For other designs of coaming stays, such as, for examples, those shown in Fig. III 1A-16 and 17, the stress levels in 1A.7.3(a) apply and are to be checked at the highest stressed locations.

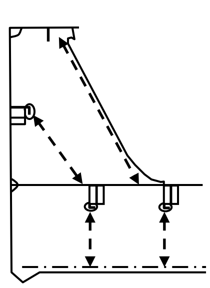

Fig. III 1A-14

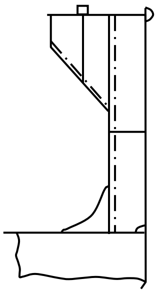

Fig. III 1A-15

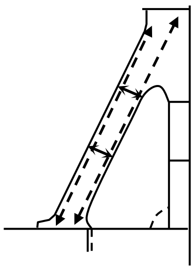

Fig. III 1A-16

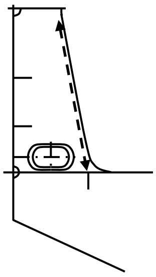

Fig. III 1A-17

(e) Local details

The design of local details is to comply with the Society requirement for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

Underdeck structures are to be checked against the load transmitted by the stays, adopting the same allowable stresses specified in 1A.7.4(d).

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society requirements.

Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than 0.44 t_W, where t_W is the gross thickness of the stay web.

Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15% of the stay width.

1A.7.5 Closing arrangements

(a) Securing devices

The strength of securing devices is to comply with the following requirements:

Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

The net sectional area of each securing device is not to be less than:

$A = 1.4\ a/f$ $\quad$ cm^2

where:

a = Spacing in m of securing devices, not being taken less than 2 m.
f = $(\sigma_Y / 235)^e$
σ_Y = Specified minimum upper yield stress in N/mm^2 of the steel used for fabrication, not to be taken greater than 70% of the ultimate tensile strength.
e = 0.75 for $\sigma_Y > 235$
= 1.0 for $\sigma_Y \leq 235$

Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

Between cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by the securing devices.

For packing line pressures exceeding 5 N/mm^2, the cross section area is to be increased in direct proportion. The packing line pressure is to be specified.

The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, I, of edge elements is not to be less than:

$I = 6\,pa^4$ cm^4

where:
p = Packing line pressure in N/mm, minimum 5 N/mm.
a = Spacing in m of securing devices.

Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

(b) Stoppers

Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.

With the exclusion of No.1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

No. 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2.

This pressure may be reduced to 175 kN/m^2 when a forecastle is fitted in accordance with 1.8 of this Part.

The equivalent stress:

(i) in stoppers and their supporting structures, and

(ii) calculated in the throat of the stopper welds is not to exceed the allowable value of $0.8\sigma_Y$.

(c) Materials and welding

Stoppers or securing devices are to be manufactured of materials, including welding electrodes, meeting the relevant requirements of the Rules.

1A.7.6 Corrosion addition and steel renewal

(a) Hatch covers

For all the structure (plating and secondary stiffeners) of single skin hatch covers, the corrosion addition t_s is to be 2.0 mm.

For pontoon hatch covers, the corrosion addition is to be:

(i) 2.0 mm for the top and bottom plating,

(ii) 1.5 mm for the internal structures.

For single skin hatch covers and for the plating of pontoon hatch covers, steel renewal is required where the gauged thickness is less than t_{net} + 0.5 mm. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in GOOD condition, as defined in 2.1.2(l) of Part I of the Rules.

For the internal structure of pontoon hatch covers, thickness gauging is required when plating renewal is to be carried out or when this is deemed necessary, at the discretion of the Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than t_{net}.

(b) Hatch coamings

For the structure of hatch coamings and coaming stays, the corrosion addition t_S is to be 1.5 mm.

Steel renewal is required where the gauged thickness is less than t_{net} + 0.5 mm. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in GOOD condition, as defined in 2.1.2(l) of Part I of the Rules.

1A.8 Cargo Hatch Cover Securing Arrangements for Bulk Carriers not Built in Accordance with 1A.7

1A.8.1 Application and implementation

(a) These requirements apply to all bulk carriers, which were not built in accordance with 1A.7 and are for steel hatch cover securing devices and stoppers for cargo hold hatchways No.1 and No.2 which are wholly or partially within 0.25L of the fore perpendicular, except pontoon type hatch cover.

(b) All bulk carriers not built in accordance with 1A.7 are to comply with the requirements of 1A.8 in accordance with the following schedule:

(i) For ships which will be 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

(ii) For ships which will be 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

(iii) For ships which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

(c) Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1 January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.

1A.8.2 Securing devices

(a) The strength of securing devices is to comply with the following requirements:

(i) Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

(ii) The net sectional area of each securing device is not to be less than:

$A = 1.4\ a/f$ cm^2

where:

a = Spacing between securing devices not to be taken less than 2 meters.

f = $(\sigma_Y / 235)^e$

σ_Y = Specified minimum upper yield stress in N/mm^2 of the steel used for fabrication, not to be taken greater than 70% of the ultimate tensile strength.

e = 0.75 for $\sigma_Y > 235$

= 1.0 for $\sigma_Y \leq 235$

Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

(iii) Between cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by the securing devices.

For packing line pressures exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line pressure is to be specified.

(iv) The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, I, of edge elements is not to be less than:

$I = 6\ p\ a^4$ cm^4

where:

p = Packing line pressure in N/mm, minimum 5 N/mm.

a = Spacing in m of securing devices.

(v) Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

(vi) Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

(vii) Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

1A.8.3 Stoppers

(a) No. 1 and 2 hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.

(b) No. 2 hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

(c) No. 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 if a forecastle is fitted.

(d) The equivalent stress

(i) in stoppers and their supporting structures, and

(ii) calculated in the throat of the stopper welds is not to exceed the allowable value of 0.8 σ_Y.

1A.8.4 Materials and welding

Where stoppers or securing devices are fitted to comply with 1A.8, they are to be manufactured of materials, including welding electrodes, meeting the relevant requirements of the Rules.

1A.9 Renewal Criteria for Side Shell Frames and Brackets in Single Side Skin Bulk Carriers not Built in Accordance with 1A.3

1A.9.1 Application and definitions

These requirements apply to the side shell frames and brackets of cargo holds bounded by the single side shell of bulk carriers constructed with single deck, topside tanks and hopper tanks in cargo spaces intended primarily to carry dry cargo in bulk, which were not built in accordance with 1A.3.

Ships subject to these requirements are to be assessed for compliance with the requirements of 1A.9 and steel renewal, reinforcement or coating, where required in accordance with 1A.9, is to be carried out in accordance with the schedule as specified in 1A.8.1(b) to (c) and at subsequent intermediate and special surveys.

These requirements define steel renewal criteria or other measures to be taken for the webs and flanges of side shell frames and brackets as per 1A.9.2. Reinforcing measures of side frames are also defined as per 1A.9.2(e).

(a) Ice strengthened ships

(i) Where bulk carriers are reinforced to comply with an ice class notation, the intermediate frames are not to be included when considering compliance with 1A.9.

(ii) The renewal thicknesses for the additional structure required to meet the ice strengthening notation are to be based on the Society's requirements.

(iii) If the ice class notation is requested to be withdrawn, the additional ice strengthening structure, with the exception of tripping brackets (see 1A.9.2(b)(i)(2) and 1A.9.2(e), is not to be considered to contribute to compliance with 1A.9.

1A.9.2 Criteria for renewal or other measures

(a) Symbols used in 1A.9.2

t_M = Thickness as measured, in mm.
t_{REN} = Thickness at which renewal is required. See 1A.9.2(b).
$t_{REN,d/t}$ = Thickness criteria based on d/t ratio. See 1A.9.2(b)(i).
$t_{REN,S}$ = Thickness criteria based on strength. See 1A.9.2(b)(ii).
t_{COAT} = 0.75 t_{S12}
t_{S12} = Thickness in mm as required by 1A.3.3 for frame webs and 1A.3.4 for upper and lower brackets.
t_{AB} = Thickness as built, in mm
t_C = See Table III 1A-1 below

Table III 1A-1
t_C Values, in mm

Ship's length L, in m	Holds other than No. 1		Hold No. 1	
	Span and upper brackets	Lower brackets	Span and upper brackets	Lower brackets
≤ 100	2.0	2.5	2.0	3.0
150	2.0	3.0	3.0	3.5
≥ 200	2.0	3.0	3.0	4.0

Note: For intermediate ship lengths, t_c is obtained by linear interpolation between the above values.

(b) Criteria for webs (Shear and other checks)

The webs of side shell frames and brackets are to be renewed when the measured thickness (t_M) is equal to or less than the thickness (t_{REN}) as defined below:

t_{REN} is the greatest of (t_{COAT} − t_C), (0.75 t_{AB}), ($t_{REN,d/t}$) and ($t_{REN,S}$) (where required by 1A.9.2(b)(ii)).

(i) Thickness criteria based on d/t ratio

Subject to (2) and (3) below, $t_{REN,d/t}$ is given by the following equation:

$t_{REN,d/t}$ = (web depth in mm)/R

where:
For frames
R = $65K^{0.5}$ for symmetrically flanged frames.
= $55K^{0.5}$ for asymmetrically flanged frames.
For lower brackets (see (1) below)
R = $87K^{0.5}$ for symmetrically flanged frames.
= $73K^{0.5}$ for asymmetrically flanged frames.
K = 1.0 for ordinary hull structural steel and according to 1.5.2(a) of Part II of the Rules for higher tensile steel.

In no instance is $t_{REN,d/t}$ for lower integral brackets to be taken as less than $t_{REN,d/t}$ for the frames they support.

(1) Lower brackets
In calculating the web depth of the lower brackets, the following will apply:

a) The web depth of lower bracket may be measured from the intersection of the sloped bulkhead of the hopper tank and the side shell plate, perpendicularly to the face plate of the lower bracket (see Fig.III 1A-20).

b) Where stiffeners are fitted on the lower bracket plate, the web depth may be taken as the distance between the side shell and the stiffener, between the stiffeners or between the outermost stiffener and the face plate of the brackets, whichever is the greatest.

(2) Tripping bracket alternative
When t_M is less than $t_{REN,d/t}$ at section b) of the side frames as shown in Fig. III 1A-19, tripping brackets in accordance with 1A.9.2(e) may be fitted as an alternative to the requirements for the web depth to thickness ratio of side frames, in which case $t_{REN,d/t}$ may be disregarded in the determination of t_{REN} in accordance with 1A.9.2(b).

(3) Immediately abaft collision bulkhead
For the side frames located immediately abaft the collision bulkheads, whose scantlings are increased in order that their moment of inertia is such to avoid undesirable flexibility of the side shell, when their web as built thickness t_{AB} is greater than $1.65\cdot t_{REN,S}$, the thickness $t_{REN,d/t}$ may be taken as the value $t'_{REN,d/t}$ obtained from the following equation:

$$t'_{REN,d/t} = \sqrt[3]{t^2_{REN,\frac{d}{t}} \times t_{REN,S}}$$

where $t_{REN,S}$ is obtained from 1A.9.3(c).

(ii) Thickness criteria based on shear strength check

Where t_M in the lower part of side frames, as defined in Fig. III 1A-18, is equal to or less than t_{COAT}, $t_{REN,S}$ is to be determined in accordance with 1A.9.3(c).

(iii) Thickness of renewed webs of frames and lower brackets

Where steel renewal is required, the renewed webs are to be of a thickness not less than t_{AB}, 1.2 t_{COAT} or 1.2 t_{REN}, whichever is the greatest.

(iv) Criteria for other measures

When $t_{REN} < t_M < t_{COAT}$, measures are to be taken, consisting of all the following:

(1) sand blasting, or equivalent, and coating (see 1A.9.2(d));

(2) fitting tripping brackets (see 1A.9.2(e)), when the above condition occurs for any of the side frame zones A, B, C and D, shown in Fig. III 1A-18, and

(3) maintaining the coating in "as-new" condition (i.e. without breakdown or rusting) at Special and Intermediate Surveys.

The above measures may be waived if the structural members show no thickness diminution with respect to the as built thicknesses and coating is in "as-new" condition (i.e. without breakdown or rusting).

(c) Criteria for frames and brackets (Bending check)

Where the length or depth of the lower bracket does not meet the requirements in 1A.3, a bending strength check in accordance with 1A.9.3(d) is to be carried out and renewals or reinforcements of frames and/or brackets effected as required therein.

(d) Thickness measurements, steel renewal, sand blasting and coating

For the purpose of steel renewal, sand blasting and coating, four zones A, B, C and D are defined, as shown in Fig. III 1A-18.

Representative thickness measurements are to be taken for each zone and are to be assessed against the criteria in 1A.9.2.

In case of integral brackets, when the criteria in 1A.9.2 are not satisfied for zone A or B, steel renewal, sand blasting and coating, as applicable, are to be done for both zones A and B.

In case of separate brackets, when the criteria in 1A.9.2 are not satisfied for zone A or B, steel renewal, sand blasting and coating is to be done for each one of these zones, as applicable.

When steel renewal is required for zone C according to 1A.9.2, it is to be done for both zones B and C. When sand blasting and coating is required for zone C according to 1A.9.2, it is to be done for zones B, C and D.

When steel renewal is required for zone D according to 1A.9.2, it needs only to be done for this zone. When sand blasting and coating is required for zone D according to 1A.9.2, it is to be done for both zones C and D.

Special consideration may be given by the Society to zones previously renewed or recoated, if found in "as-new" condition (i.e., without breakdown or rusting).

When adopted, on the basis of the renewal thickness criteria in 1A.9.2, in general coating is to be applied in compliance with the requirements of 23.1.6, Part II of the Rules as applicable.

Where, according to the requirements in 1A.9.2, a limited number of side frames and brackets are shown to require coating over part of their length, the following criteria apply.

(i) The part to be coated includes:

(1) the web and the face plate of the side frames and brackets,

(2) the hold surface of side shell, hopper tank and topside tank plating, as applicable, over a width not less than 100 mm from the web of the side frame.

(ii) Epoxy coating or equivalent is to be applied.

In all cases, all the surfaces to be coated are to be sand blasted prior to coating application.

(e) Reinforcing measures

Reinforcing measures are constituted by tripping brackets, located at the lower part and at midspan of side frames (see Fig. III 1A-4). Tripping brackets may be located at every two frames, but lower and midspan brackets are to be fitted in line between alternate pairs of frames.

The thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

Double continuous welding is to be adopted for the connections of tripping brackets to the side shell frames and shell plating.

(f) Weld throat thickness

In case of steel renewal the welded connections are to comply with 1A.3.7.

(g) Pitting and grooving

If pitting intensity is higher than 15% in area (see Fig. III 1A-21), thickness measurement is to be taken to check pitting corrosion.

The minimum acceptable remaining thickness in pits or grooves is equal to:

(i) 75% of the as built thickness, for pitting or grooving in the frame and brackets webs and flanges.

(ii) 70% of the as built thickness, for pitting or grooving in the side shell, hopper tank and topside tank plating attached to the side frame, over a width up to 30 mm from each side of it.

1A.9.3 Strength check criteria

In general, loads are to be calculated and strength checks are to be carried out for the aft, middle and forward frames of each hold. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the above frames.

When scantlings of side frames vary within a hold, the required scantlings are also to be calculated for the mid frame of each group of frames having the same scantlings. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the calculated frames.

(a) Load model

(i) Forces

The forces $P_{fr,a}$ and $P_{fr,b}$, in kN, to be considered for the strength checks at sections a) and b) of side frames (specified in Fig. III 1A-19; in the case of separate lower brackets, section b) is at the top of the lower bracket), are given by:

$P_{fr,a} = P_S + \max(P_1, P_2)$

$P_{fr,b} = P_{fr,a}\frac{h-2h_B}{h}$

where:

P_S = Still water force, in kN.

= $sh\frac{(p_{S,U}+p_{S,L})}{2}$ when the upper end of the side frame span h (see Fig. III 1A-18) is below the load water line.

= $sh'\left(\frac{p_{S,L}}{2}\right)$ when the upper end of the side frame span h (see Fig. III 1A-18) is at or above the load water line.

P_1 = $sh\frac{(p_{1,U}+p_{1,L})}{2}$,wave force, in kN, in head sea.

P_2 = $sh\frac{(p_{2,U}+p_{2,L})}{2}$,wave force, in kN, in beam sea.

h, h_B = Side frame span and lower bracket length, in m, defined in Fig. III 1A-18 and 19, respectively.

h' = Distance, in m, between the lower end of side frame span h (see Fig. III 1A-18) and the load water line.

s = Frame spacing, in m.

$p_{S,U}$, $p_{S,L}$ = Still water pressure, in kN/m^2, at the upper and lower end of the side frame span h (see Fig. III 1A-18), respectively.

$p_{1,U}$, $p_{1,L}$ = Wave pressure, in kN/m^2, at defined in 1A.9.3(a)(ii)(1). below for the upper and lower end of the side frame span h, respectively.

$p_{2,U}$, $p_{2,L}$ = Wave pressure, in kN/m^2, as defined in 1A.9.3(a)(ii)(2). below for the upper and lower end of the side frame span h, respectively.

(ii) Wave Pressure

(1) Wave pressure p_1

a) The wave pressure p_1, in kN/m^2, at and below the waterline is given by:

$$p_1 = 1.50\left[p_{11} + 135\frac{B}{2(B+75)} - 1.2(d-z)\right]$$

$$p_{11} = 3k_sC + k_f$$

b) The wave pressure p_1, in kN/m^2, above the water line is given by:

$$p_1 = p_{1WL} - 7.50(z-d)$$

(2) Wave pressure p_2

a) The wave pressure p_2, in kN/m^2, at d and below the waterline is given by:

$$p_2 = 13.0\left[0.5B\frac{50C_r}{2(B+75)} + C_b\frac{0.5B+k_f}{14}\left(0.7+2\frac{z}{d}\right)\right]$$

b) The wave pressure p_2, in kN/m^2, above the water line is given by:

$p_2 = p_{2WL} - 5.0(z - d)$

where:

p_{1WL} = p_1 wave sea pressure at the waterline.

p_{2WL} = p_2 wave sea pressure at the waterline.

L = Length of ship, in m, as defined in 1.2, Part II of the Rules.

B = Greatest moulded breadth, in m.

C_b = Block coefficient, as defined in 1.2, Part II of the Rules but not to be taken less than 0.6.

d = Maximum design draught, in m.

C = Coefficient,

= $10.75 - \left(\frac{300-L}{100}\right)^{1.5}$ for 90 m ≤ L ≤ 300m,

= 10.75 for 300 m < L.

C_r = $\left(1.25 - 0.025\frac{2k_r}{\sqrt{GM}}\right)k$

k = 1.2 for ships without bilge keel.

= 1.0 for ships with bilge keel.

k_r = Roll radius of gyration. If the actual value of k_r is not available,

= 0.39 B for ships with even distribution of mass in transverse section (e.g. alternate heavy cargo loading or homogeneous light cargo loading).

= 0.25 B for ships with uneven distribution of mass in transverse section (e.g. homogeneous heavy cargo distribution).

GM = 0.12 B if the actual value of GM is not available.

z = Vertical distance, in m, from the baseline to the load point.

k_s = $C_b = \frac{0.83}{\sqrt{C_b}}$ at aft end of L,

= C_b between 0.2 L and 0.6 L from aft end of L,

= $C_b + \frac{1.33}{C_b}$ at forward end of L.

Between the above specified points, k_s is to be interpolated linearly.

k_f = 0.8 C

(b) Allowable stresses

The allowable normal and shear stresses σ_a and τ_a, in N/mm^2, in the side shell frames and brackets are given by:

$\sigma_a = 0.90\sigma_F$
$\tau_a = 0.40\sigma_F$

where σ_F is the minimum upper yield stress, in N/mm^2, of the material.

(c) Shear strength check

Where t_M in the lower part of side frames, as defined in Fig. III 1A-18, is equal to or less than t_{COAT}, shear strength check is to be carried out in accordance with the following.

The thickness $t_{REN,S}$, in mm, is the greater of the thicknesses $t_{REN,Sa}$ and $t_{REN,Sb}$ obtained from the shear strength check at sections a) and b) (see Fig. III 1A-19 and 1A.9.3(a)) given by the following, but need not be taken in excess of $0.75t_{S12}$.

(i) At sections a): $t_{REN,Sa}=\frac{1000k_s p_{fr,a}}{d_a \sin\phi \tau_a}$

(ii) At sections b): $t_{REN,Sb}=\frac{1000k_s p_{fr,b}}{d_b \sin\phi \tau_a}$

where:

k_s = Shear force distribution factor, to be taken equal to 0.6

$P_{r,a}$,$P_{r,b}$ = Pressures forces defined in 1A.9.3(a)(i).

d_a, d_b = Bracket and frame web depth, in mm, at sections a) and b), respectively (see Fig. III 1A-19); in case of separate (non integral) brackets, d_b is to be taken as the minimum web depth deducing possible scallops.

ϕ = Angle between frame web and shell plate.

τ_a = Allowable shear stress, in N/mm^2, defined in 1A.9.3(b).

(d) Bending strength check

Where the lower bracket length or depth does not meet the requirements in 1A.3.4, the actual section modulus, in cm^3, of the brackets and side frames at sections a) and b) is to be not less than:

(i) At section a): $Z_a=\frac{1000p_{fr,a}h}{m_a\sigma_a}$

(ii) At section b): $Z_b=\frac{1000p_{fr,a}h}{m_b\sigma_a}$

where:

$p_{fr,a}$ = Pressures force defined in 1A.9.3(a)(i).

h = Side frame span, in m, defined in Fig. III 1A-18.

σ_a = Allowable normal stress, in N/mm^2, defined in 1A.9.3(b).

m_a, m_b = Bending moment coefficients defined in Table III 1A-2.

The actual section modulus of the brackets and side frames is to be calculated about an axis parallel to the attached plate, based on the measured thicknesses. For pre-calculations, alternative thickness values may be used, provided they are not less than:

- t_{REN}, for the web thickness.
- the minimum thicknesses allowed by the Society renewal criteria for flange and attached plating.

The attached plate breadth is equal to the frame spacing, measured along the shell at midspan of h.

If the actual section moduli at sections a) and b) are less than the values Z_a and Z_b, the frames and brackets are to be renewed or reinforced in order to obtain actual section moduli not less than 1.2 Z_a and 1.2 Z_b, respectively.

In such a case, renewal or reinforcements of the flange are to be extended over the lower part of side frames, as defined in Fig. III 1A-18.

Table III 1A-2
Bending Moment Coefficients m_a and m_b

	m_a	m_b		
		h_B = 0.08h	h_B = 0.1h	h_B = 0.125h
Empty holds of ships approved to operate in non-homogeneous loading conditions	10	17	19	22
Other cases	12	20	22	26

Notes:

(1) Non homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, exceeds 1.20 corrected for different cargo densities.

(2) For intermediate values of the bracket length h_B, the coefficient m_b is obtained by linear interpolation between the table values.

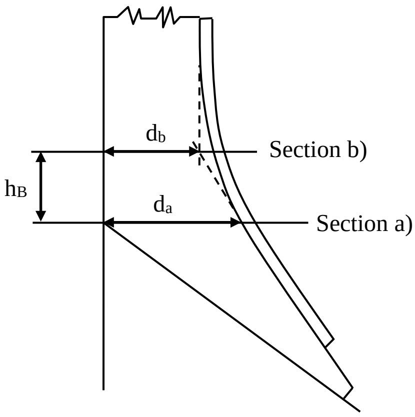

Fig. III 1A-18

Chapter 2

Oil Tankers

2.1 General

2.1.1 For double hull oil tankers of 150 m in length or greater, classed with the Society and contracted for construction on or after 1 April 2006, the structural requirements are to be in accordance with IACS's Common Structural Rules for Oil Tankers. For regions of the structure, which IACS's Common Structural Rules do not cover, the relevant requirements of the Society's Rules are to be applied, with appropriate consideration to related provisions of the Common Structural Rules.

2.1.2 This Chapter applies to ships classed in accordance with the provisions in Chapter 1 of Part I and built for the purpose of carrying oil in bulk having a specific gravity not exceeding 1.05, and flash point at or below 60°C closed cup test. For oil tankers intended to carry oil having a flash point above 60°C and assigned a service notation in accordance with 1.4.5 of Part I, the requirements for cofferdams and gastight bulkheads may be modified.

2.1.3 Except otherwise provided by this chapter, the requirements for the construction of general ships given in Part II are to be applied.

2.1.4 Scantling requirements given in this Chapter are generally intended to apply to single deck tankers with machinery aft and having two or more longitudinal bulkheads. The bottom and the deck are to be framed longitudinally in cargo oil tank spaces. Side frames and bulkhead stiffeners may be arranged either horizontally or vertically. The scantling for the ship constructions other than those mentioned above may be specially considered by the Society.

2.1.5 Tank arrangement

Oil tankers are to comply with the requirements in 2A.2.1, 2A.2.2, 2A.2.3 of Chapter 2A with regard to segregated ballast tanks, protective location, hypothetical outflow of oil, limitation of size and arrangement of cargo tanks and subdivision and damage stability.

2.1.6 Cofferdams

(a) Cofferdams are to be provided to separate cargo oil tanks from the galley, living quarters, the navigation space, general cargo spaces, boiler room and enclosed spaces containing machinery, where sources of vapour ignition are normally present.

(b) The width of cofferdams is at least to be adequate for ready access.

(c) Pump rooms may be considered as cofferdams provided that they have no direct access to the machinery space, the service passage, or the accommodation.

(d) Cofferdams may be omitted provided that the space immediately adjacent to the cargo oil space is a ballast tank or a completely welded fuel oil tank carrying liquid oil having a flash point above 60°C.

(e) Any access or opening to cofferdams is to be from the open deck.

(f) Where a corner to corner situation occurs between a safe space and a cargo tank, a diagonal plate across the corner may be accepted as a cofferdams. Such cofferdams are to be ventilated if accessible or filled with a suitable compound if not accessible.

2.1.7 Gastight bulkheads complying with the requirement of Chapter 14 Part II are to be provided for the isolation of cargo pump and piping from spaces containing stoves, boilers, propelling machinery, electric apparatus other than those of explosion proof type, or machinery where sources of ignition are normally present.

2.1.8 Vent holes are to be cut in structural members to prevent the gas to be "Pocketed"; Special attention is to be paid to the effective ventilation of the pump room, cofferdam and other working spaces adjacent to cargo oil tanks.

2.1.9 The thickness of any part of the structural members in the cargo tank spaces is not to be less than:

0.025L + 6.5 mm, or

11.5 mm

Whichever is the lesser.

2.1.10 When an approved method of protection against corrosion is adopted in cargo spaces, and after all minimum thickness and longitudinal strength requirements have been satisfied, approval may be given for the following reduction in thickness.

(a) 10% for plating and stiffeners of transverse and longitudinal bulkheads; bottom, side and deck transverses; transverse side framing; vertical webs and horizontal girders; cross ties.

(b) 5% for keels, bottom and side shells, deck plating, bottom, side and deck longitudinals, bottom and deck centerline and side girders.

(c) The minimum thickness of remaining items may be 1.0 mm less than the minimum given in 2.1.9 of this Part.

2.1.11 Tanks forward of the collision bulkhead are not to be arranged for the carriage of oil or other liquid substances that are flammable.

2.2 Special Conditions of Assignment for Tanker Freeboard

2.2.1 For ships intended to be operated at the freeboard for type "A" ships the following conditions are to be complied with.

2.2.2 Machinery casings

(a) The machinery casing is to be protected by an enclosed poop or bridge of at least standard height, or by a deckhouse of equal height and equivalent strength, provided that machinery casings may be exposed if there are no openings giving direct access from the freeboard deck to the machinery space. Weathertight doors of steel or other equivalent materials may, however, be permitted in the machinery casing, provided that it leads to a space or passageway which is as strongly constructed as the casing and is separated from the stairways to the engine room by a second weathertight door of steel or other equivalent materials. The sill height of the exterior door is not to be less than 600 mm and of the second not less than 230 mm.

(b) The standard height of a superstructure is to be as follows:

1.8	m	for $L_f \le 75$ m
$1.8 + 0.5\left(\frac{L_f - 75}{50}\right)$	m	for 75 m $< L_f <$ 125 m
2.3	m	for $L_f \ge 125$ m

2.2.3 Gangways and accesses

(a) An efficiently constructed fore and aft permanent gangway of sufficient strength is to be fitted on the ship at the level of the superstructure deck between the poop and the midship bridge or deckhouse where fitted, or equivalent means of access are to be provided in lieu of the gangway, such as passages below the deck. Elsewhere, and on type "A" ships without a midship bridge, arrangements to the satisfaction of the Society are to be provided to safeguard the crew in reaching all parts of the ship to carry out the necessary work.

(b) Safe and satisfactory access from the gangway level is to be available between separate crew accommodations and also between crew accommodations and the machinery space.

2.2.4 Exposed hatchways on the freeboard and forecastle decks or on tops of expansion trunks on type "A" ships are to be provided with efficient watertight covers of steel or other equivalent materials.

2.2.5 Freeing arrangements

(a) Type "A" ships with bulwarks are to have open rails fitted for at least half the length of the exposed parts of the weather deck or other effective freeing arrangements. The upper edge of the sheer strakes is to be kept as low as practicable.

(b) Where superstructures are connected by trunks, open rails are to be fitted for the whole length of exposed parts of the freeboard deck.

2.3 Primary Supporting Members-Webs, Girders, Transverses and Cross Ties

2.3.1 The depth measured at the middle of the span *l* of primary supporting members is not to be less than the following requirements:

(a) The depth of side and deck transverses, webs and horizontal girders of longitudinal bulkheads, and stringers is not to be less than 12.5% of the span *l*.

(b) The depth of deck centerline girders, webs and the horizontal girders of transverse bulkheads, bottom transverses and bottom centerline girders is not to be less than 20% of the span *l*.

(c) The depth of side transverses and vertical webs may be tapered from bottom to top by an amount not exceeding 20% of the depth measured at the middle of the span *l*.

(d) In no case is the depth of the member to be less than 3 times the depth of the slot for longitudinals.

2.3.2 The thickness of webs is not to be less than 8.0 mm in the ship 45 m in length and 12.5 mm in ships 210 m in length and above with the intermediate thickness used at lengths between 45 m and 210 m.

2.3.3 The section modulus of the member in association with an effective area of plating of a width equal to s, or *l*/3, whichever is the lesser, and the thickness equal to the mean thickness of the plating attached is not to be less than that given in the following:

$Cshl^2$ $\quad$ cm^3

where:

s = The spacing of transverses, webs, girders or stringers, in m.

h = The depth of the ship (D) for bottom transverses and girders, in m, and for others h is the vertical distance from the middle of the span *l*, or the center of the area supported to a point located 1.2 m above the deck at side amidships in ships 60 m in length and under, and to a point located 2.4 m above the deck at side amidships in 120 m in length and above. For intermediate lengths, intermediate points may be used. The value of h is not to be less than the distance to the top of the hatch. For deck transverses and girders h is not to be less than 0.15 D.

l = The unsupported span of transverses, webs, girders or stringers as shown in Fig. III 2-1, in m. For deck and bottom transverses in wing tanks, l is not to be less than the half breadth of the wing tank. Where intercostal centerline bottom and deck girders are arranged, the span of the bottom and deck transverses in the center tank is to be determined without consideration of the center line bottom and deck girders.

C = 7.0, 4.0, 3.0, 2.5 and 3.5 for the side transverse and the vertical web of the longitudinal bulkhead where there is no cross tie, one cross tie, 2 cross ties, 3 or more cross ties, and one horizontal and 3 diagonal cross ties meeting at the side transverse respectively.
= 8.5 for the bottom transverse in the center tank with continuous bottom center line girder.
= 7.3 for the bottom transverse in the center tank with intercostal bottom center line girder.
= 5.6 for the bottom transverse in the center tank with 3 continuous bottom girders.
= 9.5 for the continuous bottom center line girder, the vertical web of the transverse bulkhead, the horizontal girder and the stringer.
= 12 for the bottom transverse in the wing tank, the deck transverse in the center tank with continuous deck center line girder and the continuous deck center line girder.
= 8.65 for the deck transverse in the center tank with intercostal center line deck girder.
= 17 for the deck transverse in the win tank.

In ships without a continuous bottom center line girder, the intercostal center line docking girder is to be provided having sufficient strength depending upon docking conditions and support arrangements.

2.3.4 The net sectional area of the web plate, including effective brackets where applicable, at any section of its length is not to be less than:

$0.117\,Q$ cm^2

where:

Q = Shear force at the actual section under consideration obtained by means of an acceptable method of engineering analysis, in kN.

2.3.5 The sectional area of the cross tie is not to be less than that given in the following:

$$\frac{0.875\mathrm{sbh}}{1-0.37\frac{l}{\mathrm{r}}} \quad \mathrm{cm}^2$$

where:

l = The length of the cross tie, in m.
b = The breadth of the area supported, in m.
r = The least radius of gyration of the cross tie, in cm.
s and h are to be as defined in 2.3.3 of this Part.

2.3.6 The web of the transverse, the horizontal girder and the vertical web are to be efficiently stiffened and their face plates or flanges are to be properly supported by tripping brackets.

2.3.7 The lightening hole cut in the web of the primary supporting member is to be located at not less than 30% of the depth of the web from the face plate and the corner of the notch and its diameter is not to exceed 25% of the depth of the web.

2.4 Longitudinal Strength

2.4.1 The longitudinal strength is to be as required by Chapter 3 of Part II.

2.4.2 A loading manual as required by Chapter 3 of Part II is to be prepared to the satisfaction of the Society and furnished to the master of the ship for guidance. Alternative means of obtaining this information are to be considered.

2.5 Shell and Deck Plating

2.5.1 The thickness of the shell and deck plating is not to be less than that required to provide the longitudinal strength in accordance with Chapter 3 of Part II nor is to be less than as required in Chapters 7 and 11 of Part II respectively.

2.6 Structural Sections

2.6.1 The section modulus of the structural section is not to be less than that given by the following:

$Csh\mathit{l}^2$ cm^3

where:

s = The spacing of structural sections, in m.

h = As defined in 2.3.3 of this Part. The value of "h" for the bulkhead stiffener and the deck longitudinal is not to be less than he distance from the stiffener or the longitudinal to the top of the hatch, in m.

C = 7.50 for the horizontal stiffener on the longitudinal bulkhead.
= 7.75 for the side longitudinal.
= 8 for the vertical shell frame, the horizontal or the vertical stiffener on the transverse bulkhead and the vertical stiffener on the longitudinal bulkhead.
= 10 for the deck longitudinal.
= 11.5 for the bottom longitudinal.

l = The unsupported span of structural sections as shown in Fig. III 2-2, in m.

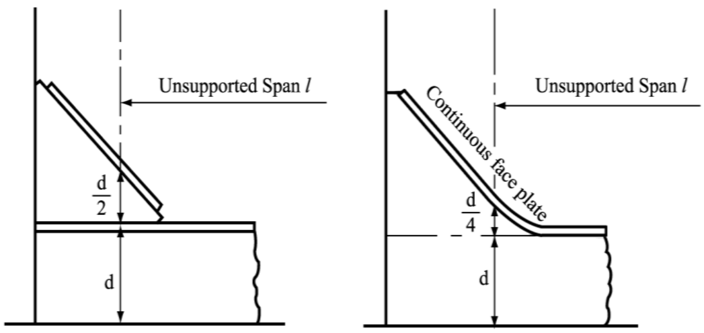

Fig. III 2-1
Unsupported Span *l* for Primary Supporting Member

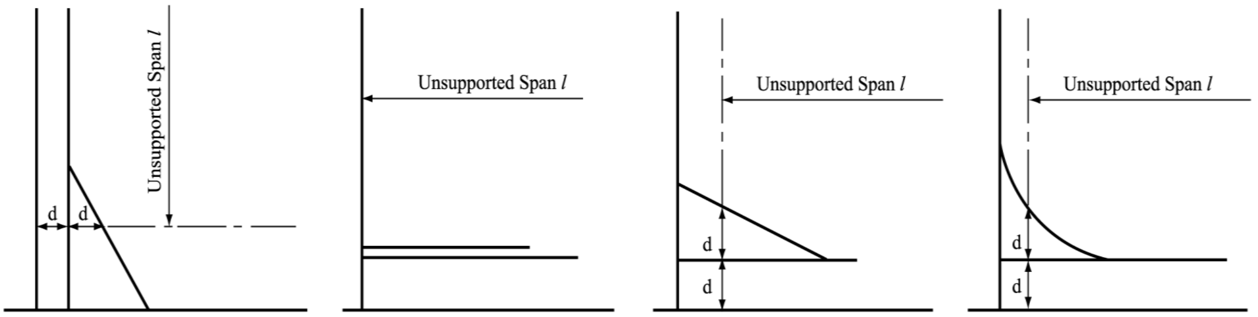

Fig. III 2-2
Unsupported Span *l* for Structural Section

2.6.2 Longitudinals around the bilge are to be gradated in size from that required for the lowest side longitudinals to that required for the bottom longitudinals.

2.7 Bulkhead Plating

2.7.1 General.

(a) Longitudinal bulkheads may be plane or horizontally corrugated.

(b) Transverse bulkheads may be plane or arranged horizontally or vertically corrugated.

2.7.2 Scantling.

(a) The plate thickness of plane bulkheads is to be determined from 16.2.2 of Part II, where h is to be measured from the lower edge of the plate to the top of the hatch or to a point located at 1.2 m above the deck at side amidships, whichever is the greater.

(b) The thickness and breadth of top strakes of the longitudinal bulkhead

(i) The thickness of top strakes of the longitudinal bulkhead is not to be less than that given in the following:

$0.045L + 4.5$ mm

(ii) The breadth of top strakes of the longitudinal bulkhead is not to be less than that given in the following:

$100D$ mm

where:
L = Length of ship, in m.
D = Depth of ship, in m.

(c) The section modulus of the stiffener is to be determined in accordance with 2.6.1 of this Part.

2.8 Structural Requirements beyond Cargo Spaces and at Ends

2.8.1 The scantling of primary supporting members and structural sections beyond cargo spaces may be as required in way of cargo oil spaces in association with the values of "h" in the various formulae measured to the upper deck, except:

(a) In way of deep tanks, the value of "h" for determining the scantling of structures is not to be less than the distance measured to the top of the overflow.

(b) In way of dry spaces.

(i) The scantling of deck beams and longitudinals is to be as required in Chapter 9 of Part II.

(ii) The section modulus of deck transverses is to be obtained from the formula given in 2.3.3 of this Part by using:

C = 6.0
h = As required in Chapter 9 of Part II.

2.9 Finite Element Analyses

2.9.1 Where finite element analysis are employed to determine the scantling of structural members, consideration is to be given to the following local loading conditions:

(a) Center tank loaded; wing tank empty; 1/3 summer load line draft.

(b) Center tank empty; wing tank loaded; 1/3 summer load line draft.

(c) Center and wing tank loaded; 1/3 summer load line draft.

(d) Center tank loaded; wing tank empty; summer load line draft.

(e) Center tank empty; wing tank loaded; summer load line draft.

2.9.2 For loaded tanks, the water head up to the level of 2.45 m above the deck at side is to be applied.

2.9.3 The calculated stresses using the loading conditions specified in 2.9.1 are not to exceed the following permissible bending and average shearing stresses:

Members			Stress
Transverse members		Web σ_e	$\frac{200}{K}$ N/mm^2
Longitudinal members	Within 0.4L amidships	Face σ_n	$\frac{188}{K}$ N/mm^2
		Web τ_n	$\frac{85}{K}$ N/mm^2
		Web σ_e	$\frac{177}{K}$ N/mm^2
	Others	Face σ_n	$\frac{166}{K}$ N/mm^2
		Web τ_n	$\frac{69}{K}$ N/mm^2

where:

σ_e = Von Mises equivalent stress

= $\sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x\sigma_y + 3\tau^2}$

σ_x = In-plane stress in x-direction.

σ_y = In-plane stress in y-direction.

τ = Shear stress in xy-plane.

σ_n = Axial stress of face plate.

τ_n = Average shearing stress.

K = Material factor as defined in 1.5.2 of Part II.

2.9.4 Detail calculations for buckling control of stiffeners subjected to large axial compressive stress are also to be considered.

2.10 Structural Details

2.10.1 All main structural members are to be so arranged that continuity of the strength is ensured.

2.10.2 Primary supporting members are as far as practicable to be connected to one another so as to complete planes of stiffness.

2.10.3 If the edge of the primary supporting member is flanged, the arrangement at the junction of the member and the bracket is to be of careful design and execution.

2.10.4 The bracket of the primary supporting member is generally to be of the same thickness as the thinner one of these two adjacent members, and to be flanged at their edges, and are to be suitably stiffened.

2.10.5 Where members about on both sides of the bulkhead or on other members, care is to be taken that they are in alignment.

2.10.6 Where the bracket is attached to the unsupported plating, suitable arrangement is to be made to distribute the load effectively.

2.10.7 The notch is to have well rounded corners and smooth edges and not to be larger than necessary. When the notch occurs at such a point as adjacent to the toe of a bracket, where stress concentration may develop, a welded collar or equivalent reinforcement is to be fitted. The collar is also to be fitted in way of the cross tie.

2.10.8 Small drains or air holes cut in primary supporting members or structural sections are to be kept clear of the toe of end brackets and their edges are to be well rounded.

2.10.9 Welding

The special requirements of welded construction for oil carriers are to comply with the requirements given in Chapter 5 of Part XII.

2.11 Safe Access to Tanker Bows

2.11.1 Tankers are to be provided with means to enable the crew to gain safe access to the bow even in severe weather conditions. The access is to be by means of either a walkway on the deck or a permanently constructed gangway of substantial strength at or above the level of the superstructure deck or the first tier of a deck house which is to:

(a) be not less than 1 m in width, situated on or as near as practicable to the centre line of the ship and located so as not to hinder easy access across working areas of the deck; be fitted at each side throughout its length with a foot-stop and guard rails supported by stanchions. Such rails are to consist of no less than three courses, the lowest being not more than 230 mm and the uppermost being at least 1 m above the gangway or walkway, and no intermediate opening is to be more than 380 mm in height. Stanchions are to be at intervals of not more than 1.5m;

(b) be constructed of fire resistant and non-slip material;

(c) have openings, with ladders where appropriate, to and from the deck. Openings are not to be more than 40 m apart;

(d) if the length of exposed deck to be traversed exceeds 70 m, have shelters of substantial construction set in way of the gangways or walkways at intervals

(e) not exceeding 45 m. Every such shelter is to be capable of accommodating at least one person and be so constructed as to afford weather protection of the forward, port and starboard sides; and

(f) if obstructed by pipes or other fittings of a permanent nature, be provided with means of passage over such obstruction.

2.11.2 Alternative or modified arrangements for tanker with space constraint, such as small tankers, provided that such alternation or modified arrangements achieve an equivalent level of safety for access to the bow.

Chapter 2A

Double Hull Tankers

2A.1 General

2A.1.1 This chapter applies primarily to the arrangements and scantlings within the cargo tank region of sea going tankers having integral cargo tanks, for the carriage of oil having a flash point not exceeding 60 °C (closed cup test) or other similar liquid cargoes.

2A.1.2 The requirements in this Chapter are framed for tankers with machinery aft having one or more longitudinal bulkheads and single deck with double bottom or with double hull structures or mid-deck.

2A.1.3 In case where the construction differs from that specified in 2A.1.2 and the requirements in this Chapter are considered to be not applicable. Matters are to be determined as deemed appropriate by the Society.

2A.1.4 As regards matters not specifically provided for in this Chapter, the general requirements for the construction and equipment of steel ships are to be applied.

2A.1.5 In addition to the requirements specified in 2A.1.4, the relevant requirements in Part IX of the Rules are to be applied to ships specified in 2A.1.1.

2A.2 Tank Arrangement

2A.2.1 Accidental oil outflow performance

(a) For the purpose of this paragraph, the following definitions shall apply:

(i) "Load line draught (d_S)" is the vertical distance, in m, from the moulded baseline at midlength to the waterline corresponding to the summer freeboard to be assigned to the ship. Calculations pertaining to this paragraph should be based on draught ds, notwithstanding assigned draughts that may exceed d_S, such as the tropical loadline.

(ii) "Waterline (d_B)" is the vertical distance, in meters, from the moulded baseline at midlength to the waterline corresponding to 30% of the depth D_S.

(iii) "Breadth (B_S)" is the greatest moulded breadth of the ship, in m, at or below the deepest load line d_S.

(iv) "Breadth (B_B)" is the greatest moulded breadth of the ship, in m, at or below the waterline d_B.

(v) "Depth (D_S)" is the moulded depth, in m, measured at midlength to the upper deck at side.

(vi) Length (L) means 96 per cent of the total length on a waterline at 85 per cent of the least moulded depth measured from the top of the keel, or the length from the foreside of the stem to the axis of the rudder stock on that waterline, if that be greater. In ships designed with a rake of keel the waterline on which this length is measured shall be parallel to the designed waterline. The length (L) shall be measured in m.

(vii) Deadweight (DW) means the difference in tonnes between the displacement of a ship in water of a relative density of 1.025 at the load waterline corresponding to the assigned summer freeboard and the lightweight of the ship.

(b) To provide adequate protection against oil pollution in the event of collision or stranding, the following shall be complied with:

(i) for oil tankers of 5,000 tonnes deadweight (DWT) and above, the mean oil outflow parameter shall be as follows:

$O_M \leq 0.015$ for $C \leq 200{,}000$ m^3

$O_M \leq 0.012 + \frac{0.003}{200{,}000} \times (400{,}000 - C)$ for $200{,}000$ m$^3 < C < 400{,}000$ m^3

$O_M \leq 0.012$ for $C \geq 400{,}000$ m^3

for combination carriers between 5,000 tonnes deadweight (DWT) and 200,000 m^3 capacity, the mean oil outflow parameter may be applied, provided calculations are submitted to the satisfaction of the Administration, demonstrating that after accounting for its increased structural strength, the combination carrier has at least equivalent oil outflow performance to a standard double hull tanker of the same size having a $O_M \leq 0.015$.

$O_M \leq 0.021$ for $C \leq 100{,}000$ m^3

$O_M \leq 0.015 + \frac{0.006}{100{,}000} \times (200{,}000 - C)$ for $100{,}000$ m$^3 < C \leq 200{,}000$ m^3

where:

O_M = Mean oil outflow parameter.

C = Total volume of cargo oil, in m^3, at 98% tank filling

(ii) for oil tankers of less than 5,000 tonnes deadweight (DWT), The length of each cargo tank shall not exceed 10 m or one of the following values, whichever is the greater:

(1) where no longitudinal bulkhead is provided inside the cargo tanks:

$$\left(0.5\frac{b_i}{B} + 0.1\right)L \quad \text{but not to exceed } 0.2L$$

(2) where a centreline longitudinal bulkhead is provided inside the cargo tanks:

$$\left(0.25\frac{b_i}{B} + 0.15\right)L$$

(3) where two or more longitudinal bulkheads are provided inside the cargo tanks:

a) for wing cargo tanks: 0.2L

b) for centre cargo tanks:

i) if b_i / B ≥0.2L: 0.2L

ii)if b_i / B <0.2L:

1) where no centreline longitudinal bulkhead is provided: $(0.5b_i/B+0.1)L$

2) where a centreline longitudinal bulkhead is provided: $(0.25b_i/B+0.15)L$

(4) b_i is the minimum distance from the ship's side to the outer longitudinal bulkhead of the tank in question measured inboard at right angles to the centreline at the level corresponding to the assigned summer freeboard.

(c) The following general assumptions shall apply when calculating the mean oil outflow parameter:

(i) The cargo block length extends between the forward and aft extremities of all tanks arranged for the carriage of cargo oil, including slop tanks.

(ii) Where this paragraph refers to cargo tanks, it shall be understood to include all cargo tanks, slop tanks and fuel tanks located within the cargo block length.

(iii) The ship shall be assumed loaded to the load line draught ds without trim or heel.

(iv) All cargo oil tanks shall be assumed loaded to 98% of their volumetric capacity. The nominal density of the cargo oil (ρ_n) shall be calculated as follows:

$$\rho_n = \frac{1000(DWT)}{C} \qquad kg/m^3$$

(v) For the purposes of these outflow calculations, the permeability of each space within the cargo block, including cargo tanks, ballast tanks and other non-oil spaces shall be taken as 0.99, unless proven otherwise.

(vi) Suction wells may be neglected in the determination of tank location provided that such wells are as small as practicable and the distance between the well bottom and bottom shell plating is not less than 0.5h, h = B/15, in m, or h = 2.0 m, whichever is the lesser. The minimum value of h = 1.0 m.

(d) The following assumptions shall be used when combining the oil outflow parameters:

(i) The mean oil outflow shall be calculated independently for side damage and for bottom damage and then combined into the non-dimensional oil outflow parameter O_M, as follows:

$$O_M = (0.4O_{MS} + 0.6O_{MB})/C$$

where:

O_{MS} = Mean outflow for side damage, in m^3; and

O_{MB} = Mean outflow for bottom damage, in m^3.

(ii) For bottom damage, independent calculations for mean outflow shall be done for 0 m and minus 2.5 m tide conditions, and then combined as follows:

$$O_{MB} = 0.7O_{MB(0)} + 0.3O_{MB(2.5)}$$

where:

$O_{MB(0)}$ = Mean outflow for 0 m tide condition; and

$O_{MB(2.5)}$ = Mean outflow for minus 2.5 m tide condition, in m^3.

(e) The mean outflow for side damage O_{MS} shall be calculated as follows:

$$O_{MS} = C_3 \sum_{i}^{n} P_{s(i)} O_{s(i)} \qquad m^3$$

where:

i = Represents each cargo tank under consideration;

n = Total number of cargo tanks;

$P_{s(i)}$ = The probability of penetrating cargo tank i from side damage, calculated in accordance with 2A.2.1(g)(i);

$O_{s(i)}$ = The outflow, in m^3, from side damage to cargo tank i, which is assumed equal to the total volume in cargo tank i at 98% filling, unless it is proven through the application of the Guidelines that any significant cargo volume will be retained; and

C_3 = 0.77 for ships having two longitudinal bulkheads inside the cargo tanks, provided these bulkheads are continuous over the cargo block and $P_{s(i)}$ is developed in accordance with this paragraph. C_3 equals 1.0 for all other ships or when $P_{s(i)}$ is developed in accordance with 2A.2.1(g).

(f) The mean outflow for bottom damage shall be calculated for each tidal condition as follows:

(i) $O_{MB(0)} = \sum_{i}^{n} P_{B(i)} O_{B(i)} C_{DB(i)} \qquad m^3$

where:

i = Represents each cargo tank under consideration;

n = The total number of cargo tanks;

$P_{B(i)}$ = The probability of penetrating cargo tank i from bottom damage, calculated in accordance with 2A.2.1(h)(i);

$O_{B(i)}$ = The outflow from cargo tank i, in m^3, calculated in accordance with 2A.2.1(f)(iii);

$C_{DB(i)}$ = Factor to account for oil capture as defined in 2A.2.1(f)(iv).

(ii) $O_{MB(2.5)} = \sum_i^n P_{B(i)} O_{B(i)} C_{DB(i)}$ m^3

where:

i, n, $P_{B(i)}$ and $C_{DB(i)}$ = As defined in subparagraph (i) above;

$O_{B(i)}$ = The outflow from cargo tank i, in m³, after tidal change

(iii) The oil outflow $O_{B(i)}$ for each cargo oil tank shall be calculated based on pressure balance principles, in accordance with the following assumptions:

(1) The ship shall be assumed stranded with zero trim and heel, with the stranded draught prior to tidal change equal to the load line draught d_s.

(2) The cargo level after damage shall be calculated as follows:

$$h_c = \frac{(d_s + t_c - Z_l)(\rho_s) - \frac{1000p}{g}}{\rho_n}$$

where:

h_c = The height of the cargo oil above Z_l, in m.

t_c = The tidal change, in m. Reductions in tide shall be expressed as negative values ;

Z_l = The height of the lowest point in the cargo tank above baseline, in m.

ρ_s = Density of seawater, to be taken as 1,025 kg/m^3.

p = If an inert gas system is fitted, the normal overpressure, in kPa, is to be taken as 5 kPa; if an inert gas system is not fitted, the over pressure may be taken as 0;

g = The acceleration of gravity, to be taken as 9.81 m/s^2 and

ρ_n = Nominal density of cargo oil, calculated in accordance with 2A.2.1(c)(iv).

(3) For cargo tanks bounded by the bottom shell, unless proven otherwise, oil outflow $O_{B(i)}$ shall be taken not less than 1% of the total volume of cargo oil loaded in cargo tank *i*, to account for initial exchange losses and dynamic effects due to current and waves.

(iv) In the case of bottom damage, a portion from the outflow from a cargo tank may be captured by nonoil compartments. This effect is approximated by application of the factor $C_{DB(i)}$ for each tank, which shall be taken as follows:

$C_{DB(i)}$ = 0.6 for cargo tanks bounded from below by nonoil compartments;
$C_{DB(i)}$ = 1.0 for cargo tanks bounded by the bottom shell.

(g) The probability Ps of breaching a compartment from side damage shall be calculated as follows:

(i) $P_S = P_{SL} \cdot P_{SV} \cdot P_{ST}$

where:

$P_{SL} = 1 - P_{Sf} - P_{Sa}$ = Probability the damage will extend into the longitudinal zone bounded by X_a and X_f

$P_{SV} = 1 - P_{Su} - P_{Sl}$ = Probability the damage will extend into the vertical zone bounded by Z_l and Z_u and

$P_{ST} = 1 - P_{Sy}$ = Probability the damage will extend transversely beyond the boundary defined by y.

(ii) P_{Sa}, P_{Sf}, P_{Sl}, P_{Su} and P_{Sy} shall be determined by linear interpolation from the table of probabilities for side damage provided in 2A.2.1(g)(iii),

where:

P_{Sa} = The probability the damage will lie entirely aft of location X_a/L.

P_{Sf} = The probability the damage will lie entirely forward of location X_f/L.

P_{Sl} = The probability the damage will lie entirely below the tank.

P_{Su} = The probability the damage will lie entirely above the tank and

P_{Sy} = The probability the damage will lie entirely outboard of the tank.

Compartment boundaries X_a, X_f, Z_l, Z_u and y shall be developed as follows:

X_a = The longitudinal distance from the aft terminal of L to the aftmost point on the compartment being considered, in m.

X_f = The longitudinal distance from the aft terminal of L to the foremost point on the compartment being considered, in m.

Z_l = The vertical distance from the moulded baseline to the lowest point on the compartment being considered, in m.

Z_u = The vertical distance from the moulded baseline to the highest point on the compartment being considered, in m. Z_u is not to be taken greater than D_S and

y = The minimum horizontal distance measured at right angles to the centreline between the compartment under consideration and the side shell in m.

(iii) Table of probabilities for side damage

P_{Sy} shall be calculated as follows:

$$P_{Sy} = \left(24.96 - \frac{199.6y}{B_S}\right)\left(\frac{y}{B_S}\right) \quad \text{for} \quad \frac{y}{B_S} \le 0.05$$

$$P_{Sy} = 0.749 + \left[5 - 44.4\left(\frac{y}{B_S} - 0.05\right)\right]\left(\frac{y}{B_S} - 0.05\right) \quad \text{for} \quad 0.05 < \frac{y}{B_S} < 0.1$$

$$P_{Sy} = 0.888 + 0.56\left(\frac{y}{B_S} - 0.1\right) \quad \text{for} \quad \frac{y}{B_S} \ge 0.1$$

P_{Sy} shall not be taken greater than 1.

$\frac{X_a}{L}$	P_{Sa}	$\frac{X_f}{L}$	P_{Sf}	$\frac{Z_l}{D_S}$	P_{Sl}	$\frac{Z_u}{D_S}$	P_{Su}

(h) The probability P_B of breaching a compartment from bottom damage shall be calculated as follows:

(i) $P_B = P_{BL} \cdot P_{BT} \cdot P_{BV}$

where:

$P_{BL} = 1 - P_{Bf} - P_{Ba}$ = Probability the damage will extend into the longitudinal zone bounded by X_a and X_f ;

$P_{BT} = 1 - P_{Bp} - P_{Bs}$ = Probability the damage will extend into the transverse zone bounded by Y_p and Y_s and

$P_{BV} = 1 - P_{Bz}$ = Probability the damage will extend vertically above the boundary defined by z.

(ii) P_{Ba}, P_{Bf}, P_{Bp}, P_{Bs} and P_{Bz} shall be determined by linear interpolation from the table of probabilities for bottom damage provided in 2A.2.1(h)(iii),

where:

P_{Ba} = The probability the damage will lie entirely aft of location X_a / L.

P_{Bf} = The probability the damage will lie entirely forward of location X_f / L.

P_{Bp} = The probability the damage will lie entirely to port of the tank.

P_{Bs} = The probability the damage will lie entirely to starboard of the tank; and

P_{Bz} = The probability the damage will lie entirely below the tank.

Compartment boundaries X_a, X_f, Y_p, Y_s and z shall be developed as follows:

X_a and X_f are as defined in 2A.2.1(g)(ii);

Y_p = The transverse distance from the port-most point on the compartment located at or below the waterline d_B, to a vertical plane located $B_B/2$ to starboard of the ship's centreline, in m.

Y_s = the transverse distance from the starboard-most point on the compartment located at or below the waterline d_B, to a vertical plane located $B_B/2$ to starboard of the ship's centreline, in m and

z = the minimum value of z over the length of the compartment, where, at any given longitudinal location, z is the vertical distance from the lower point of the bottom shell at that longitudinal location to the lower point of the compartment at that longitudinal location, in m.

(iii) Table of probabilities for bottom damage

1.00	0.761	1.00	0.000	1.00	0.000	1.00	0.844

P_{Bz} shall be calculated as follows:

$$P_{Bz} = \left(14.5 - \frac{67z}{D_S}\right)\left(\frac{z}{D_S}\right) \qquad \text{for } \frac{z}{D_S} \le 0.1$$

$$P_{Bz} = 0.78 + 1.1\left(\frac{z}{D_S} - 0.1\right) \qquad \text{for } \frac{z}{D_S} > 0.1$$

P_{Bz} shall not be taken greater than 1.

(i) The following provisions regarding piping arrangements shall apply:

(i) Lines of piping which run through cargo tanks in a position less than $0.3B_S$ from the ship's side or less than $0.3D_S$ from the ship's bottom are to be fitted with valves or similar closing devices at the point at which they open into any cargo tank. These valves shall be kept closed at sea at any time when the tanks contain cargo oil, except that they may be opened only for cargo transfer needed for essential cargo operations.

(ii) Credit for reducing oil outflow through the use of an emergency rapid cargo transfer system or other system arranged to mitigate oil outflow in the event of an accident may be taken into account only after the effectiveness and safety aspects of the system are approved by the Society.

2A.2.2 Subdivisions and stability

(a) Every oil tanker is to comply with the subdivision and damage stability criteria as specified in 2A.2.2(c) after the assumed side or bottom damage as specified in 2A.2.2(b), for any operating draught reflecting actual partial or full load conditions consistent with trim and strength of the ship as well as specific gravities of the cargo. Such damage is to be applied to all conceivable locations along the length of the ship as shown in the following (i) to (iii):

(i) In tankers of more than 225 m in length, anywhere in the ship's length.

(ii) In tankers of more than 150 m, but not exceeding 225 m in length, anywhere in the ship's length except involving either after or forward bulkhead bounding the machinery space located aft. The machinery space is to be treated as a single floodable compartment.

(iii) In tankers not exceeding 150 m in length, anywhere in the ship's length between adjacent transverse bulkheads with the exception of the machinery space. For tankers of 100 m or less in length where all requirements in 2A.2.2(c) cannot be fulfilled without materially impairing the operational qualities of the ship, the Society may allow relaxations from these requirements. Ballast conditions where the tanker is not carrying oil (excluding oil residues) in cargo tanks, is not to be considered.

(b) The following requirements regarding the extent and the character of the assumed damage are to apply:

(i) The extent of side damage is to be as shown in Table III 2A-3.

(ii) The extent of bottom damage is to be as shown in Table III 2A-4.

Table III 2A-3
Extent of Side Damage

Direction	Extent of damage
Longitudinal extent	$\frac{1}{3}L_f^{\frac{2}{3}}$ or 14.5m, whichever is less
Transverse extent	B/5 or 11.5 m, whichever is less (inboard from the ship's side at right angles to the centreline at the level of the summer load line)
Vertical extent	From the moulded line of the bottom shell plating at centreline, upwards without limit

Table III 2A-4
Extent of Bottom Damage

Direction	Extent of damage	
	For 0.3 L_f from the forward perpendicular of the ship	Any other part of the ship
Longitudinal extent	$\frac{1}{3}L_f^{\frac{2}{3}}$ or 14.5 m, whichever is less	$\frac{1}{3}L_f^{\frac{2}{3}}$ or 5 m, whichever is less
Transverse extent	B/6 or 10 m, whichever is less	B/6 or 5 m, whichever is less
Vertical extent	B/15 or 6 m, whichever is less, measured from the moulded line of the bottom shell plating at centreline	

(iii) If any damage of lesser extent than the maximum extents of damage specified in (i) and (ii) result in a more severe condition, such damage is to be assumed.

(iv) Where the damage involving transverse bulkheads is envisaged as specified in 2A.2.2(a)(i) and (ii), transverse watertight bulkheads are to be spaced at least at a distance equal to the longitudinal extent of assumed damage specified in (i) in order to be considered effective. Where transverse bulkheads are spaced at a lesser distance one or more of these bulkheads within such extent of damage are to be assumed as non-existent for the purpose of determining flooded compartments.

(v) Where the damage between adjacent watertight bulkheads is envisaged as specified in 2A.2.2(a)(iii), no main transverse bulkhead or a transverse bulkhead bounding side tanks or double bottom tanks are to be assumed damaged, unless:

(1) the spacing of the adjacent bulkheads is less than the longitudinal extent of assumed damage specified in (i); or

(2) there is a step or a recess in a transverse bulkhead of more than 3.05 m in length, located within the extent of penetration of assumed damage. The step formed by the after peak bulkhead and after peak tank top is not to be regarded as a step for the purpose of the requirements of 2A.2.2.

(vi) If pipes, ducts or tunnels are situated within the assumed extent of damage, arrangements are to be made so that progressive flooding cannot thereby extend to compartments other than those assumed to be floodable for each case of damage.

(c) Oil tankers are to be regarded as complying with the damage stability criteria of the following requirements as shown (i) to (v) are met:

(i) The final waterline, taking into account sinkage, heel and trim, are to be below the lower edge of any opening through which progressive flooding may take place. Such openings are to include air pipes and those which are closed by means of weathertight doors or hatch covers and may exclude those openings closed by means of watertight manhole covers and flush scuttles, small watertight cargo tank hatch covers which maintain the high integrity of the deck, remotely operated watertight sliding doors, and side scuttles of the non-opening type.

(ii) In the final stage of flooding, the angle of heel due to unsymmetrical flooding is not to exceed 25 degrees, provided that this angle may be increased up to 30 degrees if no deck edge immersion occurs.

(iii) It may be regarded as sufficient if the righting lever curve has at least a range of 20 degrees beyond the position of equilibrium in association with a maximum residual righting lever of at least 0.1 m within the 20 degrees range. The area within this range below the curve is to be 0.0175 m-radian or more. Except for the case in which the relevant compartments are assumed flooded, unprotected openings are to be assumed not to immerse. Within this range, all openings listed in (i) and other openings which can be closed with a weathertight cover may be accepted by the Society.

(iv) It is to be satisfied that the stability is sufficient during intermediate stages of flooding.

(v) Even in cases where an equalizing system requiring the mechanical aid such as valves or inter-connecting pipes for the purpose of reducing the heel angle or of acquiring the minimum residual stability are provided for complying with the requirements in (i) to (iii), such provisions are not to be taken into account, and sufficient residual stability is to be maintained in all stages of service of the equalizing system. Compartments connected through ducts with a large sectional area may be considered to be common.

(d) The requirements in the preceding (a) above are to be confirmed by calculations which take into consideration the design characteristics of the ship, the arrangements, configuration and contents of the damaged compartments; and the distribution, specific gravities and the free surface effect of liquids. The calculations are to be based on the following requirements (i) through (v):

(i) Account is to be taken of any empty or partially filled tanks, the specific gravity of cargoes carried as well as any outflow of liquids from damaged compartments.

(ii) The permeabilities are to be assumed as given in Table III 2A-5.

(iii) The buoyancy of any superstructure directly above the side damage is to be disregarded.

Table III 2A-5
Permeabilities

Spaces	Permeability
Appropriated to stores	0.60
Occupied by accommodation	0.95
Occupied by machinery	0.85
Voids	0.95
Intended for consumable liquids	0 - 0.95*
Intended for other liquids	0 - 0.95*

*The permeability of partially filled compartment is to be consistent with the amount of liquid carried in the compartment. Whenever damage extends to any tank carrying liquid, it is to be assumed that the content totally flows out of the compartment and is replaced by salt water up to the level of final plane of equilibrium.

The unflooded parts of superstructure beyond the extent of damage, however, may be taken into consideration provided that they are separated from the damaged space by watertight bulkheads and the requirements in the preceding 2A.2.2(c)(i) in respect of these intact spaces are complied with. Hinged watertight doors may be acceptable in watertight bulkheads in the superstructure.

(iv) The free surface effect is to be calculated at an angle of heel of 5 degrees for each individual compartment. The Society may require or allow the free surface corrections to be calculated at an angle of heel greater than 5 degrees for partially filled tanks.

(v) In calculating the effect of free surface of consumable liquids it is to be assumed that, for each type of liquid at least one transverse pair or a single centerline tank has a free surface and the tank or combination of tanks to be taken into account is to be those where the effect of free surface is the greatest.

(e) Every oil tanker to which the requirements in this chapter applied is to be provided with the following (i) and (ii):

(i) Information relative to loading and distribution of cargo necessary to ensure compliance with the requirements of 2A.2.2; and

(ii) Data on the ability of the ship to comply with damage stability criteria as determined by 2A.2.2, including the effect of relaxations that have been allowed under the preceding 2A.2.2(a)(iii).

2A.2.3 Segregated ballast tanks

Every crude oil tanker of 20,000 tons deadweight and over and product carrier of 30,000 tons deadweight and over are to be provided with segregated ballast tanks of the following capacities and arrangements. However, it is no need to comply with the provisions of following requirements in (b) where the paragraph 2A.2.4 is applied:

(a) The capacity of the segregated ballast tanks in all cases of ballast conditions including the light weight plus segregated ballast only are to be such that the ship’s draughts and trim can meet each of the following requirements (i) to (iii). However, the segregated ballast conditions for oil tankers less than 150 m in length are to be the satisfaction of the Society.

(i) the moulded draught amidships (d_m), in m, (with-out taking into account any ship’s deformation) is to be not less than:

$$2.0 + 0.02L_f$$

(ii) the draughts at the forward and after perpendiculars are to correspond to those determined by the draught amidships (d_m) as specified in (i) of this paragraph, in association with the trim by the stern of not greater than 0.015L: and

(iii) in any case the draught at the after perpendicular is not to be less than that which is necessary to obtain full immersion of the propeller(s).

(b) The segregated ballast tanks situated within the cargo oil spaces are to meet the following requirements (i) to (iii) to provide a measure of protection against oil outflow in the event of grounding or collision:

(i) The segregated ballast tanks and enclosed spaces other than cargo oil tanks within the cargo tank length (L_t) are to be so arranged as to comply with the following requirements:

$$\Sigma PA_c + \Sigma PA_s \geq J[L_t(B + 2D)]$$

where:

PA_c = The side shell area, in m^2, for each segregated ballast tank or space other than an oil tank based on projected moulded dimensions,

PA_s = The bottom shell area, in m^2, for each such tank or space based on projected moulded dimensions,

L_t = Length, in m, between the forward and after extremities of the cargo tanks,

D = Moulded depth, in m, measured vertically from the top of the keel to the top of the freeboard deck beam at side amidships. In ships having rounded gunwales, the moulded depth is to be measured to the point of intersection of the moulded lines of the deck and side shell plating, the lines extending as though the gunwale were of angular design,

J = 0.45 for oil tankers of 20,000 tons deadweight, 0.30 for oil tankers of 200,000 tons deadweight and above, subject to the provisions of paragraph (ii) of this regulation.

For intermediate values of deadweight the value of J are to be determined by linear interpolation.

(ii) For oil tankers of 200,000 tons deadweight and over, the value of J may be reduced as follows:

$$J_{reduced} = \left[J - \left(a - \frac{O_c + O_s}{4O_A}\right)\right] \text{ or } 0.2, \text{whichever is the greater}$$

where:

a = 0.25 for oil tankers of 200,000 tons dead-weight;
= 0.40 for oil tankers of 300,000 tons dead-weight;
= 0.50 for oil tankers of 420,000 tons dead-weight and above.

For oil tankers of intermediate dead-weight tonnage between the above, the value of a is to be determined by linear interpolation.

O_c and O_s = The values specified in 2A.2.1 (b).

O_A = Allowable oil outflow as required in 2A.2.1 (c).

In the determination of PA_c and PA_s for segregated ballast tanks and enclosed spaces other than cargo oil tanks, the requirements into following (1) and (2) are to be complied with:

(1) The width of a full-depth wing tank, or space either of which extends from the deck to the top of double bottom is not to be less than 2 m. The width of a wing tank or other enclosed space is to be measured inboard from the ship side at right angles to the centerline of the ship. Any wing tank or other enclosed space with the minimum width of less than 2 m is not to be considered in determining PA_c.

(2) The minimum vertical depth of each double bottom tank or other enclosed space is not to be less than B/15 or 2 m, whichever is less. Double bottom tanks or other enclosed spaces with the minimum depth of less than the above value are not considered in determining PA_s.

The minimum width and minimum depth of wing tanks or double bottom tanks are to be measured clear of the bilge area and, in the case of minimum width, are to be measured clear of any rounded gunwale area.

2A.2.4 Prevention of oil pollution in the event of collision or stranding

(a) Every oil tanker of 5,000 tons deadweight and above is to comply with any one of the following requirements (i) to (iii):

(i) The entire cargo tank length is to be protected by ballast tanks or spaces other than cargo and fuel oil tanks as follows:

(1) Wing tanks or spaces are to extend either for the full depth of the ship's side or from the top of the double bottom to the uppermost deck, disregarding a rounded gunwale where fitted. They are to be arranged such that the cargo tanks are located inboard of the moulded line of the side shell plating, nowhere less than the distance *w* which, as shown in Fig. III 2A-1, is measured at any cross-section at right angles to the side shell, as specified below:

$$w = 0.5 + \frac{DW}{20{,}000} \text{ or } 2.0\text{m, whichever is the lesser.}$$

where:
DW = Dead weight.
However, the minimum value of w = 1.0 m.

(2) At any cross-section the depth of each double bottom tank or space is to be such that the distance h between the bottom of the cargo tanks and the moulded line of the bottom shell plating measured at right angles to the bottom shell plating as shown in Fig. III 2A-1 is not less than specified below:

h = B/15 or 2.0 m, whichever is the lesser.

However, the minimum value of h = 1.0 m.

(3) When the distances h and w are different at turn of the bilge area or at locations without a clearly defined turn of the bilge, the distance w is to have preference at levels exceeding 1.5 h above the base line as shown in Fig. III 2A-1.

(4) On crude oil tankers of 20,000 tons deadweight and above and product carriers of 30,000 tons deadweight and above, the aggregate capacity of wing tanks, double bottom tanks, forepeak tanks and after peak tanks are not to be less than the capacity of segregated ballast tanks necessary to meet the requirements of 2A.2.3(a). Wing tanks or spaces and double bottom tanks used to meet the requirements of 2A.2.3(a) are to be located as uniformly as practicable along the cargo tank length. Additional segregated ballast capacity provided for reducing longitudinal hull girder bending stress, trim, etc., may be located anywhere within the ship.

(5) Suction wells in cargo tanks may protrude into the double bottom below the boundary line defined by the distance h provided that such wells are as small as practicable and the distance between the well bottom and bottom shell plating is not to be less than 0.5h.

(6) Ballast piping and other piping such as sounding and vent piping to ballast tanks are not to pass through cargo tanks. Cargo piping and similar piping to cargo tanks are not to pass through ballast tanks. Exemptions to this requirement may be granted for short lengths of piping, provided that they are completely welded or equivalent.

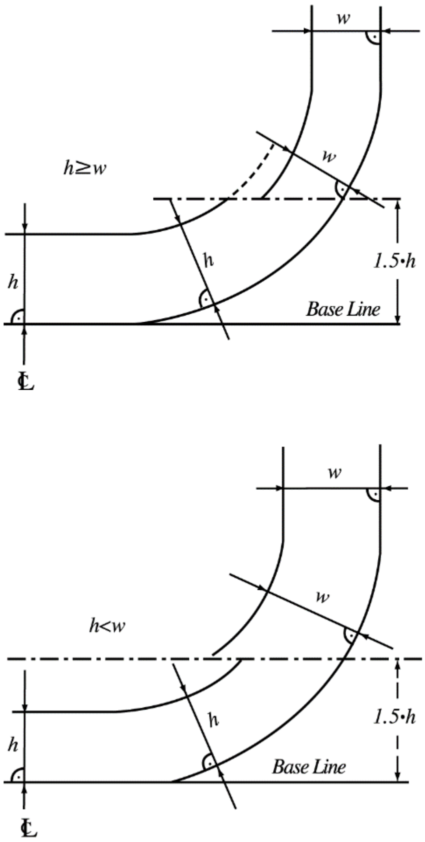

Fig. III 2A-1
Cargo Tank Boundary Lines

(ii) Double bottom tanks or spaces as required by paragraph 2A.2.4(a)(i)(2) may be dispensed with, provided that the entire cargo tank length is to be protected by mid-deck plating, ballast tanks or spaces other than cargo and fuel oil tanks as follows:

(1) The cargo and vapour pressure exerted on the bottom shell plating forming a single boundary between the cargo and the sea is not to exceed the external hydrostatic water pressure as expressed by the following formula:

$$f \cdot h_c \cdot \rho_c \cdot g + 100 \cdot \Delta P \leq d_n \cdot \rho_s \cdot g$$

where:

h_c = Height of cargo in contact with the bottom shell plating, in m.

ρ_c = Maximum cargo density in t/m^3.

d_n = Minimum operating draught under any expected loading condition, in m.

ρ_s = Density of sea water in t/m^3.

ΔP = Maximum set pressure of pressure/ vacuum valve provided for the cargo tank in bars.

f = 1.1 , safety factor

g = 9.81 m/sec^2, standard acceleration of gravity

(2) Any horizontal partition necessary to fulfill the above requirements is to be located at a height of not less than B/6 or 6 m, whichever is the lesser, but not more than 0.6 D, above the base line where D is the moulded depth amidships.

(3) The location of wing tanks or spaces is to be as defined in 2A.2.4(a)(i)(1) except that, below a level 1.5 h above the baseline where h is as defined in 2A.2.4(a)(i)(2), the cargo tank boundary line may be vertical down to the bottom plating, as shown in Fig. III 2A-2.

(4) On crude oil tankers of 20,000 tons deadweight and above and product carriers of 30,000 tons deadweight and above, the aggregate capacity of wing tanks, forepeak tanks and afterpeak tanks are to be comply with the requirements of 2A.2.4(a)(i)(4).

(5) Ballast piping and cargo piping are to be comply with the requirements of 2A.2.4(a)(i)(6).

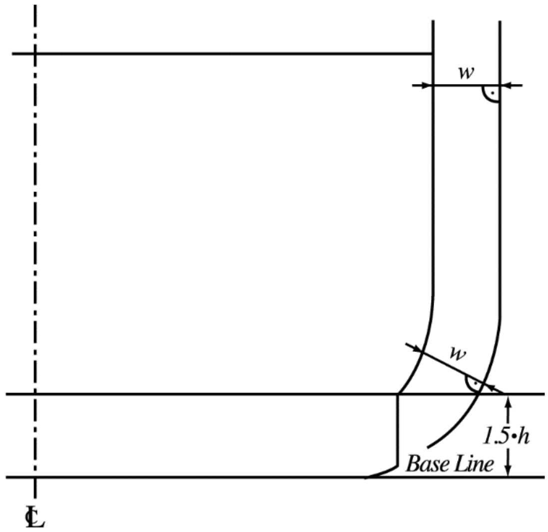

Fig. III 2A-2
Cargo Tank Boundary Lines

Table III 2A-6
Extent of Bottom Raking Damage

Direction	Extent of damage
Longitudinal extent	Ships of 75,000 tons deadweight and above: 0.6 L_f measured from the forward perpendicular
	Ships of less than 75,000 tons deadweight: 0.4 L_f measured from the forward perpendicular
Transverse extent	B/3 anywhere in the bottom
Vertical extent	Breach of the outer hull.

(iii) Other methods of design and construction of oil tankers may be accepted as alternatives to the requirements prescribed in 2A.2.4(a)(i), provided that such methods ensure at least the same level of protection against oil pollution in the event of collision or stranding by the Society.

(b) For oil tankers of 20,000 tons deadweight and above, the damage assumptions prescribed in 2A.2.2(b)(ii) are to be supplemented by the assumed bottom raking damage in accordance with Table III 2A-6.

(c) Oil tankers of less than 5,000 tons deadweight are to comply with the following requirements (i) and (ii):

(i) Double bottom tanks or spaces in accordance with 2A.2.4(a)(i)(2) are to be arranged along the entire cargo tank length. However, the distance h specified in 2A.2.4(a)(i)(2) may comply with the following:

$$h = B/15 \quad \text{m}$$

However, the minimum value of h = 0.76 m in the turn of the bilge area and at locations without a clearly defined turn of the bilge, the cargo tank boundary line is to run parallel to the line of the mid-ship flat bottom as shown in Fig. III 2A-3.

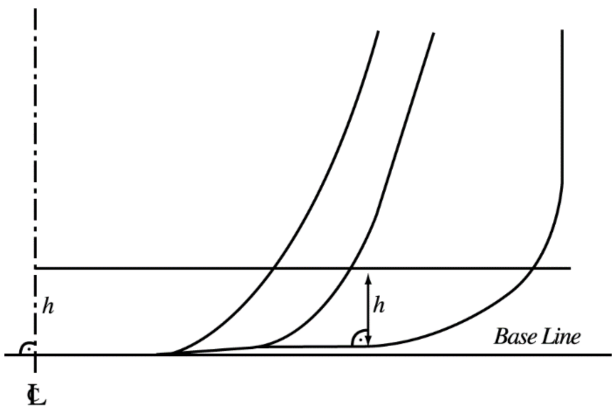

Fig. III 2A-3
Cargo Tank Boundary Lines

(ii) The capacity of each cargo tanks is not to exceed 700 m^3 unless wing tanks or spaces in accordance with 2A.2.4(a)(i)(1) are arranged along the entire cargo tank length. However, the distance w specified in 2A.2.4(a)(i)(1) is to comply with the following:

$$w = 0.4 + \frac{2.4DW}{20{,}000} \quad \text{m}$$

where:

DW = Dead weight.
However, the minimum value of w = 0.76 m.

(d) Oil is not to be carried in any space extending forward of a collision bulkhead located in accordance with 14.1.1(a) of Part II. An oil tanker other than the above is not to carry oil in any space extending forward of the transverse plan perpendicular to the centerline that is located as if it were a collision bulkhead located in accordance with that requirement.

2A.3 Location and Separation

2A.3.1 In cargo oil spaces, the standard arrangement of bulkheads is to be such that the interval between longitudinal bulkheads or transverse bulkheads does not exceed $1.2\sqrt{L}$, in m.

2A.3.2 Cofferdams are to be provided in accordance with followings:

(a) Cofferdams of air-tight construction with a sufficient width for access are to be provided at fore and aft terminations of cargo oil spaces and the space between cargo space and accommodation space.

(b) Cofferdams specified in (a) may be used as pump rooms.

(c) Fuel oil or ballast water tanks may be concurrently used as the cofferdams to be provided between cargo oil tanks and fuel oil or ballast water tanks, subject to the approval by the Society.

2A.3.3 Passageways leading to cargo areas are to be provided in accordance with followings:

(a) Access to cofferdams, ballast tanks, cargo oil tanks and other spaces in the cargo area are to be direct from the open deck and such as to ensure their complete inspection. Access to double bottom spaces may be through a cargo pump room, pump room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspect.

(b) For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self-contained air breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is 600 mm × 600 mm.

(c) For access through vertical openings, or man-holes providing passage through the length and breadth of the space, the minimum clear opening is to be 600 mm × 800 mm at a height of not more than 600 mm, unless gratings or other footholds are provided.

(d) For tankers of 5,000 tons deadweight and above, smaller dimensions of clear opening specified in (b) and (c) may be approved by the Society in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Society.

2A.3.4 All areas, where cargo oil pumps and cargo oil piping are provided, are to be segregated by an air-tight bulkhead from areas where boilers, propelling machinery, electric installations other than those of explosion-proof type or machinery where source of ignition is normally present.

2A.3.5 Ventilation inlets and outlets are to be arranged so as to minimize the possibilities of vapours of cargoes being admitted to an enclosed space containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard. Especially, openings of ventilation for machinery spaces are to be situated as far afterwards apart from the cargo spaces as practicable.

2A.3.6 Ullage openings, sight port and tank cleaning openings are not to be arranged in enclosed spaces.

2A.3.7 The arrangement of openings on the boundaries of superstructures and deck-houses are to be such as to minimize the possibility of accumulation of vapours of cargoes. Due consideration in this regards is to be given for the openings in superstructures and deck-houses when the ship is equipped with cargo piping to load or unload at the stern.

2A.3.8 Where long tanks or wide tanks are fitted, nontight bulkheads are to be provided to prevent excessive sloshing pressure form internal liquid cargo. Alternatively, reinforcements to the bulkheads and decks without fitting of nontight bulkheads may be determined by an acceptable engineering method.

2A.4 Minimum Thickness

2A.4.1 The thickness of structural members in cargo oil tanks and deep tanks such as bulkheads plating, floors, girders, including struts and their end brackets is not to be less than:

$t = 8.0$	mm	for $L \leq 105$ m
$t = 11.5$	mm	for $L = 210$ m
$t = 13.5$	mm	for $L \geq 375$ m

for L between 105 m and 210 m or between 210 m and 375 m, t is to be obtained by interpolation.

2A.4.2 The thickness of structural members other than 2A.4.1 in cargo oil tanks and deep tanks is not to be less than 7 mm.

2A.5 Direct Strength Calculation

2A.5.1 Notwithstanding the requirements in this Chapter, scantling of structural members may be determined based on direct strength calculation. Where, however, this is not to be applied to the minimum thickness of plating specified in 2A.4 and the special requirements for corrosion specified in 2A.10.5, 2A.10.6 and 2A.10.7.

2A.5.2 A three dimension stress analysis may be required, if deemed necessary, to carry out the load sharing effects of girders and transverses from the forces combination by internal tank loadings and external sea pressure etc.

2A.6 Bulkhead Plating

2A.6.1 "Bulkhead plating" referred to in this Chapter means those plate members used in the boundaries of cargo oil tanks and deep tanks where longitudinal bulkheads, transverse bulkheads, deck plates, side shell and inner bottom plates are included.

(a) The thickness t of bulkhead plating is not to be less than the greatest of the values obtained from the following formula when h is substituted with h_1, h_2 and h_3.

$$t = C_1 C_2 S\sqrt{h} + 3.5 \quad \text{mm}$$

where:

S = Spacing of stiffeners, in m

h = The following h_1, h_2 and h_3:

h_1 = Vertical distance from the lower edge of the plating under consideration to the top of hatchway.

h_2 = As obtained from the following formula:

= $0.85 (h_1 + \Delta h)$

Δh = Additional water head given by the following formula:

$$= \frac{16}{L}(l_t - 10) + 0.25(b_t - 10) \quad \text{mm}$$

l_t = Tank length, in m, take 10, when less than 10 m.

b_t = Tank breadth, in m, take 10, when less than 10 m.

h_3 = For oil tank obtained from the following formula:

= $0.3\sqrt{L}$

For deep tank, as obtained by multiplying 0.7 by vertical distance from the lower edge of the bulkhead plating under consideration to the point 2.0 m above the top of overflow pipe.

C_1 = Coefficients determined according to values of L as specified below:

C_1 = 1.0 where $L \leq 230$ m

C_1 = 1.07 where $L \geq 400$ m

For intermediate values of L, C_1 are to be obtained by linear interpolation.

C_2 = $3.6\sqrt{K}$, however, C_2 for h_1 is to be obtained by the following formulae according to the type of bulkhead and stiffening system:

In the case of longitudinal bulkheads of longitudinal system,

$$C_2 = 13.4\sqrt{\frac{K}{27.7 - \alpha K}}$$

Where, however, value of C_2 are not to be less than $3.6\sqrt{K}$.

In the case of longitudinal bulkheads of transverse system,

$$C_2 = 100\sqrt{\frac{K}{767 - \alpha^2 K^2}}$$

K = Coefficient corresponding to material strength, and is to be as given below:

= 1 for MS

= 0.78 for HT32

= 0.72 for HT36

= 0.69 for HT40

α = Either α_1 or α_2 according to value of y. However, value of α are not to be less than α_3

when $y_B < y$

$$\alpha_1 = 15.5 f_D \frac{(y - y_B)}{y_O}$$

when $y \leq y_B$

$$\alpha_2 = 15.5 f_B \left(1 - \frac{y}{y_B}\right)$$

$$\alpha_3 = \beta\left(1 - \frac{2b}{B}\right)$$

f_D, f_B = Ratios of section modulus of athwartship section on the basis of mild steel in accordance with the requirements of Chapter 3 in Part II of the Rules to actual section modulus of athwartship section concerning the strength deck and bottom.

y = Vertical distance from the top of keel to the lower edge of the bulkhead plating under consideration, in m.

y_B = Vertical distance from the top keel amidship to the horizontal neutral axis of the athwartship section of the hull, in m.

y_O = The greater of the value specified in 3.2.5 (e), (i) or (ii), Part II of the Rules.

β = Coefficient given by the following formulae. For the intermediate values of L, β is to be obtained by linear interpolation.

= $\frac{6}{a}$ where $L \leq 230m$

= $\frac{10.5}{a}$ where $L \geq 400m$

a = $\sqrt{K}$ when high tensile steels are used for not less than 80% of side shell plating at the athwartship section amidships, and 1.0 for other parts.

B = Horizontal distance from side shell plating to the outer end of the bulkhead plating under consideration, in m.

B = Moulded breadth of ship, in m.

(b) In determining the thickness of plating, coefficient C_2 for h_1 may be gradually reduced for the parts forward and afterward the midship part, and it may take as $3.6\sqrt{K}$ in calculations at 0.1 L from fore end and aft end.

2A.6.2 Swash bulkheads

(a) Stiffeners and girders of swash bulkhead are to be of sufficient strength considering the size of tanks and opening ratios.

(b) The thickness of swash bulkhead plating is not to be less than that obtained from the following formula:

$$t = 0.3S\sqrt{L + 150} + 3.5 \quad \text{mm}$$

where:
S = Spacing of stiffeners, in m.

(c) In determining the thickness of swash bulkhead plating, sufficient consideration is to be given to buckling.

2A.6.3 Trunk

The thicknesses of trunk top and side plating are to be determined applying the requirements of 2A.6.1 in addition to the requirements in Chapter 11 of Part II.

2A.7 Longitudinals and Stiffeners

2A.7.1 Longitudinals

(a) The section modulus of bottom longitudinals is not to be less than the value obtained from the following formula:

$$Z = 100C_1C_2Shl^2 \quad \text{cm}^3$$

where:
l = Spacing of girders, in m.
S = Spacing of longitudinals, in m.
h = Distance from the longitudinals under consideration to the following point above the top of keel, in m.
= d + 0.026L′
L′ = Length of ship, in m. Where, however, L exceed 230 m, L′ is to be taken as 230 m.

C_1 = As specified in 2A.6.1 (a).
C_2 = Coefficient given by the following formula:
= $\frac{K}{24 - 15.5 f_B K}$
f_B and K = As specified in 2A.6.1 (a).

(b) The section modulus of side longitudinals including bilge longitudinals is not to be less than the value obtained from the following formula:

$Z = 100 C_1 C_2 S h l^2$ cm^3

where:
l, S = As specified in (a).
h = Distance from the longitudinals under consideration to the following point above the top of keel, in m.
= $d + 0.038 L'$
L′ = As specified in (a).
C_1 = As specified in 2A.6.1 (a).
C_2 = Coefficient given by the following formula:
= $\frac{K}{24 - \alpha K}$
K = As specified in 2A.6.1 (a).
α = α_1 or α_2 as given below, whichever is greater.
α_1 = $15.5 f_B \left(1 - \frac{y}{y_B}\right)$
f_B, y_B = As specified in 2A.6.1(a).
y = Vertical distance from the top of keel to the longitudinals under consideration, in m.
α_2 = Coefficient as given below, determined by values of L. For intermediate value of L, the value of α_2 is to be obtained by linear interpolation.
= $\frac{6}{a}$ where $L \leq 230m$
= $\frac{10.5}{a}$ where $L \geq 400m$
a = $\sqrt{K}$ when high tensile steels are used in the athwartship sections of the midship hull for 80% or more of side shell plating, and 1.0 for other cases.

The section modulus, however, need not exceed that of bottom longitudinals specified in (a), but is not to be less than the value obtained from the following formula:

$Z = 2.9 K \sqrt{L} S l^2$ cm^3

(c) For side longitudinals, sufficient consideration is to be given for fatigue strength.

(d) For the parts forward and afterward of the midship part, the scantlings of longitudinals may be gradually reduced and at the end parts they may reduced by 15% of the value obtained from the requirements in (a) and (b). In no case, however, are the scantlings of longitudinals to be less than required in (a) and (b) for the part between a point 0.15L from the fore end and the collision bulkhead.

2A.7.2 Bulkhead stiffeners in cargo oil tanks and deep tanks

(a) Section modulus of stiffeners is not to be less than the value obtained from the following formula:

$Z = 125C_1C_2C_3Shl^2$ cm^3

where:

S = Spacing of stiffeners, in m.

h = As specified in 2A.6.1(a). Where, however, "the lower edge of the bulkhead plating" is to be construed as "the mid-point of the stiffener" for vertical stiffeners, and as "the stiffener" for horizontal stiffeners.

l = Spacing of girders, in m.

C_1 = As specified in 2A.6.1(a).

C_2 = K/18, however C_2 for h_1 is to be obtained by the following formula according to the stiffening system:

= $\frac{K}{24-\alpha K}$ for the longitudinal system, however, in no case is the value of C_2 to be less than K/18.

= K/18, for the transverse system or transverse bulkheads.

α,K = As specified in 2A.6.1(a), however, "the lower edge of the bulkhead plating" and "the bulk head" are to be construed as "the stiffener" in applying the requirements for y and b.

C_3 = As determined from Table III 2A-7 according to the fixity condition of stiffener ends.

(b) In determining the section modulus of stiffeners attached to bulkhead plating, coefficient C_2 for h_1 may be gradually reduced, and at the end parts, C_2 may be as K/18.

2A.7.3 Buckling strength

(a) Buckling strength of longitudinal frames, beams and stiffeners is to be in accordance with the requirements (i) to (iii) below.

(i) Longitudinal beams, side longitudinals attached to sheer strakes and longitudinal stiffeners attached to the longitudinal bulkhead within 0.1D from the strength deck are to have a slenderness ratio not exceeding 60 at the midship part as far as practicable.

(ii) As for flat bars used for longitudinal beams, frames and stiffeners, the ratio of depth to thickness is not to exceed 15.

(iii) The full width of face plates of longitudinal beams, frames and stiffeners is not to be less than that obtained from the following formula:

$b = 69.6\sqrt{d_0 l}$ mm

where:

d_0 = Depth of web of longitudinal beam, frame or stiffener, in m.

l = Spacing of girders, in m.

(b) In case where assembled members, special shape steels or flanged plates are used for frames, beams or stiffeners in cargo oil tanks and deep tanks whose scantlings are specified only in terms of section modulus, the thickness of web is not to be less than that obtained from the following formula. In case where, however, the depth of web is intended to be greater than the required level due to reasons other than strength, it may be suitably modified.

$t = 15K_0d_0 + 3.5$ mm

where:

d_0 = Depth of web, in m.

K_0 = As specified bellows:

$K_0 = \sqrt{\frac{1}{4}\left(3f_B + \frac{1}{K}\right)}$ for bottom longitudinals located not more than 0.25D above top of keel,

$K_0 = \sqrt{\frac{1}{4}\left(3f_D + \frac{1}{K}\right)}$ for deck longitudinals located not more than 0.25D below deck,

$K_0 = \sqrt{\frac{1}{4}\left(3 + \frac{1}{K}\right)}$ for other structural members.

f_B, f_D, K = As specified in 2A.6.1 (a).

Table III 2A-7
Value of C_3

Another end→ One end↓	(1)	(2)	(3)	(4)
(1) Rigid fixity by bracket	0.70	1.15	0.85	1.30
(2) Soft fixity by bracket	1.15	0.85	1.30	1.15
(3) Supported by girders or lug-connection	0.85	1.30	1.00	1.50
(4) Snip	1.30	1.15	1.50	1.50

Notes:

(1) Rigid fixity by bracket means the fixity in the connection between the double bottom plating or comparable stiffeners within adjoining planes and brackets, or equivalent fixity.

(2) Soft fixity by bracket means the fixity in the connection between beams, frames, etc., which are crossing members, and brackets.

2A.8 Girders, Transverses and Cross Tie

2A.8.1 General

(a) The double bottom and double side hull structures and the arrangements and scantlings of girders in cargo oil spaces are to be based upon direct strength calculation and deemed appropriate by the Society.

(b) Notwithstanding the requirement in (a), the scantlings of girders may be determined in accordance with the requirements in 2A.8.2 to 2A.8.6 provided that the arrangements of girders in the double bottom, double side hull and cargo oil tank at cargo oil spaces are determined referring to the structural types shown in following (i) to (v) as the standard:

(i) The height of a double bottom at cargo oil spaces is not to be less than B/20, in m.

(ii) The width of a double side hull is not to be less than D/9, in m.

(iii) In double bottoms at cargo oil spaces, girders are to be provided at a spacing not exceeding $0.9\sqrt{l_T}$, and floors are to be provided at a spacing not exceeding $0.55\sqrt{B}$ (m) or $0.75\sqrt{D}$ (m), whichever is smaller. l_T is the length of a cargo hold, in m.

(iv) In double side hull, side stringers are to be provided at a spacing not exceeding $1.1\sqrt{l_T}$, in m.

(v) Transverses in double side hull, cargo oil tanks and deep tanks are to be provided in line with floors in double bottoms.

2A.8.2 Scantlings of girders and floors in double bottom.

The scantlings of girders and floors in double bottom are to be as deemed appropriate by the Society.

2A.8.3 Scantlings of stringers and transverses in double side hull

The scantling of stringers and transverses in double side hull are to be as deemed appropriate by the Society.

2A.8.4 Girders and transverses in cargo oil tanks and deep tanks.

(a) The section modulus Z of girders is not to be less than that obtained from the following formula:

$$Z = 7.13 C_1 K S h l_0^2 \qquad cm^3$$

where:

S = Width of the area supported by the girders, in m.

h = As specified in 2A.6.1 (a). Where, however, "from the lower edge of the bulkhead plating under consideration" is to be construed as "from the midpoint of S" for horizontal girders, and as "from the midpoint of l_0" for vertical girders in applying the value of h.

l_0 = Length of girders obtained from the following formula:

l_0 = kl, in m.

l = Total length of girders, in m, and if it is continuous with other girders and transverses, distance to the inner surface of face plates of the girder.

k = Correction factor for brackets, and to be as obtained from the following formula:

$$= 1 - \frac{0.65(b_1 + b_2)}{l}$$

b_1, b_2 = Arm length of brackets at respective ends of girders and transverses, in m.

K = As specified in 2A.6.1 (a).

C_1 = Coefficient determined by L as given below:

= 1.0, where L is not more than 230 m.

= 1.20, where L exceeds 400 m.

For intermediate value of L, to be obtained by linear interpolation.

(b) The moment of inertia of girders is not to be less than that obtained from the following formula. Additionally, in no case is the depth of girders to be less than 2.5 times the depth of slots.

$$I = 30 h l_0^4 \qquad cm^4$$

where:

h, l_0 = As specified in (a).

(c) The thickness of girders is not to be less than the greatest of the following t_1, t_2 or t_3:

$$t_1 = 0.0417 \frac{(C_1 C_2 S h l_0)}{d_1} + 3.5 \qquad mm$$

$$t_2 = 1.74 \sqrt[3]{\frac{C_1 C_2 K S h l_0 S_1^2}{d_1}} + 3.5 \qquad mm$$

$$t_3 = 0.01 S_1 + 3.5 \qquad mm$$

where:

S, h, l_0, C_1 & K = As specified in (a).

S_1 = Spacing of stiffeners of girders or the depth of girders, whichever is smaller, in m.

d_1 = Depth of the girder under consideration, in m, subtracting the depth of openings.

C_2 = Coefficient as obtained from the following formula:

In no case is it to be less than 0.5:

C_2 = $\left|1 - 2\frac{x}{l_0}\right|$ for vertical girders,

= $\left|1 + \frac{1}{5}\frac{l_0}{h} - \left(2 + \frac{l_0}{h}\right)\frac{x}{l_0} + \frac{l_0}{h}\left(\frac{x}{l_0}\right)^2\right|$ for horizontal girders.

x = Distance from the end of l_0 to the sectional area under consideration, in m, and from the lower end of l_0 for vertical girders.

(d) Effective steel plates used for calculating actual moment of inertia of girders and section modulus are to be as specified in 1.6.3 of Part II. In case where, however, stiffeners are provided within the effective width, they may be included in the effective steel plates.

(e) The web thickness of transverse at the portion where cross ties are connected is not to be less than obtained from the following formula. Where slots are provided in the web at the portion where cross ties are connected, the slots are to be effectively covered with collar plates.

$$t = 16\sqrt{\frac{C_1 S b_s h_s}{A}} S_1 \qquad \text{mm}$$

where:

S = Spacing of transverses, in m.

b_s = Width supported by cross tie, in m.

h_s = Distance from mid-point of b_s to the following point above top of keel, in m:

= d+0.038L′

L′ = As specified in 2A.7.1(a).

C_1 = As specified in (a).

S_1 = Spacing of stiffeners provided depth-wise on the web plates of transverses at the portion where cross ties are connected, in m.

A = Sectional area effective to support the axial force from cross tie (cm^2), which is to be taken as follows:

(i) Where the face plates of cross ties are continuous to the face plates of transverses in an arc form or a similar form, A is the total sum of the sectional area of the web plate of transverse at the portion between the contact points of tangents to the arc or similar curve making an angle of 45° to the direction of cross tie, that of the stiffener provided in the axial direction of cross tie on the web plate between the contact points, and 0.50 times that of the face plates at the contact points (See Fig. III 2A-4(a)).

(ii) Where the face plates of cross ties are continuous to the face plates of transverses in the form of straight line with rounded corners, A is the total sum of the sectional area of the web plate of transverse at the portion between the mid-points of the intersections of the extensions of the lines of inner surface of face plates of both cross tie and transverse with the lines making an angle of 45° to the direction of cross tie in contact with the inner surface plates at the transforming parts, that of the stiffener provided in the axial direction of cross tie on the web plate between the above-mentioned mid-points and 0.50 times that of the face plates at the mid-points (See Fig. III 2A-4(b)).

(iii) Where the face plates of cross ties are joined directly to the face plates of transverses with a right or nearly right angle and both face plates are connected with brackets and further, stiffeners are provided on the web plate of transverses on the extended lines of face plates of cross tie. A is the total sum of the sectional area of the web plate of transverse at the portion between the mid-points of the intersections of the extensions of lines of inner surface of face plates of both cross tie and transverse with the lines making an angle of 45° to the direction of cross tie in contact with the free edge lines of brackets, and that of the stiffeners provided as mentioned above (See Fig. III 2A-4(c)).

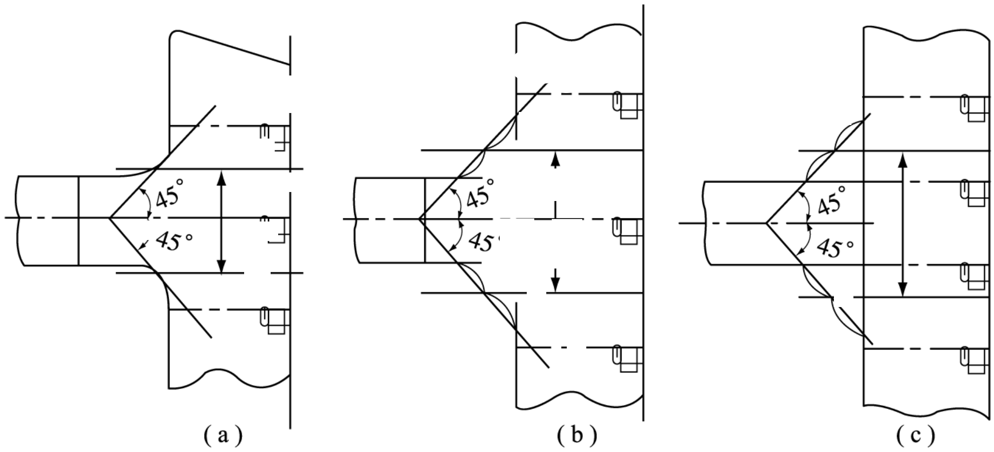

Fig. III 2A-4
Extent for Total Sectional Area

(f) The thickness of face plates forming a girder is to be greater than the thickness of web, and the total width is not to be less than that obtained from the following formula:

$85.4\sqrt{d_0 l}$ mm

where:

d_0 = Depth of girders, in m.

l = Distance between supporting points of girders, in m. Where, however, if effective tripping brackets are provided, they may be regarded as supporting points.

2A.8.5 Transverse of ships without double side hull

(a) In addition to the requirements in 2A.8.4, depth of side transverse d and section modulus of transverse Z are not to be less than that obtained from the following formulae:

$d = 0.15l$ m

$Z = 8.7KShl_0^2$ cm^3

where:

l = Total length of side transverses, and if they are continuous with other transverses, distance to the inner surface of face plates of the transverses, in m.

l_0 = As given below;

= kl, in m.

k = As specified in 2A.8.4(a).

S = Spacing of transverses, in m.

h = Distance from mid-point of l_0 to the following point above top of keel, in m.

= d + 0.038L′

L′ = As specified in 2A.7.1(a).

K = As specified in 2A.6.1(a).

(b) The scantlings of deck transverses are to be as given in (i) and (ii) below:

(i) Section modulus Z of deck transverses of a ship without trunks is not to be less than that obtained from the following formula:

$$Z = 3KS\sqrt{L}\, l_0^2 \quad cm^3$$

where:

S, K, l_0 = As specified in (a).

(ii) For ships with trunks the construction of providing continuous deck transverses across the trunks is to be considered as the standard. In this case, the depth of the deck transverses that can be regarded as those supported by trunks may be 0.03B.

(c) For transverses provided on the centreline bulkhead, the requirements for side transverses specified in (a) are to be applied correspondingly. In no case, however, are the scantlings to be less than the value obtained by 0.8 times the coefficient in each formula.

2A.8.6 Stiffeners attached to girders in cargo oil tanks and deep tanks

The thickness of flat bar stiffeners and tripping brackets provided on girders and transverses, and stiffeners attached to bulkhead is not to be less than that obtained from the following formula. However, it needs not exceed the thickness of webs of the girder to which they are provided.

$$t = 0.5\sqrt{L} + 3.5 \quad mm$$

2A.8.7 Cross ties

(a) Cross ties in ships having two or more rows of longitudinal bulkheads, where they are effectively connected with longitudinal bulkhead transverses in cargo oil tanks are to be in accordance with this requirements.

(b) The sectional area of cross ties interconnecting longitudinal bulkhead transverses in cargo oil tanks is not to be less than that obtained from the following formula:

$$A = C_1C_2KSb_sh \quad cm^2$$

where:

S, b_s and C_1 = As specified in 2A.8.4(e).

h = Vertical distance from mid-point of b_s to top of hatch-ways of adjacent cargo oil tanks, in m.

K = As specified in 2A.6.1(a).

C_2 = Coefficient obtained from the following formula:

= $\dfrac{0.77}{1 - 0.5\frac{l}{k}}$ in no case, however, is it to be less than 1.1.

l = Length of cross ties between the inner surface of longitudinal bulkhead transverses, in m.

k = As given below:

= $\sqrt{\dfrac{I}{A}}$ cm

I = Moment of inertia of cross ties (cm^4).

A = Sectional area of cross ties (cm^2).

2A.9 Structural Details

2A.9.1 General

(a) The principal structural members are to be arranged so that continuity of strength can be secured throughout the cargo area. In forward and afterward parts of the cargo area, the structures are to be effectively strengthened so that continuity of strength is not impaired sharply.

(b) For the principal structural members, sufficient consideration is to be given for fixity at ends, supporting and stiffening systems against out-of-plan deflections, and the construction is to minimize local stress concentrations.

2A.9.2 Frames and stiffeners

Longitudinal beams, frames and stiffeners are to be of continuous structures, or to be connected securely so that their sectional areas at ends can be properly maintained and provide sufficient resistance against bending moments.

2A.9.3 Girders and cross ties

(a) Girders provided within the same plane are to be arranged to avoid sharp changes in strength and rigidity, and brackets in suitable size are to be provided at the ends of girders, and bracket toes are to be sufficiently rounded.

(b) In case where the depth of longitudinal girders is large, stiffeners are to be arranged in parallel with face plates.

(c) Transverses and vertical webs are to be provided with tripping brackets at the junctions with cross ties.

(d) Where the breadth of face plates forming cross ties exceeds 150 mm on one side of the web, stiffeners are to be provided at proper intervals to support the face plates as well.

(e) Tripping brackets are to be provided on the web plate transverses at the inner edge of end brackets and at the connecting part of cross ties, etc. and also at the proper intervals in order to support transverses effectively. In case where the width of face plates of each girder exceeds 180 mm on one side, the tripping brackets shown above are to support face places as well.

(f) Web for the upper and lower end brackets of side transverses and longitudinal bulkhead transverses and those in the vicinity of the roots of cross ties are to be stiffened specifically with closer spacing.

2A.10 Special Requirements for Corrosion

2A.10.1 Thickness of shell plating

(a) The thickness of shell plating forming casing of cargo oil tanks planned to carry ballast water, except the tank to carry ballast water only in heavy weather conditions, in ships without double side hull is not to be less than a thickness added with 0.5 mm to that obtained from the formula given in 2A.6.

(b) 0.5 mm may be reduced for the thickness of shell plating when applying the requirements of this Chapter from the thickness of shell plating when applying the requirements of this Chapter from the thickness obtained from the formula given in 2A.6.1.

2A.10.2 Thickness of deck plating

(a) 0.5 mm may be reduced for the thickness of freeboard deck plating when applying the requirements of this Chapter from the thickness obtained from the formula given in 2A.6.1.

(b) The thickness of the freeboard deck plating in spaces carrying cargo oil when applying the requirements in Chapter 11 of Part II, the thickness obtained from the formula given in 11.3 of Part II is to be added at least by 0.5 mm.

2A.10.3 Thickness of tank top plating

The thickness of tank top plating in cargo oil tanks and deep tanks is not to be less than the thickness corresponding to that obtained from the formula given in 2A.6.1 added by 1.0 mm. Such an addition, however, is not required for the thickness of the inner bottom plating.

2A.10.4 Section modulus of longitudinal beams, frames and stiffeners

(a) The section modulus of longitudinal beams provided on deck plating in spaces carrying cargo oil is not to be less than 1.1 times that calculated according to the requirements in 9.3 of Part II.

(b) The section modulus of frames and stiffeners provided on shell plating and bulkheads forming cargo oil tanks planned to carry ballast water, except the tank to carry ballast only in heavy weather conditions, is not to be less than 1.1 times that calculated in accordance with the requirements in 2A.7.1 and 2A.7.2.

2A.10.5 Thickness of plate members in ballast tanks adjacent to cargo oil tanks

(a) The thickness of bulkhead plating at the boundaries between ballast tanks and cargo oil tanks is not to be less than the thickness specified in 2A.4 added by 1.0 mm.

(b) In case where the adjacent cargo oil tanks are equipped with heating systems, the thickness of bulkhead plating at the boundaries between ballast tanks and cargo oil tanks is not to be less than the thickness determined from (a) added by 1.0 mm.

2A.10.6 Thickness of deck plating in cargo oil tanks

(a) The thickness of deck plating in cargo oil tanks is not to be less than the thickness specified in 2A.4 added by 1.0 mm.

2A.10.7 Thickness of inner bottom plating in cargo oil tanks.

(a) The thickness of inner bottom plating of cargo oil tanks is to be sufficient considering the effects of pitting corrosion.

(b) The thickness of inner bottom plating in the vicinity of suction bell mouths in cargo oil tanks, and the thickness of suction wells, when provided, are not to be less than the thickness obtained by the requirements in 2A.6.1(a) or the appropriate area of application added by 2.0 mm.

2A.11 Special Requirements for Tankers with Mid-Deck

2A.11.1 Application

The structural members of tankers having mid-deck penetrating longitudinally through the cargo areas are to comply with the requirements in 2A.1 through 2A.10 in addition to the requirements in 2A.11.

2A.11.2 Loads

Values of h_1, h_2 and h_3 in case where the scantlings of structural members in cargo oil tanks below the mid-deck are obtained from the formulae specified in 2A.6.1, 2A.7.2 and 2A.8.4 are to be as specified in Table III 2A-8.

2A.11.3 Mid-Deck

In case where the thickness of a mid-deck plating is counted as the top plating of the lower cargo oil tank, it is not to be less than the thickness obtained from the formula given in 2A.6.1, using the loads specified in 2A.11.2 adding 1.0 mm thereto.

2A.12 Special Requirements for Forward Wing Tanks

2A.12.1 Application

For tankers of not less than 200m in length, the structural members in wing tanks which become empty in the full loaded condition for spaces from a point 0.15 L from the bow to the collision bulkhead are to comply with the requirements in 2A.1, 2A.3 through 2A.11 in addition to the requirements in 2A.12.

2A.12.2 Side longitudinals

(a) The section modulus of side longitudinals is not to be less than that obtained from the following formula:

$$Z = 9C_1KSh l^2 \quad \text{cm}^3$$

where:

l = As specified in 2A.8.4(e).

S = Spacing of side longitudinals, in m.

h = Distance from the longitudinals under consideration to the point above top of keel obtained from the following formula, in m:

= $0.7d + 0.05L$

Where, however, in no case is h to be less than that obtained from the following formula, in m:

= $0.2\sqrt{L} + 0.03L$

C_1, K = As specified in 2A.6.1(a).

(b) In case where side longitudinals are connected to transverses by brackets, the section modulus may be determined by multiplying the value obtained from the following formula by the formula specified in (a):

$$(1 - C)^2$$

where:

C = As obtained from the following formula:

$$C = \frac{b_1 + b_2 - 0.3}{l} \quad \text{where brackets are provided at both ends,}$$

$$C = \frac{b - 0.15}{l} \quad \text{where a bracket is provided at one end.}$$

b_1, b_2, b = Length of bracket arms along longitudinals, in m.

Where, however, in case where the value of C is negative, C = 0. (See Fig. III 2A-5)

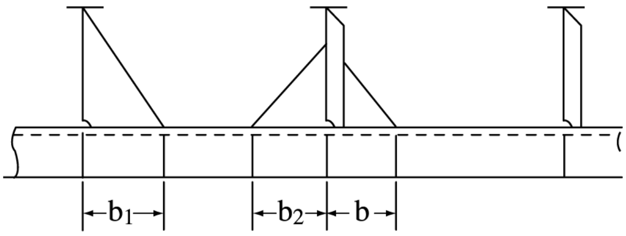

Fig. III 2A-5
Measurement of b, b_1 and b_2

2A.13 Construction and Strengthening of the Forward Bottom

Strengthening of the forward bottom is to comply with the requirements in 8.2 of Part II.

2A.14 Special Requirements for Hatchways and Freeing Arrangements

2A.14.1 Tankers having unusually large freeboard
Relaxation from the requirements in 2A.14 will be considered to tankers having an unusually large freeboard.

2A.14.2 Hatchways to cargo oil tanks

(a) The thickness of coaming plates is not to be less than 10 mm. Where the length and coaming height of a hatch way exceed 1.25 meters and 760 mm respectively, vertical stiffeners are to be provided to the side or end coamings, and the upper edge of coamings is to be suitably stiffened.

(b) Hatch covers are to be of steel or other approved materials. The construction of steel hatch covers is to comply with the following requirements. The construction of hatch covers of materials other than steel is to be in accordance with the discretion of the Society.
  (i) The thickness of cover plates is not to be less than 12 mm.
  (ii) Where the area of a hatchway exceeds 1 m^2 but does not exceed 2.5 m^2, cover plates are to be stiffened by flat bars of 100 mm in depth space not more than 610 mm apart. Where, however, the cover plates are 15 mm or more in thickness, the stiffeners may be dispensed with.
  (iii) Where the area of a hatchway exceeds 2.5 m^2, cover plates are to be stiffened by flat bars of 125 mm in depth spaced not more than 610 mm apart.
  (iv) The covers are to be secured by fastenings spaced not more than 457 mm apart in circular hatchways or 380 mm apart and not more than 230 mm from the corners in rectangular hatchways.

(c) The cover is to be provided with an opening at least 150 mm in diameter which is to be so constructed as to be capable of being closed oil tight by means of a screw plug or a cover of peep hole.

(d) Hatchway coamings are to be provided with gas cocks or other suitable exhausting devices.

2A.14.3 Hatchways to spaces other than cargo oil tanks.
In exposed positions on the freeboard and forecastle decks or on the top of expansion trunks, hatchways serving spaces other than cargo oil tanks are to be provided with steel watertight covers having scantlings complying with the requirements in Chapter 17 of Part II.

2A.14.4 Freeing arrangement

(a) Ships with bulwarks are to have open rails for at least half the length of the exposed part of the freeboard deck or to have other effective freeing arrangements. The upper edge of sheer strake is to be kept as low as practicable.

(b) Where superstructures are connected by trunks, open rails are to be provided for the whole length of exposed parts of freeboard deck.

2A.15 Welding

2A.15.1 Application

The welding in tankers is to be accordance with the requirements given in Table XII 5-4 and XII 5-5.

2A.15.2 Fillet welding

(a) The application of fillet welding to structural members within the cargo areas is to be as given in Table III 2A-9.

(b) The leg length of fillet welds in areas given in (i) and (ii) below is to be at least 0.7 times the plate thickness as specified in the requirements in this Chapter.

(i) Fillet welding at the connected parts between the outermost girders in the double bottom and floors.

(ii) Fillet welding at the connected parts between the lowermost girders in the double side hull and transverses.

Table III 2A-8
Loads

Provisions / Loads	2A.6.1	2A.7.2	2A.8.4
h_1	Vertical distance from the lower edge of bulkhead plating to the mid-deck, in m	Vertical distance from mid-length of l for vertical stiffeners, and from mid-point between the upper and lower stiffeners for horizontal stiffeners to the mid-deck, in m	Vertical distance from mid-length of S for horizontal girders, and from mid-length of *l* for vertical girders to the mid-deck, in m
h_2	0.85 (h_1 + Δh), in m Δh is to be as specified in 2A.6.1(a)	0.85 (h_1 + Δh), in m Δh is to be as specified in 2A.6.1(a)	0.85 (h_1 + Δh), in m Δh is to be as specified in 2A.6.1(a)
h_3	0.7 times the vertical distance from the lower edge of bulkhead plating to the top of hatchway multiplied, in m	0.7 times the vertical distance from mid-length of *l* for vertical stif-feners, and from mid-span of the upper and lower stiffeners for horizontal stiffeners to the top of hatchway, in m	0.7 times the vertical distance from mid-length of S for horizontal girders, and from mid-length of *l* for vertical girders to the top of hatchway, in m

Table III 2A-9
Application of Fillet Welding

Column	Item		Application	Double continuous Type of fillet weld size	Intermittent Pitch (S) (All with 75 mm long of Type 2 fillet weld)
1	Girders and transverses	Web plates	Shell, deck, longitudinal bulkhead or inner bottom plating	2	
2			Web plates	2	
3			Face plates	4	
4		Slots in web plates	Web plates of longitudinal frames, beams and horizontal stiffeners on longitudinal bulkheads	4	
5		Tripping brackets and stiffeners provided on web plates	Web plates	2	200
6			Longitudinal frames, beams horizontal stiffeners on longitudinal bulkheads	2	
7	Longitudinal frames, beams and horizontal stiffeners on longitudinal bulkheads		Shell, deck or longitudinal bulkhead plating	2	200
8	Cross ties		Members forming cross ties (web plates to face plates)	2	200
9			Face plates of transverses or girders	2	

Note: Where the radius at the toe of end brockets is small, it is recommended that Type 2 be used for appropriate length at the toe of bracket.

Chapter 3

Container Carriers

3.1 General

3.1.1 This Chapter applies to ships classed in accordance with the provisions in Chapter 1 of Part I and built for the carriage of containers in holds and on deck. Ships complying with the requirements of this Chapter are to be assigned the service notation of **Container Carrier**. Proposals for the omission of hatch covers will be specially considered to comply with the provisions of the MSC Circular.608/Rev.1(1994/07/05) of the IMO "Interim Guidelines for Open-top Containerships". Such proposals are to include details, established by model tests or alternative means, of the quantity of water likely to ingress the cargo holds under the worst sea-going and weather conditions, and the means by which it is efficiently and safely discharged.

3.1.2 Except otherwise provided by this Chapter, the requirements for the construction of general ships given in Part II are to be applied.

3.1.3 The scantlings requirements given in this Chapter are generally intended to apply to container carriers with a basic structure configuration which includes a double bottom and a double skin side construction, or alternatively a single skin side construction with an efficient torsion box girder or equivalent structure at topsides. Longitudinal framing is to be fitted at topsides and at the bottom throughout the region of container holds. The side shell clear of the topside torsion box girder may be longitudinally or transversely framed.

3.1.4 The scantlings for ship constructions other than those mentioned above, to which the requirements in this Chapter are not applicable, may be specially considered by the Society.

3.1.5 Where required by the Society, direct calculations are to be employed in derivation of the scantlings of structural members. The scantlings so determined are to be adopted where they exceed the scantlings required by the Rules. Direct calculations are also to be used for unusual structural arrangements.

3.1.6 Special consideration is to be given to ships having hatch openings with a width greater than 0.85B, or where the average rate of the torsional deformation exceeds 0.006° per meter, or where the elongation of the hatch opening diagonal exceeds 35 mm under hydrodynamic torque loading, M_t, as defined in 3.3.1(c).

3.1.7 For container ships contracted for construction on or after 1 July 2016, the following requirements are to be complied with, if applicable:

(a) IACS UR S34 "Functional Requirements on Load Cases for Strength Assessment of Container Ships by Finite Element Analysis"

(b) IACS UR S11A "Longitudinal Strength Standard for Container Ships"

3.2 Submission of Plans and Data

3.2.1 In addition to the plans required by 1.3 of Part II, the followings are to be submitted:

(a) Hull section modulus and inertia calculations about vertical and horizontal axis in way of container holds, are as follows:

(i) At the forward end of the engine room.

(ii) At the forward end of the foremost container hatch.

(iii) At five intermediate sections, at least three of which are to be within 0.4L amidships.

(iv) At any other sections where there are structural changes.

(b) Details of hatch coamings and underdeck longitudinal girders supporting hatch coamings, together with their modulus and inertia calculations.

(c) Plan showing overlap arrangement and scarfing of steps in longitudinal inner skin bulkheads.

(d) An outline plan showing arrangement of cell guides, and indicating the position of guides relative to hatch corner radii, and attachment to structure members.

(e) An outline plan showing stowage arrangement and securing plan of containers.

(f) Details of reinforcement to structure in way of container corners.

(g) Combined stress diagrams with envelope of still water bending moments and wave bending moments.

(h) Direct calculations for structural scantlings as specified in 3.1.5.

(i) Container stowage and securing manual which include copies of the container stowage and securing plans as well as an inventory list for all container securing equipment required for the ship.

3.3 Longitudinal Strength

Longitudinal strength calculations are to be made in accordance with the requirements given in Part II, Chapter 3, covering the range of load and ballast conditions proposed for the ship. The longitudinal strengh requirements in IACS UR S11A are also to be complied with, if applicable as specified in 3.1.7.

3.4 Double Bottoms

3.4.1 The requirements in Chapter 5 of Part II are generally to apply. However, the construction of double bottoms in holds which are exclusively loaded with containers is to be in accordance with the requirements of this Section.

3.4.2 Side girders, solid floors or local stiffeners are to be provided in double bottoms under container corner seating.

3.4.3 For double bottoms having a depth greater than 1.6 m, additional stiffening may have to be introduced in order to ensure the buckling stability of the side girders.

3.4.4 The inner bottom plating with which their corner fittings of containers are in contact is to be strengthened by means of doubling or by other appropriate means.

3.5 Decks

3.5.1 The Upper deck is to be longitudinally framed throughout the region of container holds for ships where L ≥ 100 m, and the midship scantlings are generally to extend over the region of the container holds.

3.5.2 The scantlings of upper and second deck plating and stiffeners are to satisfy the modulus requirements of 3.3, and are to be not less than that required by Chapter 11 of Part II. The thickness of strength deck may be required to be increased locally in way of large openings.

3.5.3 Attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thicknesses are to be avoided. Where the difference between the thicknesses of plating inside and outside the line of main hatches exceeds 12 mm, a transitional plate of a thickness equivalent to the mean of the adjacent plate thickness is to be fitted.

3.5.4 Arrangements in way of corners and openings are to be such as to minimize the creation of stress concentration. Corners of main hatchway openings are to be rounded with a radius not less than:

0.525L + 350	mm, for outboard corners.
0.3L + 250	mm, for inboard corners.
40B	mm, for corners adjacent to engine room.

Where:
L = Length of ship, in m.
B = Breadth of ship, in m.
Parabolic or elliptic corners, or corners with less radii are to be specially considered.

3.5.5 If insert plates are required at main hatch corners. They are to have a thickness increase above the adjacent plating outside the line of hatchways of 15% in way of container holds, and 25% in container holds at the engine room bulkheads. The minimum increase is to be not less than 4 mm, and minimum fore and aft extent is to be 1 m from the edge of openings.

3.5.6 Longitudinal underdeck girders of open sections or closed box sections are to be fitted at deck level to support hatch coamings. They are to be continuous throughout the container hold area, including the machinery space which is situated between container holds.

3.6 Shell Plating and Double Skin

3.6.1 The thickness of the bottom, bilge and side shell plating is to comply with the requirements in Chapter 7 of Part II, and is to be such as to achieve the hull modulus required to limit the combined stress to that given in 3.3. However, at positions where high forces are present, and where the double skin construction is terminated, local increases in thickness may be required.

3.6.2 Side shell and inner skin longitudinal bulkheads may be transversely or longitudinally framed. The continuity of the longitudinal material is to be maintained in way of container holds and the machinery space which is situated between container holds.

3.6.3 In general, the thickness of the strake below the sheer strake is to be not less than 80% of the sheer strake thickness, and the thickness of the strake below the top strake of inner skin longitudinal bulkhead is to be not less than 80% of the top strake thickness, but the difference in thickness is in no case to exceed 12 mm.

3.6.4 Where the inner skin bulkheads are stepped to accommodate the container stowage arrangement, the scantlings and stiffening arrangement are to be specially considered. The scarfing arrangements in way of the steps are to be sufficient to ensure an efficient overlap of the inner skin bulkheads.

3.7 Fixed Cell Guides

3.7.1 Arrangement of fixed cell guides

(a) Vertical guides generally consist of sections with equal sides, not less than 12 mm in thickness, extended for a height sufficient to give uniform support to containers.

(b) Guides are to be connected to each other and to the supporting structures of the hull by means of cross-ties and longitudinal members such as to prevent deformation due to the action of forces transmitted by containers.

In general, the spacing between cross-ties connecting the guides may not exceed 5 metres, and their position is to coincide as nearly as possible with that of the container corners.

Cross-ties are to be longitudinally restrained at one or more points so that their elastic deformation due to the action of the longitudinal thrust of containers does not exceed 20 mm at any point.

(c) The upper end of the guides is to be fitted with a block to facilitate entry of the containers. Such appliance is to be of robust construction so as to withstand impact and chafing.

3.7.2 Strength criteria

The local stresses in the elements of cell guides, transverse and longitudinal cross-ties, and connections with the hull structure are to be less than the following values:

(a) normal stress：150/k (N/mm^2)

(b) shear stress：100/k (N/mm^2)

(c) Von Mises equivalent stress: 175/k (N/mm^2)

Where k is material factor defined in Part II/1.5.2 (a) of the Rules. Calculations are to consider net scantlings in accordance with IACS UR S11A.

3.8 Lashing Bridge

3.8.1 General

(a) Container securing

Containers on deck may be secured by means of lashing bridges permanently connected by welding to the ship structure. Lashing bridges allow lashing at a higher level.

(b) Material

Materials used are to comply with Part XI of the Rules. The manufacturing processes and testing are to comply with the applicable requirements of Part XII of the Rules.

(c) Strength verification

Drawings of the lashing bridge structure and details of the supporting structure are to be submitted to the Society for approval together with details on the calculations carried out.

Calculations shall be based at least on a three-dimensional beam analysis or on finite element analysis.

Calculations are to consider net scantlings in accordance with IACS UR S11A.

The mesh size requirement for each component of the lashing bridge model is to be as follow:

Table III 3-1
Mesh Size for Lashing Bridge Model

Application	Mesh Size
Hull structure below the lashing bridge: - Stringer - Upper deck - Bulkhead - Side shell/Inner shell	Secondary stiffener spacing or smaller
Lashing bridge structure and region connecting to the hull structure: - Vertical, horizontal and diagonal members/columns - Hatch coaming top	20t × 20t or 150 mm × 150 mm
Hot spot stress locations: - Lashing eye brackets - Brackets, etc.	To allow adequate representation of structural geometry and accurate determination of stress concentrations. Need not be less than t × t
Note: t is the smaller member thickness.	

(d) General arrangement

Structural continuity is to be ensured at the connections of the vertical supports of the lashing bridge to the ship structure.

3.8.2 Design loads

(a) General

Forces applied to the lashing bridge structure are to consider the loads transferred by containers. Force intensity is considered by the Society on a case by case basis, depending on the lashing arrangement and the proportion of the load that is considered as transferred to the lashing bridge structure.

(b) Container loads

To derive loads induced by container lashing devices, loads to be applied to container stacks include still water, inertial and wind forces.

(c) Forces applied on lashing bridge

Forces applied on each fixed cargo securing device on the lashing bridge shall be considered acting in the direction of the lashing bar.

In general, the SWL (Safe Working Load) for fixed cargo securing device may be taken as 250 kN and the applied force as 70% of this SWL value.

(d) Loading conditions

The following loading conditions are to be considered for the calculation of lashing bridges:

(i) both fore and aft bay of the lashing bridge are loaded with containers

(ii) fore bay of the lashing bridge is loaded with containers while the aft bay is empty

(iii) aft bay of the lashing bridge is loaded with containers while the fore bay is empty.

Loading condition (i) is intended to maximize vertical and transverse forces acting on the lashing bridge. Loading conditions (ii) and (iii) are intended to maximize the longitudinal forces acting on the lashing bridge.

3.8.3 Strength criteria

Permissible stresses for all supports and plating elements should comply with Part II/17.2.5 (a) of the Rules.

3.9 Breakwater

3.9.1 General

When a breakwater is fitted on deck to protect the containers from green sea loads, it is to comply with the requirements given in 3.8.2 and 3.8.3.

3.9.2 Design loads

Design loads on the breakwater are to be taken as the design head for unprotected lowest tier front bulkhead of superstructure, as defined in Part II/Ch.12.3.

3.9.3 Strength criteria

Scantlings of plating and stiffeners are to be evaluated according to criteria for unprotected lowest tier front bulkhead of superstructure, as described in Part II/Ch.12.

3.10 Measures to Prevent Propagation of Brittle Fractures

For container carriers where extremely thick steel plates are applied for longitudinal structural members, measures to prevent propagation of brittle fractures are to be taken in accorcance with Part XI 3.10.

3.11 Direct Strength Assessment

3.11.1 General

(a) Cargo Hold Analysis is to be carried out for ships of length 150 m or above. An additional Global Analysis is to be carried out for ships of length 250 m or above.

(b) Fatigue assessment is to be carried out on ships equal to or greater than 150 m in length. It may also be required on ships less than 150 m in length, if deemed necessary by the Society.

(c) Direct Strength assessment is to be carried out according to Appendix III-1, considering load cases and loading conditions as described in 3.11.2~3.11.4. The acceptance criteria for the strength assessment are to be referred to IACS UR S11A.

(d) Direct Strength assessment is to consider the net scantling in accordance with IACS UR S11A.

(e) Definition

(i) Global Analysis

A Global Analysis is a finite element analysis, using a full ship model, for assessing the structural strength of global hull girder structure, cross deck structures and hatch corner radii.

(ii) Cargo Hold Analysis

A Cargo Hold Analysis is a finite element analysis for assessing the structural strength of the cargo hold primary structural members (PSM) in the midship region.

(iii) Primary Structural Members (PSM)

Primary structural members are members of girder or stringer type which provide the overall structural integrity of the hull envelope and cargo hold boundaries, such as:

(1) double bottom structure (bottom plate, inner bottom plate, girders, floors)

(2) double side structure (shell plating, inner hull, stringers and web frames)

(3) bulkhead structure

(4) deck and cross deck structure

3.11.2 Load components

(a) Global analysis

The following methods may be used for Global Analysis:

(i) Method 1: Analysis where hull girder loads only (vertical bending moment, horizontal bending moment and torsional moment) are directly applied to the full ship finite element model

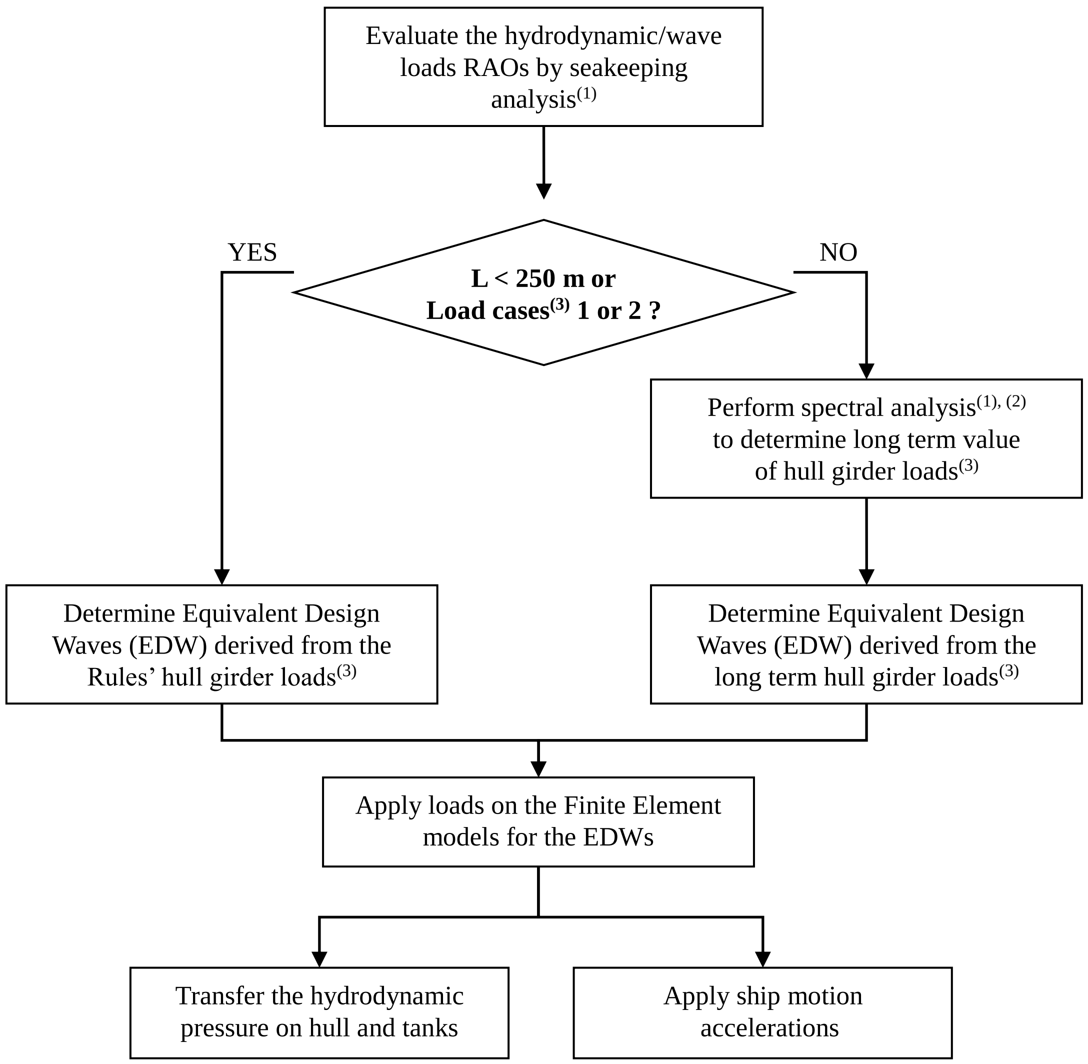
(ii) Method 2: Analysis where direct loads transferred from direct load analysis are applied to the full ship finite element model

The load components to be considered in Global Analysis are defined in Table III 3-2.

The loads definition is to be obtained accordingly to the flowchart presented in Fig. III 3-1.

Table III 3-2
Load Components to be Considered in Global Analysis

	Static load	Dynamic load
Method 1	- Still water vertical bending moment - Still water torsional moment	- Wave-induced vertical bending moment - Wave-induced horizontal bending moment - Wave-induced torsional moment
Method 2	- Static sea pressure - Static container loads - Static loads for ballast and fuel oil - Self-weight of hull structure	-Wave-induced sea pressure -Dynamic loads for hull structure, containers, ballast and fuel oil



Notes:
(1) CR Internal Guidance for Seakeeping Assessment
(2) Spectral analysis settings are provided in Appendix III-1
(3) Governing loads as provided in Table III 3-5. Rules values of hull girder loads are provided in 3.11.5.

Fig. III 3-1
Flowchart for the Determination of Governing Loads for Global Analysis

(b) Cargo hold analysis

The load components to be considered in Cargo Hold Analysis are defined in Table III 3-3.

Table III 3-3
Load Components to be Considered in Cargo Hold Analysis

	Static load	Dynamic load
Hull girder loads	- Still water vertical bending moment	- Wave-induced vertical bending moment - Wave-induced horizontal bending moment - Wave-induced torsional moment
Local loads	- Static sea pressure - Static container loads - Static loads for ballast and fuel oil[(1)] - Self-weight of hull structure	- Wave-induced sea pressure - Dynamic loads for hull structure containers, ballast and fuel oil [(1)]

Note:

(1) For the minimum set of loading conditions specified in Table III 3-4, all ballast and fuel oil tanks in way of the cargo hold model are to be empty. If additional loading conditions other than those given in Table III 3-4 are considered, ballast and fuel oil loads may be taken into consideration at the discretion of the Society.

3.11.3 Loading conditions

(a) Global analysis

A single loading condition is to be selected from the loading manual, considering the following criteria:

(i) the ship is to be homogeneously loaded with 40' containers (few 20' containers might be used to fill in empty spaces)

(ii) cargo holds are to be loaded up to their top

(iii) no ballast water is carried in the cargo hold region

(iv) among all conditions that fulfil the above requirements, the one with the lightest weight per container is to be selected.

If no relevant homogeneous loading condition is provided without ballast water, the one with the least ballast water is to be selected.

This generally leads to a nominal container weight of 28 t / FEU. Any significant deviation to this value shall be discussed with the Society.

(b) Cargo hold analysis

The minimum set of loading conditions is specified in Table III 3-4. In addition, loading conditions from the Loading Manual are to be considered in the Cargo Hold Analysis where deemed necessary.

Table III 3-4
Minimum Set of Loading Conditions for Cargo Hold Analysis

Loading Condition	Draught	Container weight	Ballast and fuel oil tanks	Still water hull girder moment
Full load condition	Scantling Draught	Heavy cargo weight(1) (40' containers)	Empty	Permissible hogging(7)
Full load condition	Scantling Draught	Light cargo weight(2) (40' containers)	Empty	Permissible hogging(7)
Full load condition	Reduced draught(3)	Heavy cargo weight(1) (20' containers)	Empty	Permissible sagging(7) (or minimum hogging)
One bay empty condition(4)	Scantling Draught	Heavy cargo weight(1) (40' containers)	Empty	Permissible hogging(7)
Ballast condition	Ballast draught(5)	Cargo holds empty	Full Ballast/ Empty fuel oil tanks	From the loading manual
Flooding condition (Any cargo hold flooded)	Flooding draught(6)	Heavy cargo weight(1) (40' containers)	Empty	-(6)

Notes:

(1) Heavy cargo weight of a container unit is to be calculated as the permissible stacking weight divided by the maximum number of tiers planned.

(2) Light cargo weight corresponds to the expected cargo weight when light cargo is loaded in the considered holds.

- Light cargo weight of a container unit in hold is not to be taken more than 55% of its related heavy cargo weight (see (1) above).

- Light cargo weight of a container unit on deck is not to be taken more than 90% of its related heavy cargo weight (see (1) above) or 17 metric tons, whichever is the lesser.

(3) Reduced draught corresponds to the expected draught amidships when heavy cargo is loaded in the considered holds while lighter cargo is loaded in other holds. Reduced draught is not to be taken more than 90% of scantling draught.

(4) For one bay empty condition, if the cargo hold consists of two or more bays, then each bay is to be considered entirely empty in hold and on deck (other bays full) in turn as separate load cases.

(5) The ballast draught is to be taken as the minimum ballast draught provided in the loading manual and the still water bending moment is to be taken from the same condition.

(6) The flooding draught is the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations. If the value is not available at the design stage, draught is to be considered up to the freeboard deck. It is to be checked at a later stage that the deepest equilibrium waterline remains below the freeboard deck. Hull girder loads are disregarded and the structural analysis is only carried out on the transverse bulkheads.

(7) Permissible maximum (hogging) and minimum (sagging) vertical still water bending moments at any longitudinal postion are to envelop

- The maximum and minimum still water bending moments for the seagoing loading conditions defined in the Loading Manual.

- The maximum and minimum still water bending moments and shear forces specified by the designer.

3.11.4 Load cases (wave conditions)

The ship is to be considered sailing in the North Atlantic wave environment for yielding and buckling assessments. The corresponding vertical wave bending moments are to be in line with IACS UR S11A and the hull girder loads formulations to be considered are provided in 3.11.5.

(a) Global analysis

Wave conditions presumed to lead to the most severe load combinations due to vertical bending moment, horizontal bending moment and torsional moment are to be considered.

Table III 3-5
Governing Load Cases

Load case	Governing load	Wave heading	Wave length
1	Maximum vertical wave bending moment amidship in hogging condition	180°	Peak value of vertical wave bending moment RAO amidship
2	Maximum vertical wave bending moment amidship in sagging condition	180°	Peak value of vertical wave bending moment RAO amidship
3	Maximum roll motion amidship	90°	Peak value of roll motion RAO amidship
4	Maximum wave pressure at the waterline amidship	90°	Peak value of wave pressure RAO amidship
5	Maximum horizontal wave bending moment amidship	~120° (1)	Peak value of horizontal wave bending moment RAO amidship
6	Maximum wave torque in vicinity of 0.75 L from AP	~60° (1)	Peak value of wave torque RAO at 0.75L
7	Maximum heave motion at fore end	~120° (1)	Peak value of heave motion RAO at fore end

Note:

(1) For Rules' load based EDWs (see Fig. III 3-1), the wave heading corresponds to the highest peak value of the RAO. For long term value based EDW (see Fig. III 3-1), the wave heading is to be selected as the most contributive one to the long-term value.

(b) Cargo hold analysis

The following wave conditions are to be considered:

(i) Head sea condition yielding the maximum hogging and sagging vertical bending moments.

(ii) Beam sea condition yielding the maximum roll motion. This condition may be disregarded for some loading conditions defined in Table III 3-4 where deemed not necessary.

3.11.5 Wave loads

(a) Vertical wave bending moment

The distribution of the vertical wave induced bending moments, M_W in kNm, along the ship length is given in Fig. III 3-3, where:

$$M_{W-Hog} = +1.5 f_R L^3 C C_W \left(\frac{B}{L}\right)^{0.8} f_{NL-Hog}$$

$$M_{W-Sag} = -1.5 f_R L^3 C C_W \left(\frac{B}{L}\right)^{0.8} f_{NL-Sag}$$

L = Ship Length, in m

C = Wave parameter

$$C = 1 - 1.50\left(1 - \sqrt{\frac{L}{L_{ref}}}\right)^{2.2} \quad \text{for } L \le L_{ref}$$

$$C = 1 - 0.45\left(\sqrt{\frac{L}{L_{ref}}} - 1\right)^{1.7} \qquad \text{for } L > L_{ref}$$

L_{ref} = Reference length, in m, taken as:

= $315C_W^{-1.3}$ for the determination of vertical wave bending moments

C_w = Waterplane coefficient at scantling draught
B = Moulded breadth, in m
f_R = Factor related to the operational profile, to be taken as: $f_R = 0.85$
f_{NL-Hog} = Non-linear correction for hogging, to be taken as:

$f_{NL-Hog} = 0.3 \cdot (C_B/C_W) \cdot \sqrt{T}$, not to be taken greater than 1.1

f_{NL-Sag} = Non-linear correction for sagging, to be taken as:

$$f_{NL-Sag} = 4.5\left(\frac{1 + 0.2f_{BOW}}{C_W\sqrt{C_B}L^{0.3}}\right), \text{not to be taken less than } 1.0$$

f_{Bow} = Bow flare shape coefficient, to be taken as: $\frac{A_{DK} - A_W}{0.2L_{zf}}$

A_{DK} = Projected area in horizontal plane of uppermost deck, in m^2 including the forecastle deck, if any, extending from 0.8L forward (see Fig. III 3-2). Any other structures, e.g. plated bulwark, are to be excluded.

A_W = Waterplane area, in m^2, at draught T, extending from 0.8L forward

Z_f = Vertical distance, in m, from the waterline at draught T to the uppermost deck (or forecastle deck), measured at FE (see Fig. III 3-2). Any other structures, e.g. plated bulwark, are to be excluded.

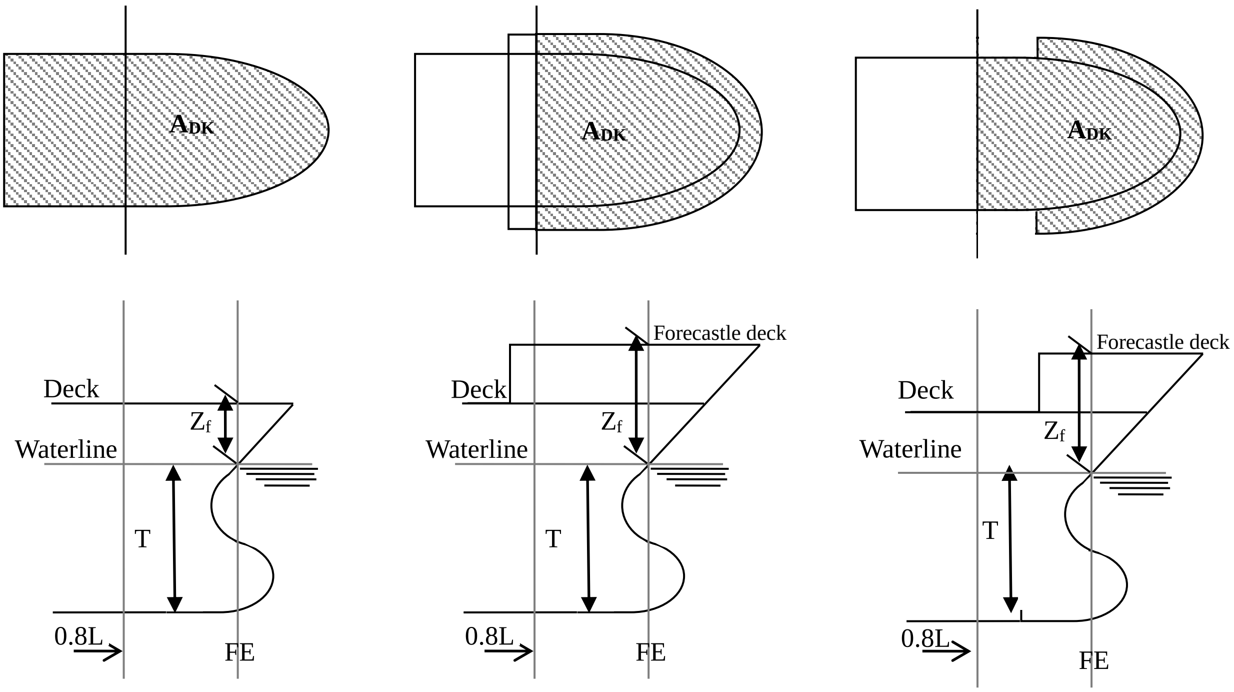


Fig. III 3-2
Projected Area A_{DK} and Vertical Distance Z_f

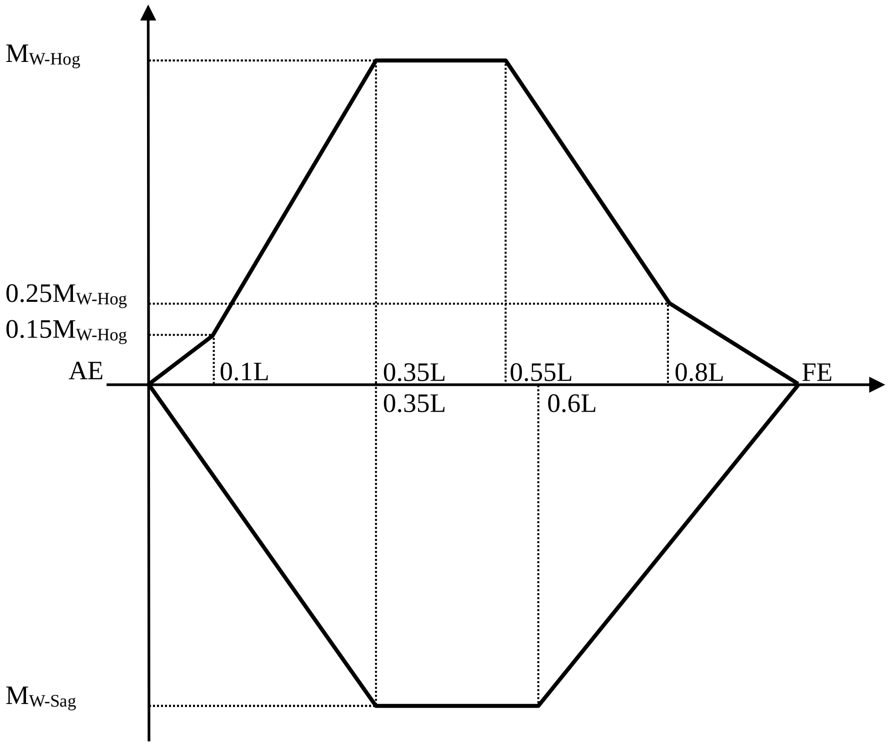

Fig. III 3-3
Distribution of Vertical Wave Bending Moment M_W along the Ship Length

(b) Horizontal wave bending moment

The horizontal wave bending moment at any hull transverse section is obtained, in kN · m, from the following formula:

$$M_{WH} = 0.42\ F_M\ H\ L^2\ T\ C_B$$

where

F_M = Distribution factor defined in Table III 3-6 (see Fig. III 3-4).

H = Wave parameter

= $8.13 - \left(\frac{250 - 0.7L}{125}\right)^3$, without being taken greater than 8.13

Table III 3-6
Distribution Factor F_M

Hull transverse section location	Distribution factor F_M
$0 \leq x < 0.4\ L$	$2.5 \frac{x}{L}$
$0.4\ L \leq x \leq 0.65\ L$	1
$0.65\ L < x \leq L$	$2.86\left(1 - \frac{x}{L}\right)$

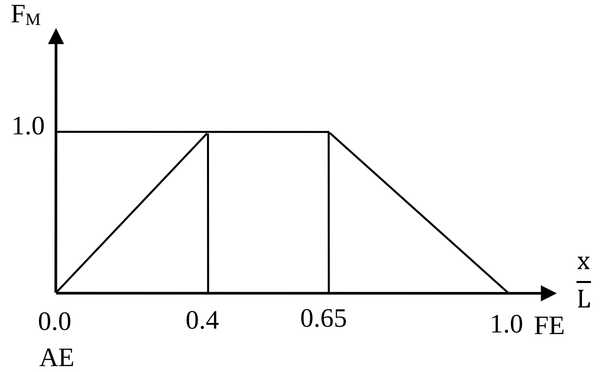

Fig. III 3-4
Distribution Factor F_M

(c) Wave torque

The wave torque at any hull transverse section is to be calculated considering the ship in two different conditions:

(i) condition 1: ship direction forming an angle of 60° with the prevailing sea direction

(ii) condition 2: ship direction forming an angle of 120° with the prevailing sea direction.

The values of the wave torques in these conditions, calculated with respect to the section center of torsion, are obtained, in kN · m, from the following formula:

$$M_{WT} = \frac{HL}{4}(F_{TM}C_M + F_{TQ}C_Q d)$$

F_{TM}, F_{TQ} = Distribution factors defined in Table III 3-7 for ship conditions 1 and 2

C_M = Wave torque coefficient:

$C_M = 0.45\ B^2\ C_W^2$

C_Q = Horizontal wave shear coefficient:

$C_Q = 5\ T\ C_B$

C_W = Waterplane coefficient, to be taken not greater than the value obtained from the following formula:

$C_W = 0.165 + 0.95\ C_B$

where C_B is to be assumed not less than 0.6. In the absence of more precise determination, C_W may be taken equal to the value provided by the above formula.

d = Vertical distance, in m, from the center of torsion to a point located 0.6 T above the baseline.

Table III 3-7
Distribution Factors F_{TM} and F_{TQ}

Ship condition	Distribution factor F_{TM}	Distribution factor F_{TQ}
1	$1-\cos\frac{2\pi x}{L}$	$\sin\frac{2\pi x}{L}$
2	$1-\cos\frac{2\pi(L-x)}{L}$	$\sin\frac{2\pi(L-x)}{L}$

3.11.6 Forces applied to containers

(a) Still water and inertial forces

The still water and inertial forces applied to one container located at tier "i", are to be obtained, in kN, as specified in Table III 3-8.

Table III 3-8
Container at Tier "i" Still Water and Inertial Forces

Load case	Still water force F_S and inertial force F_W, in kN
Still water	• in z direction z: $F_{S,i} = M_i.g$
Head sea (positive heave motion)	• in x direction x: $F_{W,X,i} = M_i\ a_{X1}$ • in z direction z: $F_{W,Z,i} = M_i\ a_{Z1}$
Beam sea (negative roll angle)	• in y direction y: $F_{W,Y,i} = M_i\ a_{Y2}$ • in z direction z: $F_{W,Z,i} = M_i\ a_{Z2}$

g = Gravitational acceleration, in m/s^2:

= $9.81\ m/s^2$

M_i = Mass, in t, of the container at tier "i"

a_{X1}, a_{Z1} = Reference values of longitudinal and vertical accelerations, in m/s^2, determined at the container center of gravity in accordance with "Condition B" as specified in 5.2.4 of the "Guidelines for Certification of Container Securing Systems."

a_{Y2}, a_{Z2} = Reference values of longitudinal and vertical accelerations, in m/s^2, determined at the container center of gravity in accordance with "Condition A" as specified in 5.2.4 of the "Guidelines for Certification of Container Securing Systems."

(b) Empty containers

When empty containers are stowed at the top of a stack, still water and inertial forces are to be derived considering weight of empty containers equal to:

(i) 2.5 t for twenty feet containers

(ii) 3.5 t for forty feet containers

(iii) 3.5 t for forty-five feet containers.

For other container sizes, the weight of empty containers is to be taken equal to 0.14 times the maximum gross weight of the container.

(c) Wind forces

The forces due to the effect of the wind, applied to one exposed container stowed above deck at tier "i", are to be obtained, in kN, from the following formulae:

in x direction x : $F_{x,wind,i} = 1.08\, h_C\, b_C$

in y direction y : $F_{y,wind,i} = 1.08\, h_C\, l_C$

where:

h_C = Height, in m, of a container

l_C , b_C = Dimension, in m, of the container stack in the ship longitudinal and transverse direction, respectively.

These forces only act on a stack exposed to wind. In the case of M juxtaposed and connected stacks of the same height, the wind forces are to be distributed over the M stacks.

In the case of juxtaposed and connected stacks of different heights, the wind forces are to be distributed taking into account the number of stacks at the tier considered (see example on Fig. III 3-5).

Note: Are said "exposed containers" any containers which the position/arrangement comply with the definition provided in 5.2.2 of the "Guidelines for Certification of Container Securing Systems."

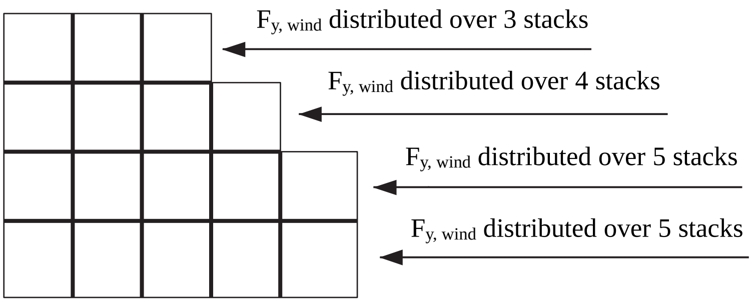

Fig. III 3-5
Distribution of Wind Forces in the Case of Stacks of Different Heights

(d) Stacks of containers

The still water, inertial and wind forces are to be considered as being applied at the center of gravity of the stack, and forces transmitted at the corners of such a stack are to be obtained as specified in Table III 3-9.

If the container securing strength calculations have been conducted accordingly to the "Guidelines for Certification of Container Securing Systems", the produced vertical reaction forces at the corner of the stack can be employed.

Table III 3-9
Container Stack Load and Corners Vertical Reaction Forces

Load case	Still water force F_S and inertial and wind force F_W, in kN, acting on each container stack	Vertical still water force R_S and inertial and wind force R_W, in kN, transmitted at the corners of each container stack
Still water	$F_S = \sum_{i=1}^{N} Fs,i$	$R_s = \frac{F_s}{4}$
Head sea (positive heave motion) (see Fig. III 3-6)	• in x direction $F_{w,x} = \sum_{i=1}^{N}(F_{w,x,i}+F_{x,wind,i})$ • in z direction $F_{w,z} = \sum_{i=1}^{N} F_{w,z,i}$	$R_{w,1} = \frac{F_{w,z}}{4} + \frac{N_c h_c F_{w,x}}{4l_c}$ $R_{w,2} = \frac{F_{w,z}}{4} - \frac{N_c h_c F_{w,x}}{4l_c}$
Beam sea (negative roll angle) (see Fig. III 3-7)	• in y direction $F_{w,y} = \sum_{i=1}^{N}(F_{w,y,i}+F_{y,wind,i})$ • in z direction $F_{w,z} = \sum_{i=1}^{N} F_{w,z,i}$	$R_{w,1} = \frac{F_{w,z}}{4} + \frac{N_c h_c F_{w,y}}{4b_c}$ $R_{w,2} = \frac{F_{w,z}}{4} - \frac{N_c h_c F_{w,y}}{4b_c}$

Note:

(1) N_C = Number of containers per stack

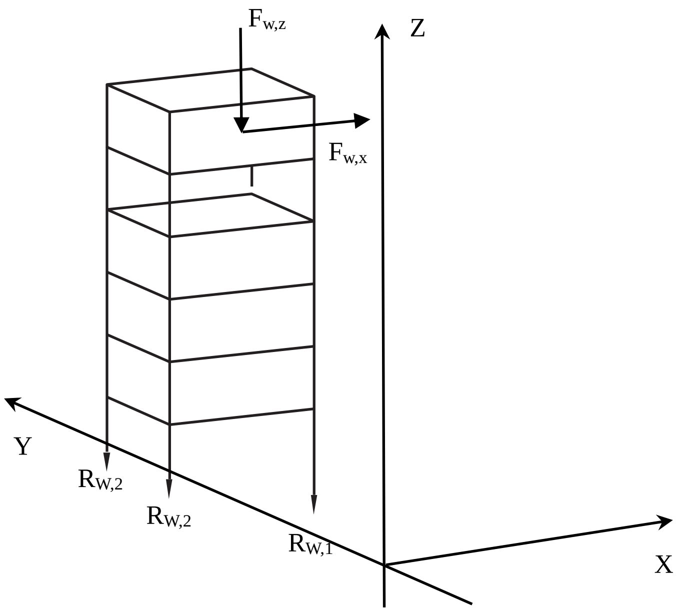

Fig. III 3-6
Container Stack Loads and Reaction Forces at Corners for Head Sea Condition

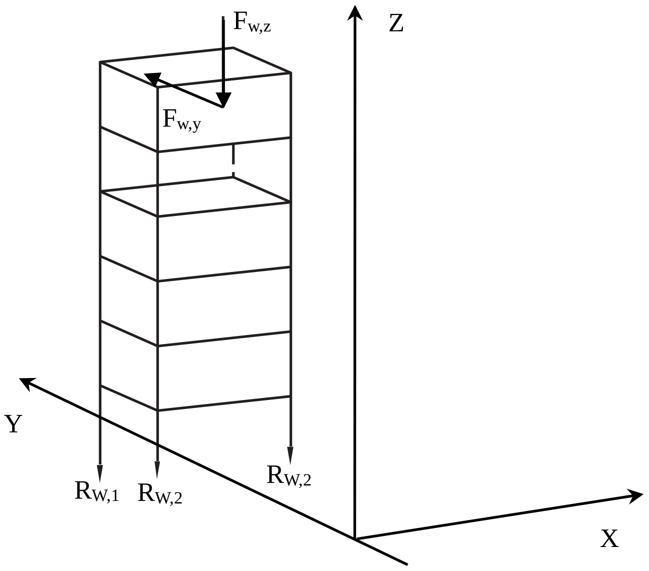

Fig. III 3-7
Container Stack Loads and Reaction Forces at Corners for Beam Sea Condition

(e) Effect of cell guides

Where cell guides support the containers stowed in holds, values of $R_{W,1}$ and $R_{W,2}$ calculated according to 3.11.6(d) for Beam sea condition, may be assumed not to be greater than ($F_{W,Z}$ / 4 + 160), provided that arrangements of cell guides and horizontal transverse crossties, effectively block the container corners.

Any other arrangement may be accepted, to the Society's satisfaction.

3.11.7 Mesh size

Mesh size for finite element modelling should comply with Appendix III-1 3.3.

(a) Global analysis model is to be built using a coarse mesh.

(b) Cargo hold analysis model is to be built using a coarse mesh.

(c) A fine mesh analysis is to be carried out for high stress areas of the cargo hold model. In addition, the following details are to be investigated by means of a fine mesh analysis:

(i) Representative hatch corners in way of cargo holds (from the second deck to the top of hatch coaming, where second deck means the first complete deck below the main deck), in particular in way:

(1) of connections between the engine room and adjacent cargo holds (aft and fore)

(2) of connections between fuel oil tanks and adjacent cargo holds

(3) of a representative watertight bulkhead amidships and of the first watertight bulkhead forward of the engine room fore bulkhead (if different)

(4) of support bulkheads beside the watertight bulkheads listed above

(5) of the first discontinuity forward at each deck level
(each complete deck above the inner bottom)

(6) of any other areas with significant scantling modifications

(ii) Ends of hatch coamings

(iii) Openings in way of engine room platforms (from the second deck to the upper deck)

(iv) Openings in way of fuel oil tanks platforms, when deep fuel oil tanks are located in the cargo hold area (from the second deck to the upper deck)

(v) Typical uppermost and lowest openings in vertical girders of transverse watertight bulkhead

(vi) Typical connection of longitudinal step bulkheads with web frames, inner hull and inner bottom as well as holes nearby.

Fine mesh analysis might also be required on other details when deemed relevant by the Society

(d) When fatigue assessment is required, the following structural details are to be checked using a very fine mesh model:

(i) Representative hatch corners in way of cargo holds (from the second deck to the top of hatch coaming)

(ii) Ends of hatch coamings

(iii) Openings in way of engine room platforms (from the second deck to the upper deck)

(iv) Openings in way of fuel oil tanks platforms, when deep fuel oil tanks are located in the cargo hold area (from the second deck to the upper deck)

(v) Connection of longitudinal stiffeners with stiffeners of transverse primary supporting members or bulkheads

(vi) Connection of longitudinal stiffeners with transverse primary supporting members or bulkheads (without stiffener on transverse primary member connected to longitudinal stiffeners).

Items (i) to (iv) are to be checked through a spectral fatigue analysis. As an alternative, for ships of length less than 250 m, they might be checked using the deterministic approach.Items (v) and (vi) are to be checked following a deterministic approach.

Fatigue calculation might be requested for other details when deemed relevant by the Society.

Chapter 4

Liquefied Gas Carriers

4.1 General

4.1.1 This Chapter applies to ships classed for the carriage in bulk of liquefied gases having an absolute vapor pressure exceeding 0.28 MPa (2.8 kgf/mm^2) at a temperature of 37.8°C. Where permitted by the class notations assigned to the ship, certain other substances may also be carried.

4.1.2 Except otherwise provided by this Chapter, the ship's hull, machinery and equipment are generally to comply with the requirements in relevant Parts of the Rules.

4.1.3 In addition to the applicable requirements of the Rules, the ship is to comply with the requirements of the International Maritime Organization (IMO) Resolution MSC.5(48) "International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk" (hereinafter referred to as IGC Code), adopted on 17 June 1983 and amendments in force, except that the requirements for personnel, operating and as prescribed in 4.1.4 are not within the scope of classification.

4.1.4 The following requirements of IGC Code are not classification requirements, however, when the Society is authorized to issue an "International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk" under provisions of IGC Code 1.5, and carries out surveys on behalf of an Administration, all requirements are to be applied:

2.2 Freeboard and stability
2.3 Damage and flooding assumptions
2.4 Survival requirements
2.5 Standard of damage
2.6 Location of cargo tanks
2.7 Special consideration for small ships

4.1.5 Gas carriers also intended for carriage of oil are to comply with the rules for oil tankers, Chapter 2 of this Part.

4.1.6 Gas carriers also intended for carriage of dangerous liquid chemical cargoes in bulk are to comply with the rules for chemical carriers, Chapter 5 of this Part.

4.2 Class Notations

4.2.1 For ships to which the requirements in this Chapter applies, a notation of **"Liquefied Gas Carrier"** is to be assigned in accordance with 1.4.5 of part I. Additional notations in respect of the following items are to be affixed in the certificate of class as appropriate:

Name of Liquefied Gas
Names of tanks.
Maximum allowable relief valve setting (MARVS).
Minimum design temperature.

4.2.2 For ships for which the survival capability as prescribed in Chapter 2 of IGC Code has been approved by the Society in accordance with 4.1.4, the ship type for survival capability and cargo tank arrangement (Type 1G, 2G, 2PG, and/or 3G) are to be included in the class notations.

4.3 Submission of Plans and Data

4.3.1 For classification surveys during construction, plans and information as may be necessary depending upon the products intended to be carried, condition of cargo stowage, construction of cargo containment system and other design conditions, are to be submitted before the work is commenced.

4.3.2 In addition to the plans required by the appropriate Chapters of the Rules, the following plans and data are to be submitted for approval.

(a) A general arrangement is to be submitted for approval giving location of:
   - (i) machinery and boiler spaces, accommodation, service and control station spaces, chain lockers, cofferdams, fuel oil tanks, drinking and domestic water tanks and stores.
   - (ii) cargo tanks and cargo containment systems.
   - (iii) cargo pump and compressor rooms.
   - (iv) cargo control rooms.
   - (v) cargo piping with shore connections including stern loading/discharge arrangements and emergency cargo pumping arrangement, if fitted.
   - (vi) cargo hatches, vent pipes and any other openings to the cargo tanks.
   - (vii) ventilating pipes, doors and openings to cargo pump rooms, cargo compressor rooms and other gas-dangerous spaces.
   - (viii) doors, air locks, hatches, ventilating pipes and openings, hinged scuttles which can be opened, and other openings to gas-safe spaces within and adjacent to the cargo area including spaces in and below the forecastle.
   - (ix) entrances, air inlets and openings to accommodation, service and control station spaces.
   - (x) gas-safe spaces and zones and gas-dangerous spaces and zones to be clearly identified.

(b) Plans of the cargo containment system with the following particulars are to be submitted for approval:
   - (i) drawing of cargo tanks including information on non-destructive testing of welds and strength and tightness testing of tanks.
   - (ii) drawings of support and staying of independent tanks.
   - (iii) drawing of anti-floatation arrangement for independent tanks.
   - (iv) specification on materials in cargo tanks and cargo piping systems.
   - (v) specifications of welding procedures for cargo tanks.
   - (vi) specification of stress relieving procedures for independent tanks type C (thermal or mechanical).
   - (vii) specification of design loads and structural analysis of cargo tanks.
   - (viii) a complete stress analysis is to be submitted for independent tanks, type B and type C.
   - (ix) detailed analytical calculation of hull and tank system for independent tanks, type B.
   - (x) specification of cooling-down procedure for cargo tanks.
   - (xi) arrangement and specifications of secondary barriers, including method for periodically checking of tightness.
   - (xii) documentation of model tests of primary and secondary barriers of membrane tanks.
   - (xiii) drawings and specifications of tank insulation.
   - (xiv) drawing of marking plate for independent tanks.

(c) Plans of the following piping systems are to be submitted for approval:
   - (i) drawings and specifications of cargo and process piping including vapour piping and vent lines of safety relief valves or similar piping, and relief valves discharging liquid cargo from the cargo piping system.

(ii) drawings and specifications of offsets, loops, bends and mechanical expansion joints, such as bellows, slip joints (only inside tank) or similar means in the cargo piping.

(iii) drawings and specifications of flanges, valves and other fittings in the cargo piping system. For valves intended for piping systems with a design temperature below –55°C, documentation for leak test and functional test at design temperature (type test) is required.

(iv) complete stress analysis of piping system when design temperature is below –110°C.

(v) documentation of type tests for expansion components in the cargo piping system.

(vi) specification of materials, welding, post-weld heat treatment and non-destructive testing of cargo piping.

(vii) specification of pressure tests (structural and tightness tests) of cargo and process piping.

(viii) program for functional tests of all piping systems including valves, fittings and associated equipment for handling cargo (liquid or vapour).

(ix) specifications of control system for all quick-closing shut-off valves.

(x) drawings and specifications of insulation for low temperature piping where such insulation is installed.

(xi) specification of electrical bonding of piping.

(xii) specification of means for removal of liquid contents from cargo loading and discharging crossover headers and/or cargo hoses prior to disconnecting the shore connection.

(d) The following plans and particulars for the safety relief valves are to be submitted for approval:

(i) drawings and specifications for safety relief valves and pressure/vacuum relief valves and associated vent piping.

(ii) calculation of required cargo tank relief valve capacity.

(iii) specification of procedures for changing of set pressures of cargo tank safety relief valves if such arrangements are contemplated.

(e) Plans of electrical installations giving the following particulars are to be submitted for approval:

(i) drawing(s) showing location of all electrical equipment in gas dangerous area.

(ii) single line diagram for intrinsically safe circuits.

(iii) list of explosion protected equipment with reference to drawings together with certificates.

(f) Damage stability

The following documentation is to be submitted for approval:

(i) Preliminary damage stability calculations.

(ii) Final damage stability calculations.

(g) Other plans and data considered necessary by the Society.

4.3.3 Plans of the following equipment and systems with particulars are to be submitted:

(a) construction and specifications of pressure relief systems for hold spaces, interbarrier spaces and cargo piping if such systems are required.

(b) calculation of hull steel significant temperature when cargo temperature is below –20°C.

(c) specification of tightness test of hold spaces for membrane tank system.

(d) arrangement and specifications of means for maintaining the cargo tank vapour pressure below MARVS. (cooling plant, gas burning arrangement, etc.)

(e) drawings showing location and construction of air locks with alarm equipment
  - (i) drawings of gastight bulkhead stuffing boxes
  - (ii) arrangements and specifications of mechanical ventilation systems for spaces in the cargo area, giving capacity and location of fans and their motors. Drawings and material specifications of rotating parts and casings for fans and portable ventilators
  - (iii) drawings and specifications of protection of hull steel beneath liquid piping where liquid leakage may be anticipated, such as at shore-connections and at pump seals
  - (iv) arrangement and specifications of piping systems for gas freeing and purging of cargo tanks
  - (v) arrangement of piping for inerting of interbarrier and hold spaces (not required for independent tanks type C)
  - (vi) specifications of equipment for provision of dry inert gas (dry air in hold spaces containing independent tanks type C) for the maintenance of an inert atmosphere in interbarrier and hold spaces
  - (vii) specification of instruments for measurement of oxygen content in inert atmospheres
  - (viii) arrangement and specifications of all monitoring systems and devices for indicating liquid level, vapour pressure and temperature in the cargo tanks, interbarrier and hold spaces
  - (ix) specifications of liquid level alarms
  - (x) arrangement of automatic shut-down of cargo pump and compressors
  - (xi) arrangement and specifications of gas detecting equipment
  - (xii) location of gas sampling points within cargo tanks
  - (xiii) bilge and drainage arrangements in cargo pump rooms, cargo compressor rooms, cofferdams, pipe tunnels, hold spaces and interbarrier spaces
  - (xiv) drawings and specifications of inert gas plants if installed
  - (xv) documentation for fire protection
  - (xvi) Other plans and data considered necessary by the Society.

4.4 Special Material and Construction Requirements

4.4.1 Chapter 6 of IGC Code gives the requirements for plates, sections, pipes, forgings, casting and weldments used in the construction of cargo tanks, cargo process pressure vessels, cargo and process piping, secondary barriers and contiguous hull structures associated with the transportation of products are to meet the requirements of IGC Code Chapter 6, materials of construction.

4.4.2 Materials for low temperature service are to be manufactured, tested and inspected in accordance with the relevant requirements in Part XI. Materials with alternative chemical composition, mechanical properties, or that treatment are to be specially considered in each case.

4.4.3 For liquefied gas carriers, where low temperature cargo is carried, the grade of material for the strength deck stringer, sheer strake and bilge strake outside 0.4L amidships is to be the same as would be required within 0.4L amidships for the particular thickness. The strakes of this material are to extend beyond the end of the space containing low temperature cargoes.

4.5 Safe Access to Tanker Bows

The requirement of safe access to tanker bows as specified in 2.11 of this part is to be applied.

Chapter 5

Chemical Carriers

5.1 General

5.1.1 This Chapter applies to ships classed for the carriage in bulk of dangerous liquid chemical cargoes having an absolute vapor pressure exceeding 0.28 MPa (2.8 kgf/cm^2) at a temperature of 37.8°C, other than petroleum or similar flammable products as follows:

(a) Products having significant fire hazards in exceed of those of petroleum products and similar flammable products.

(b) Products having significant hazards in addition to or other than flammability.

5.1.2 Except otherwise provided by this Chapter, the ship's hull, machinery and equipment are generally to comply with the requirements in relevant Parts of the Rules.

5.1.3 In addition to the applicable requirements of the Rules, the ship is to comply with the requirements of the International Maritime Organization (IMO) Resolution MSC.4(48) "International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk" (hereinafter referred to as IBC Code), adopted on 17 June 1983 and amendments in force, except that the requirements for personnel, operating and as prescribed in 5.1.4 are not within the scope of classification.

5.1.4 The following requirements of IBC Code are not classification requirement, however, in cases when the Society is authorized to issue an "International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk" under provisions of IBC Code 1.5, and carries out surveys on behalf of an Administration, all requirements are to be applied:

2.2 Freeboard and intact stability.
2.3 Shipside discharge below the freeboard deck.
2.4 Conditions of loading.
2.5 Damage assumptions.
2.6 Location of cargo tanks.
2.7 Flooding assumptions.
2.8 Standard of damage.
2.9 Survival requirements.

5.1.5 Chemical carriers also intended for carriage of oil are to comply with the rules for oil tankers in Chapter 2 of this Part.

5.2 Class Notations

5.2.1 For ships to which the requirements in this chapter applies, a notation of **"Chemical Carrier"** is to be assigned in accordance with 1.4.5 of Part I.

5.2.2 For ships for which the survival capability as prescribed in Chapter 2 of IBC Code has been approved by the Society in accordance with 5.1.4, the ship type for survival capability and cargo tank arrangement (type 1 ship, type 2 ship, or type 3 ship) are to be included in the class notations.

5.3 Submission of Plans and Data

5.3.1 In addition to the plans required by the appropriate Chapter of the rules, the following plans and data are to be submitted.

(a) Full particulars of the intended cargoes, including relative density, maximum vapor pressure, stowage and operating temperature, etc., which are the governing points of the design and are required for approval of arrangements and scantling.

(b) Designed maximum contemplated cargo relative density and intended pressure/vacuum relief valve settings.

(c) Construction of cargo tank boundaries and particulars of special materials, tank linings and coatings.

(d) Plans showing the location of:

Hatches, manholes and other openings to cargo tanks. Doors, hatches, ventilation ducts and other openings to enclosed spaces used for cargo handling and spaces adjacent to cargo tanks. Doors, hatches and other openings to superstructures accommodations, store and working spaces.

(e) Particulars and arrangements of ventilation system for spaces adjacent to cargo tanks and other spaces in which hazardous vapors may collect.

(f) Details and installations of various monitoring systems, including devices for measuring the level and temperature of cargoes, pressure indicators and vapor detectors.

(g) Particulars of the cargo temperature control system and temperature distribution of structures, where appropriate.

(h) Details of testing procedure.

(i) Other plans and data considered necessary by the Society.

5.4 Safe Access to Tanker Bows

The requirements of safe access to tanker bows as specified in 2.11 of this part are to be applied.

Chapter 6

Roll on-Roll off Ships

6.1 General

6.1.1 This Chapter applies to roll on-roll off cargo ships specially designed and constructed for the carriage of vehicles, and cargoes in pallet form or in containers, and loaded/unloaded by wheeled vehicles.

6.1.2 Except otherwise provided by this Chapter, the requirements for the construction of general ships given in Part II are to be applied.

6.1.3 The requirements provide for a basic structural configuration of a multideck hull which includes a double bottom, and in some cases wing tanks up to the lowest deck. Where bulkheads are omitted, a system of partial bulkheads, web frames and deck transverses are to be fitted to provide equivalent transverse strength. Longitudinal framing is to be adopted at the strength deck and at the bottom, but special consideration is to be given to proposals for transverse framing in these regions.

6.1.4 Reference is to be made to the regulations of the International Convention for the Safety of Life at Sea, 1974 and applicable amendments.

6.2 Submission of Plans and Data

6.2.1 In addition to plans required by 1.3 of Part II, the following are to be submitted:

(a) Bow, side and stern doors.

(b) Vehicle ramps.

(c) Movable decks, if fitted, including supports or suspensions, connections to hull structure and stowing arrangements for portable components.

(d) Plans and specifications for fire alarm system, fire extinguishing system and ventilation system, where cargo spaces are intended for the carriage of vehicles with petrol in their tanks.

6.3 Deck Structure

6.3.1 Vehicle decks for the carriage of cars, trucks, etc., are to have loading resulting from the proposed storage or operation of vehicles. Details including the wheel load, axle and wheel spacing, wheel size, tire pressure and tire print dimensions for the vehicles are to be supplied by the shipbuilder.

6.3.2 Where vehicle decks are also used for the carriage of cargoes the scantlings of the deck structure are to be not less than that required by relevant Chapters. Train decks for transport of railway carriages on fixed rails are to be considered individually.

6.3.3 Deck plating

(a) The vehicle deck plate thickness is to be not less than that obtained from the following formula:

$$K\sqrt{P_w} + 1.5 \qquad \text{mm}$$

where:

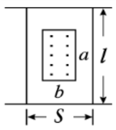
K = Tire print load stress factor as given in Table III 6-1.

P_w = Load on the tire print, in tons.

(b) Where the necessary data is not initially available, the deck plate thickness may be estimated from the maximum as given in Table III 6-2.

Table III 6-1
Tire Print Load Stress Factor K

		a/s									
a/b	*l*/s	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0
0.5	2.5	6.42	5.63	5.04	4.62	4.32	4.01	3.74	3.50	3.29	3.12
	1.0	6.19	5.30	4.74	4.29	3.96	3.65	3.38	3.15	2.91	2.76
1.0	2.5	6.29	5.38	4.78	4.34	3.98	3.68	3.41	3.19	2.95	2.76
	1.0	6.03	5.08	4.46	4.01	3.59	3.25	2.95	2.64	2.43	2.21
2.0	2.5	5.89	4.93	4.32	3.85	3.50	3.19	2.87	2.60	2.39	2.21
	1.0	5.63	4.60	3.90	3.35	2.91	2.52	2.16	–	–	–
3.0	2.5	5.54	4.58	3.90	2.62	3.09	2.76	2.43	2.21	–	–
	1.0	5.26	4.17	3.41	2.84	2.30	–	–	–	–	–



l, s = Spacing of beams or longitudinals

a, b = Tire print dimensions

a/b = Tire print ratio

l/s = Plate panel ratio

Note: For intermediate value of tire print ratio and plate panel ratio, the stress factor K is obtained by interpolation.

Table III 6-2
Approximate Deck Thickness for Fork Lift Trucks

Capacity of fork lift (tons)	Min. thickness (mm)
1.0	s/85
5.0	s/45
10.0	s/37
15.0	s/34
20.0	s/32
s = Beam spacing, in mm.	

Note: Interpolation method is to be used for intermediate values of fork lift trucks.

6.3.4 Deck beams and longitudinals

(a) The section modulus of deck beams or longitudinals is to be not less than that derived from the following formula:

$$K\,(CK_1Pl + 0.00125K_2hsl^2) \qquad \text{cm}^3$$

where:

K = Material factor as defined in 1.5.2 of Part II.

C = 0.375 for general purpose cargo decks where fork lift trucks are to be used. 0.536 for permanent vehicle decks in association with a value of h which need not to exceed 2.5 m.
K_1,K_2 = Factors as given in Table III 6-3.
P = Maximum axle load, in tons. Generally, P is to be taken as the total weight of vehicles divided by the number of axles. For fork lift trucks the total weight is to be applied to one axle.
l = Length of the stiffening members measured between span points, in m.
s = Spacing of stiffeners, in mm.
h = Normal load height on the deck, in m.

Table III 6-3
K_1, K_2, K_3, and K_4

$\frac{\text{Wheel spacing}}{\text{Beam span}}$	K_1	K_2	K_3	K_4
0.1	15.4	1.89	11.96	2.32
0.2	14.6	1.845	10.69	1.89
0.3	13.35	1.730	9.58	1.55
0.4	11.8	1.55	8.46	1.28
0.5	10.1	1.30	7.46	1.07
0.6	–	–	6.51	0.91
0.7	–	–	5.55	0.73
0.8	–	–	4.23	0.36
0.9	–	–	2.38	0.11
Note: Wheel spacing is measured from outer wheel to outer wheel on axles with multiple wheel arrangements.				

(b) For decks designed only for the carriage of wheeled vehicles, the section modulus is to be required that bending stress in associate with the most severe arrangement of print wheel loads on the stiffener, assuming both ends fixed, is not to exceed 100/K N/mm^2. Where K is the material factor.

6.3.5 Deck girders and transverses.

(a) Where the load on deck girders and transverse is uniformly distributed, the section modulus is to be not less than:

$4.75bhl^2$ cm^3

where:
b = Mean width of plating supported by a deck girder or transverse, in meters.
h = Normal load height on the deck, in meters.
l = Effective length of deck girder or transverse measured between span points.

(b) Where the member supports point loads, with or without the addition of uniformly distributed load. The section modulus is to be based on a stress of 123.6/K N/mm^2, assuming both ends are fixed.

6.3.6 Where wheeled vehicles are to be loaded on hatch covers, the thickness of hatch cover plating is to be not less than that required by 6.3.3, and the section modulus of stiffeners is to be not less than:

$K_3Pl + 0.00167\ K_4hsl^2$ cm^3

where:

K_3, K_4 = Factors as given in Table III 6-3.
P, *l*, s and h are defined as 6.3.4(a).

6.4 Doors in Ship's Shell

6.4.1 General

Bow doors, inner doors, side shell doors and stern doors are to be in accordance with the requirements in 13.4 and 13.5 of Part II.

Chapter 7

Fishing Ships

7.1 General

7.1.1 This Chapter applies to ships classed in accordance with the provisions in Chapter 1 of Part I and built for the purpose of fishing.

7.1.2 Except where the following modifications are required or are permissible, the requirements for the construction of general ships given in Part II are to be applied.

7.1.3 Definitions

(a) Where the freeboard assignment is not required for a fishing ship, the draft d for determining the hull scantling and the definition of the length of ship L is to be taken as 90% of the depth of ship D, unless otherwise specially noted and subject to special consideration by the Society.

(b) Position 1, Position 2 and L_f used in 7.4 of this Chapter are as defined in 17.1.2 of Part II and 1.2.10 of Part II respectively, for fishing ships for which the assignment of freeboard is not required where L_f may be substituted by L.

7.2 Decks

7.2.1 The thickness of unsheathed upper strength deck plating for vessels up to 90 meters in length is to be not less than that given by the following formula:

$0.064L + 3.7$ mm

Where the beam spacing differs from 2L + 480 mm the thickness is to be modified at the rate of 0.5 mm for every 100 mm of difference.

7.2.2 The thickness of the unsheathed upper strength deck plating at 0.1L from ends needs not exceed the following formula:

$0.025L + 4.7$ mm

7.2.3 The thickness of the unsheathed forecastle and bridge deck plating for ships up to 60 meters in length is to be not less than that given by the following formula:

$0.05L + 3.5$ mm

7.2.4 The thickness of the unsheathed poop deck plating for ships up to 70 meters in length is to be not less than that given by the following formula:

$0.05L + 3.0$ mm

But in no case to be less than 4.5 mm.

7.2.5 Where steel upper and superstructure deck is sheathed with wood planking, the thickness of steel deck plating may be 1 mm less, but in no case to be less than 4.5 mm.

7.2.6 The thickness of the wood plank on the weather deck is to be as required by 11.6 of Part II (the Rules 1997) except that for ships of 50 meters and under in length the thickness of the wood plank on the exposed superstructure deck may be of 50 mm. In way of the wood plank with excessive wear during fishing operations the thickness of the wood plank is to be increased in thickness or double wood planks to be fitted.

7.2.7 The trawl ramp of the stern trawler is to be of sufficient strength. The thickness is recommended to be not less than 12 mm. The thickness of sides of the trawl ramp is not to be less than 10% in excess that of the shell plating at ends. Doubling plates or other equivalent means are to be fitted in way of the trawl ramp which is subject to excessive wear.

7.3 Shell Plating and Bulwarks

7.3.1 In way of gallows of side trawlers the upper part of the shell plating is to be strengthened by doubling plates or other equivalent means.

7.3.2 The garbage opening is to be reinforced by inserted plates or doubling plates.

7.3.3 The thickness of the bulwark is to be not less than 5 mm for ships less than 30 meters in length and 6 mm for ships of 30 meters and over in length. In way of gallows and shrouds the thickness is to be suitably increased.

7.4 Weather Deck Hatchways and Openings

7.4.1 The height of the coaming above the upper surface of the wood deck for hatchways and openings closed by portable covers secured weathertight by tarpaulins and battening devices is not to be less than:

600 mm on upper deck
300 mm on superstructure deck

7.4.2 The thickness of the coaming plate of weather deck hatchways is to be not less than 7 mm in ships not exceeding 30 m in length and 11 mm in ships of 75 m in length and above. The thickness at the intermediate length is obtained by interpolation.

7.4.3 The finished thickness of wood hatch covers may be of 50 mm when the unsupported span is less than 1.0 m.

7.4.4 The height of the coaming of the companionway above the upper surface of the wood deck is to be not less than 450 mm in position 1 and 230 mm in position 2.

7.4.5 The height of the sill above the deck of doors in the exposed machinery casing is not to be less than:

600 mm on upper deck
300 mm on superstructure deck

7.4.6 The thickness of the steel ventilator coaming plate is to be not less than that obtained by the following formula but the thickness needs not exceed 8 mm and is not to be less than 6 mm:

$$3.0 + \frac{\phi}{32} \quad \text{mm}$$

where:

ϕ = External diameter of the ventilator coaming, in mm.

7.5 Equipment

7.5.1 The equipment may be based on the "Equipment Number", with 10% less than that determined by 25.2 of Part II.

Chapter 8

Floating Docks

8.1 General

8.1.1 This Chapter apply to steel floating docks of the caisson type, in which the bottom caisson and both wing walls are continuous and inseparable; and the pontoon type, in which wing walls are continuous and the bottom is framed of non-continuous pontoons, which are bolted to wing walls. The scantlings and arrangements of docks of other types are to be specially considered.

8.1.2 Floating docks which have been constructed in accordance with these Rules are to be assigned a service notation of **"Floating Dock"** affixed to surveying symbols or if there are no surveying symbols, affixed to classification symbols. Where floating docks are specifically approved by the Society for the carriage of objects other than ships to be repaired, such as reinforced concrete blocks to be built, the service notation is to be specially assigned accordingly.

8.1.3 Materials used for main structural members are to comply with Part XI.

8.2 Plans

8.2.1 The following plans are to be submitted for approval:

(a) General arrangement.

(b) Midship section.

(c) Structural plan of wing walls, top deck, safety deck and for pontoon type decks, the planting across the base of the wing walls in way of the pontoon gaps.

(d) Structural plan of bottom caisson or pontoons.

(e) Tank arrangement.

(f) Hydrostatic curves and stability calculations.

(g) Calculations or data for longitudinal strength, transverse and local strength including diagram showing the maximum differences in pressure between the inside and outside water over the whole docking procedure.

(h) Operating and loading instructions.

(i) Water level indicator system for tanks and drafts.

(j) Machinery and electrical installation plans.

(k) Piping systems.

(l) Fire extinguishing arrangements.

(m) Other plans, if deemed necessary.

8.3 Definitions

8.3.1 The lifting capacity is the maximum ship weight that the dock can lift and support in normal service corresponding to the minimum pontoon freeboard with all dock machinery, cranes and equipment in place, full fresh water, fuel oil for the use of the dock, compensating ballast water if required and rest-water.

8.3.2 The length L of the dock is to be measured from the aft end of the aftermost pontoon to the fore end of the forward pontoon, exclusive of end platforms or swing bridges.

8.3.3 The breadth is the molded breadth.

8.3.4 The depth is the vertical distance from the top of the keel to the top of the beam at the outer wall of the upper most deck.

8.3.5 The safety deck is a watertight deck arranged at such a height below the top deck that when all tank spaces below the safety deck are filled with water but with no load on keel blocks, the buoyancy of the space above the safety deck and the air cushion below the safety deck, if any, is sufficient to keep the dock afloat and to have a freeboard as required in 8.4.1, hereinafter.

8.3.6 Rest-water is ballast water in tanks which pumps cannot discharge.

8.3.7 Compensating ballast water is ballast water which may be used to control the deflection of the dock under longitudinal bending. Rest-water is not included in compensating ballast water.

8.4 Freeboards and Stability

8.4.1 The safety freeboard from the upper edge of the top deck of the completely immersed dock is generally not to be less than 1 m.

8.4.2 The freeboard to the top of the pontoon deck at the centerline of the dock when supporting a ship whose displacement is the lifting capacity is generally to be not less than 300 mm. The freeboard at side is to be such that when both cranes are moved to the forward or after end of the dock, the side of the pontoon deck at the ends of the dock is not to be submerged.

8.4.3 Stability calculations for the dock in the various operating conditions are to be submitted. The results of these calculations are to be shown in the form of curves over the whole docking procedure. The GM of the ship-dock unit after all corrections have been made is generally not to be less than 1.0 m.

8.4.4 The operating instructions for the dock are to include preferably in the form of curves, data giving a range of ship weights and the associated ship centers of gravity that would result in the ship-dock unit complying with the foregoing stability requirements.

8.5 Longitudinal Strength

8.5.1 The longitudinal strength of the dock is to be calculated for the condition when the dock supports the shortest ship anticipated to be docked whose displacement is equal to the lifting capacity of the dock. Generally the length between perpendiculars of the shortest ship may be assumed to be 80% that of the length of the dock.

8.5.2 Where it is intended that the normal operation of the dock is to be with ballast water evenly distributed over its entire length, the bending stress in the bottom or deck is not to exceed 138 N/mm^2.

8.5.3 Where it is intended that the normal operation of the dock is to be by the compensating ballast water available, the bending stress with the water ballast suitably distributed is to be in accordance with 8.5.2 above and in addition, the section modulus of the dock is to be not less than that required to ensure that the bending stress does not exceed 216 N/mm^2 when the ballast water of the same amount used in the foregoing condition is evenly distributed over the length of the dock.

8.5.4 Where the dock is to be towed in open waters, the total permissible stress en route is not to exceed 177 N/mm^2. The length of wave to be assumed is to be equal to the length of the dock, and the wave height is to be assumed equal to the maximum height to be expected during the voyage in tow.

8.5.5 The scantlings of members included in the midship section modulus calculations are to extend over the midship 0.4L of the dock and gradually tapered beyond the 0.4L. For the pontoon type dock material of pontoon lying between the lines of the inner walls is not included in the modulus calculation. At the section in way of the gap between pontoon all continuous fore and aft material of the wing walls structure may be included together with the horizontal plate across the base of the outer and inner walls, provided this plate extends longitudinally at least 2 m over each pontoon.

8.5.6 Two completely independent deflection meters, preferably of different types, are to be fitted. On very small docks, alternative proposals for ensuring stress limitation will be considered. The maximum allowable deflection is indicated such that the corresponding longitudinal bending stress is not to exceed 138 N/mm^2.

8.6 Transverse Strength

8.6.1 Bending moments and shearing forces are to be calculated with the assumption that there is one line of center keel blocks support only. The load on keel blocks is to be the maximum permissible load per meter length of dock specified in the operating instructions and is to be not less than that obtained with the shortest ship anticipated to be docked as specified in 8.5.1 above and having displacement equal to the lifting capacity of the dock. Under the foregoing loading conditions the compressive or tensile stress as computed is not to exceed 157 N/mm^2. The shear stress is not to exceed 98 N/mm^2.

8.6.2 The transverse strength of the dock is also to be considered with the dock emerged to that draft which gives the maximum difference in pressure between the inside and outside water over the whole docking procedure.

8.7 Local Strength

8.7.1 The tank or shell plating, stiffeners or framing and other structural members are to be taken as Part II with the following heads to be used:

(a) For ballast tanks the head is to be the maximum expected due to unequal filling of the tanks in service, or where air pipes projected into the ballast tanks, the head corresponding to the maximum pressure in the air cushion, but at least the vertical distance from the tank crown to the maximum immersion waterline, in m.

(b) For all other tanks the head is to be the vertical distance to a point located 1/2 of the distance from the top of the tank to the top of the overflow, to the maximum immersion waterline, or 2.5 m, whichever is the greatest, in m.

(c) For void spaces and cofferdams the head is to be the vertical distance from the member being considered to the maximum immersion waterline but at least 2.5 m.

8.7.2 The thickness of the top deck plating for the 0.4L amidships is to be as required for the longitudinal strength. For 0.1L at each end of the dock, the thickness is to be not less than:

$$6.5 + \left(1 + 0.03\frac{s - 610}{25}\right) \quad \text{mm}$$

where:

s = Spacing of longitudinals, in mm.

For intermediate lengths the thickness of the deck is to be of proportionate values.

8.7.3 The scantlings of top deck longitudinals for the 0.4L amidships is to be as required for longitudinal strength but are not to be less than that for longitudinals at ends. For 0.1L at each end of the deck, the scantlings of longitudinals are to be such that the stress under a loading of 14.2 kN/m^2 does not exceed 132 N/mm^2. The scantlings of the longitudinals in the intermediate length are to be intermediate between those required for the middle and end portions.

8.7.4 The thickness of non-watertight bulkheads and girders in pontoons is to be at least 7.5 mm. Stiffeners are to be spaced not more than 1500 mm apart.

8.7.5 The loading on platforms extending from ends of the dock is generally to be assumed as 5.88 kN/m^2.

8.7.6 The loading on swing bridges at ends of the dock is generally to be assumed as 3.4 kN/m^2.

8.7.7 The total weight of cranes and the arrangement of wheels and rails, are to be taken into consideration in determining the crane foundation and indicated on the plans.

8.7.8 All structural panels and members are to be adequately stiffened to prevent buckling.

8.8 Tests

8.8.1 All ballast tanks are to be hose tested. The water pressure in the hose is not to be less than 0.2 N/mm^2. On submission of all necessary details, air testing may be considered as an alternative to the foregoing. All other tanks and cofferdams are to be separately tested by a head of water of 2.45 m or by a head of water to the overflow or to the maximum immersion waterline, whichever is the greatest.

8.8.2 Immersion tests are to be carried out upon completion of the dock to ascertain freeboards, the dock lightweight and the lifting capacity of the dock.

8.9 Machinery and Electrical Installation

8.9.1 Machinery such as boilers, pressure vessels, auxiliary engines, compressors, pumps, etc., essential to the operation of the floating dock are to be constructed and installed in general accordance with the relevant requirements of the Rules.

8.9.2 Pumping arrangements and piping systems are to be provided in accordance with Part VI so far as they may be applicable to floating docks. Arrangements for discharging water ballast are to be such that not less than 2 pumps are available for pumping out each ballast compartment.

8.9.3 The electrical plant is to be constructed in general with the requirements of Part VII.

8.10 Fire Extinguishing Arrangements

8.10.1 Fire extinguishing arrangements are to be in accordance with the requirements of Part IX as they are applicable.

8.11 Surveys

8.11.1 The general requirements for the survey of steel ships given in Part I are to be applied except otherwise provided by the followings.

8.11.2 In order to maintain the class, the floating dock is to be subjected to the following surveys:

(a) Biennial Survey.

(b) Periodical Special Survey.

(c) Occasional Survey.

8.11.3 A Biennial Survey is to be carried out at 2-year intervals within 3 months either way of each due date after the date of build or the date of completion of the previous Class Renewal Survey. The requirement of Biennial Survey are in general as those required for Annual Survey of steel ships given in Chapter 2 of Part I so far as they are applicable to floating docks and in general is need not to be docked.

8.11.4 A Class Renewal Survey is to be carried out 4-year after the date of build and thereafter 4 years from the date of the completion of the previous Class Renewal Survey. The requirements of the Class Renewal Survey are in general as those required for Class Renewal surveys of steel ships given in Chapter 2 of Part I so far as they are applicable to floating docks except that at the discretion of the Society docking may be waived according to the actual condition of the floating dock.

8.11.5 An Occasional Survey is to be carried out:

(a) When the floating dock has sustained damage or undergoes major repairs or alterations. In the case of alterations, plans are to be submitted and approved by the Society before the work is commenced.

(b) When requested by the Owner.

(c) When the Society considers necessary.

Chapter 9

Steel Barges

9.1 General

9.1.1 This Chapter applies to non-self-propelled barges classed in accordance with the provisions in Chapter 1 of Part I and intended to be towed or pushed.

9.1.2 Except otherwise provided in the Chapter, the requirements given in Part II are to be applied.

9.1.3 Barges built for the carriage of special cargo or of novel design in respect of the hull, piping or equipment are to be subject to special consideration.

9.1.4 Existing barges which have not been built under the supervision of the Surveyors to the Society, but are submitted for classification, are to be subject to a special classification survey.

9.1.5 Barges built in accordance with these Rules are to be assigned a ship type notation of **Barge** and a non-self-propelled notation **NSP** affixed to surveying or classification symbols, e.g. "**CR 100 ✠ Barg**e..." and "**CMS ✠ NSP**".

9.2 Longitudinal Strength

9.2.1 Barges of 100 m or more in length intended to be classed for services other than harbour use are to have longitudinal strength in accordance with the requirements of Chapter 3 of Part II, but the midship section modulus may be 5% less than that required by 3.2 of Part II.

9.2.2 Barges of less than 100 m in length are to have the midship section modulus not less than that obtained from the following formula:

$$SM_0 = f\ B\ (C_b + 0.7)\ 10^{-2}$$

where :

SM_0	=	Midship section modulus, in cm^2-m.
f	=	$13.6L^2 - 683.4L + 11400$
C_b	=	The molded block coefficient at load draught.
B	=	Breadth of ship, in m.
L	=	Length of ship, in m.

9.3 Single Bottoms

9.3.1 In general the single bottom is to be constructed in accordance with Chapter 4 of Part II, except otherwise provided in this Chapter.

9.3.2 Center keelsons

(a) Depth of center keelsons:

D = 45B

(b) the minimum thickness of vertical plates and horizontal top plates within 0.4L amidships:

T = 0.064L + 5.0

The plate thickness may be reduced by 10% at ends.

(c) The sectional area of horizontal top plates amidships:

A = 0.7L + 5.0

(d) The notations used in 9.3.2(a) to (c) above are defined as follows:
d = Depth of center keelson, in mm.
t = Plate thickness, in mm.
B = Breadth of ship, in m.
L = Length of ship, in m.
A = Sectional area of horizontal top plate, in cm^2.

9.3.3 Side keelsons

(a) The Minimum thickness of vertical plates and face plates within 0.4L amidships:

T = 0.047L + 4.7

The plate thickness may be reduced by 10% at ends.

(b) The sectional area of face plates amidships:

A = 0.18L + 5.3

(c) The notations used in 9.3.3(a) and (b) above are defined as follows:
t = Plate thickness, in mm.
L = Length of ship, in m.
A = Sectional area of face plate, in cm^2.

9.4 Double Bottoms

9.4.1 In general double bottoms are to be constructed in accordance with Chapter 5 of Part II except otherwise provided in this Chapter.

9.4.2 The thickness of solid floor plates is to be obtained from the following formula:

(a) Longitudinally framed barges:

t = 0.047L + 4.6

(b) Transversely framed barges:

t = 0.036L + 4.9

(c) Tank end floors:

t = 0.047L + 6.1

(d) The notations used in 9.4.2(a) to (c) above are defined as follows:

t = Thickness of floor plate, in mm.
L = Length of ship, in m.

9.4.3 For barges intended for the carriage of bulk or ore cargo, the requirements given in 1.4 of this Part are to apply.

9.5 Frames

9.5.1 The scantlings of frames for dry cargo barges are to be determined according to Chapter 6 of Part II and the scantlings of frames for oil barges are determined according to Chapter 2 of this Part.

9.6 Shell Plating

9.6.1 The thickness of the shell plating is neither to be less than that required for the purpose of longitudinal strength in accordance with 9.2 of this Chapter nor that required in the following.

9.6.2 Side shell plating
The minimum thickness of the side shell plating is to be obtained from the following formula:

(a) For the midship 0.4L with longitudinal framing:

$$t = 0.00138s\sqrt{L} + 2.0$$

(b) For the midship 0.4L with transverse framing:

$$t = 0.00138s\sqrt{L} + 2.5$$

(c) Side shell plating at ends:

$$t = 0.0014s\sqrt{L} + 3.0$$

(d) In general, the thickness of the sheer strake is to be of the thickness of the deck stringer plate or the thickness of the adjacent side shell plating whichever is the greater.

(e) The notations used in 9.6.2(a) to (c) above are defined as follows:
t = Thickness of side shell plating, in mm.
s = Frame spacing, in mm.

L = Length of ship, in m.

9.6.3 Bottom shell plating

The minimum thickness of the bottom shell plating is to be obtained from the following formula:

(a) For midship 0.4L with longitudinal framing:

$$t = 0.0011s\sqrt{L} + 3.7$$

(b) For midship 0.4L with transverse framing:

$$t = 0.0011s\sqrt{L} + 4.45$$

(c) Bottom plating forward for 0.2L from the fore end

$$t = 0.0013s\sqrt{L} + 4.4$$

(d) The notations used in 9.6.3(a) to (c) above are defined as follows:

t = Thickness of bottom shell plating, in mm.
s = Frame spacing, in mm.
L = Length of ship, in m.

9.6.4 Immersed bow plating

Where the bow is of ship-shape form, the thickness of the plating below the waterline for 0.15L from the stem is to be not less than that obtained from the following formula:

$$t = 0.0013s\sqrt{L} + 3.3$$

where:
t = Plate thickness, in mm.
s = Frame spacing, in mm.
L = Length of ship, in m.

9.6.5 The thickness of the short superstructure side plating is to be obtained from the following formula:

$$t = 0.00095s\sqrt{L} + 3.0$$

where:
t = Thickness of super structure side plating, in mm.
s = Frame spacing, in mm.
L = Length of ship, in m.

9.7 Beams and Deck Longitudinals

9.7.1 The scantlings of beams and deck longitudinals for dry cargo and oil barges are to be determined according to Chapter 9 of Part II and 2.3 of this Part respectively.

9.8 Deck Girders and Pillars

9.8.1 The scantlings of deck girders for dry cargo and oil barges are to be determined according to Chapter 10 of Part II and 2.3 of this Part respectively.

9.8.2 The sectional area of pillars, is to be determined according to 10.6 of Part II.

9.9 Decks

9.9.1 The thickness of the deck plating within the 0.4L amidships is neither to be less than that required for purpose of longitudinal strength nor that obtained from the following formula.

9.9.2 Deck plating amidships

(a) For decks on transverse beams:

$t = 0.012\,s + 1.0$ when $s \leq 700$
$\;\;= 0.0053\,s + 6.0$ when $s > 700$

(b) For decks on longitudinal beams:

$t = 0.012\,s + 0.5$ when $s \leq 700$
$\;\;= 0.0054\,s + 5.4$ when $s > 700$

9.9.3 Deck plating amidships inside the line of opening

$t = 0.01\,s + 0.9$ when $s \leq 760$
$\;\;= 0.0067\,s + 3.4$ when $s > 760$

9.9.4 Deck stringer amidships

(a) Thickness of deck stringer plate:

$t = 0.018L + 7.0$

(b) Breadth of deck stringer plate:

$b = 8L + 30$

9.9.5 Platform deck
Thickness of platform deck plating:

$t = 0.007s + 1.0$

9.9.6 The notations used in 9.9.2 to 9.9.5 above are defined as follows:
t = Plate thickness, in mm.
s = Beam spacing, in mm.

b = Breadth of deck stringer plate, in mm.
L = Length of ship, in m.

9.10 Watertight Bulkheads and Tank Bulkheads

9.10.1 All barges are to be fitted with a collision bulkhead located not less than 0.05L abaft the forward perpendicular at any point. A watertight bulkhead is to be fitted at the aft end of the hold region. Other watertight bulkheads are to be fitted as necessary to provide transverse strength and subdivision.

9.10.2 The scantlings of watertight bulkheads, collision bulkheads and tank bulkheads are to be determined according to Chapters 14, 16 of Part II and 2.7 of this Part.

9.10.3 The scantlings of non-watertight centerline bulkheads in cargo space are to be determined according to Chapter 15 of Part II.

9.11 End Constructions

9.11.1 For barges which have normal ship-shape fore and aft ends, the scantlings of structural members are to be determined according to Chapter 2 and 8 of Part II.

9.11.2 Where barges are always operating without appreciable trim, relaxation from the requirements concerning strengthening of bottom forward may be admitted.

9.11.3 Where barges have raked ends with flat bottom, at least one centre keelson and one side keelson on each side are to be fitted and effectively connected with the midship structure. The keelsons are to be spaced not more than 4.5 m apart.

9.11.4 Where the bottom is of longitudinal construction, floors are to be spaced not more than 2.5 m apart.

9.11.5 The scantlings of deck, side and bottom structure members are to be determined in accordance with the respective chapters of Part II.

9.11.6 Where trusses and stanchions are used for the support of frames. The sectional areas are to be determined according to 10.6 of Part II.

9.12 Hatchways and Other Closing Appliances

For barges for services than harbour use, the requirements given in Chapters 17, 21 and 22 of Part II are to apply.

9.13 Equipment

9.13.1 For manual barges, the equipment of anchors, chains and ropes is to be determined according to Chapter 25 of Part II.

9.13.2 Where more than two anchors are prescribed, the spare anchor may be used as stern anchor.

9.13.3 For unmanned barges, a reduced equipments as compared with the equipment required may be admitted.

Chapter 10

Navigation in Ice

10.1 General

10.1.1 Application

(a) The classification and surveying symbols are followed by the notation **Ice Class** if the scantling of hull, power of propulsion engine and the machinery and equipment arrangements given in this Chapter have been complied with.

(b) The requirements in this Chapter are embodied for the ice strengthened ships which are intended to navigate in ice. If ships are intended to navigate in ice-infested polar waters, they are to be in compliance with the requirements of Chapter 10A.

10.1.2 Classification of Ice Class

(a) The notation, **Ice Class**, is classified into the following four ice classes in this chapter:
   (i) class **IAS**
   (ii) class **IA**
   (iii) class **IB**
   (iv) class **IC**

(b) The scantling of hull, power of propulsion engine and the machinery and equipment arrangements which are complied with the requirements specified in this Chapter, ice class annotation will be affixed to the notation, Ice Class, e.g. **Ice Class IAS**.

10.1.3 Additional description in drawing

(a) Ice belt, LWL and BWL defined in 10.4.2 and 10.2.1 are to be shown in the Shell Expansion.

(b) The power of propulsion engine defined in 10.3.1, the displacement defined in 10.2.3 and the power necessary for propulsion engine required in 10.3.2 or 10.3.3 are to be indicated in the General Arrangement.

10.2 Max. and Min. Draught

10.2.1 LWL and BWL

The line defined by the max. draughts fore, amidships and aft will be referred to as LWL(Load water Line). The line defined by the min. draughts fore and aft will be referred to as BWL(Ballast Water Line).

10.2.2 Max. draught

(a) The max. ice class draught amidships is to be the draught on the Fresh Water Load Line in Summer. If the ship has a timber load line, the Fresh Water Timber Load Line in Summer is to be used.

(b) The draught and trim, limited by the LWL, must not be exceeded when the ship is navigating in ice. The salinity of the sea water along the intended route is to be taken into account when loading the ship.

10.2.3 Min. draught

(a) The ship is always to be loaded down at least to the BWL when navigating in ice. Any ballast tank, situated above the BWL and needed to load down the ship to this water line, is to be equipped with devices to prevent the water from freezing.

(b) In determining the BWL, regard is to be paid to the need for ensuring a reasonable degree of ice-going capacity in ballast. The propeller is to be fully submerged, if possible entirely below the ice. The forward draught is to be at least:

$(2+0.00025\Delta)\ h_o$ m
but need not exceed 4 h_o,

where :
Δ = displacement of the ship in tons, on the max. ice class draught according to 10.2.2.
h_o = level ice thickness in m, according to Table III 10-1.

Table III 10-1
Level Ice Thickness

Ice class	h_o (m)
IAS	1.0
IA	0.8
IB	0.6
IC	0.4

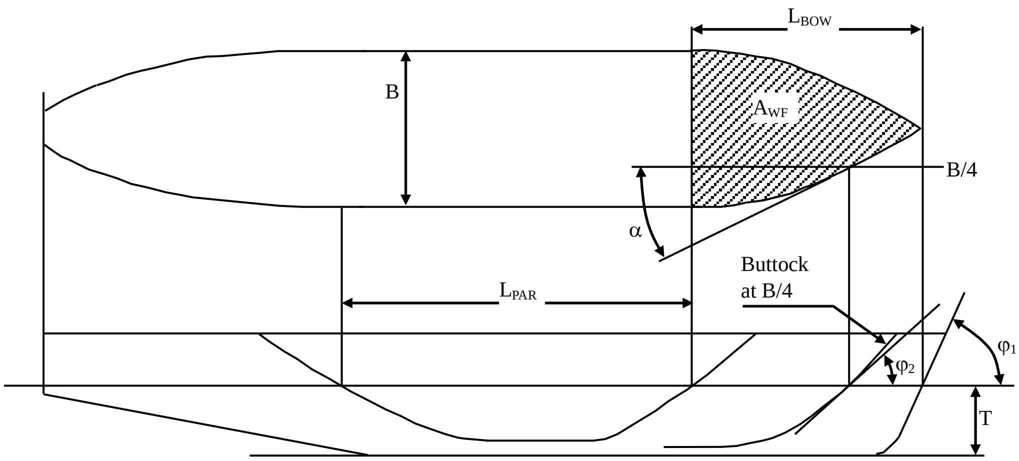
10.3 Power of Propulsion Engines

10.3.1 Definition

(a) The power of propulsion engine P_E is the max. continuous output of engine. If the output of the engine is restricted by technical means or by any regulations applicable to the ship, P_E is to be taken as the restricted output.

(b) The power of propulsion engine is not to be less than that determined by the formula below and in no case less than 1,000 KW for ice class **IA**, **IB** and **IC**, and not less than 2,800 KW for **IAS**.

(c) The dimensions of the ship and some other parameters are defined below and shown as Fig. III 10-1:
L = Length of the ship between the perpendiculars, in m.
L_{BOW} = Length of the bow, in m.
L_{PAR} = Length of the parallel midship body, in m.
B = Maximum breadth of the ship, in m.



T	=	Actual ice class draughts of the ship, in m, according to 10.3.2.
A_{wf}	=	Area of the waterline of the bow, in m^2.
α	=	The angle of the waterline at B/4, in degrees.
φ_1	=	The rake of the stem all the centerline, in degrees, if ship with bulbous bow $\varphi_1 = 90°$.
φ_2	=	The rake of the bow at B/4, in degrees.
D_p	=	Diameter of the propeller, in m.
H_M	=	Thickness of the brash ice in mid channel, in m.
H_F	=	Thickness of the brash ice layer displaced by the bow, in m.

Fig. III 10-1
Dimensions and Parameters

10.3.2 New ship

(a) The power of propulsion engine requirement is to be calculated for the max. draught amidships referred to as LWL and the min. draught referred to as BWL, as defined in 10.2. But L and B are to be determined only at the LWL. The power of propulsion engine is not to be less than the greater of these two outputs.

$$P_E = K_e \frac{\left(\frac{R_{CH}}{1000}\right)^{\frac{2}{3}}}{D_P} \quad \text{kW}$$

where:
K_e = Constant is to be taken as Table III 10-2.

Table III 10-2
Value of K_e

Propeller type or machinery	CP or electric or hydraulic propulsion machinery	FP propeller
1 propeller	2.03	2.26
2 propellers	1.44	1.60
3 propellers	1.18	1.31

R_{CH} = the resistance of the ship in a channel with brash ice and a consolidated layer, in N,

= $C_1 + C_2 + C_3 C_\mu (H_F + H_M)^2 (B + C_\Psi H_F) + C_4 L_{PAR} H_F^2 + C_5 \left(\frac{LT}{B^2}\right)^3 \frac{A_{wf}}{L}$

C_1 = $f_1 \frac{BL_{PAR}}{2\left(\frac{T}{B}\right)+1} + (1 + 0.021\varphi_1)(f_2 B + f_3 L_{BOW} + f_4 BL_{BOW})$ for ice class **IAS**.

= 0, for ice class **IA**, **IB** and **IC**.

C_2	=	$(1+0.063\varphi_1)(g_1+g_2B)+g_3\left(1+1.2\frac{T}{B}\right)\frac{B^2}{\sqrt{L}}$ for ice class **IAS**.
	=	0, for ice class **IA**, **IB** and **IC**.
C_μ	=	$0.15\cos\varphi_2+\sin\Psi\sin\alpha$, C_μ is to be taken equal or larger than 0.45.
C_Ψ	=	$0.047\Psi-2.115$,
	=	0, if $\Psi \le 45°$.
H_F	=	$0.26+(H_MB)^{0.5}$
H_M	=	1.0 for ice classes **IA** and **IAS**,
	=	0.8for ice class **IB**,
	=	0.6 for ice class **IC**.
C_3	=	845 kg/(m^2 s^2)
C_4	=	45 kg/(m^2 s^2)
C_5	=	825 kg/s^2
f_1, f_2, f_3, f_4, g_1, g_2 and g_3	=	values is to be taken as Table III 10-3.
Ψ	=	$\arctan\left(\frac{\tan\varphi_2}{\sin\alpha}\right)$ degrees

$\left(\frac{LT}{B^2}\right)^3$ is not to be taken as less than 5 and not to be taken as more than 20.

Table III 10-3
Value of f_1, f_2, f_3, f_4, g_1, g_2 and g_3

$f_1 = 23$	N/m^2	$g_1 = 1530$	N
$f_2 = 45.8$	N/m	$g_2 = 170$	N/m
$f_3 = 14.7$	N/m	$g_3 = 400$	N/$m^{1.5}$
$f_4 = 29$	N/m^2		

(b) The ranges of parameters used in the validation of the above formulae are shown in Table III 10-4. If any of the ships parameters are outside these ranges of validity, other methods for determining R_{CH} are to be used as specified in 10.3.4. When calculating the parameter D_p / T, T is to be measured on the LWL.

Table III 10-4
Ranges of Ship Parameters

Parameter		Minimum	Maximum
α	degree	15	55
φ_1	degree	25	90
φ_2	degree	10	90
L	m	65.0	250.0
B	m	11.0	40.0
T	m	4.0	15.0
L_{BOW}/L		0.15	0.40
L_{PAR}/L		0.25	0.75
D_p/T		0.45	0.75
$A_{wf}/(LB)$		0.09	0.27

10.3.3 Existing Ship

(a) Existing ships of ice class **IAS** and **IA**

(i) For ships of ice class **IAS** and **IA** which are keel laid before 1 September 2003, is to be complied with the requirement as specified in 10.3.2 at the following dates, whichever occurs the latest.

(1) 1 January 2005 or

(2) 1 January in the year when 20 years has elapsed since the year the ship was delivered.

(ii) When values for some of the hull form parameters required for the calculating method in 10.3.2 are difficult to obtain, the following alternative formulae for determining R_{CH} can be used:

$$R_{CH} = C_1 + C_2 + C_3(H_F + H_M)^2(B + 0.658H_F) + C_4LH_F^2 + C_5\left(\frac{LT}{B^2}\right)^3\frac{B}{4}$$

where:

C_1 = $f_1\dfrac{BL}{2\left(\frac{T}{B}\right)+1} + 1.84(f_2B + f_3L + f_4BL)$ for ice class **IAS** and ship without bulbous bow,

= $f_1\dfrac{BL}{2\left(\frac{T}{B}\right)+1} + 2.89(f_2B + f_3L + f_4BL)$ for ice class **IAS** and ship with bulbous bow,

= 0, for ice class **IA**.

C_2 = $3.52(g_1 + g_2B) + g_3\left(1 + 1.2\frac{T}{B}\right)\frac{B^2}{\sqrt{L}}$ for ice class **IAS** and ship without bulbous bow,

= $6.67(g_1 + g_2B) + g_3\left(1 + 1.2\frac{T}{B}\right)\frac{B^2}{\sqrt{L}}$ for ice class **IAS** and ship with bulbous bow,

= 0, for ice class **IA**.

C_3 = 460 kg/(m^2 s^2)

C_4 = 18.7 kg/(m^2 s^2)

C_5 = 825 kg/s^2

f_1, f_2, f_3, f_4, g_1, g_2 and g_3 = values are to be taken as Table III 10-5.

$\left(\frac{LT}{B^2}\right)^3$ is not to be taken as less than 5 and not to be taken as more than 20.

Table III 10-5
Values of f_1, f_2, f_3, f_4, g_1, g_2 and g_3

f_1=10.3	N/m^2	g_1=1530	N
f_2=45.8	N/m	g_2=170	N/m
f_3=2.94	N/m	g_3=400	N/m$^{1.5}$
f_4=5.8	N/m^2		

(b) For existing ship of ice class **IB** and **IC** which are keel laid before 1 September 2003, the power of propulsion engine is to be determined by the following formulae and in no case less than 740 kW.

$P_E = f_1 \cdot f_2 \cdot f_3 \cdot (f_4 \cdot \triangle + P_{E0})$ kW

where :

f_1 = 1.0, for a fixed pitch propeller,

= 0.9, for a controllable pitch propeller.

f_2 = $(\varphi_1/200) + 0.675$, but not more than 1.1,

= 1.1, for a bulbous bow.

f_3 = $1.2B/\triangle^{1/3}$, but not less than 1.0.

f_4 and P_{E0} = Values are to be taken as Table III 10-6.

Δ = Displacement, in t, of the ship on the max. draught according to 10.2.2. It needs not be taken greater than 80,000 t.

The product of f_1 f_2 is not to be taken as less than 0.85.

Table III 10-6
Values of f_4 and P_{E0}

Ice class	**IB**	**IC**	**IB**	**IC**
Displacement	△＜30000		△ ≥ 30000	
f_4	0.22	0.18	0.13	0.11
P_{E0}	370	0	3,070	2,100

10.3.4 Other methods of determining K_e or R_{CH}

(a) For individual ship, in lieu of the K_e or R_{CH} values defined in 10.3.2 and 10.3.3, the use of K_e values based on more exact calculations or R_{CH} values based on model tests may be approved. Such an approval will be given on the understanding that it can be revoked if experience of the ship's performance in practice motivates this.

(b) The design requirement for ice classes is a min. speed of 5 knots in the following brash ice channels:

IAS: H_M = 1.0 m and a 0.1 m thick consolidated layer of ice.

IA: H_M = 1.0 m

IB: H_M = 0.8 m

IC: H_M = 0.6 m

10.4 Reinforcement of Hull Structures

10.4.1 General

(a) The frame spacing and spans defined in the following requirements are to be measured in a vertical plane parallel to the centerline of the ship. However, if the ship's side deviates more than 20° from this plane, the frame distances and spans are to be measured along the side of the ship.

(b) Side scuttles are not to be situated in the ice belt as defined in 10.4.2. If the weather deck in any part of the ship is situated below the upper limit of the ice belt (e.g. in way of the well of a raised quarter deck), the bulwark is to be given at least the same strength as is required for the shell in the ice belt. The strength of the construction of the freeing ports is to meet the same requirements.

(c) An ice-strengthened ship is assumed to operate in open sea conditions corresponding to a level ice thickness not exceeding h_o, as defined in 10.2.3. The design height h of the area actually under ice pressure is, however, assumed to be less than h and given in Table III 10-7.

Table III 10-7
The Design Ice Pressure Height

Ice class	h (m)
IAS	0.35
IA	0.30
IB	0.25
IC	0.22

10.4.2 Areas to be strengthened

(a) Areas which are to be strengthened are shown in Fig. III 10-2.

(i) Forward region

From the stem to a line parallel to and 0.04L aft of the forward borderline of the part of the hull where the water lines run parallel to the centerline. For ice class **IAS** and **IA** the overlap over the borderline need not exceed 6 meters, for ice class **IB** and **IC** this overlap need not exceed 5 meters.

(ii) Midship region

From the aft boundary of the Forward region to a line parallel to and 0.04L aft of the aft borderline of the part of the hull where the water line run parallel to the centerline. For ice classes **IAS** and **IA** the overlap over the borderline need not exceed 6 meters, for ice classes **IB** and **IC** this overlap need not exceed 5 meters.

(iii) Aft region

From the aft boundary of the midship region to the stern.

(b) other shell plating

(i) Fore foot (for ice class **IAS** only):

The shell plating below the ice belt from the stem to a position five main frame spaces abaft the point where the bow profile departs from the keel line.

(ii) Upper forward ice belt (for ice classes **IAS** and **IA** and with open water service speed ≥ 18 knots only):

The shell plate from the upper limit of the ice belt to 2 meters above it and from the stem to a position at least 0.2L abaft the forward perpendiculars.

(iii) The vertical extension of the Forward, midship and Aft regions is to be determined from Table III 10-8.

L is to be taken as the definition as specified in 1.2.1 of Part II

Table III 10-8
Vertical Extension of Ice Belt

Ice Class	Above LWL (m)	Below BWL (m)
IAS	0.6	0.75
IA	0.5	0.6
IB	0.4	0.5
IC	0.4	0.5

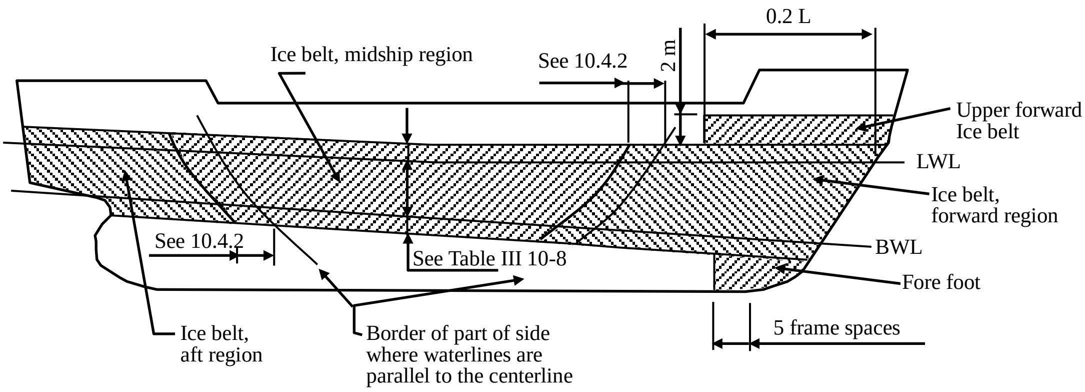


Fig. III 10-2
Regions and Shell Plating

10.4.3 Ice pressure

The design ice pressure is determined by the formula:

$p = c_d \cdot c_1 \cdot c_a \cdot p_o$ MPa where :

c_d = A factor which takes account of the influence of the size and engine output of the ship. It is calculated by the formula:

$$= \frac{a \cdot k + b}{1000}$$

$$k = \frac{\sqrt{\Delta P_E}}{1000}$$

a and b are given in the following Table III 10-9:

Table III 10-9
Values of a and b

	Region			
	Forward		Midship & Aft	
	k ≤ 12	k > 12	k ≤ 12	k > 12
a	30	6	8	2
b	230	518	214	286

Δ = The displacement of the ship at maximum ice class draught, in t.

P_E = The actual continuous engine output of the ship, in kW.

c_1 = A factor which takes account of the probability that the design ice pressure occurs in a certain region of the hull for the ice class in question.

The value of c_1 is given in the following Table III 10-10.

Table III 10-10
Value of C_1

Ice Class	Region		
	Forward	Midship	Aft
IAS	1.0	1.0	0.75
IA	1.0	0.85	0.65
IB	1.0	0.70	0.45
IC	1.0	0.50	0.25

C_a = A factor which takes account of the probability that the full length of the area under consideration will be under pressure at the same time. It is calculated by the formula:

$$C_a = \frac{47 - 5l_a}{44} \quad \text{maximum 1.0; minimum 0.6}$$

P_o = the nominal ice pressure; the value 5.6 MPa is to be used.

l_a is to be taken as following Table III 10-11:

Table III 10-11
Value of l_a

Structure	Type of framing	l_a (m)
Shell	Transverse	Frame space
	Longitudinal	2 frame spaces
Frames	Transverse	Frame space
	Longitudinal	Span of stringer
Ice stringer		Span of stringer
Web frame		2 web frame spaces

10.4.4 Shell plating thickness

(a) The shell plating in way of fore foot, as defined in 10.4.2, is to have at least the thickness required in the midship region.

(b) The shell plating in way of upper forward ice belt, as defined in 10.4.2, is to have at least the thickness required in the midship region. A similar strengthening of the bow region is advisable also for a ship with a lower service speed, when it is, e.g. on the basis of the model tests, evident that the ship will have a high bow wave.

(c) Plate thickness in the ice belt

For transverse framing the thickness of the shell plating is to be determined by the formula:

$$t = 667s\sqrt{\frac{f_1 \cdot P_{PL}}{\sigma_y}} + t_c \qquad \text{mm}$$

For longitudinal framing the thickness of the shell plating is to be determined by the formula:

$$t = 667s\sqrt{\frac{P_{PL}}{f_2 \cdot \sigma_y}} + t_c \qquad \text{mm}$$

where :

s = The frame spacing, in m.

P_{PL} = 0.75 p in MPa.

p = As given in 10.4.3.

f_1 = $1.3 - \frac{4.2}{\left(\frac{h}{s} + 1.8\right)^2}$ maximum 1.0.

f_2 = $0.6 + \frac{0.4}{\frac{h}{s}}$ when $\frac{h}{s} \le 1.$

= $1.4 - 0.4 \cdot (h/s)$ when $1 \le h/s < 1.8$.

h = As given in Table III 10-7.

σ_y = Yield stress of the material, in N/mm^2.

t_c = Increment for abrasion and corrosion, in mm; normally t_c is to be 2 mm; if a special surface coating, by experience shown capable to withstand the abrasion of ice, is applied and maintained, lower values may be approved.

10.4.5 Side frames

(a) Within the ice-strengthened area all frames are to be effectively attached to all the supporting structures. A longitudinal frame is to be attached to all the supporting web frames and bulkheads by brackets. When a transversal frame terminates at a stringer or deck, a bracket or similar construction is to be fitted. When a frame is running through the supporting structure, both sides of the web plate of the frame are to be connected to the structure (by direct welding, collar plate or lug). When a bracket is installed, it has to have at least the same thickness as the web plate of the frame and the edge has to be appropriately stiffened against buckling.

(b) For ice class **IAS**, for ice class **IA** in the forward and midship regions and for ice classes **IB** and **IC** in the forward region, the following are to apply in the ice-strengthened area:

(i) Frames which are not at a straight angle to the shell are to be supported against tripping by brackets, intercostals, stringers or similar at a distance not exceeding 1,300 mm.

(ii) The frames is to be attached to the shell by double continuous weld. No scalloping is allowed (except when crossing shell plate butts).

(iii) The web thickness of the frames is to be at least one half of the thickness of the shell plating and at least 9 mm. Where there is a deck, tank top or bulkhead in lieu of a frame, the plate thickness of this is to be as above, to a depth corresponding of the height of adjacent frames.

(c) Vertical extension of ice strengthening of side frames

The vertical extension of ice strengthening of side frames is to be at least as shown in Table III 10-12.

Table III 10-12
Vertical Extension of Ice Strengthening of Side Frames

Ice Class	Region	Above LWL (m)	Below BWL (m)
IAS	From stem to 0.3L abaft it	1.2	To double bottom or below top of floors
	Abaft 0.3L from stem	1.2	1.6
	Midship	1.2	1.6
	Aft	1.2	1.2
IA, **IB**, **IC**	From stem to 0.3L abaft it	1.0	1.6
	Abaft 0.3L from stem	1.0	1.3
	Midship	1.0	1.3
	Aft	1.0	1.0

Where an upper forward ice belt is required, see 10.4.2(b)(ii), the ice-strengthened part of the framing is to be extended at least to the top of this ice belt. Where the ice-strengthening would go beyond a deck or a tank top by no more than 250 mm, it can be terminated at that deck or tank top.

(d) Transverse frames

(i) Section modulus

The section modulus of a main or intermediate transverse frame is to be calculated by the formula:

$$Z = \frac{psh l}{m_t \sigma_y} 10^6 \qquad cm^3$$

where :

p = Ice pressure as given in 10.4.3, in MPa.
s = Frame spacing, in m.
h = Height of load area as given in Table III 10-7, in m.
l = Span of the frame, in m.
σ_y = Yield stress of the material, in N/mm^2.
m_t = $\dfrac{7m_o}{7 - \dfrac{5h}{l}}$
m_o = Values are given in Table III 10-13.

The boundary conditions are those for the main and intermediate frames. Load is applied at mid span.

Where less than 15% of the span, l, of the frame is situated with the ice-strengthening zone for frames as defined 10.4.5(c), ordinary frame scantlings may be used.

Table III 10-13
Value of m_o

Boundary condition	m_o	Example
	7	Frames in a bulk carrier with top wing tanks
	6	Frames extending from the tank top to a single deck
	5.7	Continuous frames between several decks or stringers
	5	Frames extending between two decks only

(ii) Upper end of transverse framing

(1) The upper end of the strengthened part of a main frame and of an intermediate ice frame is to be attached to a deck of an ice stringer as defined in 10.4.6.

(2) Where a frame terminates above a deck or a stringer which is situated at or above the upper limit of the ice belt (section 10.4.2(b)), the part above the deck or stringer may have the scantlings required for an unstrengthened ship and the upper end of an intermediate frame may be connected to the adjacent frames by a horizontal member having the same scantlings as the main frame. Such an intermediate frame can also be extended to the deck above, and if this is situated more than 1.8 metre above the ice belt, the intermediate frame need not be attached to that deck, except in the Forward region.

(iii) Lower end of transverse framing

(1) The lower end of the strengthened part of a main frame and of an intermediate ice frame is to be attached to a deck, tank top or ice stringer as defined in 10.4.6.

(2) Where an intermediate frame terminates below a deck, tank top or ice stringer which is situated at or below the lower limit of the ice belt (section 10.4.2(b)), the lower end may be connected to the adjacent main frames by a horizontal member of the same scantlings as the frames.

(e) Longitudinal frames

The section modulus of a longitudinal frame is to be calculated by the formula:

$$Z = \frac{f_3 \cdot f_4 \cdot p \cdot h \cdot l^2}{m\sigma_y} 10^6 \qquad cm^3$$

The shear area of a longitudinal frame is to be:

$$A = \frac{\sqrt{3} \cdot f_3 \cdot p \cdot h \cdot l}{2\sigma_y} 10^4 \qquad cm^2$$

where :

f_3	=	Factor which takes account of the load distribution to adjacent frames,
	=	(1- 0.2h/s)
f_4	=	Factor which takes account of the concentration of load to the point of support,
	=	0.6.
p	=	Ice pressure as given in 10.4.3, in MPa.
h	=	Height of load area as given in Table III 10-7.
s	=	Frame spacing, in m. The frame spacing is not to exceed 0.35 metre for ice class **IAS** or **IA** and is in no case to exceed 0.45 meter.
l	=	Span of frame, in m.
m	=	Boundary condition factor;
	=	13.3 for a continuous beam; where the boundary conditions deviate significantly from those of a continuous beam, e.g. in an end field, a smaller boundary factor may be required.
σ_y	=	Yield stress of the material, in N/mm^2.

10.4.6 Ice stringers

(a) Stringers within the ice belt

The section modulus of a stringer situated within the ice belt is to be calculated by the formula:

$$Z = \frac{f_5 \cdot p \cdot h \cdot l^2}{m\sigma_y} 10^6 \qquad cm^3$$

The shear area is to be:

$$A = \frac{\sqrt{3} \cdot f_5 \cdot p \cdot h \cdot l}{2\sigma_y} 10^4 \qquad cm^2$$

where :

p	=	Ice pressure as given in 10.4.3, MPa.
h	=	Height of load area as given in Table III 10-7, in m.

The product p·h is not to be taken as less than 0.30.

l	=	Span of stringer, in m.
m	=	Boundary condition factor as defined in 10.4.5(e).
f_5	=	Factor which takes account of the distribution of load to the transverse frames; to be taken as 0.9.
λ	=	Yield stress of the material, in N/mm^2.

(b) Stringers outside the ice belt

The section modulus of a stringer situated outside the ice belt but supporting ice-strengthened frames is to be calculated by the formula:

$$Z = \frac{f_6 \cdot p \cdot h \cdot l^2}{m\sigma_y}\left(1 - \frac{h_s}{l_s}\right) 10^6 \qquad cm^3$$

The shear area is to be:

$$A = \frac{\sqrt{3} \cdot f_6 \cdot p \cdot h \cdot l}{2\sigma_y}\left(1 - \frac{h_s}{l_s}\right)10^4 \qquad cm^2$$

where :

p = Ice pressure as given in 10.4.3, MPa.

h = Height of load area as given in Table III 10-7, in m.

The product of p·h is not to be taken as less than 0.30.

l = Span of stringer, in m.

m = Boundary condition factor as defined in 10.4.5(e).

l_s = The distance to the adjacent ice stringer, in m.

h_s = The distance to the ice belt, in m.

f_6 = Factor which takes account of load to the transverse frames; to be taken as 0.95.

σ_y = Yield stress of the material, in N/mm^2.

(c) Deck stringers

Narrow deck strips abreast of hatches and serving as ice stringers are to comply with the section modulus and shear area requirements in 10.4.6(a) and (b) respectively. In the case of very long hatches, the product of p·h may be taken as less than 0.30 but in no case as less than 0.20. Regard is to be paid to the deflection of the ship's sides due to ice pressure in way of very long hatch openings when designing weather deck hatch covers and their fittings.

10.4.7 Web frames

(a) Load

The load transferred to a web frame from an ice stringer or from longitudinal framing is to be calculated by the formula:

$$F = p \cdot h \cdot S \qquad MN$$

where :

p = Ice pressure as given in 10.4.3, in MPa, in calculating c_a however, l_a is to be taken as 2S.

h = Height of load area as given in Table III 10-7, in m.

The product of p·h is not to be taken as less than 0.30.

S = Distance between web frames, in m.

In case the supported stringer is outside the ice belt, the force F is to be multiplied by $(1 - h_s/l_s)$, where h_s and l_s is to be taken as defined in 10.4.6(b).

(b) Section modulus and shear area

If a web frame is represented by the structure model shown in Fig. III 10-3, the section modulus and shear area is to be calculated by the formulae:

(i) Shear area

$$A = \frac{\sqrt{3} \cdot \alpha \cdot Q \cdot 10^4}{\sigma_y} \qquad cm^2$$

where :

p = Maximum calculated shear force under the load F, as given in 10.4.7(a), or $k_1 \cdot F$.

k_1 = $1 + 1/2\,(l_F/l)^3 - 3/2\,(l_F/l)^2$ or

= $3/2\ (l_F/l)^2 - 1/2\ (l_F/l)^3$ whichever is greater.

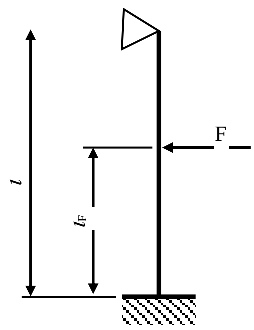

Fig. III 10-3
Loading Model

For the lower part of the web frame the smallest l_F within the ice belt is to be used. For the upper part the biggest l_F within the ice belt is to be taken.

α = As given in the Tables III 10-14.
σ_y = Yield stress of the material, in N/mm^2.
F = As in 10.4.7(a).

(ii) Section modulus

$$Z = \frac{M}{\sigma_y}\sqrt{\frac{1}{1-\left(\frac{\gamma A}{A_a}\right)^2}}\,10^6 \qquad cm^3$$

where :
M = Maximum calculated bending moment under the load F, as given in 10.4.7(a), or $k_2 \cdot F \cdot l$.
k_2 = $1/2\ (l_F/l)^3 - 3/2\ (l_F/l)^2 + (l_F/l)$
γ = As given in Table III 10-14.
A = Required shear area obtained by using k_1.
k_1 = $1 + 1/2\ (l_F/l)^3 - 3/2\ (l_F/l)^2$
A_a = Actual cross sectional area of the web frame.

Table III 10-14
Factors α and γ

$\frac{A_f}{A_w}$	α	γ
0	1.5	0
0.2	1.23	0.44
0.4	1.16	0.62
0.6	1.11	0.71
0.8	1.09	0.76
1.0	1.07	0.80
1.2	1.06	0.83
1.4	1.05	0.85
1.6	1.05	0.87
1.8	1.04	0.88
2.0	1.04	0.89

where :
A_f = Cross section area of free flange.
A_w = Cross section area of web plate.

(c) Direct calculations

For other web frame configurations and boundary conditions than those given in 10.4.7(b), a direct stress calculation is to be performed.

The concentrated load on the web frame is given in 10.4.7(a). The point of application is in each case to be chosen in relation to the arrangement of stringers and longitudinal frames so as to obtain the maximum shear and bending moments. Allowable stresses are as follows:

(i) Shear stress

$$\tau = \frac{\sigma_y}{\sqrt{3}}$$

(ii) Bending stress

$$\sigma_b = \sigma_y$$

(iii) Equivalent stress

$$\sigma_c = \sqrt{\sigma_b^2 + 3\tau^2} = \sigma_y$$

10.4.8 Bow

(a) Stem

The stem is to be made of rolled, cast or forged steel or of shaped steel plates. A sharp edged stem (see Fig. III 10-4) improves the manoeuvrability of the ship in ice and is recommended particularly for smaller ships with a length under 150 m.

The plate thickness of a shaped plate stem and in the case of a blunt bow, any part of the shell which forms an angle of 30° or more to the centerline in a horizontal plane, is to be calculated according to the formula in 10.4.4 assuming that:

S = Spacing of elements supporting the plate, in m.
P_{PL} = Pressure, as given in 10.4.4, in MPa.
l_a = Spacing of vertical supporting elements, in m.

The stem and the part of a blunt bow defined above are to be supported by floors or brackets spaced not more than 0.6 m apart and having a thickness of at least half the plate thickness. The reinforcement of the stem is to extend from the keel to a point 0.75 m above LWL or, in case an upper forward ice belt is required (section 10.4.2(b)), to the upper limit of this.

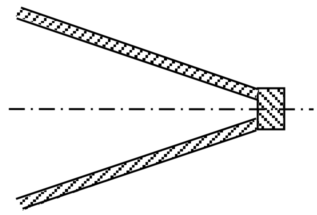

Fig. III 10-4A
Sharp Edge Stem

(b) Arrangements for towing

(i) A mooring pipe with an opening not less than 250 by 300 mm, a length of at least 150 mm and an inner surface radius of at least 100 mm is to be fitted in the bow bulwark at the centerline.

(ii) A bitt or other means for securing a towline, dimensioned to stand the breaking force of the towline of the ship, is to be fitted.

(iii) On ships with a displacement not exceeding 30,000 t, the part of the bow which extends to a height of at least 5 m above the LWL and at least 3 m back from the stem is to be strengthened to take the stresses caused by fork towing. For this purpose intermediate frames are to be fitted and the framing is to be supported by stringers or decks.

(iv) It is to be noted that fork towing is often the most efficient way of assisting ships of moderate size (displacement not exceeding 30,000t) in ice. Ships with a bulb protruding more than 2.5 m forward of the forward perpendicular are, however, often difficult to tow in this way.

10.4.9 Stern

The introduction of new propulsion arrangements with azimuthing thrusters or "podded" propellers, which provide an improved manoeuvrability, will result in increased ice loading of the aft region and the stern area. This fact is to be considered in the design of the aft/stern structure.

(a) An extremely narrow clearance between the propeller blade tip and the stern frame is to be avoided as a small clearance would cause very high loads on the blade tip.

(b) On twin and triple screw ships the ice strengthening of the shell and framing is to be extended to the double bottom for 1.5 m forward and aft of the side propellers.

(c) Shafting and stern tubes of side propellers is to normally be enclosed within plated bossings. If detached struts are used, their design, strength and attachments to the hull are to be duly considered.

(d) A wide transom stern extending below the LWL will seriously impede the capability of the ship to back in ice, which is most essential. Therefore a transom stern is not to be extended below the LWL, if this can be avoided. If unavoidable, the part of the transom below the LWL is to be kept as narrow as possible. The part of a transom stern situated within the ice belt is to be strengthened as for the midship region.

10.4.10 Bilge keels

Bilge keels are often damaged or ripped off in ice. The connection of bilge keels to the hull is to be so designed that the risk of damage to the hull, in case a bilge keel is ripped off, is minimized. To limit damage when a bilge keel is partly ripped off, it is recommended that bilge keels are cut up into several shorter independent lengths.

10.5 Rudders and Steering Arrangements

10.5.1 Scantlings

The scantlings of rudder post, rudder stock, pintles, steering engine etc. as well as the capability of the steering engine are to be determined according to Chapter 24 of Part II. The maximum service speed of the ship to be used in these calculations is to, however, not be taken as less than stated below:

IAS	20 knots
IA	18 knots
IB	16 knots
IC	14 knots

If the actual maximum service speed of the ship is higher, that speed is to be used.

10.5.2 Protection of rudder

For the ice classes **IAS** and **IA** the rudder stock and the upper edge of the rudder are to be protected against ice pressure by an ice knife or equivalent means.

10.5.3 Excessive load

For the ice classes **IAS** and **IA** due regard is to be paid to the excessive load caused by the rudder being forced out of the midship position when backing into an ice ridge.

10.5.4 Special devices

Relief valves for hydraulic pressure are to be effective. The components of the steering gear are to be dimensioned to stand the yield torque of the rudder stock. Where possible, rudder stoppers working on the blade or rudder head are to be fitted.

10.6 Propellers, Shafts and Gears

10.6.1 Dimensions of propellers, shafting and gearing are determined by formulae taking into account the impact when a propeller blade hits ice. The ensuing load is hereinafter called the ice torque M.

$$M = m \cdot D_P^2 \qquad kN - m$$

where :

D_P = Diameter of propeller, in m.

m = 21.09 for ice class **IAS**,

= 15.70 for ice class **IA**,

= 13.05 for ice class **IB**,

= 11.97 for ice class **IC**.

If the propeller is not fully submerged when the ship is in ballast condition, the ice torque for ice class **IA** is to be used for ice classes **IB** and **IC**.

10.6.2 Propellers

(a) The elongation of the material used is not to be less than 19%, preferably less than 22% for a test piece length = 5 d and the value for the Charpy V-notch test is not to be less than 21 J at –10°C.

(b) Width c and thickness t of propeller blade sections are to be determined so that:

(i) at the radius 0.25 D_P/2, for solid propellers

$$ct^2 = \frac{26490}{\sigma_b \cdot \left(0.65 + \frac{0.7H}{D}\right)}\left(27.2\frac{P_s}{Z \cdot n} + 2.24M\right)$$

(ii) at the radius 0.35 $D_P/2$ for cp-propellers

$$ct^2 = \frac{21090}{\sigma_b \cdot \left(0.65 + \frac{0.7H}{D}\right)}\left(27.2\frac{P_s}{Z \cdot n} + 2.34M\right)$$

(iii) at the radius 0.6 $D_P/2$

$$ct^2 = \frac{9320}{\sigma_b \cdot \left(0.65 + \frac{0.7H}{D}\right)}\left(27.2\frac{P_s}{Z \cdot n} + 2.85M\right)$$

where :

c = Length, in cm, of the expanded cylindrical section of the blade, at the radius in question.
t = The corresponding maximum blade thickness, in cm.
H = Propeller pitch in m at the radius in question.
(For controllable pitch propellers 0.7 $H_{nominal}$ is to be used.)
P_s = Shaft engine output according to 10.3.1, in kW.
n = Propeller revolutions, in rpm.
M = Ice torque according to 10.3.1.
Z = Number of blades.
σ_b = Tensile strength, in N/mm^2, of the material.

(c) The blade tip thickness t at the radius 1.0 $D_p/2$ is to be determined by the following formulae:

(i) Ice Class **IAS**

$$t = (20 + 2D_P)\sqrt{\frac{490}{\sigma_b}} \quad \text{mm}$$

(ii) Ice Classes **IA**, **IB** and **IC**

$$t = (15 + 2D_P)\sqrt{\frac{490}{\sigma_b}} \quad \text{mm, where } D_P \text{ and } \sigma_b \text{ are as defined in (b).}$$

(d) The thickness of other sections is governed by a smooth curve connecting the above section thicknesses.

(e) Where the blade thickness derived is less than the thickness as specified in 7.2 of Part IV, the latter is to be used.

(f) The thickness of blade edges is not to be less than 50% of the derived tip thickness t, measured at 1.25 t from the edge. For controllable pitch propellers this applies only to the leading edge.

(g) The strength of mechanisms in the boss of a controllable pitch propeller is to be 1.5 times that of the blade when a load is applied at the radius 0.9 $D_p / 2$ in the weakest direction of the blade.

10.6.3 Propeller shaft

The diameter of the propeller shaft at the aft bearing is not to be less than:

$$d_s = 10.8 \cdot \sqrt[3]{\frac{\sigma_b \cdot ct^2}{\sigma_y}} \quad \text{mm}$$

where:

σ_b = Tensile strength of the blade in N/mm^2.
ct^2 = Value derived by the formulae in 10.6.2.
σ_y = Yield stress of the shaft, in N/mm^2.

If the diameter of the propeller boss is greater than 0.25 D_p, the following formula is to be used:

$$d_s = 11.5 \cdot \sqrt[3]{\frac{\sigma_b \cdot ct^2}{\sigma_y}} \quad \text{mm}$$

where :

ct^2 = Value derived by the formulae in 10.6.2.
σ_b and σ_y are as defined previously.

If the shaft diameter derived is less than the diameter as specified in 6.4 of Part IV, the latter is to be used. The shaft may be tapered in accordance with the rules.

10.6.4 Intermediate shafts

The diameter of intermediate shafts and thrust shafts in external bearings are not to be less than:

d_i =1.1 d_{rule}, for ice class **IAS**.

No strengthening is required for ice classes **IA**, **IB** and **IC**, i.e. the diameters as specified in 6.2 of Part IV, are to be used.

10.6.5 Reduction gears

For calculation of the maximum permissible gear tooth load for maximum P_S according to 10.3.1, the following loading factor K_i is to be used:

$$K_i = K \frac{N}{N + \frac{\frac{M I_h R^2}{9.81}}{I_1 + I_h R^2}}$$

where :

K = The rule loading factor as specified in 5.3.1 of part IV.
M = Ice torque according to 10.6.1.
N = 0.534 P_S/n where,
  P_S = Shaft engine output according to 10.3.1, in kW.
  n = Corresponding engine, in rpm.
R = Gear ratio, pinion rpm/gear wheel rpm.
I_h = Mass moment of inertia of machinery components rotating at higher rpm.
I_1 = Mass moment of inertia of machinery components rotating at lower rpm including propeller with an addition of 30% for water. (I_h and I_1 are to be expressed in the same dimension)

10.7 Starting Arrangements

10.7.1 Capacity of starting air receivers

The capacity of the air receivers is to be sufficient to provide without reloading not less than 12 consecutive starts of the propulsion engine, if this has to be reversed for going astern, or 6 consecutive starts if the propulsion engine does not have to be reversed for going astern. If the air receivers serve any other purposes than starting the propulsion engine, they are to have additional capacity sufficient for these purposes.

10.7.2 Capacity of starting air compressors

The capacity of the air compressors is to be sufficient for charging the air receivers from atmospheric to full pressure in one (1) hour, except for a ship with the ice class **IAS**, if its propulsion engine has to be reversed for going astern, in which case the compressor is to be able to charge the receivers in half an hour.

10.8 Sea Inlets and Cooling Water Systems

The cooling water system is to be designed to ensure supply of cooling water when navigating in ice.

10.8.1 Sea chest

For this purpose at least one cooling water inlet chest is to be arranged as follows:

(a) The sea inlet is to be situated near the center line of the ship and well aft if possible.

(b) As guidance for design the volume of the chest is to be about one cubic metre for every 750 kW engine output of the ship including the output of auxiliary engines necessary for the ship's service.

(c) The chest is to be sufficiently high to allow ice to accumulate above the inlet pipe.

(d) A pipe for discharge cooling water, allowing full capacity discharge, is to be connected to the chest.

(e) The open area of the strainer plates is to not be less than four (4) times the inlet pipe sectional area. If there are difficulties to meet the requirements of paragraphs (b) and (c) above, two smaller chests may be arranged for alternating intake and discharge of cooling water. Otherwise the arrangement and situation is to be as above.

10.8.2 Heating coils

Heating coils may be installed in the upper part of the sea chest.

10.8.3 Using ballast water for cooling

Arrangements for using ballast water for cooling purposes may be useful as a reserve in ballast condition but cannot be accepted as a substitute for sea inlet chest as described above.

Chapter 10A

Polar Class

10A.1 Polar Class Descriptions and Application

10A.1.1 Application

(a) The classification and surveying symbols are followed by the notation **Ice Class** if ships are in compliance with the requirements of this chapter.

(b) The requirements for Polar Class ships apply to ships constructed of steel and intended for independent navigation in ice-infested polar waters, except ice breakers.

(c) Ships that comply with the 10A.2 and 10A.3 can be considered for a Polar Class notation as listed in Table III 10A-1. The requirements of 10A.2 and 10A.3 are in addition to the open water requirements of the Rules. If the hull and machinery are constructed such as to comply with the requirements of different Polar Classes, then both the hull and machinery are to be assigned the lower of these classes in the classification certificate. Compliance of the hull or machinery with the requirements of a higher Polar Class is also to be indicated in the classification certificate or equivalent.

(d) For ships which are assigned a Polar Class notation, the hull form and propulsion power are to be such that the ship can operate independently and at continuous speed in a representative ice condition, as defined in Table III 10A-1 for the corresponding Polar Class. For ships and ship-shaped units which are intentionally not designed to operate independently in ice, such operational intent or limitations are to be explicitly stated in the classification certificate or equivalent.

(e) For ships which are assigned a Polar Class notation **PC1** through **PC5**, bows with vertical sides, and bulbous bows are generally to be avoided. Bow angles should in general be within the range specified in 10A.2.3(a)(v).

(f) For ships which are assigned a Polar Class notation **PC6** and **PC7**, and are designed with a bow with vertical sides or bulbous bows, operational limitations (restricted from intentional ramming) in design conditions are to be stated in the classification certificate or equivalent.

10A.1.2 Polar Classes

(a) The Polar Class (**PC**) notations and descriptions are given in Table III 10A-1. For ships complying with the requirements specified in this chapter, ice class notation will be affixed to the notation, **Ice Class**, e.g., **Ice Class PC1**.

(b) It is the responsibility of the Owner to select an appropriate Polar Class. The descriptions in Table III 10A-1 are intended to guide owners, designers and administrations in selecting an appropriate Polar Class to match the requirements for the ship with its intended voyage or service.

(c) The Polar Class notation is used throughout this chapter to convey the differences between classes with respect to operational capability and strength.

Table III 10A-1
Polar Class Descriptions

Polar Class	Ice description(based on WMO Sea Ice Nomenclature)
PC1	Year round operation in all polar waters
PC2	Year-round operation in moderate multi-year ice conditions
PC3	Year-round operation in second-year ice which may include multi- year ice inclusions.
PC4	Year-round operation in thick first-year ice which may include old ice inclusions
PC5	Year-round operation in medium first-year ice which may include old ice inclusions
PC6	Summer/autumn operation in medium first-year ice which may include old ice inclusions
PC7	Summer/autumn operation in thin first-year ice which may include old ice inclusions

10A.1.3 Upper and lower ice waterlines

(a) The upper and lower ice waterlines upon which the design of the ship has been based is to be indicated in the classification certificate. The upper ice waterline (UIWL) is to be defined by the maximum draughts fore, amidships and aft. The lower ice waterline (LIWL) is to be defined by the minimum draughts fore, amidships and aft.

(b) The lower ice waterline is to be determined with due regard to the ship's ice-going capability in the ballast loading conditions. The propeller is to be fully submerged at the lower ice waterline.

10A.2 Structural Requirements for Polar Class Ships

10A.2.1 Application

These requirements are to be applied to Polar Class ships according to 10A.1.

10A.2.2 Hull areas

(a) The hull of Polar Class ships is divided into areas reflecting the magnitude of the loads that are expected to act upon them. In the longitudinal direction, there are four regions: Bow, Bow Intermediate, Midbody and Stern. The Bow Intermediate, Midbody and Stern regions are further divided in the vertical direction into the Bottom, Lower and Icebelt regions. The extent of each hull area is illustrated in Fig. III 10A-1.

(b) The upper ice waterline (UIWL) and lower ice waterline (LIWL) are as defined in 10A.1.3.

(c) Fig. III 10A-1 notwithstanding, at no time is the boundary between the Bow and Bow Intermediate regions to be forward of the intersection point of the line of the stem and the ship baseline.

(d) Fig. III 10A-1 notwithstanding, the aft boundary of the Bow region need not be more than 0.45 L aft of the forward perpendicular (FP).

(e) The boundary between the bottom and lower regions is to be taken at the point where the shell is inclined 7 degrees from horizontal.

(f) If a ship is intended to operate astern in ice regions, the aft section of the ship is to be designed using the Bow and Bow Intermediate hull area requirements.

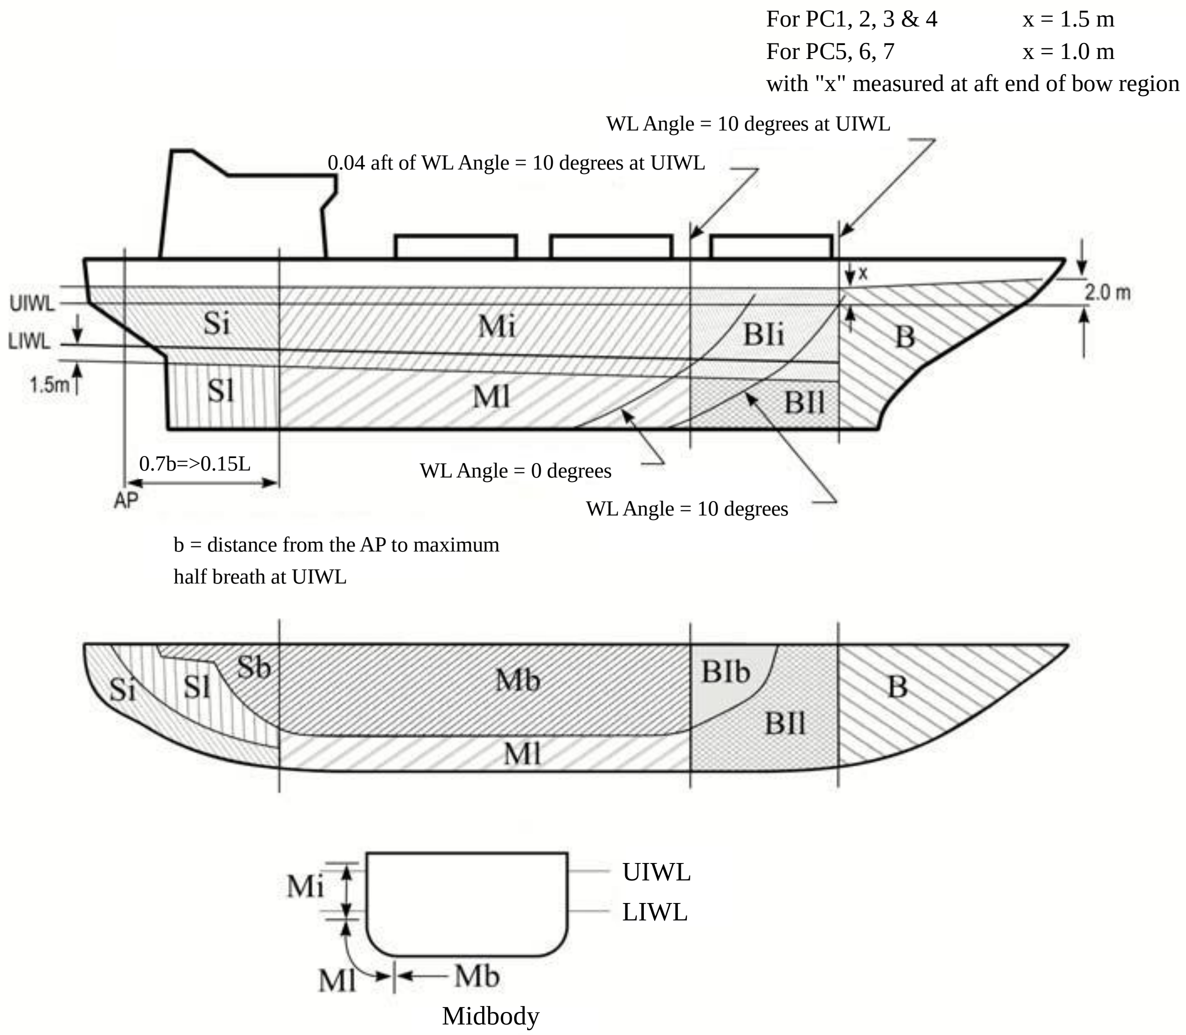

Fig. III 10A-1
Hull Area Extents

10A.2.3 Design ice loads

(a) General

(i) A glancing impact on the bow is the design scenario for determining the scantlings required to resist ice loads.

(ii) The design ice load is characterized by an average pressure (P_{avg}) uniformly distributed over a rectangular load patch of height (b) and width (w).

(iii) Within the Bow area of all Polar Class ships, and within the Bow Intermediate Icebelt area of Polar Classes **PC6** and **PC7**, the ice load parameters are functions of the actual bow shape. To determine the ice load parameters (P_{avg}, b and w), it is required to calculate the following ice load characteristics for sub-regions of the bow area; shape coefficient (fa_i), total glancing impact force (F_i), line load (Q_i) and pressure (P_i).

(iv) In other ice-strengthened areas, the ice load parameters (P_{avg}, b_{NonBow} and w_{NonBow}) are determined independently of the hull shape and based on a fixed load patch aspect ratio, AR= 3.6.

(v) Design ice forces calculated according to 10A.2.3(b) are applicable for bow forms where the buttock angle γ at the stem is positive and less than 80 degrees, and the normal frame angle β' at the center of the foremost sub-region, as defined in 10A.2.3(b)(ii)(1), is greater than 10 degrees.

(vi) Design ice forces calculated according to 10A.2.3(b)(ii)(4) are applicable for ships which are assigned the Polar Class **PC6** or **PC7** and have a bow form with vertical sides. This includes bows where the normal frame anglesβ' at the considered sub-regions, as defined in 10A.2.3(b)(ii)(1), are between 0 and 10 degrees.

(vii) For ships which are assigned the Polar Class **PC6** and **PC7**, and equipped with bulbous bows, the design ice forces on the bow are to be determined according to 10A.2.3(b)(ii)(4). In addition, the design forces are not to be taken led than those given in 10A.2.3(b)(ii)(3), assuming f_a=0.6 and AR=1.3.

(viii) For ships with bow forms other than those defined in (v) to (vii), design forces are to be specially considered by the Society.

(ix) Ship structures that are not directly subjected to ice loads may still experience inertial loads of stowed cargo and equipment resulting from ship/ice interaction. These inertial loads are to be considered in the design of these structures.

(b) Glancing impact load characteristics

(i) The parameters defining the glancing impact load characteristics are reflected in the Class Factors listed in Table III 10A-2 and Table III 10A-3.

Table III 10A-2
Class Factors to be Used in 10A.2.3(b)(ii)(3)

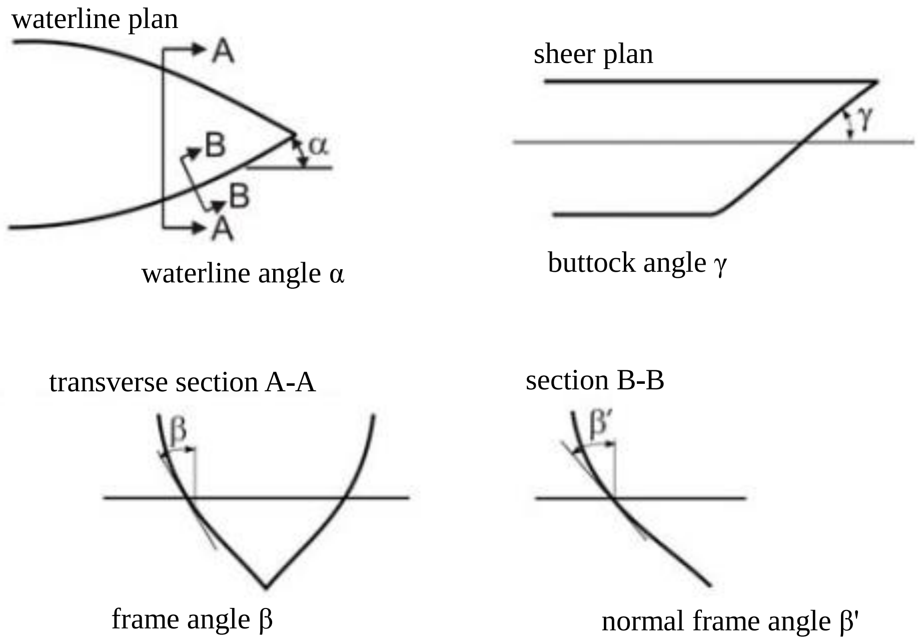
Polar Class	Crushing failure Class Factor (CF_C)	Flexural failure Class Factor (CF_F)	Load Patch Dimensions Class Factor(CF_D)	Displacement Class Factor (CF_{DIS})	Longitudinal Strength Class Factor(CF_L)
PC1	17.69	68.60	2.01	250	7.46
PC2	9.89	46.80	1.75	210	5.46
PC3	6.06	21.17	1.53	180	4.17
PC4	4.50	13.48	1.42	130	3.15
PC5	3.10	9.00	1.31	70	2.50
PC6	2.40	5.49	1.17	40	2.37
PC7	1.80	4.06	1.11	22	1.81

Table III 10A-3
Class Factors to be Used in 10A.2.3(b)(ii)(4)

Polar Class	Crushing failure Class Factor (CF_{CV})	Line load Class Factor (CF_{QV})	Pressure Class Factor(CF_{PV})
PC6	3.43	2.82	0.65
PC7	2.60	2.33	0.65

(ii) Bow area

(1) In the Bow area, the force (F), line load (Q), pressure (P) and load patch aspect ratio (AR) associated with the glancing impact load scenario are functions of the hull angles measured at the upper ice waterline (UIWL). The influence of the hull angles is captured through calculation of a bow shape coefficient (fa). The hull angles are defined in Fig. III 10A-2.



Note: β' = Normal frame angle at upper ice waterline, in degree

α = Upper ice waterline angle, in degree

γ = Buttock angle at upper ice waterline, in degree (angle of buttock line measured from horizontal)

$\tan(\beta)$ = $\tan(\alpha) / \tan(\gamma)$

$\tan(\beta')$ = $\tan(\beta) \cdot \cos(\alpha)$

Fig. III 10A-2
Definition of Hull Angles

(2) The waterline length of the bow region is generally to be divided into 4 sub-regions of equal length. The force (F), line load (Q), pressure (P) and load patch aspect ratio (AR) are to be calculated with respect to the mid-length position of each sub-region (each maximum of F, Q and P is to be used in the calculation of the ice load parameters P_{avg}, b and w).

(3) The Bow area load characteristics for bow forms defined in 10A.2.3(a)(v) are determined as follows:

a) Shape coefficient fa_i is to be taken as:

$$fa_i = \min(fa_{i,1}, fa_{i,2}, fa_{i,3}) \quad \text{[Eq. III 10A-1]}$$

where:

$$fa_{i,1} = \left[0.097 - 0.68\left(\frac{x}{L} - 0.15\right)^2\right] \cdot \alpha_i / (\beta_i')^{0.5} \quad \text{[Eq. III 10A-2]}$$

$$fa_{i,2} = 1.2 \cdot CF_F / [\sin(\beta_i') \cdot CF_C \cdot D^{0.64}] \quad \text{[Eq. III 10A-3]}$$

$$fa_{i,3} = 0.60 \quad \text{[Eq. III 10A-4]}$$

b) Force, F_i:

$$F_i = fa_i \cdot CF_C \cdot D^{0.64} \quad \text{MN} \quad \text{[Eq. III 10A-5]}$$

c) Load patch aspect ratio, AR:

$$AR_i = 7.46 \cdot \sin(\beta_i') \geq 1.3 \quad \text{[Eq. III 10A-6]}$$

d) Line load, Q:

$$Q_i = F_i^{0.61} \cdot CF_D / AR_i^{0.35} \quad \text{MN/m} \quad \text{[Eq. III 10A-7]}$$

e) Pressure, P:

$$P_i = F_i^{0.22} \cdot CF_D^2 \cdot AR_i^{0.3} \quad \text{MPa} \quad \text{[Eq. III 10A-8]}$$

where:

i	=	Sub-region considered
CF_D	=	Load patch dimensions class factor from Table III 10A-2
L	=	Ship length as defined in 10A.2.1,in m, but measured on the upper ice waterline (UIWL)
x	=	Distance from the forward perpendicular (FP) to station under consideration, in m
α	=	Waterline angle,in degree, see Fig. III 10A-2
β'	=	Normal frame angle, in degree, see Fig. III 10A-2
D	=	Ship displacement, in kt, not to be taken less than 5 kt
CF_C	=	Crushing failure Class Factor from Table III 10A-2
CF_F	=	Flexural failure Class Factor from Table III 10A-2
β'_i	=	Normal frame angle of sub-region i, in degree

(4) The bow area load characteristics for bow forms defined in 10A.2.3(a)(vi) are determined as follows:

a) Shape coefficient, fa_i, is to be taken as

$$fa_i = \alpha_i / 30$$

b) Force, F_i:

$$F_i = fa_i \cdot CF_{CV} \cdot D^{0.47} \quad \text{MN}$$

c) Line load, Q_i:

$$Q_i = F_i^{0.22} \cdot CF_{QV} \quad \text{MN/m}$$

d) Pressure, P_i:

$$P_i = F^{0.56} \cdot CF_{PV} \quad \text{MPa}$$

i	=	Sub-region considered
α	=	Waterline angle, in degree, see Fig. III 10A-2
D	=	Ship displacement, in kt, not to be taken less than 5kt
CF_{CV}	=	Crushing failure Class Factor from Table III 10A-3
CF_{QV}	=	Line load Class Factor from Table III 10A-3
CF_{PV}	=	Pressure Class Factor from Table III 10A-3

(iii) Hull areas other than the bow

(1) In the hull areas other than the bow, the force (F_{NonBow}) and line load (Q_{NonBow}) used in the determination of the load patch dimensions (b_{NonBow}, w_{NonBow}) and design pressure (P_{avg}) are determined as follows:

a) Force, F_{NonBow}:

$$F_{NonBow} = 0.36 \cdot CF_C \cdot DF \quad \text{MN} \qquad \text{[Eq. III 10A-9]}$$

b) Line Load, Q_{NonBow}:

$$Q_{NonBow} = 0.639 \cdot F_{NonBow}^{0.61} \cdot CF_D \quad \text{MN/m} \qquad \text{[Eq. III 10A-10]}$$

where:

CF_C	=	Crushing failure Class Factor from Table III 10A-2	
DF	=	Ship displacement factor	
	=	$D^{0.64}$	if $D \le CF_{DIS}$
	=	$CF_{DIS}^{0.64} + 0.10 \cdot (D - CF_{DIS})$	if $D > CF_{DIS}$
D	=	Ship displacement, in kt, not to be taken less than 10 kt	
CF_{DIS}	=	Displacement Class Factor from Table III 10A-2	
CF_D	=	Load patch dimensions Class Factor from Table III 10A-2	

(c) Design load patch

(i) In the Bow area, and the Bow Intermediate Icebelt area for ships with class notation **PC6** and **PC7**, the design load patch has dimensions of width, w_{Bow}, and height, b_{Bow}, defined as follows:

$$w_{Bow} = F_{Bow}/Q_{Bow} \quad m \qquad \text{[Eq. III 10A-11]}$$
$$b_{Bow} = Q_{Bow}/P_{Bow} \quad m \qquad \text{[Eq. III 10A-12]}$$

where:

F_{Bow} = Maximum force F_i in the Bow area from Eq. III 10A-5, in MN

Q_{Bow} = Maximum line load Q_i in the Bow area from Eq. III 10A-7, in MN/m

P_{Bow} = Maximum pressure P_i in the Bow area from Eq. III 10A-8, in MPa

(ii) In hull areas other than those covered by 10A.2.3(c)(i), the design load patch has dimensions of width, w_{NonBow}, and height, b_{NonBow}, defined as follows:

$$w_{NonBow} = F_{NonBow}/Q_{NonBow} \quad m \qquad \text{[Eq. III 10A-13]}$$
$$b_{Nonbow} = w_{NonBow}/3.6 \quad m \qquad \text{[Eq. III 10A-14]}$$

where:

F_{NonBow} = Force determined using Eq.III 10A-9, in MN

Q_{NonBow} = Line load determined using Eq.III 10A-10, in MN/m

(d) Pressure within the design load patch

(i) The average pressure, P_{avg}, within a design load patch is determined as follows:

$$P_{avg} = F/(b \cdot w) \quad MPa \qquad \text{[Eq. III 10A-15]}$$

where:

F = F_{Bow} or F_{NonBow} as appropriate for the hull area under consideration, in MN

b = b_{Bow} or b_{NonBow} as appropriate for the hull area under consideration, in m

w = w_{Bow} or w_{NonBow} as appropriate for the hull area under consideration, in m

(ii) Areas of higher, concentrated pressure exist within the load patch. In general, smaller areas have higher local pressures. Accordingly, the peak pressure factors listed in Table III 10A-4 are used to account for the pressure concentration on localized structural members.

Table III 10A-4
Peak Pressure Factors

Structural member		Peak Pressure Factor(PPF_i)
Plating	Transversely-framed	$PPF_p = (1.8 - s) \geq 1.2$
	Longitudinally-framed	$PPF_p = (2.2 - 1.2s) \geq 1.5$
Frames in transverse framing systems	With load distributing stringers	$PPF_t = (1.6 - s) \geq 1.0$
	With no load distributing stringers	$PPF_t = (1.8 - s) \geq 1.2$
Load carrying stringers Side and bottom longitudinals Web frames		$PPF_s = 1$, if $S_w \geq 0.5w$, $PPF_s = 2.0 - 2.0S_w / w$, if $S_w < (0.5w)$
Where: s = Frame or longitudinal spacing, in m S_w = Web frame spacing, in m w = Ice load patch width, in m		

(e) Hull area factors

(i) Associated with each hull area is an Area Factor that reflects the relative magnitude of the load expected in that area. The Area Factor (AF) for each hull area is listed in Table III 10A-5.

(ii) In the event that a structural member spans across the boundary of a hull area, the largest hull area factor is to be used in the scantling determination of the member.

(iii) Due to their increased manoeuvrability, ships having propulsion arrangements with azimuthing thruster(s) or "podded" propellers are to have specially considered Stern Icebelt (S_i) and Stern Lower (S_l) hull area factors.

Table III 10A-5
Hull Area Factors (AF)

Hull Area		Area	Polar Class						
			PC1	**PC2**	**PC3**	**PC4**	**PC5**	**PC6**	**PC7**
Bow (B)	All	B	1.00	1.00	1.00	1.00	1.00	1.00	1.00
Bow Intermediate (BI)	Icebelt	BI_i	0.90	0.85	0.85	0.80	0.80	1.00(1)	1.00(1)
	Lower	BI_l	0.70	0.65	0.65	0.60	0.55	0.55	0.50
	Bottom	BI_b	0.55	0.50	0.45	0.40	0.35	0.30	0.25
Midbody (M)	Icebelt	M_i	0.70	0.65	0.55	0.55	0.50	0.45	0.45
	Lower	M_l	0.50	0.45	0.40	0.35	0.30	0.25	0.25
	Bottom	M_b	0.30	0.30	0.25	(2)	(2)	(2)	(2)
Stern (S)	Icebelt	S_i	0.75	0.70	0.65	0.60	0.50	0.40	0.35
	Lower	S_l	0.45	0.40	0.35	0.30	0.25	0.25	0.25
	Bottom	S_b	0.35	0.30	0.30	0.25	0.15	(2)	(2)

Notes:

(1) See 10A.2.3(a)(iii)

(2) Indicates that strengthening for ice loads is not necessary

10A.2.4 Shell plate requirements

(a) The required minimum shell plate thickness, t, is given by:

$$t = t_{net} + t_s \text{ mm} \quad \text{[Eq. III 10A-16]}$$

where:

t_{net} = Plate thickness required to resist ice loads according to 10A.2.4(b), in mm

t_s = Corrosion and abrasion allowance according to 10A.2.11, in mm

(b) The thickness of shell plating required to resist the design ice load, t_{net}, depends on the orientation of the framing.

In the case of transversely-framed plating ($\Omega \geq 70$ degrees), including all bottom plating, i.e. plating in hull areas BI_b, M_b and S_b, the net thickness is given by:

$$t_{net} = 500s \cdot \left[(AF \cdot PPF_P \cdot P_{avg})/\sigma_y\right]^{0.5} / [1 + s/(2 \cdot b)] \text{ mm} \quad \text{[Eq. III 10A-17a]}$$

In the case of longitudinally-framed plating ($\Omega \leq 20$ degrees), when $b \geq s$, the net thickness is given by:

$$t_{net} = 500s \cdot \left[(AF \cdot PPF_P \cdot P_{avg})/\sigma_y\right]^{0.5} / [1 + s/(2 \cdot l)] \text{ mm} \quad \text{[Eq. III 10A-17b]}$$

In the case of longitudinally-framed plating ($\Omega \leq 20$ degrees), when $b < s$, the net thickness is given by:

$$t_{net} = 500s \cdot \left[(AF \cdot PPF_P \cdot P_{avg})/\sigma_y\right]^{0.5} \cdot [2 \cdot b/s - (b/s)^2]^{0.5} / [1 + s/(2 \cdot l)] \text{ mm} \quad \text{[Eq. III 10A-17c]}$$

In the case of obliquely-framed plating(70 degrees $> \Omega >$ 20 degrees), linear interpolation is to be used.

where:

Ω = Smallest angle between the chord of the waterline and the line of the first level framing as illustrated in Fig. III 10A-3, in degree

s = Transverse frame spacing in transversely-framed ships or longitudinal frame spacing in longitudinally-framed ships, in m

AF = Hull Area Factor from Table III 10A-5

PPF_P = Peak Pressure Factor from Table III 10A-4

P_{avg} = Average patch pressure according to Eq.III 10A-15, in MPa

σ_y = Minimum upper yield stress of the material, in N/mm^2

b = Height of design load patch, where $b \leq (l\text{-}s/4)$ in the case of Eq.III 10A-17a, in m

l = Distance between frame supports, i.e. equal to the frame span as given in 10A.2.5(e), but not reduced for any fitted end brackets, in m. When a load-distributing stringer is fitted, the length *l* need not be taken larger than the distance from the stringer to the most distant frame support.

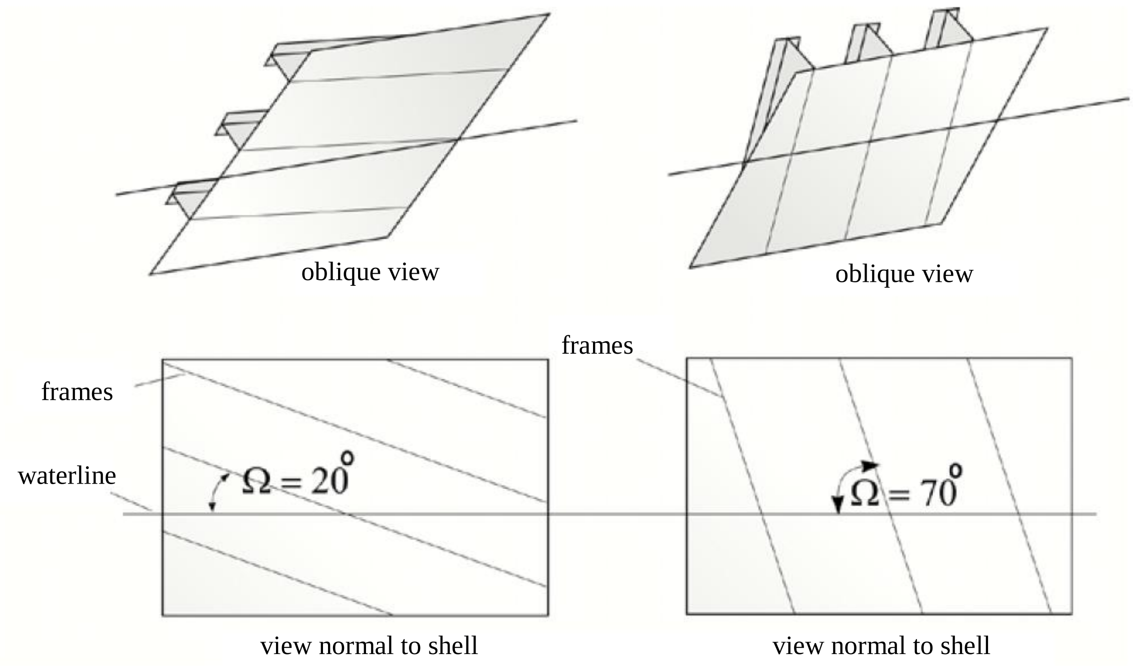


Fig. III 10A-3
Shell Framing Angle Ω

10A.2.5 Framing - General

(a) Framing members of Polar Class ships are to be designed to withstand the ice loads defined in 10A.2.3.

(b) The term "framing member" refers to transverse and longitudinal local frames, load-carrying stringers and web frames in the areas of the hull exposed to ice pressure, see Fig. III 10A-1. Where load-distributing stringers have been fitted, the arrangement and scantlings of these are to be in accordance with the requirements of the Society.

(c) The strength of a framing member is dependent upon the fixity that is provided at its supports. Fixity can be assumed where framing members are either continuous through the support or attached to a supporting section with a connection bracket. In other cases, simple support is to be assumed unless the connection can be demonstrated to provide significant rotational restraint. Fixity is to be ensured at the support of any framing which terminates within an ice-strengthened area.

(d) The details of framing member intersection with other framing members, including plated structures, as well as the details for securing the ends of framing members at supporting sections, are to be in accordance with the requirements of the Society.

(e) The effective span of a framing member is to be determined on the basis of its moulded length. If brackets are fitted, the effective span may be reduced in accordance with the usual practice of the Society. Brackets are to be configured to ensure stability in the elastic and post-yield response regions.

(f) When calculating the section modulus and shear area of a framing member, net thicknesses of the web, flange (if fitted) and attached shell plating are to be used. The shear area of a framing member may include that material contained over the full depth of the member, i.e. web area including portion of flange, if fitted, but excluding attached shell plating.

(g) The actual net effective shear area, A_w, of a transverse or longitudinal local frame is given by:

$$A_w = h \cdot t_{wn} \cdot \sin\varphi_w / 100 \quad cm^2$$ [Eq. III 10A-18]

where:

h = Height of stiffener,in mm, see Fig. III 10A-4

t_{wn} = Net web thickness, in mm

= t_w - t_c

t_w = As built web thickness, in mm, see Fig. III 10A-4

t_c = Corrosion deduction to be subtracted from the web and flange thickness (as specified by the Society, but not less than t_s as required by 10A.2.11(c)), in mm

φ_w = Smallest angle between shell plate and stiffener web, measured at the midspan of the stiffener, in degree, see Fig. III 10A-4. The angle φ_w may be taken as 90 degrees provided the smallest angle is not less than 75 degrees.

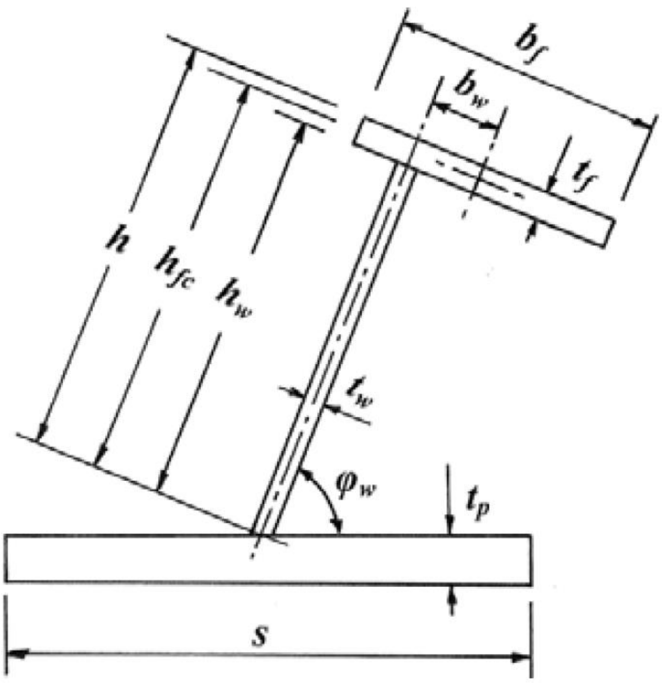

Fig. III 10A-4
Stiffener Geometry

(h) When the cross-sectional area of the attached plate flange exceeds the cross-sectional area of the local frame, the actual net effective plastic section modulus, Z_p, of a transverse or longitudinal frame is given by:

$$Z_p = A_{pn} \cdot \frac{t_{pn}}{20} + (h_w^2 \cdot t_{wn} \cdot \sin\varphi_w)/2000 + A_{fn} \cdot (h_{fc} \cdot \sin\varphi_w - b_w \cdot \cos\varphi_{w)})/10 \ cm^3$$ [Eq. III 10A-19]

where:

h, t_{wn}, t_c and φ_w are as given in 10A.2.5(g) and s as given in 10A.2.4(b).

A_{pn} = Net cross-sectional area of the local frame, in cm^2

t_{pn} = Fitted net shell plate thickness, in mm (shall comply with t_{net} as required by 10A.2.4(b))

h_w = Height of local frame web, in mm, see Fig. III 10A-4

A_{fn} = Net cross-sectional area of local frame flange, in cm^2

h_{fc} = Height of local frame measured to center of the flange area, in mm, see Fig. III 10A-4

b_w = Distance from mid thickness plane of local frame web to the center of the flange area, in mm, see Fig. III 10A-4

When the cross-sectional area of the local frame exceeds the cross-sectional area of the attached plate flange, the plastic neutral axis is located a distance z_{na} above the attached shell plate, given by:

$$z_{na} = (100 \cdot A_{fn} + h_w \cdot t_{wn} - 1000 \cdot t_{pn} \cdot s)/(2 \cdot t_{wn}) \text{ mm} \qquad \text{[Eq. III 10A-20]}$$

and the net effective plastic section modulus, Z_p, of a transverse or longitudinal frame is given by:

$$Z_P = t_{pn} \cdot s \cdot \left(z_{na} + \frac{t_{pn}}{2}\right) \cdot \sin\varphi_w + \left\{\frac{[(h_w - z_{na})^2 + z_{na}^2] \cdot t_{wn} \cdot \sin\varphi_w}{2000} + \frac{A_{fn} \cdot [(h_{fc} - z_{na}) \cdot \sin\varphi_w - b_w \cdot \cos\varphi_w]}{10}\right\} \text{ cm}^3 \qquad \text{[Eq. III 10A-21]}$$

(i) In the case of oblique framing arrangement (70 degrees $> \Omega >$ 20 degrees, where Ω is defined as given in 10A.2.4(b)), linear interpolation is to be used.

10A.2.6 Framing – Local frames in bottom structures and transverse local frames in side structures.

(a) The local frames in bottom structures and transverse local frames in side structures are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism. For bottom structure the patch load shall be applied with the dimention (b) parallel with the frame direction.

(b) The actual net effective shear area of the frame, A_w, as defined in 10A.2.5(g), is to comply with the following condition: $A_w \geq A_t$, where:

$$A_t = 100^2 \cdot 0.5 \cdot LL \cdot s \cdot (AF \cdot PPF_t \cdot P_{avg})/(0.577 \cdot \sigma_y) \quad \text{cm}^2 \qquad \text{[Eq. III 10A-22]}$$

where:

LL = Length of loaded portion of span, lesser of a and b, in m

a = Local frame span as defined in 10A.2.5(e), in m

b = Height of design ice load patch according to Eq. III 10A-12 or 14, in m

s = Transverse frame spacing, in m

AF = Hull Area Factor from Table III 10A-5

PPF_t = Peak Pressure Factor PPF_t or PPF_s as appropriate from Table III 10A-4

P_{avg} = Average pressure within load patch according to Eq. III 10A-15, in MPa

σ_y = Minimum upper yield stress of the material, in N/ mm^2

(c) The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in 10A.2.5(h), is to comply with the following condition: $Z_p \geq Z_{pt}$, where Z_{pt} is to be the greater calculated on the basis of two load conditions: a) ice load acting at the midspan of the local frame, and b) the ice load acting near a support. The A_1 parameter defined below reflects these two conditions:

$$Z_{pt} = 100^3 \cdot LL \cdot Y \cdot s \cdot (AF \cdot PPF_t \cdot P_{avg}) \cdot a \cdot A_1/(4 \cdot \sigma_y) \quad cm^3$$ [Eq. III 10A-23]

where: AF, PPF_t, P_{avg}, LL, b, s, a and σ_y are given in 10A.2.6(b);

Y = 1 - 0.5 • (LL / a)

A_1 = Maximum of:

A_{1A} = $1/\{1 + j/2 + k_w \cdot j/2 \cdot [(1 - a_1^2)^{0.5} - 1]\}$

A_{1B} = $[1 - 1/(2 \cdot a_1 \cdot Y)] / (0.275 + 1.44 \cdot k_z^{0.7})$

j = 1, for a local frame with one simple support outside the ice-strengthened areas
= 2, for a local frame without any simple supports

a_1 = A_t / A_w

A_t = Minimum shear area of the local frame as given in 10A.2.6(b), in cm^2

A_w = Effective net shear area of the local frame (calculated according to 10A.2.5(g)), in cm^2

k_w = $1/(1 + 2 \cdot A_{fn} / A_w)$ with A_{fn} as given in 10A.2.5(h)

k_z = z_p / Z_P in general
= 0, when the frame is arranged with end bracket

z_p = Sum of individual plastic section modulus of flange and shell plate as fitted, in cm^3
= $(b_f \cdot t_{fn}^2/4 + b_{eff} \cdot t_{pn}^2/4)/1000$

b_f = Flange breadth, in mm, see Fig. III 10A-4

t_{fn} = Net flange thickness, in mm
= $t_f - t_c$ (t_c as given in 10A.2.5(g))

t_f = As-built flange thickness, in mm, see Fig. III 10A-4

t_{pn} = The fitted net shell plate thickness, in mm (not to be less than t_{net} as given in 10A.2.4)

b_{eff} = Effective width of shell plate flange, in mm
= 500 • s

Z_p = Net effective plastic section modulus of the local frame, in cm^3 (calculated according to 10A.2.5(h))

(d) The scantlings of the local frame are to meet the structural stability requirements of 10A.2.9.

10A.2.7 Framing - Longitudinal local frames in side structures

(a) Longitudinal local frames in side structures are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

(b) The actual net effective shear area of the frame, A_w, as defined in 10A.2.5(g), is to comply with the following condition: $A_w \geq A_L$, where:

$$A_L = 100^2 \cdot (AF \cdot PPF_s \cdot P_{avg}) \cdot 0.5 \cdot b_1 \cdot a/(0.577 \cdot \sigma_y) \quad cm^2$$ [Eq. III 10A-24]

where:

AF = Hull Area Factor from Table III 10A-5

PPF_s = Peak Pressure Factor from Table III 10A-4

P_{avg} = Average pressure within load patch according to Eq. III 10A-15, in MPa

b_1 = $k_0 \cdot b_2$, in m

k_0 = 1 - 0.3 / b'

b' = b / s

b = Height of design ice load patch from Eq. III 10A-12 or 14, in m

s = Spacing of longitudinal frames, in m

b_2 = b (1 - 0.25 • b'), if b' < 2, in m
= s, if b' ≥ 2, in m
a = Effective span of longitudinal local frame as given in 10A.2.5(e), in m
σ_y = Minimum upper yield stress of the material, in N/mm^2

(c) The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in 10A.2.5(h), is to comply with the following condition: $Z_p \geq Z_{pL}$, where:

$$Z_{pL} = 100^3 \cdot (AF \cdot PPF_s \cdot P_{avg}) \cdot b_1 \cdot a^2 \cdot A_4 / (8 \cdot \sigma_y) \ \text{cm}^3 \qquad \text{[Eq. III 10A-25]}$$

where: AF, PPF_s, P_{avg}, b_1, a and σ_y are as given in 10A.2.7(b);
A_4 = $1/\{2 + k_{wl} \cdot [(1 - a_4^2)^{0.5} - 1]\}$
a_4 = A_L / A_W
A_L = Minimum shear area for longitudinal as given in 10A2.7(b), in cm^2
A_w = Net effective shear area of longitudinal, in cm^2 (calculated according to 10A.2.5(g))
k_{wl} = $1/(1 + 2 \cdot A_{fn} / A_w)$, with A_{fn} as given in 10A.2.5(h)

(d) The scantlings of the longitudinals are to meet the structural stability requirements of 10A.2.9.

10A.2.8 Framing - Web frames and load carrying stringers

(a) Web frames and load-carrying stringers are to be designed to withstand the ice load patch as defined in 10A.2.3. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised.

(b) Web frames and load-carrying stringers are to be dimensioned such that the combined effects of shear and bending do not exceed the limit state(s) defined by the Society. Where the structural configuration is such that members do not form part of a grillage system, the appropriate peak pressure factor (PPF) from Table III 10A-4 is to be used. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

(c) For determination of scantlings of load carrying stringers, web frames supporting local frames, or web frames supporting load carrying stringers forming part of a structural grillage system, appropriate methods as outlines in 10A.2.17 are normally to be used.

(d) The scantlings of web frames and load-carrying stringers are to meet the structural stability requirements of 10A.2.9.

10A.2.9 Framing - structural stability

(a) To prevent local buckling in the web, the ratio of web height (h_w) to net web thickness (t_{wn}) of any framing member is not to exceed:
For flat bar sections:

$$h_w / t_{wn} \leq 282 (\sigma_y)^{0.5}$$

For bulb, tee and angle sections:

$$h_w/t_{wn} \le 805/(\sigma_y)^{0.5}$$

where:

h_w = Web height

t_{wn} = Net web thickness

σ_y = Minimum upper yield stress of the material, in N/mm^2

(b) Framing members for which it is not practicable to meet the requirements of 10A.2.9(a) (e.g. load carrying stringers or deep web frames) are required to have their webs effectively stiffened. The scantlings of the web stiffeners are to ensure the structural stability of the framing member. The minimum net web thickness for these framing members is given by:

$$t_{wn} = 2.63 \cdot 10^{-3} \cdot c_1 \sqrt{\sigma_y / \left(5.34 + 4 \cdot \left(\frac{c_1}{c_2}\right)^2\right)} \text{ mm} \qquad \text{[Eq. III 10A-26]}$$

where:

c_1 = h_w - 0.8 • h, in mm

h_w = Web height of stringer / web frame (see Fig. III 10A-5), in mm

h = Height of framing member penetrating the member under consideration, in mm (0 if no such framing member) (see Fig. III 10A-5)

c_2 = Spacing between supporting structure oriented perpendicular to the member under consideration, in mm (see Fig. III 10A-5)

σ_y = Minimum upper yield stress of the material, in N/mm^2

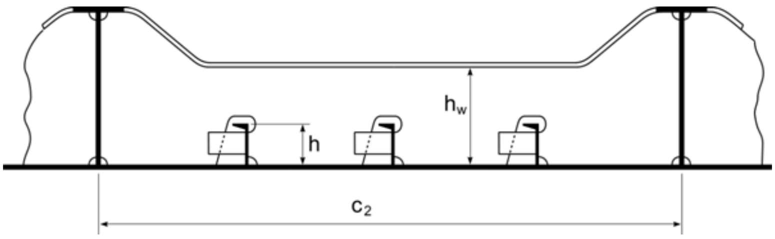

Fig. III 10A-5
Parameter Definition for Web Stiffening

(c) In addition, the following is to be satisfied:

$$t_{wn} \ge 0.35 \cdot t_{pn} \cdot (\sigma_y/235)^{0.5}$$

where:

σ_y = Minimum upper yield stress of the shell plate in way of the framing member, in N/mm^2

t_{wn} = Net thickness of the web, in mm

t_{pn} = Net thickness of the shell plate in way of the framing member, in mm

(d) To prevent local flange buckling of welded profiles, the following are to be satisfied:

(i) The flange width, b_f, in mm, is not to be less than five times the net thickness of the web

(ii) The flange outstand, b_{out}, in mm, is to meet the following requirement:

$$b_{out}/t_{fn} \leq 155/(\sigma_y)^{0.5}$$

where:

t_{fn} = Net thickness of flange, in mm

σ_y = Minimum upper yield stress of the material, in N/mm^2

10A.2.10 Plated structures

(a) Plated structures are those stiffened plate elements in contact with the hull and subject to ice loads. These requirements are applicable to an inboard extent which is the lesser of:

(i) web height of adjacent parallel web frame or stringer; or

(ii) 2.5 times the depth of framing that intersects the plated structure

(b) The thickness of the plating and the scantlings of attached stiffeners are to be such that the degree of end fixity necessary for the shell framing is ensured.

(c) The stability of the plated structure is to adequately withstand the ice loads defined in 10A.2.3.

10A.2.11 Corrosion/abrasion additions and steel renewal

(a) Effective protection against corrosion and ice-induced abrasion is recommended for all external surfaces of the shell plating for all Polar Class ships.

(b) The values of corrosion/abrasion additions, t_s, to be used in determining the shell plate thickness for each Polar Class are listed in Table III 10A-6.

Table III 10A-6
Corrosion/Abrasion Additions for Shell Plating

Hull area	t_s(mm)					
	With effective protection			Without effective protection		
	PC1-PC3	**PC4-PC5**	**PC6-PC7**	**PC1-PC3**	**PC4-PC5**	**PC6-PC7**
Bow;Bow Intermediate; Icebelt	3.5	2.5	2.0	7.0	5.0	4.0
Bow Intermediate Lower; Midbody& Stern Icebelt	2.5	2.0	2.0	5.0	4.0	3.0
Midbody and Stern Lower; Bottom	2.0	2.0	2.0	4.0	3.0	2.5

(c) Polar Class ships are to have a minimum corrosion/abrasion addition of t_s=1.0 mm applied to all internal structures within the ice-strengthened hull areas, including plated members adjacent to the shell, as well as stiffener webs and flanges.

(d) Steel renewal for ice strengthened structures is required when the gauged thickness is less than t_{net} + 0.5 mm.

10A.2.12 Materials

(a) Steel grades of plating for hull structures are to be not less than those given in Tables III 10A-8 based on the as-built thickness, the Polar Class and the material class of structural members according to 10A.2.12(b).

Table III 10A-7
Material Classes for Structural Members

Structural Members	Material Class
Shell plating within the bow and bow intermediate icebelt hull area(B,BI_i)	II
All weather and sea exposed SECONDARY and PRIMARY, as defined in Table II 1-4, structural members outside 0.4L amidships	I
Plating materials for stem and stern frames, rudder horn, rudder, propeller nozzle, shaft brackets, ice skeg, ice knife and other appendages subject to ice impact loads	II
All inboard framing members attached to the weather and sea-exposed plating, including any contiguous inboard member within 600 mm of the plating	I
Weather-exposed plating and attached framing in cargo holds of ships which by nature of their trade have their cargo hold hatches open during cold weather operations	I
All weather and sea exposed SPECIAL, as defined in Table II 1-4, structural members within 0.2L from FP	II

Table III 10A-8
Steel Grades for Weather Exposed Plating

45 < t ≤ 50	E	EH	D	DH	E	EH	D	DH	F	FH	F	FH	E	EH

Notes:

(1) Includes weather-exposed plating of hull structures and appendages, as well as their outboard framing members, situated above a level of 0.3 m below the lowest ice waterline

(2) Grades D, DH are allowed for a single strake of side shell plating not more than 1.8 m wide from 0.3 m below the lowest ice waterline.

(b) Material classes specified in Table II 1-4 are applicable to Polar Class ships regardless of the ship's length. In addition, material classes for weather and sea exposed structural members and for members attached to the weather and sea exposed plating are given in Table III 10A-7. Where the material classes in Table III 10A-7 and those in Table II 1-4 differ, the higher material class is to be applied.

(c) Steel grades for all plating and attached framing of hull structures and appendages situated below the level of 0.3 m below the lower waterline, as shown in Fig. III 10A-6, are to be obtained from Table II 1-8 and Table II 1-9 based on the material class for structural members in Table 10A-7 above, regardless of Polar Class.

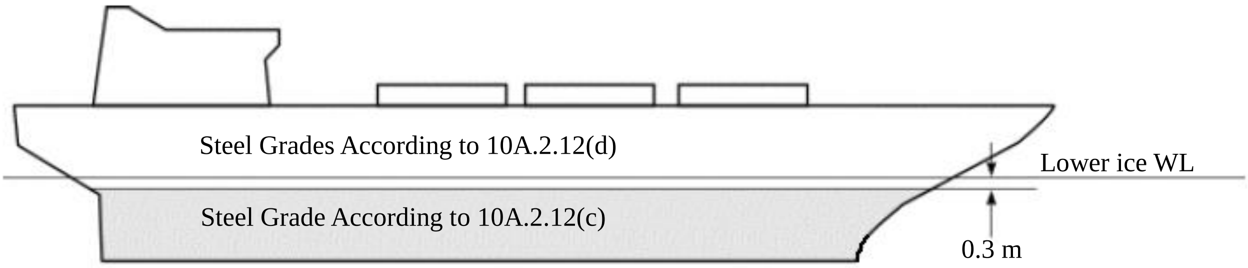

Fig. III 10A-6
Steel Grade Requirements for Submerged and Weather Exposed Shell Plating

(d) Steel grades for all weather exposed plating of hull structures and appendages situated above the level of 0.3 m below the lower ice waterline, as shown in Fig. III 10A-6, are to be not less than given in Table III 10A-8.

(e) Castings are to have specified properties consistent with the expected service temperature for the cast component.

10A.2.13 Longitudinal strength

(a) Application

(i) A ramming impact on the bow is the design scenario for the evaluation of the longitudinal strength of the hull.

(ii) Intentional ramming is not considered as a design scenario for ships which are designed with vertical or bulbous bows, see 10A.1.1(f). Hence the longitudinal strength requirements given in 10A.2.13 is not to be considered for ships with stem angle γ_{stem} equal to or larger than 80 degrees.

(iii) Ice loads are only to be combined with still water loads. The combined stresses are to be compared against permissible bending and shear stresses at different locations along the ship's length. In addition, sufficient local buckling strength is also to be verified.

(b) Design vertical ice force at the bow

(i) The design vertical ice force at the bow, F_{IB}, is to be taken as:

$$F_{IB} = \min(F_{IB,1}, F_{IB,2}) \text{ MN} \quad \text{[Eq. III 10A-27]}$$

where:

$$F_{IB,1} = 0.534 \cdot K_I^{0.15} \cdot \sin^{0.2}(\gamma_{stem}) \cdot (D \cdot K_h)^{0.5} \cdot CF_L \text{ MN} \quad \text{[Eq. III 10A-28]}$$

$$F_{IB,2} = 1.20 \cdot CF_F \text{ MN} \quad \text{[Eq. III 10A-29]}$$

$K_I = K_f / K_h$, indentation parameter

(1) for the case of a blunt bow form:

$$K_f = \left[2 \cdot C \cdot B^{1-eb}/(1 + e_b)\right]^{0.9} \cdot \tan(\gamma_{stem})^{-0.9(1+eb)}$$

(2) for the case of wedge bow form (α_{stem}<80 degrees)，e_b= 1 and the above simplifies to:

$$K_f = [\tan(\alpha_{stem})/\tan^2(\gamma_{stem})]^{0.9}$$

$$K_h = 0.01 \cdot A_{wp} \text{ MN/m}$$

CF_L = Longitudinal Strength Class Factor from Table III 10A-2

e_b = Bow shape exponent which best describes the waterplane (see Fig. III 10A-7 and Fig. III 10A-8)

= 1.0，for a simple wedge bow form

= 0.4~0.6，for a spoon bow form

= 0，for a landing craft bow form

An approximate e_b determined by a simple fit is acceptable

γ_{stem} = Stem angle to be measured between the horizontal axis and the stem tangent at the upper ice waterline(buttock angle as per Fig. III 10A-2 measured on the centerline)

α_{stem} = Waterline angle measured in way of the stem at the upper ice waterline (UIWL) (see Fig. III 10A-7)

C = $1/[2 \cdot (L_B / B)^{eb}]$

B = Ship moulded breadth, in m

L_B = Bow length used in the equation $y = B / 2 \cdot (x / L_B)^{eb}$,in m, see Fig. III 10A-7 and Fig. III 10A-8

D = Ship displacement, in kt, not to be taken less than 10 kt

A_{wp} = Ship waterplane area, in m^2

CF_F = Flexural Failure Class Factor from Table III 10A-2

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

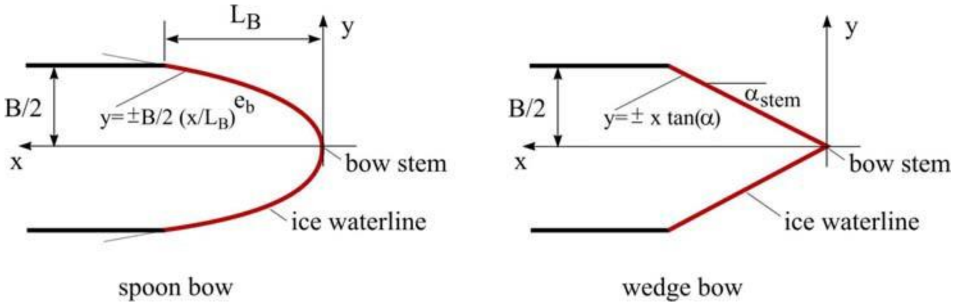

Fig. III 10A-7
Bow Shape Definition

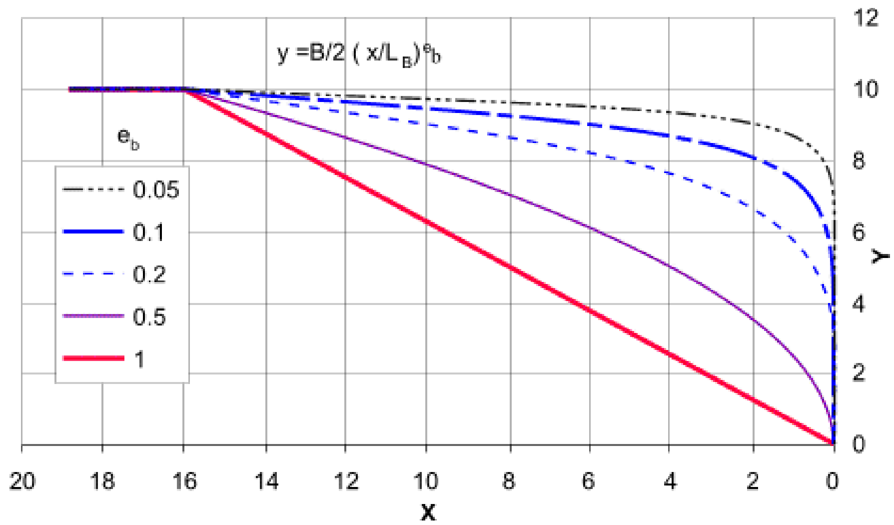

Fig. III 10A-8
Illustration of e_b Effect on the Bow Shape for B = 20 and L_B =16

(c) Design vertical shear force

(i) The design vertical ice shear force, F_I, along the hull girder is to be taken as:

$$F_I = C_f \cdot F_{IB} \ \text{MN}$$ [Eq. III 10A-30]

where:

C_f = Longitudinal distribution factor to be taken as follows:

(1) Positive shear force
$C_f = 0.0$, between the aft end of L and 0.6L from aft
$C_f = 1.0$, between 0.9 L from aft and the forward end of L

(2) Negative shear force
$C_f = 0.0$, at the aft end of L
$C_f = -0.5$, between 0.2 L and 0.6L from aft
$C_f = 0.0$, between 0.8 L from aft and the forward end of L
Intermediate values are to be determined by linear interpolation.

(ii) The applied vertical shear stress, τ_a, is to be determined along the hull girder in a similar manner as in Part II 3.4.4(b) by substituting the design vertical ice shear force for the design vertical wave shear force.

(d) Design vertical ice bending moment

(i) The design vertical ice bending moment, M_I, along the hull girder is to be taken as:

$$M_I = 0.1 \cdot C_m \cdot L \cdot \sin^{-0.2}(\gamma_{stem}) \cdot F_{IB} \text{ MNm} \qquad \text{[Eq. III 10A-31]}$$

where:

L = Ship length as defined in Part II 1.2.1, but measured on the upper ice waterline [UIWL], in m

γ_{stem} = As given in 10A.2.13(b)(i)

F_{IB} = Design vertical ice force at the bow, in MN

C_m = Longitudinal distribution factor for design vertical ice bending moment to be taken as follows:

= 0.0，at the aft end of L

= 1.0，between 0.5L and 0.7L from aft

= 0.3，at 0.95L from aft

= 0.0，at the forward end of L

Intermediate values are to be determined by linear interpolation.

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

(ii) The applied vertical bending stress, σ_a, is to be determined along the hull girder in a similar manner as in Part II 3.4.4(a), by substituting the design vertical ice bending moment for the design vertical wave bending moment. The ship still water bending moment is to be taken as the maximum sagging moment.

(e) Longitudinal strength criteria

The strength criteria provided in Table III 10A-9 are to be satisfied. The design stress is not to exceed the permissible stress.

Table III 10A-9
Longitudinal Strength Criteria

Failure mode	Applied stress	Permissible stress when $\frac{\sigma_y}{\sigma_u} \le 0.7$	Permissible stress when $\frac{\sigma_y}{\sigma_u} > 0.7$
Tension	σ_a	$\eta \cdot \sigma_y$	$\eta \cdot 0.41(\sigma_u + \sigma_y)$
Shear	τ_a	$\eta \cdot \sigma_y/(3)^{0.5}$	$\eta \cdot 0.41(\sigma_u + \sigma_y)/(3)^{0.5}$
Buckling	σ_a	σ_c for plating and for web plating of stiffeners σ_c /1.1 for stiffeners	
	τ_a	τ_c	

Where:

σ_a = Applied vertical bending stress, in N/mm^2

τ_a = Applied vertical shear stress, in N/mm^2

σ_y = Minimum upper yield stress of the material, in N/mm^2

σ_u = Ultimate tensile strength of material, in N/mm^2

σ_c = Critical buckling stress in compression, in N/mm^2, according to Part II 3.4

τ_c = Critical buckling stress in shear, in N/mm^2, according to Part II 3.4

η = 0.8

10A.2.14 Stem and stern frames

The stem and stern frame are to be designed according to the requirements of the Society. For **PC6/PC7** ships requiring IAS/IA equivalency, the stem and stern requirements of chapter 10 may need to be additionally considered.

10A.2.15 Appendages

(a) All appendages are to be designed to withstand forces appropriate for the location of their attachment to the hull structure or their position within a hull area.

(b) Load definition and response criteria are to be determined by the Society.

10A.2.16 Local details

(a) For the purpose of transferring ice-induced loads to supporting structure (bending moments and shear forces), local design details are to comply with the requirements of the Society.

(b) The loads carried by a member in way of cut-outs are not to cause instability. Where necessary, the structure is to be stiffened.

10A.2.17 Direct calculations

(a) Direct calculations are not to be utilised as an alternative to the analytical procedures prescribed for the shell plating and local frame requirements given in 10A.2.4, 10A.2.6 and 10A.2.7.

(b) Direct calculations are to be used for load carrying stringers and web frames forming part of a grillage system.

(c) Where direct calculation is used to check the strength of structural systems, the load patch specified in 10A.2.3 is to be applied, without being combined with any other loads. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

(d) The strength evaluation of web frames and stringers may be performed based on linear or non-linear analysis. Recognized structural idealisation and calculation methods are to be applied, but the detailed requirements are to be specified by the Society. In the strength evaluation, the guidance in 10A.2.17(e) and 10A.2.17(f) may generally be considered.

(e) If the structure is evaluated based on linear calculation methods, the following are to be considered:

- (i) Web plates and flange elements in compression and shear to fulfill relevant buckling criteria as specified by the Society.
- (ii) Nominal shear stresses in member web plates to be less than $\sigma_y/\sqrt{3}$
- (iii) Nominal von Mises stresses in member flanges to be less than $1.15\sigma_y$

(f) If the structure is evaluated based on non-linear calculation methods, the following are to be considered:

- (i) The analysis is to capture buckling and plastic deformation of the structure.
- (ii) The acceptance criteria are to ensure a suitable margin against fracture and major buckling and yielding causing significant loss of stiffness.

(iii) Permanent lateral and out-of-plane deformation of considered member are to be minor relative to the relevant structural dimensions.

(iv) Detailed acceptance criteria to be decided by the Society.

10A.2.18 Welding

(a) All welding within ice-strengthened areas is to be of the double continuous type.

(b) Continuity of strength is to be ensured at all structural connections.

10A.3 Machinery Requirements for Polar Class Ships

10A.3.1 Application

(a) The contents of this section apply to main propulsion, steering gear, emergency and essential auxiliary systems essential for the safety of the ship and the survivability of the crew.

(b) Machinery and supporting auxiliary systems shall be designed, constructed and maintained to comply with the requirements of "periodically unattended machinery spaces" with respect to fire safety. Any automation plant (i.e. control, alarm, safety and indication systems) for essential systems installed is to be maintained to the same standard.

(c) Systems, subject to damage by freezing, shall be drainable.

(d) Single screw ships classed **PC1** to **PC5** inclusive shall have means provided to ensure sufficient ship operation in the case of propeller damage including CP-mechanism.

10A.3.2 Drawings and particulars to be submitted

(a) Details of the environmental conditions and the required ice class for the machinery, if different from ship's ice class.

(b) Detailed drawings of the main propulsion machinery. Description of the main propulsion, steering, emergency and essential auxiliaries are to include operational limitations. Information on essential main propulsion load control functions.

(c) Description detailing how main, emergency and auxiliary systems are located and protected to prevent problems from freezing, ice and snow and evidence of their capability to operate in intended environmental conditions.

(d) Calculations and documentation indicating compliance with the requirements of this section.

10A.3.3 Materials

(a) Materials exposed to sea water

Materials exposed to sea water, such as propeller blades, propeller hub and blade bolts shall have an elongation not less than 15% on a test piece the length of which is five times the diameter.

Charpy V impact test shall be carried out for other than bronze and austenitic steel materials. Test pieces taken from the propeller castings shall be representative of the thickest section of the blade. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at minus 10 ºC.

(b) Materials exposed to sea water temperature

Materials exposed to sea water temperature shall be of steel or other approved ductile material.

An average impact energy value of 20 J taken from three tests is to be obtained at minus 10 ºC.

(c) Material exposed to low air temperature

Materials of essential components exposed to low air temperature shall be of steel or other approved ductile material.

An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at 10 ºC below the lowest design temperature.

10A.3.4 Ice interaction load

(a) Propeller ice interaction

These Rules cover open and ducted type propellers situated at the stern of a ship having controllable pitch or fixed pitch blades. Ice loads on bow propellers and pulling type propellers shall receive special consideration. The given loads are expected, single occurrence, maximum values for the whole ships service life for normal operational conditions. These loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. These Rules apply also for azimuthing (geared and podded) thrusters considering loads due to propeller ice interaction. However, ice loads due to ice impacts on the body of azimuthing thrusters are not covered by 10A.3.

The loads given in section 10A.3.4 are total loads (unless otherwise stated) during ice interaction and are to be applied separately (unless otherwise stated) and are intended for component strength calculations only. The different loads given here are to be applied separately.

F_b is a force bending a propeller blade backwards when the propeller mills an ice block while rotating ahead;F_f is a force bending a propeller blade forwards when a propeller interacts with an ice block while rotating ahead.

(b) Ice class factors

Table III 10A-10 lists the design ice thickness and ice strength index to be used for estimation of the propeller ice loads.

Table III 10A-10
Factors for Ice Thickness and Ice Strength

Ice Class	H_{ice}[m]	S_{ice}[-]	S_{qice}[-]
PC1	4.0	1.2	1.15
PC2	3.5	1.1	1.15
PC3	3.0	1.1	1.15
PC4	2.5	1.1	1.15
PC5	2.0	1.1	1.15
PC6	1.75	1	1
PC7	1.5	1	1

Where: H_{ice} = Ice thickness for machinery strength design

S_{ice} = Ice strength index for blade ice force

S_{qice} = Ice strength index for blade ice torque

(c) Design ice loads for open propeller

(i) Maximum backward blade force, F_b

when $D < D_{limit}$:

$$F_b = -27 \cdot S_{ice}(nD)^{0.7} \cdot \left(\frac{EAR}{Z}\right)^{0.3} \cdot D^2 \ \text{kN} \qquad \text{[Eq. III 10A-32]}$$

when $D \geq D_{limit}$:

$$F_b = -23 \cdot S_{ice}(nD)^{0.7} \cdot \left(\frac{EAR}{Z}\right)^{0.3} \cdot (H_{ice})^{1.4} D \ \text{kN} \qquad \text{[Eq. III 10A-33]}$$

where:

D_{limit} = $0.85 \cdot (H_{ice})^{1.4}$

n = The nominal rotational speed (at MCR free running condition) for CP-propeller;

= 85% of the nominal rotational speed (at MCR free running condition) for a FP-propeller (regardless driving engine type).

F_b is to be applied as a uniform pressure distribution to an area on the back (suction) side of the blade for the following load cases:

(1) Load case 1: from 0.6R to the tip and from the blade leading edge to a value of 0.2 chord length.

(2) Load case 2: a load equal to 50% of the F_b is to be applied on the propeller tip area outside of 0.9R.

(3) Load case 5: for reversible propellers a load equal to 60% of the F_b is to be applied from 0.6R to the tip and from the blade trailing edge to a value of 0.2 chord length.

See load cases 1, 2 and 5 in Table III 10A-14.

(ii) Maximum Forward Blade Force, F_f

when $D < D_{limit}$:

$$F_f = 250 \left(\frac{EAR}{Z}\right) D^2 \ \text{kN} \qquad \text{[Eq. III 10A-34]}$$

when $D \geq D_{limit}$:

$$F_f = 500 \left(\frac{1}{1-\frac{d}{D}}\right) H_{ice} \left(\frac{EAR}{Z}\right) D \quad \text{kN} \qquad \text{[Eq. III 10A-35]}$$

where:

$$D_{limit} = \left(\frac{2}{1-\frac{d}{D}}\right) H_{ice} \qquad \text{[Eq. III 10A-36]}$$

d = Propeller hub diameter, in m

D = Propeller diameter, in m

EAR = Expanded blade area ratio

Z = Number of propeller blades

F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side of the blade for the following loads cases:

(1) Load case 3: from 0.6R to the tip and from the blade leading edge to a value of 0.2 chord length.

(2) Load case 4: a load equal to 50% of the F_f is to be applied on the propeller tip area outside of 0.9R

(3) Load case 5: for reversible propellers a load equal to 60% F_f is to be applied from 0.6R to the tip and from the blade trailing edge to a value of 0.2 chord length.

See load cases 3, 4 and 5 in Table III 10A-14.

(iii) Maximum blade spindle torque, Q_{smax}

Spindle torque Q_{smax} around the spindle axis of the blade fitting shall be calculated both for the load cases described in 10A.3.4(c)(i) & 10A.3.4(c)(ii) for F_b and F_f. If these spindle torque values are less than the default value given below, the default minimum value shall be used.

Default value: $Q_{smax} = 0.25 \cdot F \cdot c_{0.7}$ kNm [Eq. III 10A-37]

where:

$c_{0.7}$ = Length of the blade chord at 0.7R radius, in m

F = Either F_b or F_f which ever has the greater absolute value

(iv) Maximum propeller ice torque applied to the propeller

when $D < D_{limit}$:

$$Q_{max} = 105 \cdot \left(1 - \frac{d}{D}\right) \cdot S_{qice} \cdot \left(\frac{P_{0.7}}{D}\right)^{0.16} \cdot \left(\frac{t_{0.7}}{D}\right)^{0.6} \cdot (nD)^{0.17} \cdot D^{3} \text{ kNm} \quad \text{[Eq. III 10A-38]}$$

when $D \geq D_{limit}$:

$$Q_{max} = 202 \cdot \left(1 - \frac{d}{D}\right) \cdot S_{qice} \cdot H_{ice}^{1.1} \cdot \left(\frac{P_{0.7}}{D}\right)^{0.16} \cdot \left(\frac{t_{0.7}}{D}\right)^{0.6} \cdot (nD)^{0.17} \cdot D^{1.9} \text{ kNm} \quad \text{[Eq. III 10A-39]}$$

where:

D_{limit} = $1.81H_{ice}$

$t_{0.7}$ = Max thickness at 0.7R, in m

$P_{0.7}$ = Propeller pitch at 0.7R, in m

n = The rotational propeller speed, in rps, at bollard condition. If not known, n is to be taken as follows:

Table III 10A-11
n Value

Propeller Type	n
CP propellers	n_n
FP propellers driven by turbine or electric motor	n_n
FP propellers driven by diesel engine	$0.85n_n$

Where n_n is the nominal rotational speed at MCR, free running condition.

For CP propellers, propeller pitch, $P_{0.7}$ shall correspond to MCR in bollard condition. If not known, $P_{0.7}$ is to be taken as $0.7P_{0.7n}$, where $P_{0.7n}$ is propeller pitch at MCR free running condition.

(v) Maximum propeller ice thrust applied to the shaft

$T_f = 1.1F_f$ kN [Eq. III 10A-40]
$T_b = 1.1F_b$ kN [Eq. III 10A-41]

(d) Design ice loads for ducted propeller

(i) Maximum backward blade force, F_b

when $D < D_{limit}$:

$$F_b = -9.5 \cdot S_{ice} \cdot \left(\frac{EAR}{Z}\right)^{0.3} \cdot (nD)^{0.7} \cdot D^2 \quad \text{kN} \qquad \text{[Eq. III 10A-42]}$$

when $D \geq D_{limit}$:

$$F_b = -66 \cdot S_{ice} \cdot \left(\frac{EAR}{Z}\right)^{0.3} \cdot (nD)^{0.7} \cdot H_{ice}^{1.4} \cdot D^{0.6} \quad \text{kN} \qquad \text{[Eq. III 10A-43]}$$

where:

D_{limit} = $4H_{ice}$

D = Propeller diameter, in m

EAR = Expanded blade area ratio

Z = Number of propeller blades

n shall be taken as in 10A.3.4(c)(i).

F_b is to be applied as a uniform pressure distribution to an area on the back side for the following load cases (see Table III 10A-15):

(1) Load case 1: On the back of the blade from 0.6R to the tip and from the blade leading edge to a value of 0.2 chord length.

(2) Load case 5: For reversible rotation propellers a load equal to 60% of F_b is applied on the blade face from 0.6R to the tip and from the blade trailing edge to a value of 0.2 chord length.

(ii) Maximum forward blade force, F_f

when $D \leq D_{limit}$:

$$F_f = 250 \left(\frac{EAR}{Z}\right) \cdot D^2 \quad \text{kN} \qquad \text{[Eq. III 10A-44]}$$

when $D > D_{limit}$:

$$F_f = 500\left(\frac{EAR}{Z}\right)\cdot D\cdot\left(\frac{1}{1-\frac{d}{D}}\right)\cdot H_{ice} \quad kN \qquad \text{[Eq. III 10A-45]}$$

where:

$$D_{limit} = \left(\frac{2}{1-\frac{d}{D}}\right)\cdot H_{ice} \qquad m$$

F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side for the following load case (see Table III 10A-15):

(1) Load case 3: On the blade face from 0.6R to the tip and from the blade leading edge to a value of 0.5 chord length.

(2) Load case 5: A load equal to 60% F_f is to be applied from 0.6R to the tip and from the blade leading edge to a value of 0.2 chord length.

(iii) Maximum propeller ice torque applied to the propeller

Q_{max} is the maximum torque on a propeller due to ice-propeller interaction.

when $D \le D_{limit}$:

$$Q_{max} = 74\cdot\left(1-\frac{d}{D}\right)\cdot\left(\frac{P_{0.7}}{D}\right)^{0.16}\cdot\left(\frac{t_{0.7}}{D}\right)^{0.6}\cdot(nD)^{0.17}\cdot S_{qice}\cdot D^3 \quad kNm \qquad \text{[Eq. III 10A-46]}$$

when $D > D_{limit}$:

$$Q_{max} = 141\cdot\left(1-\frac{d}{D}\right)\cdot\left(\frac{P_{0.7}}{D}\right)^{0.16}\cdot\left(\frac{t_{0.7}}{D}\right)^{0.6}\cdot(nD)^{0.17}\cdot S_{qice}\cdot H_{ice}^{1.1}\cdot D^{1.9} \quad kNm \qquad \text{[Eq. III 10A-47]}$$

where:

D_{limit} = $1.8H_{ice}$

n = The rotational propeller speed, in rps, at bollard condition. If not known, n is to be taken as Table III 10A-11

(iv) Maximum blade spindle torque for CP-mechanism design, Q_{smax}

Spindle torque Q_{smax} around the spindle axis of the blade fitting shall be calculated for the load case described in 10A.3.4(d)(i) and 10A.3.4(d)(ii). If these spindle torque values are less than the default value given below, the default value shall be used.

Default value: $$Q_{smax} = 0.25\cdot F\cdot c_{0.7} \quad kNm \qquad \text{[Eq. III 10A-48]}$$

where:

$c_{0.7}$ = Length of the blade section at 0.7R radius, in m

F = Either F_b or F_f which ever has the greater absolute value

(v) Maximum propeller ice thrust (applied to the shaft at the location of the propeller)

$$T_f = 1.1F_f \quad kN \qquad \text{[Eq. III 10A-49]}$$
$$T_b = 1.1F_b \quad kN \qquad \text{[Eq. III 10A-50]}$$

(e) Design loads on propulsion line

(i) Torque

The propeller ice torque excitation for shaft line dynamic analysis shall be described by a sequence of blade impacts which are of half sine shape and occur at the blade. The torque due to a single blade ice impact as a function of the propeller rotation angle is then

$Q(\varphi) = C_q \cdot Q_{max} \cdot \sin\left[\varphi\left(\frac{180}{\alpha_i}\right)\right]$ kNm when $\varphi = 0...\alpha_i$ [Eq. III 10A-51]

$Q(\varphi) = 0$ kNm when $\varphi = \alpha_i...360$

where C_q and α_i parameters are given in Table III 10A-12:

Table III 10A-12
Values of C_q and α_i

Torque excitation	Propeller-ice interaction	C_q	α_i
Case 1	Single ice block	0.5	45
Case 2	Single ice block	0.75	90
Case 3	Single ice block	1.0	135
Case 4	Two ice blocks with 45 degree phase in rotation angle	0.5	45

The total ice torque is obtained by summing the torque of single blades taking into account the phase shift 360 deg./Z. The number of propeller revolutions during a milling sequence shall be obtained with the formula:

$N_Q = 2 \cdot H_{ice}$ [Eq. III 10A-52]

The number of impacts is ZN_Q.

See Fig. III 10A-9.

Milling torque sequence duration is not valid for pulling bow propellers, which are subject to special consideration.The response torque at any shaft component shall be analysed considering excitation torque $Q(\varphi)$ at the propeller, actual engine torque Q_e and mass elastic system.

Q_e = actual maximum engine torque at considered speed

The design torque (Q_r) of the shaft component shall be determined by means of torsional vibration analysis of the propulsion line. Calculations have to be carried out for all excitation cases given above and the response has to be applied on top of the mean hydrodynamic torque in bollard condition at considered propeller rotational speed.

(ii) Maximum response thrust

Maximum thrust along the propeller shaft line is to be calculated with the formula below. The factors 2.2 and 1.5 take into account the dynamic magnification due to axial vibration. Alternatively the propeller thrust magnification factor may be calculated by dynamic analysis.

Maximum shaft thrust forwards:

$T_r = T_n + 2.2T_f$ kN [Eq. III 10A-53]

Maximum shaft thrust backwards:

$T_r = 1.5T_b$ kN [Eq. III 10A-54]

where:

T_n = Propeller bollard thrust, in kN

T_f = Maximum forward propeller ice thrust, in kN

If hydrodynamic bollard thrust, T_n is not known, T_n is to be taken as follows:

Table III 10A-13
T_n

Propeller type	T_n
CP propellers(open)	1.25T
CP propellers (ducted)	1.1T
FP propellers driven by turbine or electric motoe	T
FP propeller driven by diesel engine (open)	0.85T
FP propeller driven by diesel engine (ducted)	0.7T

Note: T = nominal propeller thrust at MCR at free running open water conditions

(iii) Blade failure load for both open and nozzle propeller

The force is acting at 0.8R in the weakest direction of the blade and at a spindle arm of 2/3 of the distance of axis of blade rotation of leading and trailing edge which ever is the greatest.

The blade failure load is:

$$F_{ex} = \frac{0.3 \cdot c \cdot t^2 \cdot \sigma_{ref}}{0.8D - 2r} \cdot 10^3 \quad \text{kN} \qquad \text{[Eq. III 10A-55]}$$

where:

$\sigma_{ref} = 0.6\sigma_{0.2} + 0.4\sigma_u$

Where σ_u and $\sigma_{0.2}$ are representative values for the blade material.

c, t and r are respectively the actual chord length, thickness and radius of the cylindrical root section of the blade at the weakest section outside root fillet, and typically will be at the termination of the fillet into the blade profile.

10A.3.5 Design

(a) Design principle

The strength of the propulsion line shall be designed

(i) for maximum loads in 10A.3.4;

(ii) such that the plastic bending of a propeller blade shall not cause damages in other propulsion line components; and

(iii) with sufficient fatigue strength.

(b) Azimuthing main propulsors

In addition to the above requirements special consideration shall be given to the loading cases which are extraordinary for propulsion units when compared with conventional propellers. Estimation of the loading cases must reflect the operational realities of the ship and the thrusters. In this respect, for example, the loads caused by impacts of ice blocks on the propeller hub of a pulling propeller must be considered. Also loads due to thrusters operating in an oblique angle to the flow must be considered. The steering mechanism, the fitting of the unit and the body of the thruster shall be designed to withstand the loss of a blade without damage. The plastic bending of a blade shall be considered in the propeller blade position, which causes the maximum load on the studied component.

Azimuth thrusters shall also be designed for estimated loads due to thruster body/ice interaction as per 10A.2.15.

(c) Blade design

(i) Maximum blade stresses

Blade stresses are to be calculated using the backward and forward loads given in section 10A.3.4(c) & 10A.3.4(d). The stresses shall be calculated with recognised and well documented FE-analysis or other acceptable alternative method. The stresses on the blade shall not exceed the allowable stresses σ_{all} for the blade material given below.

$$\sigma_{calc} < \sigma_{all} = \frac{\sigma_{ref}}{S}$$

where:

S = 1.5

σ_{ref} = Reference stress, defined as the following whichever is less:

$\sigma_{ref} = 0.7\sigma_u$ or [Eq. III 10A-56]

$\sigma_{ref} = 0.6\sigma_{0.2} + 0.4\sigma_u$ [Eq. III 10A-57]

Where σ_u and $\sigma_{0.2}$ are representative values for the blade material.

(ii) Blade edge thickness

The blade edge thicknesses t_{ed} and tip thickness t_{tip} are to be greater than t_{edge} given by the following formula:

$$t_{edge} \geq x \cdot S \cdot S_{ice} \sqrt{\frac{3p_{ice}}{\sigma_{ref}}} \quad \text{mm}$$ [Eq. III 10A-58]

where:

x = Distance from the blade edge measured along the cylindrical sections from the edge and shall be 2.5% of chord length, however not to be taken greater than 45 mm. In the tip area (above 0.975R radius) x shall be taken as 2.5% of 0.975R section length and is to be measured perpendicularly to the edge, however not to be taken greater than 45 mm.

S = Safety factor, 2.5 for trailing edges, 3.5 for leading edges, 5 for tip

S_{ice} = According to Table III 10A-10

p_{ice} = Ice pressure, =16MPa for leading edge and tip thickness

σ_{ref} = According 10A.3.5(c)(i)

The requirement for edge thickness has to be applied for leading edge and in case of reversible rotation open propellers also for trailing edge. Tip thickness refers to the maximum measured thickness in the tip area above 0.975R radius. The edge thickness in the area between position of maximum tip thickness and edge thickness at 0.975 radius has to be interpolated between edge and tip thickness value and smoothly distributed.

(d) Prime movers

(i) The Main engine is to be capable of being started and running the propeller with the CP in full pitch.

(ii) Provisions shall be made for heating arrangements to ensure ready starting of the cold emergency power units at an ambient temperature applicable to the Polar class of the ship.

(iii) Emergency power units shall be equipped with starting devices with a stored energy capability of at least three consecutive starts at the design temperature in 10A.3.5(d)(ii) above. The source of stored energy shall be protected to preclude critical depletion by the automatic starting system, unless a second independent means of starting is provided. A second source of energy shall be provided for an additional three starts within 30 min., unless manual starting can be demonstrated to be effective.

10A.3.6 Machinery fastening loading accelerations

(a) Essential equipment and main propulsion machinery supports shall be suitable for the accelerations as indicated in as follows. Accelerations are to be considered acting independently.

(b) Longitudinal Impact Accelerations, a_I

Maximum longitudinal impact acceleration at any point along the hull girder:

$$a_I = \left(\frac{F_{IB}}{\Delta}\right) \cdot \left\{[1.1 \cdot \tan(\gamma + \varphi)] + \left(7\frac{H}{L}\right)\right\} \quad m/s^2 \qquad \text{[Eq. III 10A-59]}$$

where:

φ = Maximum friction angle between steel and ice, normally taken as 10 degree

γ = Bow stem angle at waterline, in degree

Δ = Displacement, in kt

L = Length between perpendiculars, in m

H = Distance in meters from the waterline to the point being considered, in m

F_{IB} = Vertical impact force, defined in 10A.2.13(b)(i)

(c) Vertical acceleration, a_v

Combined vertical impact acceleration at any point along the hull girder

$$a_v = 2.5 \cdot \left(\frac{F_{IB}}{\Delta}\right) \cdot F_X \quad m/s^2 \qquad \text{[Eq. III 10A-60]}$$

where:

F_X = 1.3 at FP

= 0.2 at midships

= 0.4 at AP

= 1.3 at AP for ships conducting ice breaking astern

Intermediate values to be interpolated linearly.

(d) Transverse impact

Combined transverse impact acceleration at any point along hull girder

$$a_t = 3F_i \cdot \frac{F_X}{\Delta} \quad m/s^2 \qquad \text{[Eq. III 10A-61]}$$

where:

F_X = 1.5 at FP

= 0.25 at midships

= 0.5 at AP

= 1.5 at AP for ships conducting ice breaking astern

Intermediate values to be interpolated linearly.

F_i = Total force normal to shell plating in the bow area due to oblique ice impact, defined in 10A.2.3(b)(ii)

10A.3.7 Auxiliary systems

(a) Machinery shall be protected from the harmful effects of ingestion or accumulation of ice or snow. Where continuous operation is necessary, means should be provided to purge the system of accumulated ice or snow.

(b) Means should be provided to prevent damage due to freezing, to tanks containing liquids.

(c) Vent pipes, intake and discharge pipes and associated systems shall be designed to prevent blockage due to freezing or ice and snow accumulation.

10A.3.8 Sea inlets and cooling water systems

(a) Cooling water systems for machinery that are essential for the propulsion and safety of the ship, including sea chests inlets, shall be designed for the environmental conditions applicable to the ice class.

(b) At least two sea chests are to be arranged as ice boxes for class **PC1** to **PC5** inclusive where. The calculated volume for each of the ice boxes shall be at least $1m^3$ for every 750 kW of the total installed power. For **PC6** and **PC7** there shall be at least one ice box located preferably near center line.

(c) Ice boxes are to be designed for an effective separation of ice and venting of air.

(d) Sea inlet valves are to be secured directly to the ice boxes. The valve shall be a full bore type.

(e) Ice boxes and sea bays are to have vent pipes and are to have shut off valves connected direct to the shell.

(f) Means are to be provided to prevent freezing of sea bays, ice boxes, ship side valves and fittings above the load waterline.

(g) Efficient means are to be provided to re-circulate cooling seawater to the ice box. Total sectional area of the circulating pipes is not to be less than the area of the cooling water discharge pipe.

(h) Detachable gratings or manholes are to be provided for ice boxes. Manholes are to be located above the deepest load line. Access is to be provided to the ice box from above.

(i) Openings in ship sides for ice boxes are to be fitted with gratings, or holes or slots in shell plates. The net area through these openings is to be not less than 5 times the area of the inlet pipe. The diameter of holes and width of slot in shell plating is to be not less than 20 mm. Gratings of the ice boxes are to be provided with a means of clearing. Clearing pipes are to be provided with screw-down type non return valves.

10A.3.9 Ballast tanks

Efficient means are to be provided to prevent freezing in fore and after peak tanks and wing tanks located above the water line and where otherwise found necessary.

10A.3.10 Ventilation system

(a) The air intakes for machinery and accommodation ventilation are to be located on both sides of the ship.

(b) Accommodation and ventilation air intakes shall be provided with means of heating.

(c) The temperature of inlet air provided to machinery from the air intakes shall be suitable for the safe operation of the machinery.

10A.3.11 Alternative design

As an alternative – a comprehensive design study may be submitted and may be requested to be validated by an agreed test programme.

Table III 10A-14
Load Cases for Open Propeller

	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade(suction side) to an area from 0.6R to the tip and from the leading edge to 0.2 times the chord length	Load case 2	50% of F_b	Uniform pressure applied on the back of the blade (suction side) on the propeller tip area outside of 0.9R radius.	Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from 0.6R to the tip and from the leading edge to 0.2 times the chord length.	Load case 4	50% of F_f	Uniform pressure applied on propeller face (pressure side) on the propeller tip area outside of 0.9R radius.	Load case 5	60% of F_f or 60% of F_b which one is greater	Uniform pressure applied on propeller face (pressure side) to an area from 0.6R to the tip and from the trailing edge to 0.2 times the chord length.	
Table III 10A-15
Load Cases for Ducted Propeller

	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from 0.6R to the tip and from the leading edge to 0.2 times the chord length.	Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from 0.6R to the tip and from the leading edge to 0.5 times the chord length.	Load case 5	60% of F_f or 60% of F_b which one is greater	Uniform pressure applied on propeller face (pressure side) to an area from 0.6R to the tip and from the trailing edge to 0.2 times the chord length.

The Shape of the Propeller Ice Torque Excitation for 45, 90, 135 Degrees Single Blade Impact Sequences and 45 Degrees Double Blade Impact Sequence (Two Ice Pieces) on a Four-Bladed Propeller

Chapter 11

Tugs

11.1 General

11.1.1 This chapter applies to tugs classed in accordance with the provision in Chapter 1 of Part I and built for the purpose of towing or pushing other vessels.

11.1.2 Except otherwise provided in this chapter, the requirements given in Part II are to be applied.

11.1.3 Tugs built in accordance with these rules are to be assigned a service notation of **Tug** affixed to classification symbols.

11.2 Longitudinal Strength

11.2.1 Longitudinal strength is to be calculated in accordance with the relevant requirements given in Part II.

11.3 Hull Construction

11.3.1 For determination of scantlings of tugs, the draught d used is not less than 85 % of the moulded depth.

11.3.2 The shell plating at fore end is to have a thickness 0.5 mm larger than that required in 7.2 or 7.3 of Part II whichever is greater.

11.3.3 The thickness of strength deck plating is to comply with the relevant requirement in 11.3 of part II, but the minimum thickness for outside line of opening is to have 1 mm larger than that required in 11.3.1 of Part II.

11.3.4 Tugs designed to use the bow for pushing floating structures

If a tug is designed to use the bow for pushing floating structures, the additional strength in the fore peak shall be considered and in accordance with following requirements. Forward collision bulkhead horizontal girders are to be arranged on ship's side not more than 2 meters apart. The girders are to be connected to the collision bulkhead by brackets forming gradual transition to the bulkhead. The dimensions of the girders are not less than the followings:

Mean depth	=	$250 + 2.5\,sL$	mm
Thickness	=	$6.5 + 0.03\,L$	mm
Flange area	=	$0.15\,sL$	cm^2

where :

s = Span of horizontal girder, in m.

L = Ship length, in m.

The frames are to be connected to the girders by lugs and flat bar stiffeners at every frame.

11.3.5 For plate stems, the thickness of the plates is to be increased by 2 mm above the requirements in 2.1.1 of Part II.

11.3.6 The depth and breadth of beam knees connecting the upper deck beam to frames, measured from the point of intersection of the inner edges of the beam and frame, are to be not less than 2.5 times the depth of the beam. The thickness of the knees is not to be less than that of the web plate of the beam. The scantlings of beam knees are also to comply with the requirements in 9.4.1 of Part II.

11.4 Bulwarks and Fenders

11.4.1 Tugs are to be provided with tumblehome bulwarks and the thickness t of bulwarks plating is to be not less than the following requirements :

$t = 5$ mm for $L \le 30$m
$t = 7$ mm for $L \ge 50$m

where :
L = Ship length, in m.
For intermediate values of L, t is be determined by interpolation.

11.4.2 The bulwarks are to be supported by stays with a flange or face plate. The stays are to be spaced not more than two frame spaces apart and are to in line with deck beam.

11.4.3 A substantial fender for the protection of the vessel’s side is to be fitted at deck level, extending the whole length of the vessel. Alternatively, an arrangement with loose fenders may be approved, if the upper part of the vessel’s side is additionally stiffened.

11.5 Machinery Casings and Escape Hatches

11.5.1 The height of exposed machinery casings is to be not less than 900 mm. The stiffeners of the casings are to be spaced not more than 750 mm and the section modulus of the stiffeners and the thickness of the plating of the casing are to be the same as the requirement in 18.2 of Part II.

11.5.2 Engine rooms are to be fitted with escape hatches. Any escape hatch is to be capable of being used at extreme angles of heel. Escape hatches are to be positioned as high as possible above the waterline and on or near the ship’s centerline. The height of hatch coaming is to be at least 600 mm above the upper surface of the deck. The escape hatch covers are to have hinges arranged athwartships. The covers are to be capable of being opened or closed easily both from inside and outside the engine room. When closed, they need to maintain weathertight.

11.6 Side Scuttles

11.6.1 Side scuttles are not allowed in the vessel’s side unless the distance from the lower edge of side scuttles to the design waterline is at least 750 mm. Side scuttle in the vessel’s side and in sides of any superstructures are to be provided with internally fitted, hinged deadlights. Fixed lights in skylight etc. are to have glasses of thickness appropriate to their position as required for side scuttles, and fitted with hinged deadlights which may be arranged on the weather side.

11.7 Towing Arrangement

11.7.1 Towing gear and towing arrangement

(a) Design standard

The equipment is to meet the requirements in this Chapter. Alternatively equipment complying with recognized standard may be accepted on a case-by-case basis, provided such specifications give equivalence to the requirements of this Chapter and is fulfilling the intention. The drawings for towing arrangement listed below are to be posted on bridge.

(i) Arrangement plan is to include the following infromation:

(1) Towline paths showing extreme sectors and wrap on towing equipment towline points of attack

(2) Maximum continuous bollard pull, F_{bp}

(3) Maximum design load for each component

(4) Emergency release capabilities

(ii) Test procedure for quay and sea trial is to include the following information:

(1) Static bollard pull test procedure refer to 11.9 of this Chapter.

(2) Winch and other equipment required by this Chapter.

(b) General requirements

The towing gear is to be arranged in such a way as to minimize the danger of capsizing; the towing hook/working point of the towing force is to be placed as low as practicable.

With direct-pull (hook-towline), the towing hook and its radial gear are to be designed such as to permit adjusting to any foreseeable towline direction.

The attachment point of the towline is to be arranged closely behind the centre of buoyancy.

For tugs equipped with a towing winch, the arrangement of the equipment is to be such that the towline is led to the winch drum in a controlled manner under all foreseeable conditions (directions of the towline).

Towline protection sleeves or other adequate means is to be provided to prevent the directly pulled towlines from being damaged by chafing or abrasion.

(c) Definition of loads

The design force (F_d), in kN, corresponds to the towline pull (or the bollard pull, if the towline pull is not defined) as specified. The design force may be verified by a static bollard pull test, see 11.9 of this Chapter.

The test force (F_t) is used for dimensioning as well as for testing the towing hook and connected elements. The test force is related to the design force as shown in Table III 11-1 of this Chapter.

Table III 11-1
Design Force (F_d) and Test Force (F_t)

Design force, F_d (kN)	Test force, F_t (kN)
$F_d \leq 500$	$2.00 \times F_d$
$500 < F_d \leq 1500$	$F_d + 500$
$1500 \leq F_d$	$1.33 \times F_d$

Note: The minimum breaking force of the towline is based on the design force (F_d), see 11.7.4(c) of this Chapter.

The winch holding capacity is to be based on the minimum breaking force, see 11.7.5(c) of this Chapter, the rated winch force is the hauling capacity of the winch drive when winding up the towline.

For forces at the towing hook foundation see 11.7.3(e) of this Chapter.

11.7.2 Material for towing equipment

(a) Towing hook with attachment is to be made of rolled, forged or cast steel in accordance with Part XI.

(b) Towing winch materials are to comply with relevant requirements given in Part XI.

(c) For forged and cast steel with minimum specified tensile strength above 650 N/mm^2, specifications of chemical composition and mechanical properties are to be submitted for approval for the equipment in question.

(d) Plate material in welded parts is to be of the grades as given in Table III 16-6 of this Part.

(e) When the specified minimum upper yield stress (R_{eH}) is greater than 80% of the minimum specified tensile strength (R_m), the following value is to be used as R_{eH} in calculations for structural strength as given in 11.7.5 of this Chapter:

$$R_{eH} = \min (R_{eH} ; 0.8R_m)$$

11.7.3 Towing hook and quick release

(a) The towing hook is to be fitted with an adequate device guaranteeing slipping, i.e. emergency release, of the towline in case of an emergency. Slipping is to be possible from the bridge as well as from at least one other place in the vicinity of the hook itself, from where in both cases the hook can be easily seen.

(b) The towing hook is to be equipped with a mechanical, hydraulic or pneumatic quick release. The quick release is to be designed such as to guarantee that unintentional slipping is avoided.

(c) A mechanical quick release is to be designed such that the required release force under test force F_t does not exceed neither 150 N at the towing hook nor 250 N when activating the device on the bridge. In case of a mechanical quick release, the releasing rope is to be guided adequately over sheaves. If necessary, slipping should be possible by downward pulling, using the whole body weight.

(d) Where a pneumatic or hydraulic quick release is used, a mechanical quick release is to be provided additionally.

(e) Dimensioning of towing hook and towing gear

The dimensioning of the towing gear is based on the test force F_t, see 11.7.1(c) of this Chapter.

The towing hook, the towing hook foundation, the corresponding substructures and the quick release are to be designed for the following directions of the towline:

(i) For a test force $F_t \le 500$ kN:

- in the horizontal plane, directions from abeam over astern to abeam
- in the vertical plane, from horizontal to 60° upwards

(ii) For a test force $F_t > 500$ kN

- in the horizontal plane, as above
- in the vertical plane, from horizontal to 45° upwards.

Assuming the test force F_t acting in any of the directions described in (i) and (ii) above, the permissible stresses in the towing equipment elements defined above are not to exceed the values shown in Table III 11-2 of this Chapter. For the towing hook foundation it shall be additionally proven that the permissible stresses given in Table III 11-2 of this Chapter are not exceeded assuming a load equal to the minimum breaking force Fmin, in kN, of the towline.

Table III 11-2
Permissible Stresses

Type of stress	Permissible stress
Axial and bending tension and axial and bending compression with box type girders and tubes	$\sigma = 0.83R_{eH}$
Axial and bending compression with girders of open cross sections or with girders consisting of several members	$\sigma = 0.72R_{eH}$
Shear	$\tau = 0.48R_{eH}$
Equivalent stress	$\sigma_{vm} = 0.85R_{eH}$

11.7.4 Towlines

(a) Towline materials are to be in accordance with the requirements given in 25.5 of Part II. All wire ropes should have as far as possible the same lay.

(b) The length of the towline is to be chosen according to the tow formation (masses of tug and towed object), the water depth and the nautical conditions. Regulations of flag state are to be observed.

(c) The required minimum breaking force F_{min}, in kN, of the towline shall be determined by the following formula:

$$F_{min} = KF_d$$

Where:

K	=	2.5	for $F_d \leq 200$ kN
	=	2.625-(F_d/1600)	for 200 kN < F_d < 1000 kN
	=	2.0	for $F_d \geq 1000$ kN
F_d	=	Design force, in kN, as specified in 11.7.1(c) of this Chapter.	

(d) For ocean towing, at least one spare towline with attachments is to be available on board.

11.7.5 Towing winch

(a) Arrangement and control

The towing winch, including towline guiding equipment, is to be arranged such as to guarantee safe guiding of the towline in all directions according to 11.7.3(e) of this Chapter.

The winch is to be capable of being safely operated from all control stands. Apart from the control stand on the bridge, at least one additional control stand is to be provided on deck. From each control stand the winch drum is to be freely visible; where this is not ensured, the winch is to be provided with a self-rendering device.

Each control stand is to be equipped with suitable operating and control elements. The arrangement and the working direction of the operating elements are to be analogous to the direction of motion of the towline. Operating levers are to, when released, automatically return to the stop position. They are to be capable of being secured in the stop position.

It is recommended that, on vessels for ocean towing, the winch is fitted with equipment for measuring the pulling force in the towline.

If, during normal operating conditions, the power for the towing winch is supplied by a main engine shaft generator, another generator is to be available to provide power for the towing winch in case of main engine or shaft generator failure.

(b) Winch drum

Specific requirements for winch drums:

(i) The towline is to be fastened on the winch drum by a breaking link.

(ii) The winch drum is to be capable of being declutched from the drive.

(iii) The diameter of the winch drum is to be not less than 14 times the towline diameter. However, for all towline types, the towline bending radius should not be less than specified by the towline manufacturer.

(iv) To ensure security of the rope end fastening, at least 3 dead turns are to remain on the drum.

(v) At the ends, drums are to have disc sheaves whose outer edges shall surmount the top layer of the rope at least by 2.5 rope diameters, if no other means is provided to prevent the rope from slipping off the drum.

(vi) If a multi-drum winch is used, then each winch drum is to be capable of independent operation.

(vii) Items (iii) and (iv) above are not applicable to towlines of austenitic steels and fibre ropes. In case these towline materials are utilized, dimensioning of the winch drum is subject to the Society's approval.

(c) Holding capacity/dimensioning

The holding capacity of the towing winch (towline in the first layer) is to correspond to 80% of the minimum breaking load F_{min} of the towline.

When dimensioning the towing winch components, which with the brake engaged are exposed to the pull of the towline (rope drum, drum shaft, brakes, foundation frame and its fastening to the deck), a design tractive force equal to the holding capacity shall be assumed. When calculating the drum shaft the dynamic stopping forces of the brakes is to be considered. The drum brake is not to give way under this load.

(d) Brakes

If the drum brakes are power-operated, manual operation of the brake is to be provided additionally.

Drum brakes are to be capable of being quickly released from the control stand on the bridge, as well as from any other control stand. The emergency release is to be functional under all working conditions, including failure of the power drive.

The operating levers for the brakes are to be secured against unintentional operation.

Following operation of the emergency release device, normal operation of the brakes are to be restored immediately.

Following operation of the emergency release device, the winch driving motor are not to start again automatically.

Towing winch brakes are to be capable of preventing the towline from paying out when the vessel is towing at the design force F_d and are to be not be released automatically in case of power failure.

(e) Tricing winches

Control stands for the tricing winches are to be located at safe distance off the sweep area of the towing gear. Apart from the control stands on deck, at least one other control stand is to be available on the bridge. Tricing winches are not subject to classification. In order to assess the supporting structure, maximum reaction forces and its locations are to be provided.

(f) Emergency release

The winch is to be designed to allow drum release in an emergency, and in all operational modes.

The release capabilities are to be as specified on towing arrangement drawing.

The action to release the drum is to be possible locally at the winch and from a position at the bridge with full view and control of the operation. Identical means of equipment for the release operation to be used on all release stations.

After an emergency release the winch brakes are to be in normal function without delay. It shall always be possible to carry out the emergency release sequence (emergency release and/or application of brake), even during a black-out.

Control handles, buttons etc. for emergency release are to be protected against unintentional operation.

11.7.6 Scantlings of deck girders and transverses forming the support structure of towing equipment are to be determined by direct calculations using the following stresses:

$\tau = \frac{87}{K}$ N/mm^2

$\sigma = \frac{150}{K}$ N/mm^2

$\sigma_e = \frac{213}{K}$ N/mm^2

where :

τ = Shear stress, in N/mm^2.

σ = Bending stress, in N/mm^2.

σ_e = Equivalent stress, $\sqrt{\sigma^2 + 3\tau^2}$ in N/mm^2.

K = Material factor as specified in 1.5.2(a) of Part II.

11.7.7 Marking

Equipment is to be marked to enable them to be readily related to their specifications and manufacturer. When the Society's product certificate is required, the equipment shall be clearly marked by the Society for identification.

11.8 Stability

11.8.1 General stability requirements

(a) The requirements in this Chapter apply to vessels with freeboard length L_f of 24 meters and above.

(b) Vessels with a freeboard length L_f less than 24 meters should as far as practicable comply with the requirements given in this Chapter. Other stability requirements may however be applied provided the Society upon consideration in each case finds these requirements to be appropriate for the vessel.

(c) The vessel's stability is to be assessed when the towing line is not in line with the vessel's longitudinal centre line. The towing heeling moment is to be calculated based on the assumption in 11.8.2 as below. The criterion in 11.8.3 of this Chapter is to be complied with.

11.8.2 Towing heeling moment

A transverse heeling moment generated by the rudder and propulsion system with maximum thrust and rudder(s) hard over is assumed to act horizontally on the towline as a static transverse force derived from the maximum bollard pull. No vertical force is assumed.

A heeling lever curve as a function of the heeling angle is to be calculated as

$$T_L = \frac{F_{bp}\, C_T\, h \cos\theta}{\Delta}$$

Where:

Δ = Displacement, in t.

The displacement, LCG and VCG for the initial loading condition is assumed to remain unchanged.

If the vessel is intended to operate with additional transverse thrusters the heeling lever generated by the propulsion system is to be increased in proportion to the heeling moment generated by such thrusters.

F_{bp} = Maximum continuous bollard pull, in t. measured in accordance with 11.9 of this Chapter.

C_T = A transverse thrust and rudder force reduction factor depending on the propulsion arrangement.

= 0.6

For conventional single or twin propeller propulsion systems with rudders and fixed or no propeller nozzles. This value is increased to 0.7 for ships fitted withmoveable nozzles.

= 1.0

For single azimuth thrusters (Z-drives) acting normal to the centreline and for cycloidal drives a value of 1.0 is to be applied.

= $(1 + \cos\gamma) / 2$

For two azimuth thrusters, where γ is the offset angle that occurs between the thruster jets when one unit is directed at a right angle to the ship's centreline and the other is directed so that its thrust jet tangentially intersects the nozzle of the first.

= Other values

For C_T may be accepted if substantiated by calculations

h = The towing heeling arm, in m, taken as the vertical distance between the centre of propeller(s) and the fastening point of the towline.

11.8.3 Stability criterion for tugs

The residual area between the righting lever curve and the heeling lever curve calculated in accordance with 11.8.2 above is not to be less than 0.09 meter-radians. The area is determined from the first interception of the two curves to the angle of the second interception or the angle of down flooding, whichever is less.

Alternatively, the area under the righting lever curve is not to be less than 1.4 times the area under the heeling lever curve calculated in accordance with 11.8.2 above. The areas are determined between 0° and the angle of the second interception or the angle of down flooding, whichever is less.

11.8.4 Stability criteria for ocean towing

For ships intended only for towing operations where the towline is secured against transverse movement near the aft perpendicular the following criteria may be applied in lieu of 11.8.1(c) of this Chapter:

The residual area between the righting lever curve and the heeling lever curve calculated in accordance with 11.8.2 of this Chapter is not to be less than 0.055 meter-radians. The area is determined from the first interception of the two curves to the angle of the second interception or the angle of down flooding, whichever is less.

The static angle at the first interception is not to be more than 15°.

11.8.5 Additional information

The vessel's stability manual is to contain additional information in on the maximum bollard pull, the assumed location of the fastening point of the towline, heeling force and moment and identification of critical flooding points. The heeling lever curve is to be plotted on the GZ curve for all intended towing conditions.

11.9 Static Bollard Pull Test

11.9.1 The static bollard pull test procedure is to be submitted for review in advance of the test.

11.9.2 The first vessel of a series is to have a bollard pull test conducted. The requirements for conducting a bollard pull test on vessels of duplicate design and built in a series will be specially considered on a case-by-case basis. However, a bollard pull test certificate will only be issued to those vessels with the **BP** notation and the bollard pull test is actually carried out.

11.9.3 The static bollard pull is to be measured with the tug at the maximum continuous rpm and at or near the maximum towing draft.

11.9.4 The static bollard pull is the pull that is recorded over the state of equilibrium without any tendency to decline.

11.9.5 The static bollard pull test requirements

The static bollard pull test is to be complying with the following requirements. Where the test requirements of the static bollard pull test is in compliance with MSC/Circ. 884, it may be deemed as acceptable at the discretion of the Society.

(a) The towing vessel should be on an even keel or trimmed to the intended operating condition in tow.

(b) The draft of the towing vessel should be equal to or deeper than ballast condition, but need not be down to the summer load line mark.

(c) Depth of water under the keel and on each side of the vessel should be at least 2 × vessel draft at midship.

(d) If current exceeds 1 knot, its effect is to be subtracted from the bollard pull by direct measurement of drag effect (pulling direction downstream) and reduction of bollard pull accordingly; or, conducting pull test both upstream and downstream and averaging the results.

(e) The distance from the stern of the towing vessel to the bollard (fixed point) should be at least two ship lengths and be unobstructed by submerged pilings, bulwarks, etc.

(f) Wind speed should be 4.5m/s (10mph) or less, or such that it does not measurably affect the bollard pull results.

(g) Sea condition should be calm.

(h) The structural adequacy of the towing hawser, towing winch or tow bitts employed during the test should be satisfied.

(i) The dynamometer (load cell) used for the test should be calibrated and suitable for use in the horizontal position. It should be fitted with swivels or should be torque insensitive, such as a hydraulic dynamometer. It should be easily read from a safe location or a remote readout should be provided. A continuous recording device is suggested but not mandatory. It is suggested that the maximum scale reading be, as a minimum, at least equal to Max. Cont. Total H.P. × 0.22 kN. The dynamometer should be located at the ashore end of the tow hawser.

(j) The vessel’s main engines should not be adjusted to operate in overload condition. Engine overspeed trip setting should be verified prior to commencing the test.

(k) The steady bollard pull should be computed as the average of evenly spaced load cell recordings taken over a sustained pull interval of three to five minutes. If the tow hawser is not horizontal, the vertical angle of the hawser is to be measured and used to obtain the actual horizontal thrust.

(l) Engine temperatures should be at steady state during the test run. Engines should be operated at the maximum continuous horsepower (certified horsepower per the record) during the test. Instantaneous spike bollard pull readings should be ignored.

(m) A two-way voice communication system is to be provided for the shore and the engine room.

(n) The vessel's stability information should include the towing condition.

Chapter 11A

Escort Tugs

11A.1 Class Notations

11A.1.1 The requirements in this chapter apply to vessels specially intended for escort service.

11A.1.2 Vessels built in compliance with the requirements in this chapter may be given the class notation **Escort Tug**. in accordance with Chapter 1 of Part I.

11A.1.3 The escort rating number (**F_S, t, v**) is to be determined by approved full scale trials, performed within acceptable limits set by stability and winch criteria specified in this chapter. A test certificate indicating the escort rating number may be issued on completion of successful full scale trials. If trials take place at both 8 and 10 knots, the escort rating number will consist of 6 parts.

11A.1.4 The requirements for **Tug** notation given in Chapter 11 are to be complied with. The winch, crucifix etc. and their supporting structures are to comply with the requirements for Tug notation based on towline force F_W (see Fig. III 11A-1) instead of BP.

11A.2 Definitions

11A.2.1 The term Escort service includes steering, braking and otherwise controlling the assisted vessel. The steering force is provided by the hydrodynamic forces acting on the tug's hull. The term Escort test speed is the speed at which the full scale measurements are to be carried out, normally 8 knots and/or 10 knots.

11A.2.2 The term Escort tug is the tug performing the escort service.

11A.2.3 F_S indicates maximum transverse steering pull in metric tonnes exerted by the escort tug on the stern of the assisted vessel with the intention of controlling it, t is the time in seconds required for the change of the tug's position from one side to the corresponding opposite side, and v is the speed in knots at which this pull may be attained (see Fig. III 11A-1).

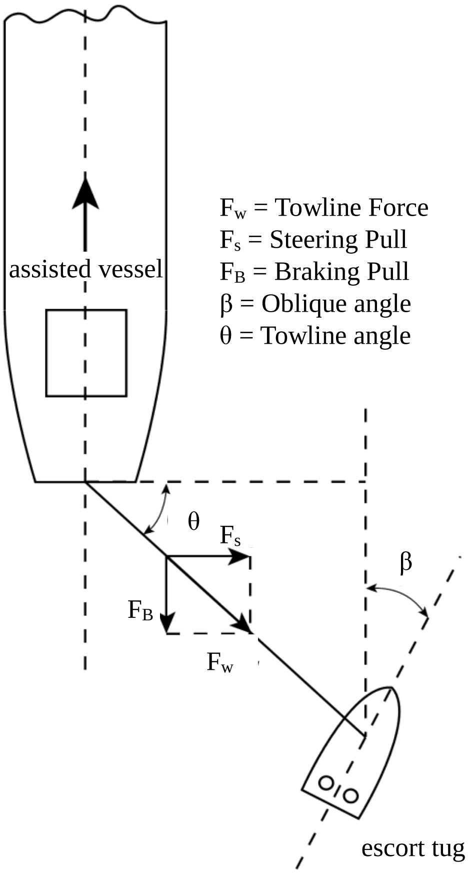

Fig. III 11A-1
Typical Escort Configuration

11A.3 Design and Arrangement

11A.3.1 The hull of the tug is to be designed to provide adequate hydrodynamic lift and drag forces when in indirect towing mode. Due attention is to be paid to the balance between hydrodynamic forces, towline pull and propulsion forces, as well as sudden loss of thrust.

11A.3.2 The vessel is to be designed so that forces are in equilibrium with a minimum use of propulsive force except for providing forward thrust and balancing transverse forces during escorting service.

11A.3.3 The propulsion system is to be able to provide ample thrust for manoeuvring at higher speeds for the tug being in any oblique angular position.

11A.3.4 In case of loss of propulsion, the remaining forces are to be so balanced that the resulting turning moment will turn the escort tug to a safer position with reduced heel.

11A.3.5 Freeboard is to be arranged so as to avoid excessive trim at higher heeling angles. Bulwark is to be fitted all around exposed weather deck.

11A.3.6 The towing winch is to have a hydraulic load reducing system in order to prevent overload caused by dynamic oscillation in the towing line. Normal escort operation is not to be based on use of brakes on the towing winch, but the hold function is to be provided by the gearbox and the hydraulic system instead. The towing winch is to pay out towing line before the pull reaches 110% of the rated towline force F_W.

11A.3.7 Documentation is to be submitted as required by Table III 11A-1.

Table III 11A-1
Documentation Requirements for Escort (F_S, t, V)

Object	Documentation type	Additional description	Info
Vessel	Test procedure for quay and sea trial		for information
	Report from quay and sea trial		for information
Stability	Preliminary stability manual, Final stability manual, as appropriate	Including stability escort calculations as described in 11A.4.	for approval
Towing arrangement	Arrangement plan	Including layout of vessels and towline path with theta-beta angles.	for information
	Calculation report	Towing forces, including F_W, F_S and F_B as described in Fig. III 11A-1.	for information
Tow line	Specification	Minimum breaking strength / safe working load for towline and associated components, fixations and supporting structures.	for information

11A.4 Stability

11A.4.1 The general stability criteria in 11.8 are to be complied with, in addition to stability criteria given below.

11A.4.2 The area under the righting arm curve and heeling arm curve is to satisfy the following ratio:

$R_{ABS} \geq 1.25$

where
R_{ABS} = Ratio between righting and heeling areas between equilibrium and 20° heeling angle. Equilibrium is obtained when maximum steering force is applied from tug.

11A.4.3 Heeling arm is to be derived from the test. The heeling arm is to be kept constant from equilibrium to 20°, see Fig. III 11A-2.

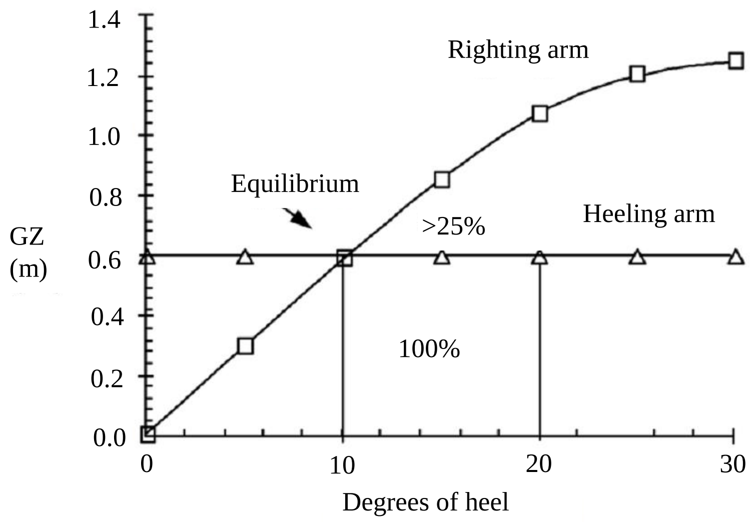

Fig. III 11A-2
Equilibrium to 20°

Note: The heeling arm is to be taken as escort heeling moment divided by the displacement. For preliminary calculations the heeling arm may be taken as the maximum value that ensures compliance with the criteria given in 11A.4.2 and 11A.4.4.

11A.4.4 The following requirement is to be satisfied:

$A + B \geq 1.4\,(B + C)$
A + B = Area under the GZ curve
B + C = Area under the heeling moment curve.
The areas are taken from 0° heel to the angle of down flooding or 40°, whichever is less. See Fig. III 11A-3.

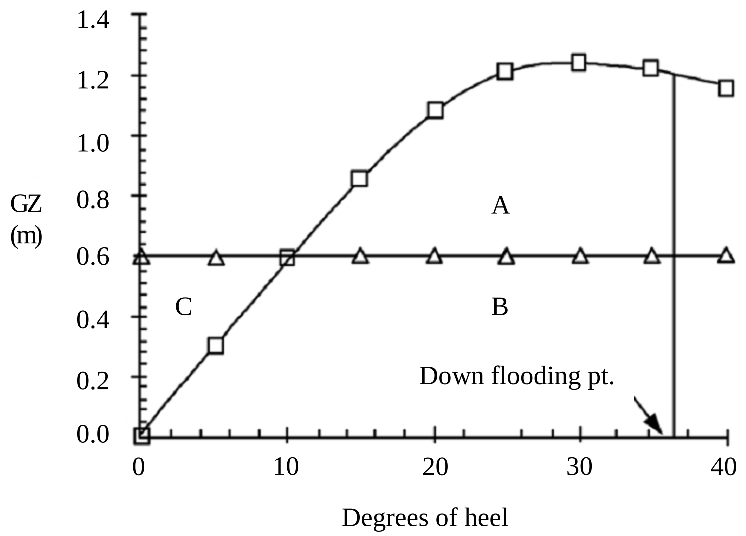

Fig. III 11A-3
Total Area Requirements

11A.5 Full Scale Testing

11A.5.1 The following tests are to be undertaken:

(a) Measurement of F_S

The escort tug will connect its towing line wire to the assisted vessel's stern and follow it with the wire slack, both ships travelling at the same speed. The tug will then position itself at an agreed angle of attack relative to the flow of water and the resulting towline tension F_W is to be recorded. These readings combined with the respective θ-β angles combinations are to be then used to establish F_S.

(b) Manoeuvre test:

The escort tug will shift its position from a steering position minimum 30° from one side of the assisted vessel (i.e. θ is 60°) to the mirror position in the opposite side and t will be the time required. The escort test speed is 8 knots and/or 10 knots. The surveyor will attend the test for the purpose of witnessing compliance with the agreed test program.

11A.5.2 Approved escort departure and escort arrival loading conditions from the stability booklet is to define the way the tug will be loaded for the trial.

11A.5.3 At least the following data is to be recorded continuously in real time mode during trials for later analysis:

(a) towline tension

(b) towline length

(c) towline angle θ

(d) oblique angle β

(e) heeling angle on tug

(f) speed of assisted vessel, relative to the sea

(g) time for the manoeuvre test

(h) weather condition and sea state.

11A.5.4 Sea trials exceeding critical heeling angle from approved stability calculations is not to be accepted.

Chapter 12
Fire-fighting Ships

12.1 General

12.1.1 This chapter applies to ships intended for fire-fighting operation classed in accordance with the provision in Chapter 1 of Part I.

12.1.2 Except otherwise provided in this chapter, the applicable requirements given in other Parts are to be applied.

12.1.3 Ships built in accordance with these rules are to be assigned a service notation of **Fire-fighting Ship** affixed to classification symbols.

12.1.4 In addition to the plans required by 1.3 of Part II, the following plans and information are to be submitted:

(a) General arrangement showing the disposition of all fire-fighting equipment required by this chapter, together with details of major items such as pumps, monitors, water main, hydrants, hoses and nozzles, including their delivery capability.

(b) Piping diagram of the water fire-fighting system.

(c) Plan showing the arrangement and construction of fire divisions, fire doors and their fire resisting class certification.

(d) Plan showing the layout, capacity and coverage of the water spray system.

(e) Plan of the seating arrangements, local and remote control system for water monitor.

(f) Specification and location of the fireman's outfits provided.

(g) Particulars of the means of keeping the ship in position during fire-fighting operation.

12.1.5 The arrangements and equipment referred to in this chapter are to be examined and tested under working conditions on completion of the installation and subsequently annual survey.

12.2 Fire-fighting Characteristics

12.2.1 For ships having the service notation **Fire-fighting Ship 1, 2** or **3**, the minimum fire-fighting characteristics are to be in accordance with the requirements given in Table III 12-1.

12.2.2 Where the water monitor pumps are used for water spray protection system, Their capacity is to be sufficient to ensure the simultaneous operation of both systems at the required performance.

12.2.3 The length and height of throw are to be achieved with the required number of monitors operating simultaneously in the same direction.

12.2.4 Length of throw is to be measured horizontally from the monitor outlet to the mean impact area. Height of throw is to be measured from the sea level, the mean impact area being at a distance of at least 70 m from the nearest part of the ship.

Table III 12-1
Minimum Fire-Fighting Characteristics

Equipment \ Notation	Fire-fighting Ship			
	1	2		3
Water monitor system				
Number of fire-fighting pumps	1	2		2
Total pump capacity, m^3/h	2400	7200		9600
Number of water monitors	2	3	4	4
Discharge rate per monitor, m^3/h	1200	2400	1800	2400
Length of throw of each monitor, m	120	150		150
Height of throw of each monitor, m	45	70		70
Number of hydrants at each side	4	8		8
Foam monitor system				
Number of foam monitors	-	-		2
Height of throw of each monitor, m	-	-		50
Discharge rate per monitor, m^3/h	-	-		300
Foam capacity, min	-	-		30
Concentrated rate	-	-		5%
Foam expansion ratio	-	-		<12
Others				
Number of fireman's outfits	4	8		8

12.3 Constructions

12.3.1 The structure of the ship is to be strengthened as necessary to withstand the forces imposed by the fire extinguishing systems when operating at their maximum capacity.

12.3.2 The seating of the monitors are to be of adequate strength for all modes of operation.

12.3.3 Sea suctions for fire-fighting pumps are not to be used for other purposes; they are to be arranged as low as practicable to avoid icing, debris clogging or the ingress of oil from the surface of the sea.

12.3.4 Sea water inlets are to be fitted with strainers having a free passage area of at least twice that of sea suction valve. Efficient means are to be provided such as low-pressure steam or compressed air connection for cleaning purposes.

12.3.5 Two searchlights are to be provided for illuminating the fire-fighting targets at night capable of providing 50 lux illumination within an area of not less than 11 m diameter at a range of 250 m in clear atmosphere. They are to be capable of being adjusted in horizontal and vertical direction.

12.4 Fire-fighting Systems

12.4.1 The pumps and their piping system which are intended for serving the monitors are not to be used for services other than fire-extinguishing and water spraying. They are to be provided with independent sea inlets.

12.4.2 Sea water suction valve, water delivery valve and pump are to be operated from the same position. Valves with a nominal diameter exceeding 450 mm are to be provided with a power actuation system in addition to manual operation device.

12.4.3 The piping system from the pumps to the water monitor is to be separate form piping system to the hydrants and fire hoses for portable fire-fighting equipment.

12.4.4 Where the water monitor pumps are also used for the water-spraying system, it is to be possible to segregate these two systems by means of a valve. Where the pumps are exclusively used for fixed water spray systems, the piping is to be independent of that supplying the monitors. The water spray systems are to be adequately protected against overpressure.

12.4.5 Monitors are to be of an approved type with robust construction capable of withstanding the reaction forces of the water jet and capable of throwing continuous water jets in full capacity without significant pulsation.

12.4.6 The monitors are to be so arranged that the required direction, range and height of trajectory can be achieved separately, with the required number of monitors operating simultaneously.

12.4.7 Monitors are to be capable of being activated and maneuvered by remote control from a protected position having adequate visibility of the monitors and the operation area of the water jets.

12.4.8 Local manual control is to be arranged for each monitor. It is to be possible to disconnect the local manual control from the remote control station and, disconnect the remote control system at each monitor to allow operation with local manual control.

12.4.9 The maximum design water velocity is normally not to exceed 4 m/s in the piping between pump and water monitor.

12.4.10 Ships having the service notation **Fire-fighting Ship 3**, are to be fitted with two foam monitors, each having a foam solution capacity not less than 300 m^3/h. The height of throw is to be at least 50 m above the sea level, when both monitors are in operation at the maximum foam production rate.

12.4.11 Foam concentrate is to be sufficient for at least 30 minutes of simultaneous operation of both monitors at maximum capacity with assumed concentrated rate of 5%. The foam expansion ratio is not to exceed 12.

12.4.12 Pumps of the water monitor system may be used for supplying water to the foam system. In such case, it may be necessary to reduce the pump water delivery pressure to ensure correct water pressure for maximum foam generation.

12.4.13 Each hydrant is to be provided with a hose and a nozzle. The hoses are to be of 38 to 70 mm in diameter and generally are to be 15 to 20 m in length. The nozzles are to be of dual-purpose type capable of producing a jet or a spray or simultaneously a compound of jet and spray.

12.5 Fire Protection

12.5.1 Ships which are intended to operate in close proximity to a large fire will require protection from the heat radiated from the fire. Such protection may be afforded by a system which provides a water spray over the surface of the ship, or by a combination of insulation and a water spray system.

12.5.2 The water spray system is to be a fixed system which is capable of delivering a spray of water over all the exposed external vertical surfaces of the hull in the lightest sea-going condition, including the superstructures and deckhouses and over the monitor position. The water spray system will also be required to cover the areas of deck which form the crowns of machinery spaces and other spaces containing combustible material.

12.5.3 The system is to have a capacity of 10 liters/min per m^2 of the protected area of insinuated steel and 5 litters/min per m^2 of the protected area which is insulated internally to A-60 standard.

12.5.4 The system is to be divided into sections, so that it will be possible to close down sections covering surfaces which are not exposed to radiant heat.

12.5.5 The nozzles are to be arranged to give an even distribution of water spray over the protected area.

12.5.6 The pumping capacity is to be sufficient to supply simultaneously at the required pressure the sections which serve the maximum area which may be exposed to radiant heat from a fire. If the main fire pumps are used for this purpose, they are to be capable of operating this system and the monitors and hydrants simultaneously at the required pressures.

12.5.7 Deck scuppers and freeing ports are to be of sufficient area to ensure efficient drainage of water from decks and horizontal surfaces in all conditions when the water spray system is in operation.

12.5.8 In ships which are not provided with a water spray system, all windows and port lights are to be provided with efficient deadlights or external steel shutters, except in the wheelhouse.

12.6 Fireman's Outfits

12.6.1 The number of fireman's outfits is to be in accordance with Table III 12-1. They are to be stored in a safe position which is readily accessible from the open deck.

12.6.2 The composition of a fireman's outfit is to be as follows:

(a) Protective clothing of material to protect the skin from heat radiating from the fire and from burns and scalding by steam. The outer surface is to be water-resistant.

(b) Boots and gloves of rubber or other electrically non-conducting material.

(c) A rigid helmet providing effective protection against impact.

(d) An electric safety lamp (hand lantern) of an approved type with a minimum operating period of three hours.

(e) An axe having an insulated handle.

(f) A self-contained breathing apparatus, which is to be capable of functioning for a period of at least 30 minutes and having a capacity of at least 1200 liters of free air. Spare, fully charged air bottles are to be provided at the rate of at least one set per required apparatus.

(g) For each breathing apparatus, a fireproof lifeline of sufficient length and strength is to be provided capable of being attached by means of a snap-hook to the harness of the apparatus or to a separate belt, in order to prevent the breathing apparatus becoming detached when the life-line is operated.

12.6.3 A suitable air compressor for recharging the bottles used in the breathing apparatus of the fireman’s outfits is to be provided. It is to be capable of recharging the bottles of the breathing apparatus required to be carried in a time not exceeding 30 minutes.

12.7 Inspections and Tests

12.7.1 Materials and machinery systems used for fire-fighting system including pumps, pipes, valves and other accessories are to be inspected and test in accordance with relevant requirement of the Rules.

12.7.2 The piping systems are to be submitted to a hydrostatic test after completion of manufacturing and before installation.

12.7.3 After assembly on board, the water fire-fighting system and the fixed foam fire-extinguishing system are to be check for leakage at normal operating pressure.

12.7.4 The water fire-fighting system and the fixed foam fire-extinguishing system are to undergo an operation test on board ship, to check characteristics and performance.

12.7.5 Maneuvering capability test of the ship with all water monitors in service is to be performed to demonstrate the control of main propulsion system and side thrusters to maintain the ship in position without requiring more than 80% of the propulsion power.

Chapter 13

Offshore Service Unit

13.1 General

This Chapter applies to units classed in accordance with the provisions in Chapter 1 of Part I and built for the purpose of ocean service.

Units complying with the requirements of this Chapter are to be assigned a notation of "**Offshore Service Unit**" and a notation of unit type,"**Self-Propelled Unit**", "**Non Self-Propelled Unit**" or "**Self-Elevating Unit**", as defined in 13.1.1.

Alternatives equivalent to the Rules may be accepted subject to the discretion of the Society.

13.1.1 Definitions

(a) General

For the purpose of this Chapter, the terms have the following meaning unless stated otherwise.

(i) Unit

A mobile offshore structure or vessel, whether designed for operation afloat or supported on sea bed.

(ii) Self-Propelled Unit

A unit designed with means of propulsion capable of propelling the unit during long distance ocean transits without external assistance.

(iii) Non-Self-Propelled Unit

A unit that is not a self-propelled unit. Units with machinery used exclusively for positioning, unassisted short field moves as allowed by the Flag Administration and/or Coastal State and to provide assistance during towing operations may be considered non-self-propelled units.

(b) Types of Unit

(i) Self-Elevating Unit

A unit with movable legs capable of raising its hull above the surface of the sea and lowering it back into the sea.

The hull has sufficient buoyancy to transport the unit to the desired location. Once on location, the hull is raised to a predetermined elevation above the sea surface on its legs, which are supported by the sea bed.

The legs of such units may be designed to penetrate the sea bed, may be fitted with enlarged sections or footings, or may be attached to a bottom mat.

(ii) Other Types of Unit

A unit does not fall into any of the above categories.

(c) Water Depth

The Water Depth is the vertical distance from the sea bed to the nominal water level plus the height of the astronomical and storm tides.

(d) Molded Base Line

The Molded Base Line is a horizontal line through the upper surface of the bottom shell, lower hull bottom shell or caisson bottom shell.

(e) Bulkhead Deck

The Bulkhead Deck in the case of self-elevating units is the highest deck to which watertight bulkheads extend and are made effective.

(f) Freeboard Deck

The Freeboard Deck in the case of self-elevating units is normally the uppermost continuous deck having permanent means of closing all openings.

(g) Lightweight

Lightweight is the displacement of the complete unit with all of its machinery, equipment and outfit, including permanent ballast, required spare parts and liquids in machinery and piping to their working levels but without liquids in storage or reserve supply tanks, items of consumable or variable loads, stores or crews and their effects.

(h) Total Elevated Load

The Total Elevated Load of a Self-Elevating Unit is the combination of:

(i) The lightweight as specified in 13.1.1(g), but excluding the weight of the legs and spud cans,

(ii) All shipboard and equipment and associated piping,

(iii) Liquid variables,

(iv) Solid variables, and

(v) Combined loads

(i) Mode of Operation

A Mode of Operation is a condition or manner in which a unit may operate or function while on location or in transit and includes the following.

(i) Normal Operating Condition

A Normal Operating Condition is a condition wherein a unit is on location to operate, and combined environmental and operational loading are within the appropriate design limits established for such operations. The unit may be either afloat or supported by the sea bed.

(ii) Severe Storm Condition

A Severe Storm Condition is a condition wherein a unit may be subjected to the most severe environmental loadings for which it was designed. During the severe storm condition, it may be necessary to discontinue operations due to the severity of the environmental loadings. The unit may be either afloat or supported by the sea bed.

(iii) Transit Conditions

Transit Conditions are all unit movements from one geographical location to another.

(j) Weathertight

Weathertight means that in any sea condition associated with the mode of operation, water will not penetrate into the unit.

(k) Watertight

Watertight means the capability of preventing the passage of water through the structure in any direction under a head of water for which the surrounding structure is designed.

(l) System of Measurement

These Rules are written in system of SI units.

(m) Service Temperature

The service temperature of the unit refers to the minimum temperature of the steel in all modes of operation and is to be taken as the lowest mean daily average air temperature based on available meteorological data for anticipated areas of operation.

13.1.2 Environmental Loadings

(a) General

A unit's modes of operation should be investigated using anticipated loads, including gravity and functional loads together with relevant environmental loads due to the effects of wind, waves, currents, and where deemed necessary by the Owner or designer, the effects of earthquake, sea bed supporting capabilities, ambient temperature, fouling, ice, etc. Where applicable, the loads indicated herein are to be adhered to for all types of offshore service unit. The Owner is to specify the environmental conditions for which the plans for the unit are to be approved. These design environmental conditions are to be recorded in the Operating Manual.

(b) Wind Loadings

(i) General

The minimum wind velocity for unrestricted offshore service for all normal operating and transit conditions is not to be less than 36 m/s (70 kn). All units in unrestricted offshore service are to have the capability to withstand a severe storm condition wherein a wind velocity of not less than 51.5 m/s (100 kn) is assumed. In order to comply with a severe storm condition, all units are to show compliance with this requirement at all times or have the capability to change their mode of operation. The steps to be taken to comply with the 51.5 m/s (100 kn) criteria from the 36 m/s (70 kn) criteria are the responsibility of the Owner. Units which, due to intended limited service, are not designed to meet the above criteria may be considered for restricted service classification. For any restricted classification, the minimum wind velocity is to be taken at not less than 25.7 m/s (50 kn).

(ii) Wind Pressure

In the calculation of wind pressure, P, the following equation is to be used and the vertical height is to be subdivided approximately in accordance with the values listed in Table III 13-2

$$P = f V_k^2 C_h C_s \quad N/m^2$$

where:

f = 0.611

V_k = Wind velocity in m/s

C_h = Height coefficient from Table III 13-2

C_s = Shape coefficient from Table III 13-1

Table III 13-1
Values of C_s

Spherical	0.4
Cylindrical shapes (all sizes)	0.5
Hull (surface-type)	1.0
Deck house	1.0
Isolated Structural shapes (cranes, angles, channels, beams, etc.)	1.5
Wires	1.2
Under deck areas (smooth surfaces)	1.0
Under deck areas (exposed beams and girders)	1.3
Small parts	1.4
Rig derrick (each face)	1.25
Note: Shapes or combinations of shapes which do not readily fall into the specified categories will be subject to special consideration.	

Table III 13-2
Values of C_h

Height (m)	C_h
0.0–15.3	1.00
15.3–30.5	1.10
30.5–46.0	1.20
46.0–61.0	1.30
61.0–76.0	1.37
76.0–91.5	1.43
91.5–106.5	1.48
106.5–122.0	1.52
122.0–137.0	1.56
137.0–152.5	1.60
152.5–167.5	1.63
167.5–183.0	1.67
183.0–198.0	1.70
198.0–213.5	1.72
213.5–228.5	1.75
228.5–244.0	1.77
244.0–259.0	1.79
259.0 and above	1.80
Note: The height, h, in m, is the vertical distance from the design water surface to the center of area, A, defined in 13.1.2(iii)	

(iii) Wind Force

The wind force, F, is to be calculated in accordance with the following equation for each vertical area and the resultant force and vertical point of application is to be determined.

$$F = P A$$

where

F = Force, in N

P = Pressure, in N/m^2

A = Projected area, in m^2, of all exposed surfaces in either the upright or heeled condition

In calculating the wind forces, the following procedures are recommended:

(1) In the case of units with columns, the projected areas of all columns are to be included (i.e., no shielding allowance is to be taken).

(2) Areas exposed due to heel, such as underdecks, etc., are to be included using the appropriate shape coefficients.

(3) The block projected area of a clustering of deck houses may be used in lieu of calculating each individual area. The shape coefficient may be assumed to be 1.1.

(4) Isolated houses, structural shapes, cranes, etc., are to be calculated individually using the appropriate shape coefficient from Table III 13-1.

(5) Open truss work commonly used for derrick towers, booms and certain types of masts may be approximated by taking 30% of the projected block areas of both the front and back sides, i.e., 60% of the projected block area of one side for double sided truss work. The shape coefficient is to be taken in accordance with Table III 13-1.

(c) Wave Loadings

(i) General

Wave criteria specified by the Owner may be described by means of wave energy spectra or by deterministic waves having shape, size and period appropriate to the depth of water in which the unit is to operate. Waves are to be considered as coming from any direction relative to the unit. Consideration is to be given to waves of less than maximum height where due to their period, the effects on various structural elements may be greater.

(ii) Determination of Wave Loads

The determination of wave loads for use in structural design is to be based on acceptable calculations, model tests or full scale measurements. For structures comprised of slender members which do not significantly alter the incident wave field, semi-empirical formulations such as Morison's equation may be used. For calculations of wave loads on structural configurations which significantly alter the incident wave field, diffraction methods are to be used which account for both the incident wave force (i.e., Froude-Krylov force) and the forces resulting from wave diffraction and radiation.

In general, Morison's equation may be used for structures comprised of slender members the diameters (or equivalent diameters giving the same cross-sectional areas parallel to the flow) of which are less than 20% of the wave lengths being considered and are small in relation to the distances between structural members subject to wave loading (e.g., self-elevating units in the elevated condition.).

For each combination of wave height, wave period and water depth being considered, a range of wave crest positions relative to the structure is to be investigated to ensure an accurate determination of the maximum wave force on the structure.

(iii) Morison's Equation

The hydrodynamic force acting normal to the axis of a cylindrical member, as given by Morison's equation, is expressed as the sum of the force vectors indicated in the following equation:

$$F_w = F_D + F_I$$

where

F_w = Hydrodynamic force vector per unit length along the member, acting normal to the axis of the member.

F_D = Drag force vector per unit length

F_I = Inertia force vector per unit length

The drag force vector per unit length for a stationary, rigid member is given by:

$$FD = (C/2)\ D\ C_D\ u_n\ |u_n| \quad \text{kN/m}$$

where

C = 1.025

D = Projected width, in m, of the member in the direction of the cross-flow component of velocity (in the case of a circular cylinder, D denotes the diameter)

C_D = Drag coefficient (dimensionless)

u_n = Component of the velocity vector, normal to the axis of the member, in m/s

$|u_n|$ = Absolute value of u_n, in m/s

The inertia force vector per unit length for a stationary, rigid member is given by:

$$F_I = C\,(\pi D^2/4)\,C_M\,a_n \quad \text{kN/m}$$

where

C_M = Inertia coefficient based on the displaced mass of fluid per unit length (dimensionless)

a_n = Component of the fluid acceleration vector normal to the axis of the member, in m/s^2

For structures which exhibit substantial rigid body oscillations due to wave action, the modified form of Morison's equation given below may be used to determine the hydrodynamic force.

$$F_w = F_D + F_I$$
$$= (C/2)\,D\,C_D\,(u_n - u_n')\,|u_n - u_n'| + C\,(\pi D^2/4)a_n + C\,(\pi D^2/4)\,C_m\,(a_n - a_n')$$

where

u_n' = Component of the velocity vector of the structural member normal to its axis, in m/s

C_m = Added mass coefficient (i.e., $C_m = C_M - 1$)

a_n' = Component of the acceleration vector of the structural member normal to its axis, in m/s^2

For structural shapes other than circular cylinders, the term $\pi D^2/4$ in the above equations is to be replaced by the actual cross-sectional area of the shape.

Values of u_n and a_n for use in Morison's equation are to be determined using wave theories appropriate to the wave heights, wave periods and water depths being considered. Drag and inertia coefficients vary considerably with section shape. Reynold's number, Keulegan-Carpenter number and surface roughness are to be based on reliable data obtained from literature, model or full scale tests. For circular cylindrical members at Reynold's numbers greater than 1×10^6, C_D and C_M may be taken at 0.62 and 1.8, respectively, provided that marine fouling is prevented or periodically removed.

(d) Current Loading

(i) Current Associated with Waves

When determining loads due to the simultaneous occurrence of waves and current using Morison's equation, the current velocity is to be added vectorially to the wave particle velocity before the total force is computed. When diffraction methods are used for calculating wave force, the drag force due to current should be calculated in accordance with 13.1.2(d)(ii) and added vectorially to the calculated wave force.

The current velocity is to include components due to tidal current, storm surge current and wind driven current. In lieu of defensible alternative methods, the vertical distribution of current velocity in still water and its modification in the presence of waves, as shown in Fig. III 13-1, are recommended,

where

$V_c = V_t + V_s + V_w\,[(h - z)/h]$, for $z \le h$

$V_c = V_t + V_s$ for $z > h$

where

V_c = Current velocity, m/s

V_t = Component of tidal current velocity in the direction of the wind, m/s

V_s = Component of storm surge current, m/s

V_w = Wind driven current velocity, m/s

h = Reference depth for wind driven current, m . (in the absence of other data, h may be taken as 5 m .

z = Distance below still water level under consideration, m

d = Still water depth, m

In the presence of waves, the current velocity profile is to be modified, as shown in Fig. III 13-1, such that the current velocity at the instantaneous free surface is a constant.

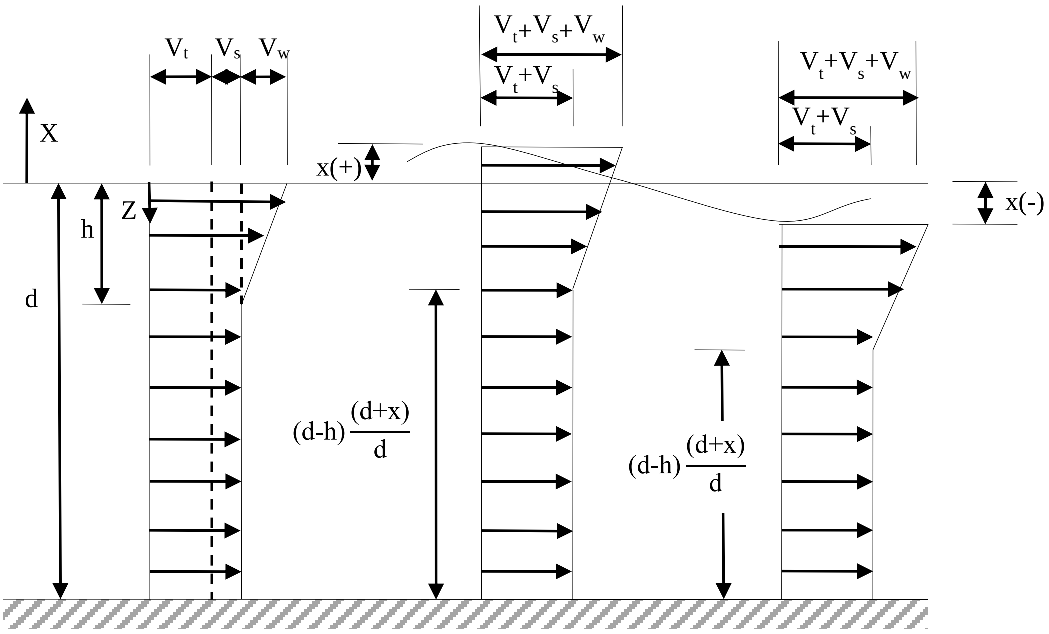

Fig. III 13-1
Current Velocity Profile

(ii) Drag Force

When calculating the drag force on submerged parts of the structure due to current alone, the following equation may be used.

$$f_D = C/2\ D\ C_D\ u_c\ |u_c|$$

where

f_D = Current drag force vector per unit length along the member, acting normal to the axis of the member in kN/m

u_c = Component of the current velocity vector, V_c, normal to the axis of the member

C, D and C_D are as defined in 13.1.2 (c)(iii)

All of the above values are to be taken in a consistent system of units, C_D being dimensionless. Drag coefficients in steady flow vary considerably with section shape, Reynold’s number and surface roughness and are to be based on reliable data obtained from literature, model or full scale tests.

(e) Loadings due to Vortex Shedding

Consideration is to be given to the possibility of flutter of structural members due to vortex shedding.

(f) Gravity and Functional Loads

(i) General

The gravity loads are steel, equipment and outfitting weights, liquid and solid variables, and live loads and should be taken into account in the design of the structural strength and stability. The load effects due to operations should also be taken into account.

(ii) Combinations of Gravity and Functional Loads for Design

For all modes of operation, the combinations of gravity and function loads are to be specified by the Owners or Designers as per the operations designed. However, maximums (or minimums) of the combinations that produce the most unfavorable load effects in the strength or stability of the unit should be taken for design.

(iii) Deck Loadings

A loading plan is to be prepared for each design. This plan is to show the maximum uniform and concentrated loadings to be considered for all areas for each mode of operation. In the preparation of this plan, the following loadings are to be considered as minimums.

Crew spaces (walkways, general traffic areas, etc.)	:	4510 N/m^2	or 0.64 m	head
Work areas	:	9020 N/m^2	or 1.28 m	head
Storage areas	:	13000 N/m^2	or 1.84 m	head

13.2 Hull Structures and Arrangements

13.2.1 Structural Analysis

(a) Structural Analysis

(i) Analysis of Primary Structure

The primary structure of the unit is to be analyzed using the loading conditions stipulated below and the resultant stresses are to be determined. To determine critical cases, conditions representative of all modes of operation are to be considered. Calculations for critical conditions are to be submitted for review. The analysis is to be performed using recognized calculation methods and is to be fully documented and referenced.

For each loading condition considered, the following stresses are to be determined, and are not to exceed the allowable stresses given in 13.2.1(b).

(1) Stresses due to static loadings only, where the static loads include operational gravity loadings and weight of the unit, with the unit afloat or resting on the sea bed in calm water.

(2) Stresses due to combined loadings, where the applicable static loads in 13.2.1(a)(i)(1) are combined with relevant environmental loadings, including acceleration and heeling forces.

(ii) Consideration of Local Stresses

Local stresses are to be combined with primary stresses, where applicable, to determine total stress levels.

(iii) Combination of Stress Components

The scantlings are to be determined on the basis of a method included in a recognized standard which combines the individual stress components acting on the various structural elements of the unit.

(iv) Consideration of Buckling

The possibility of buckling of structural elements is to be considered.

(v) Determination of Bending Stresses

(1) Effective Flange Area

The required section modulus of members such as girders, webs, etc., supporting frames and stiffeners is to be obtained on an effective width of plating basis in accordance with the following criteria. The section is to include the structural member in association with an effective width of plating not exceeding one-half the sum of spacing on each side of the member or 33% of the unsupported span, whichever is less. For girders and webs along hatch openings, an effective breadth of plating not exceeding one-half the spacing or 16.5% of the unsupported span *l*, whichever is less, is to be used. The required section modulus of frames and stiffeners is assumed to be provided by the stiffener and a maximum of one frame space of the plating to which it is attached.

(2) Eccentric Axial Loading

Where appropriate, elastic deflections are to be taken into account when determining the effects of eccentricity of axial loading, and the resulting bending moments are to be superimposed on the bending moments computed for other types of loadings.

(vi) Determination of Shear Stresses

When computing shear stresses in structural members, only the effective shear area of the web of the member is to be considered as being effective. In this regard, the total depth of the member may be used as the web depth.

(vii) Stress Concentration

The effect of notches, stress raisers and local stress concentrations is to be taken into account when considering load carrying elements. When stress concentrations are considered to be of high intensity in certain elements, the acceptable stress levels will be subject to special consideration.

(viii) Analysis and Details of Structural Connections

Unless connections of structural members are specifically detailed as hinged joints, proper consideration is to be given in the structural analysis to the degree of restraint at such connections. Structural connections are to be detailed in such a manner as to ensure full transmission of stresses between members joined, and to minimize stress concentrations. The following details are to be considered, as may be appropriate.

(1) Shear web plates, continuous through the joint, to transmit tension and compression loads between members by means of shear in the web plate

(2) Flaring or transitioning of the joint, to lower stress levels or to minimize concentrations of stress or both

(3) Thicker joint material, high strength steel, or both, consistent with good weldability, to reduce the effect of high stress levels

(4) Brackets or other supplemental transition members, with scallops and proper end attachment details to minimize high stress concentrations

Critical connections that depend upon the transmission of tensile stresses through the thickness of the plating of one of the members may result in lamellar tearing and are to be avoided wherever possible. Where unavoidable, plate material with suitable through-thickness (Z direction) properties may be required with appropriate inspection procedures.

(ix) Fatigue Analysis

The possibility of fatigue damage due to cyclic loading is to be considered in the design of the major structure of self-elevating units.

The type and extent of the fatigue analysis will be dependent on the intended mode and areas of operations to be considered in the unit’s design. An appropriate loading spectrum, in accordance with accepted theories, is to be used in the fatigue analysis.

The calculated fatigue life of the structure should be at least the design life of the unit, but not less than 20 years.

(x) Plastic Analysis

Plastic analysis methods will be subject to special consideration.

(b) Allowable Stresses

(i) General

The scantlings of effective structural elements of the primary frame of the unit, analyzed in accordance with 13.2.1(a), are to be determined on the basis of the allowable stresses specified herein for self-elevating units.

(ii) Individual Stresses

Individual stress components and, as applicable, direct combinations of such stresses are not to exceed the allowable stress F, as obtained from the following equation.

$F = F_y / F.S.$

where

F_y = Specified minimum yield point or yield strength.

F.S. = Factor of safety

For static loadings, as defined in 13.2.1 (a)(i)(1)

= 1.67 for axial or bending stress

= 2.50 for shear stress

For combined loadings, as defined in 13.2.1 (a)(i)(2)

= 1.25 for axial or bending stress

= 1.88 for shear stress

(iii) Buckling Considerations

Where buckling of a structural element due to compressive or shear stresses, or both, is a consideration, the compressive or shear stress is not to exceed the corresponding allowable stress, F, as obtained from the following equation.

$F = F_{cr} / F.S.$

where

F_{cr} = Critical compressive or shear buckling stress of the structural element, appropriate to its dimensional configuration, boundary conditions, loading pattern, material, etc.

F.S. = Factor of safety

= 1.67 for static loadings, as defined in 13.2.1 (a)(i)(1)

= 1.25 for combined loadings, as defined in 13.2.1 (a)(i)(2)

(iv) Members Subjected to Combined Axial Load and Bending

(1) When structural members are subjected to axial compression in combination with compression due to bending, the computed stresses are to comply with the following requirements:

when $f_a / F_a \leq 0.15$ $(f_a / F_a) + (f_b / F_b) \leq 1.0$

when $f_a / F_a > 0.15$ $(f_a / F_a) + C_m f_b / ((1 - f_a / F_e') F_b) \leq 1.0$

and in addition, at ends of members:

$1.67 (f_a / F_y) + (f_b / F_b) \leq 1.0$ for static loadings, as defined in 13.2.1 (a)(i)(1)

$1.25 (f_a / F_y) + (f_b / F_b) \leq 1.0$ for combined loadings, as defined in 13.2.1 (a)(i)(2)

(2) When structural members are subjected to axial tension in combination with tension due to bending, the computed stresses are to comply with the following requirements:

$f_a + f_b \leq F_y / 1.67$ for static loadings, as defined in 13.2.1 (a)(i)(1)

$f_a + f_b \leq F_y / 1.25$ for combined loadings, as defined in 13.2.1 (a)(i)(2)

However, the computed bending compressive stress, f_b, taken alone shall not exceed F_b.

where

f_a = Computed axial compressive or tensile stress

f_b = Computed compressive or tensile stress due to bending

F_a = Allowable axial compressive stress, which is to be the least of the following:

- Yield stress divided by factor of safety for axial stress specified in 13.2.1(b)(ii)
- Overall buckling stress divided by factor of safety specified in 13.2.1(b)(v)(1)

- Local buckling stress divided by factor of safety for axial stress specified in 13.2.1(b)(v)(2)

F_b = Allowable axial compressive stress due to bending, determined by dividing the Yield stress or local buckling stress, whichever is less, by the factor of safety Specified in 13.2.1(b)(ii)

F_e' = $5.15\ E / (K\ l / r)^2$

F_e' = Euler buckling stress, may be increased 1/3 for combined loadings, as defined in 13.2.1(a)(i)(2)

E = Modulus of Elasticity

l = Unsupported length of column

K = Effective length factor which accounts for support conditions at ends of length l. For cases where lateral deflection of end supports may exist, K is not to be considered less than 1.0.

r = Radius of gyration

C_m = Is a coefficient as follows

- For compression members in frames subject to joint translation (sideways), $C_m = 0.85$
- For restrained compression members in frames braced against joint translation and not subject to transverse loading between their supports, in the plane of bending,
  $C_m = 0.6 - 0.4\ (M_1 / M_2)$
  but not less than 0.4, where M_1/M_2 is the ratio of the smaller to larger moments at the ends of that portion of the member unbraced in the plane of bending under consideration. M_1/M_2 is positive when the member is bent in reverse curvature and negative when it is bent in single curvature.
- For compressive members in frames braced against joint translation in the plane of loading and subject to transverse loading between their supports, the value of C_m may be determined by rational analysis. However, in lieu of such analysis, the following values may be used. for members whose ends are restrained,
  $C_m = 0.85$;
  for members whose ends are unrestrained,
  $C_m = 1$.

(v) Column Buckling Stresses

(1) Overall Buckling

For compression members which are subject to overall column buckling, the critical buckling stress is to be obtained from the following equations.

$F_{cr} = F_y - (F_y^2/4\pi^2 E)(K\ l / r)^2$ when $K\ l / r < \sqrt{(2\pi^2 E)/F_y}$

$F_{cr} = \pi^2 E / (K\ l / r)^2$ when $K\ l / r \geq \sqrt{(2\pi^2 E)/F_y}$

where

F_{cr} = Critical overall buckling stress

F_y = As defined in 13.2.1(b)(ii)

E, K, l, r are defined in 13.2.1(b)(iv)(2).

The factor of safety for overall column buckling is to be as follows.

For static loading, as defined in 13.2.1(a)(i)(1)

$$F.S. = 1.67\left[1 + 0.15\frac{\frac{Kl}{r}}{\sqrt{(2\pi^2 E)/F_y}}\right] \quad \text{when } K\ l / r < \sqrt{(2\pi^2 E)/F_y}$$

F.S. = 1.92 when $K l / r \geq \sqrt{(2\pi^2 E)/F_y}$

For combined loadings, as defined in 13.2.1(a)(i)(2)

$$F.S. = 1.25\left[1 + 0.15\frac{\frac{Kl}{r}}{\sqrt{(2\pi^2 E)/F_y}}\right] \quad \text{when } K l / r < \sqrt{(2\pi^2 E)/F_y}$$

F.S. = 1.44 when $K l / r \geq \sqrt{(2\pi^2 E)/F_y}$

(2) Local Buckling

Members which are subjected to axial compression or compression due to bending are to be investigated for local buckling, as appropriate, in addition to overall buckling, as specified in 13.2.1(b)(v)(1).

In the case of unstiffened or ring-stiffened cylindrical shells, local buckling is to be investigated if the proportions of the shell conform to the following relationship.

$D / t > E / 9 F_y$

where

D = Mean diameter of cylindrical shell

t = Thickness of cylindrical shell (expressed in the same units as D)

E and F_y are defined in 13.2.1(b)(v)(1).

(vi) Equivalent Stress Criteria for Plated Structures

For plated structures, members may be designed according to the von Mises equivalent stress criterion, where the equivalent stress σ_{eqv}, defined as follows, is not to exceed Fy/F.S.

$$\sigma_{eqv} = \sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x\sigma_y + 3\tau_{xy}^2}$$

where

σ_x = Calculated in-plane stress in the x direction

σ_y = Calculated in-plane stress in the y direction

τ_{xy} = Calculated in-plane shear stress

F_y = As defined in 13.2.1(b)(ii)

F.S. = 1.43 for static loading, as defined in 13.2.1(a)(i)(1)

= 1.11 for combined loading, as defined in 13.2.1(a)(i)(2)

Note: The Factor of Safety will be specially considered when the stress components account for surface stresses due to lateral pressures.

The buckling strength of plated structures is to be designed according to the recognized standard acceptable to the Society.

13.2.2 Watertight Bulkheads and Watertight Flats

(a) General

Watertight bulkheads and flats are to be in accordance with this section. In all cases, the plans submitted are to clearly indicate the location and extent of the watertight bulkheads and watertight flats.

For self-elevating units, the watertight bulkheads and watertight flats are to comply with the applicable requirements of Part II of the Rules.

(b) Plating

The plating thickness of watertight bulkheads and watertight flats is not to be less than that obtained from the following equation.

$$t = \frac{sk\sqrt{qh}}{290} + 1.5 \quad \text{mm}$$

but not less than 6 mm or s / 200 + 2.5 mm, whichever is greater.

where

t = Thickness, in mm

s = Spacing of stiffeners, in mm

k = $(3.075\sqrt{\alpha} - 2.077) / (\alpha + 0.272)$ for $1 \le \alpha \le 2$

= 1.0 for $\alpha > 2$

α = Aspect ratio of the panel (longer edge/shorter edge)

q = 235 / Y

Y = Specified minimum yield point or yield strength, in N/mm^2, or 72% of the specified minimum tensile strength, whichever is the lesser

h = Distance, in m, from the lower edge of the plating to the bulkhead deck at center.

(c) Stiffeners and Beams

The section modulus, SM, of each bulkhead stiffener or beam on a watertight flat, in association with the plating to which it is attached, is not to be less than that obtained from the following equation:

$$SM = f\ c\ h\ s\ l^2 \quad \text{cm}^3$$

where

f = 7.8

c = For units with a length of 61 m and greater

= 0.56 for stiffeners with ends attached

0.60 for stiffeners with no end attachment

h = Distance, in m, from the middle of *l* to the bulkhead deck at center; where the distance is less than 6.1 m, h is to be taken as 0.8 times the distance in m plus 1.22.

s = Spacing of stiffeners, in m

l = Length of stiffeners, in m; where brackets are fitted with a slope of approximately 45 degrees and thickness given in Table III 13-2, the length of *l* may be measured to a point on the bracket equal to 25% of the length of the bracket.

For units under 45 m in length, the above values for c may be 0.46 and 0.58, respectively, and h may be taken as the distance in m from the middle of *l* to the bulkhead deck at center. For units between 45 and 61 m in length, interpolated values for c may be used.

Table III 13-3
Thickness and Flange Width of Brackets and Knees

Depth of Longer Arm (mm)	Thickness		Flange Width (mm)
	Plain (mm)	Flanged (mm)	
150	6.5		
175	7.0		
200	7.0	6.5	30
225	7.5	6.5	30
250	8.0	6.5	30
275	8.0	7.0	35
300	8.5	7.0	35
325	9.0	7.0	40
350	9.0	7.5	40
375	9.5	7.5	45
400	10.0	7.5	45
425	10.0	8.0	45
450	10.5	8.0	50
475	11.0	8.0	50
500	11.0	8.5	55
525	11.5	8.5	55
550	12.0	8.5	55
600	12.5	9.0	60
650	13.0	9.5	65
700	14.0	9.5	70
750	14.5	10.0	75
800		10.5	80
850		10.5	85
900		11.0	90
950		11.5	90
1000		11.5	95
1050		12.0	100
1100		12.5	105
1150		12.5	110
1200		13.0	110
Note: The thickness of brackets is to be increased in cases where the depth at throat is less than two-thirds of the knee.			

(d) Corrugated Bulkheads

(i) Plating

The plating thickness of corrugated bulkheads is to be as required by 13.2.2(b), with the following modification. The spacing to be used is the greater of the dimensions a or c as indicated in Fig. III 13-2. The angle ϕ is to be 45 degrees or greater.

(ii) Stiffeners

The section modulus of a corrugated bulkhead, as a stiffener, is to be as required by 13.2.2(c) using the coefficient c = 0.56. The developed section modulus, SM, may be obtained from the following equation, where a, t and d are as indicated in Fig. III 13-2, in cm.

$$SM = t\,d^2 / 6 + a\,d\,t / 2$$

The above equation is only valid for identical corrugations at both sides of the bulkhead. For other arrangements, the developed section modulus will be specially considered. The spacing of stiffeners in connection with the above equation is to be taken as a + b as indicated in Fig. III 13-2.

(iii) End Connections

The structural arrangements and size of welding at the ends of corrugations are to be designed to develop the required strength of corrugated stiffeners. Joints within 10% of the depth of corrugation from the outer surface of corrugation, d_1, are to have double continuous welds with fillet weld leg size w not less than 0.7 times the thickness of bulkhead plating or penetration welds of equal strength. See Fig. III 13-3.

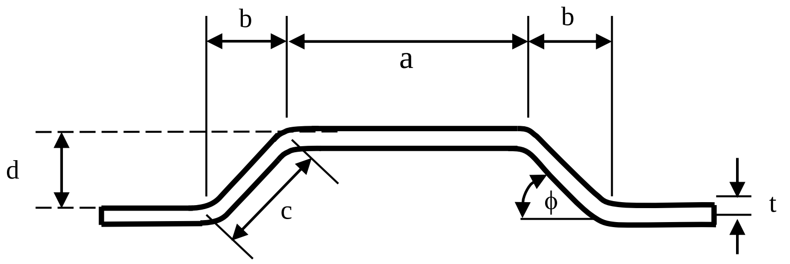

Fig. III 13-2
Corrugated Bulkhead

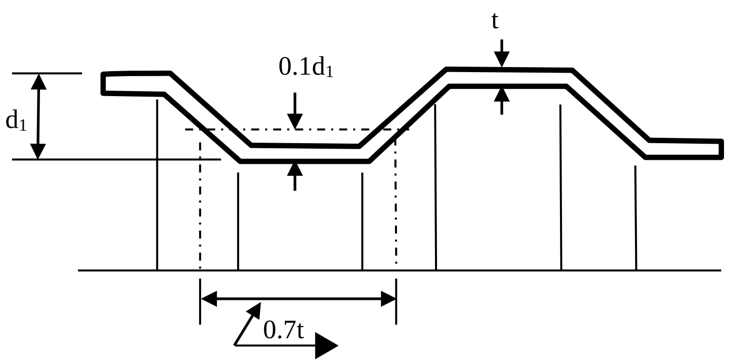

Fig. III 13-3
Corrugated Bulkhead End Connections

(e) Girders and Webs

(i) Strength Requirements

Girders and webs which support framing members on watertight bulkheads and flats are to be in accordance with the requirements given in this paragraph. In addition, the girders and webs are to meet the requirements of 13.2.6(b), where applicable. The section modulus, SM, of each girder or web is not to be less than that obtained from the following equation.

$SM = f\ h\ s\ l^2$ cm^3

where

f = 4.7

h = Distances, in m, from the middle of the area supported to the bulkhead deck at center, where that distance is less than 6.1 m, the value of h is to be 0.8 times the distance in meters plus 1.22. (See 13.2.2(a))

s = Sum of half lengths, in m (on each side of girder or web), of the stiffeners or beams supported

l = Length, in m, between supports, where brackets are fitted at shell, deck or bulkhead supports, and the brackets are in accordance with Table III 13-3 and have a slope of approximately 45 degrees, the length *l* may be measured to a point on the bracket located at the distance from the toe equal to 25% of the length of the bracket.

(ii) Proportions

Girders and webs are to have a depth not less than *l* /12. The thickness is not to be less than one percent of depth plus 3 mm, but need not exceed 11 mm. In general, the depth of girders or webs is not to be less than twice the depth of cutouts.

(iii) Tripping Brackets

Girders and webs are to be supported by tripping brackets at intervals of about 3 m and near the change of the section. Where the width of the unsupported face plate exceeds 200 mm, the tripping brackets are to support the face plate.

(f) Openings

Where stiffeners are cut in way of watertight doors, the openings are to be framed and bracketed to maintain the full strength of the bulkheads without taking the strength of the doorframes into consideration.

13.2.3 Tank Bulkheads and Tank Flats

(a) General

The arrangement of all tanks, together with their intended service and the height of the air and overflow pipes, are to be clearly indicated on the plans submitted for approval. Tank boundary bulkheads and flats are to have scantlings in accordance with the requirements of this section, where they exceed the requirements of 13.2.2 for watertight bulkheads and flats. However, tight divisional bulkheads and flats between tanks, which will be subjected to equal pressure from both sides at all times, may have scantlings based on 13.2.2. In such cases, the tanks are to be provided with suitable means to ensure that the divisions are subjected to equal pressure from both sides at all times.
When the specific gravity of the liquid contents of a tank is greater than 1.05, the head, h, specified below, is to be increased by a factor equal to the ratio of the specific gravity to 1.0.

(b) Plating

Plating is to be of the thickness derived from the following equation:

$$t = \frac{sk\sqrt{qh}}{254} + 2.5 \quad \text{mm}$$

but not less than 6.5 mm or s / 150 + 2.5 mm which ever is greater.

where

t = Thickness, in mm

s = Stiffener spacing, in mm

k = ($3.075\sqrt{\alpha}$ − 2.077) / (α + 0.272) for $1 \le \alpha \le 2$

= 1.0 for α > 2

α = Aspect ratio of the panel (longer edge/shorter edge)

q = 235 / Y

Y = Specified minimum yield point or yield strength, in N/mm^2, or 72% of the specified minimum tensile strength, whichever is the lesser

h = Greatest of the following distances, in m, from the lower edge of the plate to:
(i) a point located two-thirds of the distance from the top of the tank to the top of the overflow;
(ii) a point located 0.91 m above the top of the tank;
(iii) a point representing the load line;
(iv) a point located at two-thirds of the distance to the freeboard deck.

(c) Stiffeners and Beams

The section modulus, SM, of each bulkhead stiffener or beam on a flat, in association with the plating to which it is attached, is not to be less than that obtained from the following equation:

$$SM = f\ c\ h\ s\ l^2 \quad cm^3$$

where

f = 7.8

c = 0.9 for stiffeners having clip attachments to decks or flats at to the ends or having such attachments at one end with the other end supported by girders

= 1.00 for stiffeners supported at both ends by girders

h = Greatest of the distances, in m, from the middle of l to the same points to which h for plating is measured (see 13.2.3(b))

s = Spacing of stiffeners, in m

l = Length, in m between supports; where brackets are fitted at shell, deck or bulkhead supports, and the brackets are in accordance with Table III 13-2 and have a slope of approximately 45 degrees, the length l may be measured to a point on the bracket located at a distance from the toe equal to 25% of the length of the bracket.

(d) Corrugated Bulkheads

Where corrugated bulkheads are used as deep-tank boundaries, the scantlings may be developed from 13.2.2(d). The plating thickness t and values of h are to be as required by 13.2.3(b) and 13.2.3(c), respectively, and c = 0.90.

(e) Girders and Webs

(i) Strength Requirements

Girders and webs which support framing members on tank bulkheads and flats are to be in accordance with the requirements given in this paragraph. In addition, the girders and webs are to meet the requirements of 13.2.6(b), where applicable. The section modulus, SM, of each girder or web is not to be less than that obtained from the following equation:

$$SM = f\ c\ h\ s\ l^2 \quad cm^3$$

where

f = 4.74

c = 1.5

h = Greatest of the distances, in m, from the middle of s in the case of girders or from the middle of l in the case of webs, to the same points to which h for plating is measured (see 13.2.3(b))

s = Sum of half lengths, in m (on each side of girder or web) of the stiffeners or beams supported

l = Length, in m, between supports; where brackets are fitted at shell, deck or bulkhead supports, and the brackets are in accordance with Table III 13-2 and have a slope of approximately 45 degrees, the length may be measured to a point on the bracket located at a distance from the toe equal to 25% of the length of the bracket

Where efficient struts are fitted, connecting girders or webs on each side of the tanks, the spacing of the struts is not more than four times the depth of the girder or web, the section modulus, SM, for each girder or web may be one-half that obtained from the above.

(ii) Proportions

Girders and webs are to have a depth not less than 0.125 *l* where no struts or ties are fitted, and 0.0833 *l* where struts are fitted. The thickness is not to be less than 1 percent of depth plus 3 mm, but need not exceed 11 mm. In general, the depth is not to be less than 2.5 times the depth of cutouts.

(iii) Tripping Brackets

Girders and webs are to be supported by tripping brackets at intervals of about 3 m near the change of the section. Where the width of the unsupported face plate exceeds 200 mm, tripping brackets are to support the face plate.

(f) Drainage and Air Escape

Limber and air holes are to be cut in all parts of the structure as required to ensure the free flow to the section pipes and the escape of air to the vents. Efficient arrangements are to be made for venting the tops of tanks.

13.2.4 Appurtenant Structure

(a) General

Structures which do not contribute directly to the overall strength of the unit, i.e., their loss or damage would not impair the structural integrity of the unit, are considered appurtenant structures.
Appurtenant structures, which are necessary components of safety systems covered by these Rules, or designed to support heavy loads, are to be adequate for the nature and magnitude of applied loads in all modes of operation. Raw Water (seawater intake) structure, flare boom support structure, lifeboat platform for life saving, crane pedestal and pipe racks are considered in this category. Unless noted otherwise, allowable stresses specified in 13.2.1(b) are to be used as the stress limits, except for those structural parts whose primary function is to absorb energy during deformation, in which case, sufficient ductility is to be demonstrated.

(b) Lifeboat Platform

The strength of the lifeboat platform structure supporting the lifesaving appliances is to be designed to meet the following requirements:

(i) The most adverse combination of list and trim for which lifeboat launching is possible with Safe Working Load (total weight of lifeboat, passengers and supplies) with allowable stresses equal to Ultimate Tensile stress divided by a factor of 4.5.

(ii) The most critical motion at the transit draft with allowable stresses equal to the minimum yield stress divided by a factor of 1.25. For self-elevating units the worst motion can be taken as 15° single amplitude rolling or pitching with 10 second period without a motion calculation.

(c) Crane Pedestal and Foundation

The crane pedestal is to be designed in accordance with the recognized standard that the crane is certified to, such as "RULES FOR THE CONSTRUCTION AND SURVEY OF CARGO GEAR".
In addition, it should also be designed to resist motion-induced loads in severe storm, normal operating and transit conditions using the allowable stresses defined in 13.2.1(b), considering the operating limits of the crane.

The hull structure supporting the pedestal should also be designed to resist the same applied loads as the pedestal using the allowable stresses defined in 13.2.1(b).

13.2.5 Higher-strength Materials

(a) General

In general, applications of higher-strength materials for stiffeners, beams, girders and webs are to meet the requirements of this section, but may be modified as permitted by the following paragraphs. Calculations are to be submitted to show adequate provision to resist buckling.

(b) Watertight Bulkheads and Flats and Tank Bulkheads and Flats

Each stiffener, beam, girder and web of higher-strength material, in association with the higher-strength plating to which it is attached, is to comply with the requirements of the appropriate preceding paragraphs of this section and is to have a section modulus SM_{hts} not less than obtained from the following equation:

$$SM_{hts} = SM\ (Q)$$

where

SM = Required section modulus in ordinary-strength material as determined in 13.2.2(c), 13.2.2(e), 13.2.3(c), and 13.2.3(e), respectively

Q = See Table III 13-4 below

Table III 13-4
Values of Q

Specified Minimum Yield Stress (N/mm^2)	Q
235	1.0
265	0.93
315	0.78
340	0.74
355	0.72
390	0.68

Notes:
(1) Intermediate values are to be calculated by linear interpolation.
(2) Q factors for steels having a yield stress higher or lower than shown above will be specially considered.

The above criteria is also applicable to the required section modulus for corrugated watertight and tank bulkheads of higher-strength material, as determined in 13.2.2(d)(ii) and 13.2.3(d), respectively.

13.2.6 Self-Elevating Units

(a) Application

This section applies to self-elevating units, as defined in 13.1.1(b)(i).

(b) General Requirements for Materials and Scantlings

(i) Material Selection

The following structural elements of a self-elevating unit are typically grouped according to their material application categories such as Special, Primary and Secondary (see Fig. III 13-4).

(1) Special Application Structures (Most Critical)

a) Vertical columns in way of intersection with the mat structure

b) Intersections of lattice type leg structures which incorporate novel construction, including the use of steel castings

(2) Primary Application Structures (Intermediate)

a) External plating of cylindrical legs

b) Main structural members of lattice type legs such as the chords, diagonals, horizontals and gussets

c) Combinations of bulkhead, deck, side and bottom plating within the upper hull, which form "Box" or "I" type main supporting structure (i.e., a deep bulkhead together with its deck and bottom plating forming "Box" or an "I" beam)

d) Jack-house supporting structure and bottom footing structure which receives initial transfer of load from legs

e) Internal bulkheads, shell and deck of bottom mat or spud-can supporting structures which distribute major loads, either uniform or concentrated.

f) Fixed frames in jacking or other self-elevating systems

g) Moveable cantilever structures supporting the operating derrick

h) Crane pedestal and support structure

(3) Secondary Application Structures (Least Critical)

a) Internal framing of cylindrical legs

b) Structural members of lattice type legs such as internal bracings

c) Bulkhead, deck, side and bottom plating within the upper hull, which do not form "Box" or "I" type main supporting structure, and the internal members attached to such plating

d) Internal bulkheads, shell and deck of bottom mat or spud-can supporting structures which do not distribute major loads

e) Floating frames or yokes in jacking or other self-elevating systems

f) Substructures and moveable skid beam structures supporting the operating derrick, except where the structure is considered primary application

g) Lifeboat platform

h) Pipe racks

i) Flare boom support structure

(ii) Scantlings

Scantlings of the major structural elements of the unit are to be determined in accordance with the requirements of sub-sections 13.2.1 and 13.2.2. Where applicable, and except as outlined below, scantlings are also to meet the requirements of the Rules.

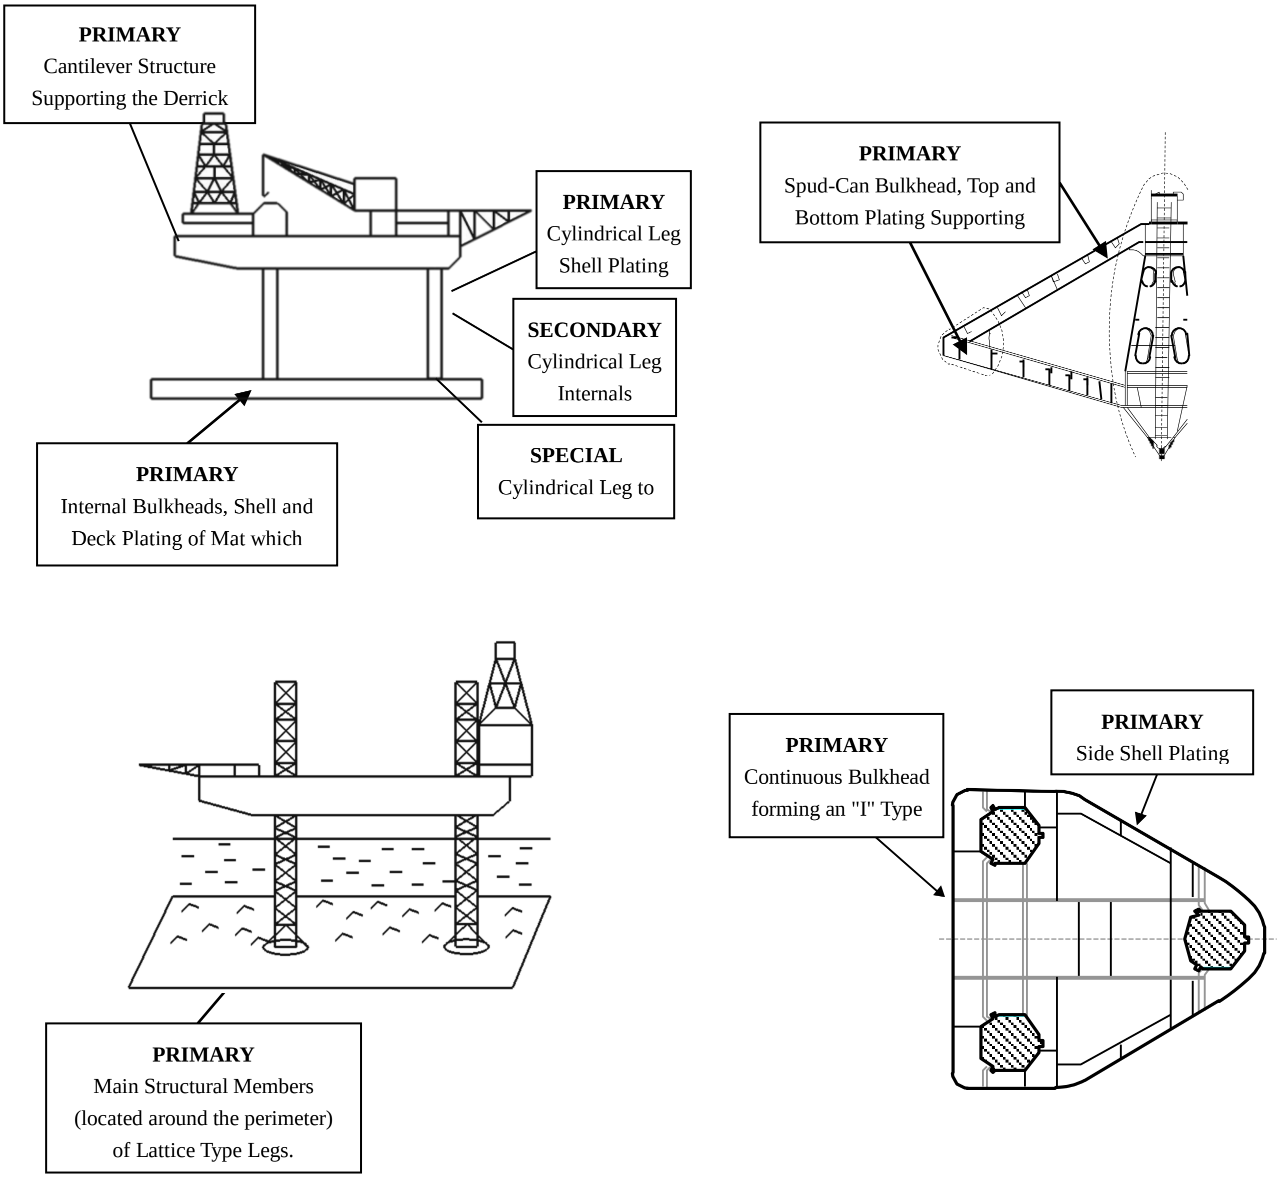

Fig. III 13-4
Typical Grades for Self-Elevating Units

(c) Units Elevated Modes

(i) General

In elevated modes, the unit is to have sufficient positive downward gravity loading to withstand overturning and an adequate air gap to prevent waves from striking the hull. Each leg is to be adequately preloaded to the maximum anticipated vertical reaction at the spudcan. The requirements in 13.2.6(c)(ii), 13.2.6(c)(iii) and 13.2.6(c)(iv) are to be complied with for a unit in elevated modes.

(ii) Safety Against Overturning

Units which are to rest on the sea bed are to have sufficient positive downward gravity loadings on the support footings or mat to withstand the overturning moment due to the combined environmental loads from any direction with the lateral deflection of the legs taken into consideration.

The safety against overturning is to be assessed using the most unfavorable direction and combination of environmental, gravity, variable, and functional loads in both normal operating and severe storm conditions.

Units with individual footings are to have righting moments calculated about the most unfavorable axis through the center of one or more footings and are to have a minimum factor of safety of 1.1 for the conditions defined below.

Units with a mat are to have righting moments calculated about the most highly stressed edge of the mat and are to have a minimum factor of safety of 1.3 for the conditions defined below.

(1) Nominal Loading Conditions for Calculation of Safety Against Overturning

a) Normal operating Condition. Units are assumed to have minimum design variable loads and the cantilever in the most unfavorable position with the associated design operating load.

b) Severe Storm Condition. Units are assumed to have minimum design variable loads and the cantilever in the design position.

(iii) Wave Clearance

A crest clearance of either 1.2 m or 10% of the combined storm tide, astronomical tide, and height of the maximum wave crest above the mean low water level, whichever is less, between the underside of the unit in the elevated position and the crest of the wave is to be maintained. This crest elevation is to be measured above the level of the combined astronomical and storm tides.

(iv) Preload

(1) Capability
Units without bottom mats are to have the capability of being preloaded such that the vertical leg reaction achieved on each leg is at least equal to the computed maximum vertical leg reaction due to the maximum gravity and functional loads plus overturning load of the severe storm condition.

(2) Leg Strength
All legs are to have adequate strength to withstand the preload condition described in 13.2.6(c)(iv)(1). The factor of safety for combined loadings given in 13.2.1(b)(ii) is to be used when considering structural aspects of the preload condition.

(v) Wave-Induced Dynamic Responses

Consideration is to be given to the possibility of structural vibrations induced by the action of waves in the case of self-elevating units in elevated condition. The dynamic response induced by the actions of waves or waves acting with current is to be considered if either of the following conditions is met.

(1) The natural vibratory period, T_n (in seconds), of the unit in a global translational mode (i.e., either lateral deck sway or surge displacement) is in the range 0.9 to 1.1 of the wave period, T (in seconds).

(2) The dynamic amplification factor (DAF), obtained in the manner described below is greater than 1.10.
Tn can be determined from the following equation applied to one leg:

$$T_n = 2\pi\sqrt{\frac{M_e}{K_e}}$$

where

M_e = Effective mass associated with one leg. This is to consider: the mass representing the Total Elevated Load 13.1.1(h) divided by the number of legs; the mass of a leg above its effective clamping location; and one half the mass of a leg below the effective clamping location, excluding the spudcan, but including the added mass of water displaced by the leg.

K_e = Effective bending stiffness of one leg to resist horizontal displacement at the level of the elevated hull. The determination of the leg bending stiffness is to consider: the leg as being pin-ended at least 3 m below the sea bed, the hull to leg stiffness, and the effects of lateral frame displacement on the leg with the highest compressive load due to the supported weight and the other environmental load effects acting with considered wave and current.

The dynamic amplification factor, DAF is determined from the following equation:

$$DAF = \left\{\left[1-\left(\frac{T_n}{T}\right)^2\right]^2\right\} + \left[2c\left(\frac{T_n}{T}\right)^2\right]^{-0.5}$$

where:
c = Fraction of critical damping (to be taken ≤ 7 percent)
T_n and T are as previously defined.

(d) Legs

(i) Legs in Elevated Condition

(1) Leg Types
Legs may be either shell type or truss type. Shell type legs may be considered as either stiffened or unstiffened shells. Legs may have individual footings or may be attached to a bottom mat.

(2) Leg Scantlings
Legs are to be designed to adequately resist the anticipated total elevated loads and environmental loads for all elevated modes of operation. Leg scantlings are to be determined in accordance with an acceptable method of rational analysis. Calculations are to be submitted for review.
When computing stresses in legs, the maximum overturning moment or base shear on the unit, using the most adverse combination of applicable variable loadings together with the loadings.. Forces and moments due to lateral frame deflection of the legs (P-Δ effect) and wave induced dynamic response as outlined in 13.2.6(c)(v) are to be taken into account.

(3) Spudcan-Soil Interaction
Legs without mats, which may penetrate the sea bed, are to be considered pinned at least 3 m below the sea bed. However when considering a loading condition that includes the unit's dynamic response, credit may be given to the added stiffness provided by spudcan-soil interaction in accordance with 13.2.6(d)(i)(4) below. But where use is made of the added spudcan-soil stiffness to offset the effects of dynamic response, it is required that the limiting wave or wave with current condition that satisfies the Rules without the added stiffness is to be established.

(4) Sea Bed Conditions
Where it is desired, as permitted in 13.2.6(d)(i)(3), to consider the added stiffness provided by the spudcan-soil interaction, the rotational stiffness from the interaction is limited to a maximum value based on the equations below. The Owner may select individual values of the rotational stiffness from zero (representing the pinned condition) to the maximum as the basis of the conditions that are reviewed in the unit's classification and listed in the Operating Manual.

Note: It is suggested that the sensitivity of the unit's strength and dynamic response be investigated using a range of values for the spudcan-soil stiffness.
The maximum extent to which this rotational stiffness can be applied to the system, $K_{rs,\ maximum}$ is defined by the following equations.

$$K_{rs,\ maximum} = \frac{\frac{EI}{L}}{C_{min}} \quad \text{[1]}$$

$$C_{min} = \frac{1.5 - J}{J + F} \quad \text{[2]}$$

$$J = 1 + \frac{7.8I}{A_S L^2} \quad \text{[3]}$$

$$F = \frac{12IF_g}{AY^2} \quad \text{..........}[4]$$

where:

I = Equivalent Leg Moment of Inertia, in m^4

A = Equivalent Leg Axial Area, in m^2

A_s = Equivalent Leg Shear Area, in m^2

L = Leg length, in m , taken as the sum of the distance from the underside of the hull to the sea bed plus the sea bed penetration [min. of 3 m]. The minimum leg lengths to be used in determination of values of $K_{rs,\ maximum}$ is $L_{min} = 4.35\ (I/A_s)^{0.5}$. For leg lengths less than L_{min}, the $K_{rs,\ maximum}$ is to be set at the value obtained when the leg length is L_{min}.

E = Elastic modulus of the leg material as 200 GPa for steel

F_g = Parameter to reflect the number of legs
= 1.125 (for 3 leg unit), 1.0 (for 4 leg unit)

Y = For a 3-leg unit, is the distance, in m, between the centerline of one leg and a line joining the centers of the other two legs
= Or for a 4-leg unit, is the distance, in m, between the centers of leeward and windward rows of legs; in the direction being considered

$K_{rs,\ maximum}$ is in the units of N-m/rad

(ii) Legs in the Transit Condition

(1) Legs in Field Transit Condition

Leg strength is to be developed to withstand a bending moment caused by a 6-degree single amplitude roll or pitch at the natural period of the unit plus 120% of the gravity moment at that angle of inclination of the legs. Special consideration, based on submitted data, will be given to angles of inclination less than 6 degrees when the separation between the bottom of the hull and the top of the mat or the lower tip of the spudcan exceeds 15% of the maximum separation. The structural adequacy of the legs is to be investigated for any anticipated vertical position with respect to the hull during transit moves.

(2) Legs in Severe Storm Transit Condition

Legs are to withstand acceleration and gravity bending moments resulting from the motions in the most severe anticipated environmental transit conditions, together with wind moments corresponding to a velocity of not less than 51.5 m/s (100 kn). The motions may be determined by acceptable calculation or model test methods. Alternatively, legs are to withstand a bending moment caused by minimum criteria of a 15 degree single amplitude roll or pitch at a 10 second period plus 120% of the gravity moment at that angle of inclination of the legs. The structural adequacy of the legs is to be investigated for any anticipated vertical position with respect to the hull during transit moves. For severe storm transit conditions, it may be necessary to reinforce the legs or to remove leg sections.

(e) Hull Interface Structure with Legs

Jackcases and associated supporting bracing system are to have adequate strength to properly transmit the loads between the legs and the hull using the allowable stresses defined in 13.2.1(b).

In no case, are the loads imposed at the holding mechanism of the jacking system or the fixation system to exceed the holding capacity defined by the manufacturer of the device for all modes of operation.

During lifting operations, the loads imposed on the jacking system are to consider the effects of friction at the leg guides. Allowance for the friction at the leg guides is to be not less than 5% of the total lifting gravity loads.

(f) Hull Structure

The hull is to be considered as a complete structure having sufficient strength to resist all induced stresses while in the elevated position and supported by all legs. Special attention is to be paid to the maximum total elevated load in the normal operating condition. The total elevated load including gravity and functional loads is to be distributed in accordance with each load's distribution and point of action. The scantlings of the hull are then to be determined consistent with this load distribution, but the scantlings are not to be less than those required by 13.2.6(b)(ii).

(g) Spudcan and Bottom Mat

(i) Spudcan

(1) General

The structure of a spudcan is to be designed for the loads imposed on it in both the afloat and the elevated modes of operation. In the afloat mode, the structure is to be capable of withstanding the hydrostatic pressure, taking into account whether or not the spudcan is freely vented to the sea once it is submerged. In the elevated mode, the structure is to be capable of withstanding the loads imposed on it by the leg, and be able to transfer these loads effectively to the foundation beneath it. These loads are composed of the gravity load of the leg and hull; variable and functional loads; the environmental loads from wind, waves, and current acting on the leg and hull; and the effects of any applicable preload conditions. It is important to note that the leg-to-spudcan connections represent a primary load path, and they are to be carefully designed to avoid stress concentrations. It is equally important to consider that a self-elevating unit may be sited in a wide variety of sea bottom conditions, including rocky foundations with virtually zero penetration, soft clay bottoms with deep penetrations, hard sandy bottoms which are prone to scour, and sloping strata that lead to eccentric contact area and therefore eccentric loading on the spudcan.

(2) Afloat Mode Loading Conditions

To address the afloat mode loading conditions, the scantlings of a spudcan are to be designed using the deep tank requirements with appropriate design heads, h. The following values of h are to be used in the formulas given in13.2.3(b) and13.2.3(c).

a) For a spudcan that is vented freely to the sea:

Plating:	h	=	The distance from the lower edge of the plate to the free flooding point or 15 m, whichever is greater.
Stiffeners:	h	=	The distance from the middle of *l* to the same points to which h for plating is measured (see above)
Girders:	h	=	The distance from the middle of *l* to the same points to which h for plating is measured (see above)

b) For a spudcan that is not vented freely to the sea:

Plating:	h	=	The distance from the lower edge of the plate to the maximum water level, taking into consideration the astronomical and storm tides
Stiffeners:	h	=	The distance from the middle of *l* to the same points to which h for plating is measured (see above)
Girders:	h	=	The distance from the middle of *l* to the same points to which h for plating is measured (see above)

(3) Elevated Mode Loading Conditions

To address the elevated mode loading conditions, the scantlings of the plating, stiffeners, and girders of the spudcan are to be adequate to resist a load equal to the maximum required preload, evenly distributed over 50% of the bottom area.

In addition, the spudcans, including the leg-to-spudcan connections, are also to be adequate to transmit the forces and moments from the leg to the foundation, as follows:

a) Preload Condition. The spudcan and the leg-to-spudcan connections are to be designed for a load equal to the maximum required preload, concentrically distributed over a range of bearing areas, from the minimum design penetration up to and including full embedment.

b) Normal Operating and Severe Storm Conditions.

Pin-ended support.
The spudcan and the leg-to-spudcan connections are to be designed for the maximum vertical reaction and the associated horizontal reaction in conjunction with 35% of the maximum calculated moment at the lower guide, (to account for the eccentric effects of possible scour and uneven bottom conditions) acting in the most unfavorable direction. The maximum lower guide bending moment is to be calculated with pin-ended conditions.
Partially-fixed support.
The spudcan and the leg-to-spudcan connections are to be designed for the following loads:

i) The maximum vertical reaction, in conjunction with the associated horizontal reaction and spudcan-soil fixity moment, acting in the most unfavorable direction.

ii) The maximum spudcan-soil fixity moment in conjunction with the associated vertical and horizontal reactions, acting in the most unfavorable direction.

Notes:

1. If the spudcans are not freely vented to the sea, the effects of hydrostatic pressure are to be included when checking the strength of the spudcans in the preload, normal operating, severe storm, and uneven bottom conditions.
2. The above requirements are for the design of the spudcan and leg-chord-to-spudcan connections. See sub-section 13.2.1, "Structural Analysis" for loading and allowable stress requirements for self-elevating unit global structural analysis and 13.2.6(d)(i)(4), "Sea Bed Conditions" for assumptions of sea bed conditions to be used for structural analyses. Stresses are not to exceed those permitted by 13.2.1(b).

(ii) Bottom Mat

Particular attention is to be given to the attachment, framing and bracing of the mat in order that loads are properly transmitted between the legs and mat. The boundary plating of the tanks which are not vented freely to the sea is not to be less in thickness than would be required for tanks, using a head to the maximum water level, taking into account the astronomical and storm tides. The mat is to be further investigated while resting on the sea bed with 20% of the bottom bearing area washed away due to scouring. Where skirt plates are provided, consideration will be given to their effectiveness in preventing such loss of bottom support due to scouring.

(h) Deckhouses

(i) General

Deckhouses on the main deck are to have sufficient strength for their size and location. When a unit is in elevated mode, deckhouses are subjected to the load effects caused by wind, steel weights, and live loads. However, when the unit is in the transit mode, deckhouses are subjected to the load effects caused by waves in addition to the load effects in the elevated mode. The load effects caused by waves include motion induced inertia and gravity effect due to unit’s static inclinations.

Deckhouses are to be designed to adequately resist these load effects in accordance with the following Paragraphs. Paragraphs 13.2.6(h)(i) through 13.2.6(h)(vi) provide the requirements for basic scantlings of the deckhouses in association with their locations on the deck and functions. Paragraph 13.2.6(h)(vii) provides the requirements for the overall strength of the deckhouse in transit.

Deckhouses, which are used as protection for openings leading to spaces below main deck, are also to be designed as a watertight boundary. For deckhouses that are cantilevered over the bow of a unit, the possibility of wave slamming and impact during transit is also to be considered.

(ii) Design Head

The design head for side and end bulkhead plating and stiffeners of deckhouses on the freeboard deck is to be obtained from the following:

$h = c\ h_b$

where

h = Design head, in m

h_b = 0.133 L − 3.0 m (L ≤ 100 m)
but not to be less than 2.8 m

c = 1.0 for front bulkheads
= 0.6 for aft bulkheads
= See 13.2.6(h)(v) for side bulkheads

L = Length of the unit, in m .

(iii) Plating

The plating thickness is not to be less than that obtained from the following equation:

$$t = 3s\sqrt{h} \quad \text{mm}$$

In no case is the plate thickness to be less than 5.0 + 0.01L mm.

where

s = Spacing of stiffeners, in m

h = Design head, as defined in 13.2.6(h)(ii)

(iv) Stiffeners

Each stiffener in association with the plating to which it is attached is to have a section modulus, SM, not less than that obtained from the following equation:

$$SM = 3.5\ s\ h\ l^2 \quad \text{cm}^3$$

where

s = Spacing of stiffeners, in m

h = Design head, as defined in 13.2.6(h)(ii)
= Tween deck height, in m

(v) House Sides

Side bulkheads of houses are generally to have scantlings based on the requirements for after bulkheads of houses. Where they are close to the side shell of the unit, they may be required to conform to the requirements of bulkheads of unprotected house fronts.

(vi) End Attachment

Both ends of the webs of lowest tier bulkhead stiffeners are to be efficiently attached.

(vii) Racking Resistance

Partial bulkheads, deep webs, etc. are to be fitted at the sides and ends of large deckhouses to provide resistance to racking caused by the most adverse combination of the load effects in 13.2.6(h)(i). Calculations using FEM to demonstrate the adequacy of the yielding and buckling strength of the large deckhouse may be required to be submitted for review.

13.3 Subdivision and Stability

13.3.1 General

(a) Load Line

Every mobile unit is to have marks which designate the maximum permissible draft when the unit is in the afloat condition. Such markings are to be placed at suitable visible locations on the structure, to the satisfaction of the Society.

The load lines are to be established under the terms of the International Convention on Load Lines. Where minimum freeboards cannot be computed by the normal methods laid down by the Convention, they are to be determined on the basis of compliance with the intact or damage stability requirements for afloat modes of operation. The requirement that the draft of the unit not exceed the assigned load line may be considered temporarily not applicable for bottom-supported units when raising, lowering or resting on the sea bed.

The requirements of the International Convention on Load Lines with respect to weathertightness and watertightness of decks, superstructures, deckhouses, doors, hatchway covers, other openings, ventilators, air pipes, scuppers, inlets and discharges, etc., are to be taken as a basis for all units in the afloat condition.

(b) Inclining Experiment

An inclining test will be required for the first unit of a series, when as near to completion as practical, to determine the lightweight and position of center of gravity. An inclining test procedure is to be submitted for review prior to the test, which is to be witnessed by a Surveyor. For successive units of a series, which are considered by the Society to be identical with regard to hull form and arrangement, with the exception of minor changes in machinery, outfit, etc., detailed weight calculations showing only the differences of weight and centers of gravity will be satisfactory, provided the accuracy of the calculations is confirmed by a lightweight survey. The results of the inclining test, or lightweight survey and inclining experiment adjusted for weight differences, are to be reviewed.

The results of the inclining experiment and lightweight survey are to be broken into the independent components of the unit (legs, platform, cantilever, skid unit, etc.) and are to indicate clearly the position of these components.

13.3.2 Stability and Watertight/Weathertight Integrity

(a) Stability

(i) General

All units are to have positive metacentric height in calm water equilibrium position for all afloat conditions, including temporary positions when raising or lowering. For the purpose of determining compliance with the stability requirements contained herein, it is to be assumed that the unit is floating free of mooring restraints. However, detrimental effects of catenary mooring systems or of the thrusters for dynamically positioned units are to be considered.

The metacentric height is to be specified for each mode of operation and guidance is to be included in the Operating Manual on the procedure to determine and satisfy the expected metacentric height. This may be accomplished by including the minimum metacentric height in the calculation of the allowable KG.

The wind speeds referenced in this Section are to be used to calculate heeling moments for intact and damage stability calculations. These wind speeds are not intended to represent actual environmental limits.

(ii) Stability Afloat

All units are to meet stability requirements set forth herein for all applicable conditions. However, units designed to ballast or deballast through designated draft ranges or "zones" need only comply with the specific metacentric height when ballasting or deballasting through these designated "zones".

(1) Intact Stability

All units are to have sufficient stability (righting stability) to withstand the heeling moment equivalent to the one produced by a wind from any horizontal direction and speed as given below in accordance with the stability criteria given in 13.3.2(b). The wind speed for unrestricted offshore service for normal operating and transit conditions is not to be less than 36 m/sec (70 kn). In addition, the unit is to be capable of withstanding a severe storm condition applying a wind speed of not less than 51.5 m/s (100 kn). In all cases, the wind speed is to be specified. Units not designed to withstand the above heeling moments will be considered for classification for "Restricted Service" in association with a heeling moment equivalent to a minimum wind speed of 25.8 m/s (50 kn).

(2) Damage Stability

All units are to have sufficient buoyancy and stability to withstand a heeling moment equivalent to a 25.8 m/s (50 kn) wind superimposed from any direction with the following causes of flooding, which are to be individually applied to the unit.

a) Collision Damage

Flooding from the sea of compartments in accordance with the applicable damage penetration requirements of 13.3.2(b)(iii) for the type of unit under consideration. Such damage need only be applied at drafts associated with normal operating and transit conditions.

b) Remote Flooding

Flooding of a single watertight compartment located wholly or partially below the draft associated with any mode of operation afloat (see 13.1.1(i)), which is:

i) A compartment containing pumps used for the handling of water ballast, or

ii) A compartment containing machinery with a sea water cooling system, or

iii) A compartment adjacent to the sea

c) Self-Elevating Units

Additionally, for self-elevating units, flooding of any single watertight compartment.

(3) Damage Stability – General Conditions

In 13.3.2(a)(ii)(2)b) above, two conditions "a compartment containing pumps used for the handling of water ballast" and "a compartment containing machinery with a sea water cooling system", only those spaces required to be functional in the afloat condition need be considered.

In condition "a compartment adjacent to the sea" in 13.3.2(a)(ii)(2)b) and 13.3.2(a)(ii)(2)c) above, for compartments designed to carry a specified amount of water ballast and so stipulated in the operating manual, the flooding of that compartment may be limited to the portion of the compartment not occupied by the specified water ballast.

For calculation purposes, flooded compartments are to be assumed to be free flooding to the damage waterline (i.e., as if they are in direct communication with the sea.).

For the purpose of damage stability calculations the following minimum permeability values are recommended:

Storerooms	0.95
Machinery spaces	0.85
Accommodation spaces	0.95
Tanks and voids	0.95

Other values may be used if adequately supported by calculations.

The ability to compensate for damage incurred, by pumping out or by ballasting other compartments, etc., is not to be considered as alleviating the requirements of 13.3.2(b)(ii)(2), 13.3.2(b)(ii)(3).

(4) Alternatives for Treatment of Void Spaces

a) For each void not provided with bilge or drainage systems but with a sounding arrangement, the effects of undrainable flooding of the void on the unit's weight and center of gravity location are to be determined for all afloat conditions, including temporary positions when ballasting or deballasting.

b) For voids not provided with bilge or drianage systems and sounding arrangement, the unit's maximum allowable KG at each draft, as determined in accordance with this Subsection, is to be reduced by an amount equal to the largest vertical moment above baseline of a non-complying void divided by the unit's displacement at that draft.

c) The Operating Manual is to include the information and procedures to account for the flooding of undrainable voids.

(b) Stability Criteria

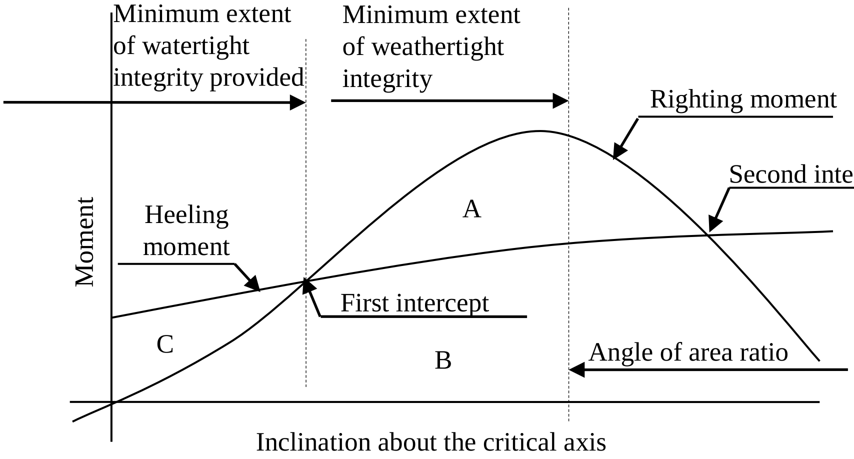
(i) General

Righting moment curves and heeling moment curves with supporting calculations are to be prepared for the full range of anticipated operating drafts. The calculations are to be performed in a manner to reflect a sustained wind force from any horizontal direction in order to determine the critical stability axis. For purposes of these calculations, the configuration of the unit is to reflect the actual condition of the unit during afloat operation, the operation of cranes and the position of legs for self-elevating units.

(ii) Righting Moment

(1) Intact Stability Criteria

For self-elevating units and surface type units, the righting energy (area under the righting moment curve) at or before the angle of the second intercept of the righting and the heeling moment curves or the downflooding angle, whichever is less, is to reach a value of not less than 40% in excess of the area under the heeling moment curve to the same limiting angle as indicated in Fig. III 13-5.



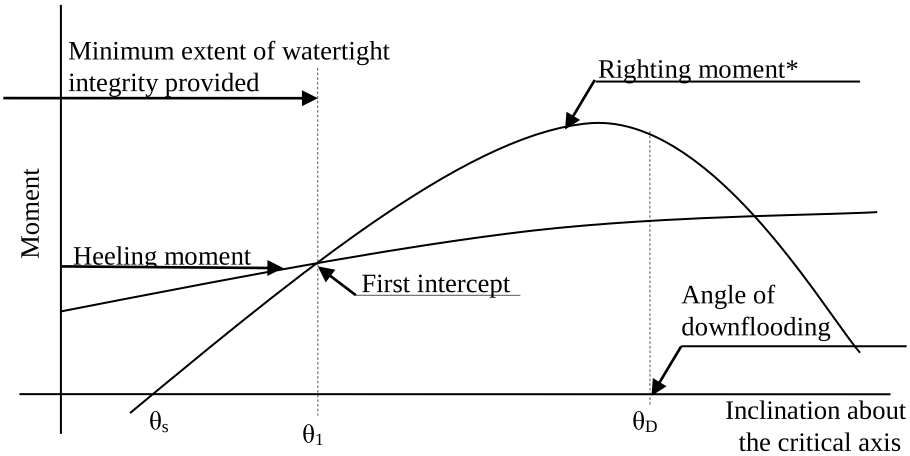
Area[A+B] $\geq$ K Area[B+C]

K = 1.4

Fig. III 13-5
Intact Stability Curve

(2) Damage Stability Criteria

The final waterline, after assuming damage under 13.3.2(a)(ii)(2) with an a heeling moment equivalent to a 25.8 m/s (50 kn) wind superimposed from any direction (See Fig. III 13-6), is not to exceed the levels to which watertight integrity has been shown on the diagrams submitted.



* Righting moment ≥ Heeling moment

$\theta_D \geq \theta_1$

Fig. III 13-6
Damage Stability Curve

(3) Residual Stability Criteria – Self-Elevating Units

In addition to the requirements contained in 13.3.2(b)(ii)(2), self-elevating units are to have sufficient residual stability to satisfy the following criterion after assuming the single-compartment flooding specified in 13.3.2(a)(ii)(2)c) and with the assumption of no wind:

$RoS \geq 7° + (1.5\ \theta_s)$

RoS is not to be less than 10 degrees.

where

RoS = Minimum range of stability, in degrees

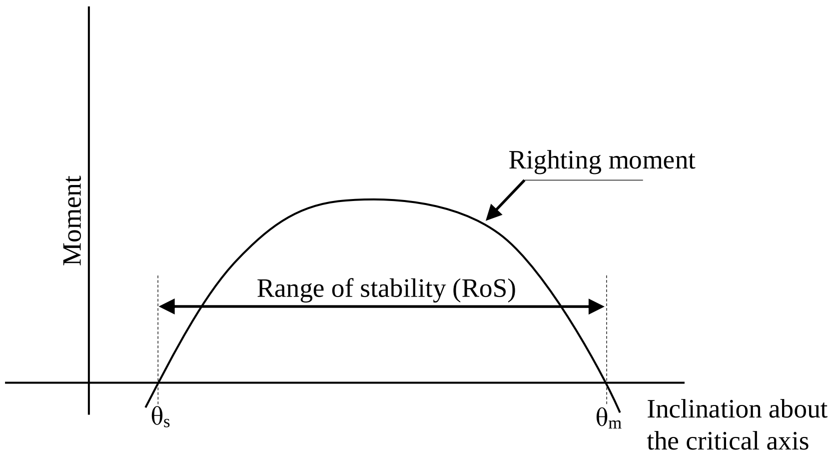
= $\theta_m - \theta_s$

θ_m = Maximum angle of positive stability, in degrees

θ_s = Static angle of inclination after damage, in degrees

The range of stability is determined without reference to the angle of downflooding.

See Fig. III 13-7.



RoS ≥ 7° + 1.5θ_S

RoS is not to be less than 10°

Fig. III 13-7
Residual Damage Stability Requirements for Self-Elevating Units

(iii) Extent of Damage for Damage Stability Studies

In assessing the damage stability of mobile offshore units, as required by 13.3.2(a)(ii)(2), the following extent of damage is to be assumed.

If damage of a lesser extent results in a more severe condition, such lesser extent is to be assumed.

All piping, ventilating systems, trunks, etc., within the assumed damage area are to be considered damaged. Positive means of closure are to be provided to preclude progressive flooding of other intact spaces.

(1) Self-Elevating Units

For self-elevating units, the following extent of damage is to be assumed to occur between effective watertight bulkheads.

a) Horizontal depth of penetration 1.5 m

b) Vertical extent of damage from the bottom shell upwards without limit. Where a bottom mat is fitted, assumed damage penetration simultaneous to both the mat and the upper hull need only be considered when the lightest draft allows any part of the mat to fall within 1.5 m vertically of the waterline, and the difference in horizontal dimension of the upper hull and mat is less than 1.5 m in the area under consideration.

The distance between effective watertight bulkheads or their nearest stepped portions which are positioned within the assumed extent of horizontal penetration should not be less than 3.0 m. Where there is a lesser distance, one or more of the adjacent bulkheads are to be disregarded.

(iv) Heeling Moment

Heeling moments represent an idealization of the total environmental loads on the unit. For purposes of calculations they are taken as the moments which result from wind forces on the unit at the speeds specified in 13.3.2(a)(ii).

The heeling moment is to be calculated at several angles of inclination for each mode of operation. The calculations are to be performed in a manner to reflect the range of stability about the critical axis. The lever for the heeling force is to be taken vertically from the center of lateral resistance or, if available, the center of hydrodynamic pressure of the underwater body to the center of pressure of the areas subject to wind loading.

For dynamically-positioned units, the heeling moment is to be taken as the sum of a wind force up to the aggregate thrust of the thruster system in each direction analyzed with a lever arm equal to the distance from the center of wind pressure to the center of the thruster propeller disc and the remaining wind force (if any) with a lever arm equal to the distance from the center of wind pressure to the center of lateral resistance. For this purpose, the aggregate thrust need not be taken greater than the wind force.

For self-elevating units, the heeling moment of the unit is to be investigated for any anticipated leg position relative to the hull.

In calculating heeling moments for surface type units having no independent platforms, the curve may be assumed to vary as the cosine function of the inclination angle.

(v) Wind Tunnel Tests

Heeling moments derived from wind tunnel tests on a representative model of the unit may be considered as alternatives to the method given herein. Such heeling moment determination is to include both lift and drag effects at appropriate inclination angles. Testing should include the full range of possible drafts, wind direction and angles of heel, to the maximum extent possible. The testing program is to be submitted for review.

(vi) Alternative Stability Criteria

(1) General
Alternative stability criteria may be considered acceptable by the Society, provided the criteria affords adequate righting moment to resist the overturning effects of operating and environmental forces and sufficient margins to preclude downflooding and capsizing in intact and damaged conditions.

(2) Guidelines
The following will be considered in determining the adequacy of alternative criteria submitted for review:

a) Environmental conditions representing realistic winds (including gusts) and waves appropriate for various modes of operation

b) Dynamic response of a unit. Where appropriate, the analysis should include the results of wind tunnel tests, wave tank model tests and nonlinear simulation. Any wind and wave spectra used should cover sufficient frequency ranges to ensure that critical motion responses are obtained.

c) Potential for downflooding, taking into account dynamic responses and wave profile

d) Susceptibility to capsizing, considering the unit’s restoration energy and maximum dynamic response

e) A safety margin consistent with the methodology to account for uncertainties

f) Damage assumptions at least equivalent to present Rule requirements

(c) Watertight/Weathertight Integrity

(i) Weathertight Integrity

Closing appliances are to be as prescribed by applicable load line requirements. In all cases, external openings whose lower edges are below the levels to which weathertight integrity is to be ensured, as shown by the diagrams to be submitted are to have weathertight closing appliances. The referenced diagrams may define different extents of weathertight integrity for each mode of operation afloat (See 13.1.1(i)). Openings fitted with appliances to ensure weathertight integrity are to effectively resist the ingress of water due to intermittent immersion of the closure in complying with the intact stability criteria (See 13.3.2(b)(ii)(1)).

A plan, identifying the disposition (open or closed) of all non-automatic closing devices and locations of all watertight and weathertight closures, for each mode of operation afloat is to be submitted for review prior to the unit’s delivery. Upon satisfactory review, the plan is to be incorporated into the Operating Manual.

(ii) Watertight Integrity

All internal and external openings whose lower edges are below the levels to which watertight integrity is to be ensured, as shown by the diagrams submitted are to be fitted with appliances to ensure watertight integrity.

(1) Internal Openings Used for Access While Afloat
Internal openings fitted with appliances to ensure watertight integrity, which are used during operation of the unit while afloat, are to comply with the following.

a) Doors and hatch covers are to be capable of being remotely controlled from a normally manned central position, such as the bridge or ballast control room, as well as being operable locally from both sides of the bulkhead. Open/shut indicators are to be provided at the control station. In addition, remotely operated doors provided to ensure the watertight integrity of internal openings which are used while afloat are to be sliding watertight doors with audible alarm. The power, control and indicators are to be operable in the event of main power failure. Particular attention is to be paid to minimizing the effect of control system failure. Each power-operated sliding watertight door is to be provided with an individual hand-operated mechanism. It shall be possible to open and close the door by hand at the door itself from both sides.

b) The provisions regarding remote control under 13.3.2(c)(ii)(1)a) are not required, provided the doors are of the quick-acting type and an indicating system (e.g., light signals) is arranged showing personnel, both locally and at a normally manned central position, whether the doors in question are open or secured closed. Hatch covers required for watertight integrity are to have similar indicators. In addition, a sign is to be posted near the opening to the effect that the closing appliance is to be secured closed while afloat and opened only during actual use.

c) The closing appliances are to have strength, tightness and means for securing which are sufficient to maintain watertightness under the water pressure of the watertight boundary under consideration.

(2) Internal Openings Secured Closed While Afloat
Internal openings fitted with appliances to ensure watertight integrity, which are normally to be secured closed while the unit is afloat, are to comply with the following.

a) A sign to the effect that the opening is to be secured closed while afloat during normal operation is to be posted near the opening.

b) Opening and closing of such closure devices is to be noted in the unit’s logbook.

c) Manholes fitted with bolted covers need not be dealt with as under 13.3.2(c)(ii)(2)a).

d) The closing appliances are to have strength, tightness and means for securing which are sufficient to maintain watertightness under the water pressure of the watertight boundary under consideration.

(3) External Openings Used While Afloat
External openings which are used during operation of the unit while afloat are to comply with the following requirements.

a) The lower edges of all openings, including air pipes, ventilators, ventilation intakes and outlets (regardless of closing appliances), non-watertight hatches and weathertight doors, are to be above the levels to which watertight integrity is to be ensured.

b) Normally closed openings fitted with appliances to provide watertight integrity, such as non-opening side scuttles, manholes and small hatches, may be located below the level of watertight integrity. Small hatches are those which are normally used for access by personnel. Such small hatches, which may be submerged in case of damage, are to be closed by approved quick-acting watertight covers of steel or equivalent material. An indicating system, e.g., light signals, is to be arranged showing personnel, both locally and at a central position, whether the hatch covers in question are open or secured closed. In addition, a sign is to be posted near the opening to the effect that the closing appliance is to be secured closed while the unit is afloat and opened only during actual use. Such openings are not to be regarded as emergency exits.

c) Where flooding of chain lockers or other buoyant volumes may occur, the openings to these spaces should be considered as downflooding points.

(4) External Openings Secured Closed While Afloat
External openings fitted with appliances to ensure watertight integrity, which are normally to be secured closed while the unit is afloat, are to comply with the requirements of 13.3.2(c)(ii)(2).

(iii) Penetrations

Where watertight bulkheads and flats are necessary for damage stability, they are to be made watertight throughout. Where individual lines, ducts or piping systems serve more than one compartment or are within the extent of damage, satisfactory arrangements are to be provided to preclude the possibility of progressive flooding through the system.

(d) Onboard Computers for Stability Calculations

The use of onboard computers for stability calculations is not a requirement of class. However, if stability software is installed onboard units, it should cover all stability requirements applicable to the unit and is to be approved by the Society.

13.4 Mooring Systems and Equipment

13.4.1 For applicable requirements for mooring systems and equipment, refer to Chpter 25 of Part II of the Rules.

13.4.2 Position Mooring Equipment

When requested by the Owner, the symbol **POME** may be placed after classification symbol, which will signify that the mooring equipment, anchors, chain or wire rope which have been specified by the Owner for position mooring have been tested in accordance with the specifications of the Owner and in the presence of a Surveyor.

Fabrication tests of the position mooring equipment, such as anchors, chains, wires, shackles, etc. are to at least satisfy the requirements of Part XI and Part XII of the Rules for the respective sizes of equipment.

13.4.3 Position Mooring Systems

When requested by the Owner, the Society is prepared to certify the position mooring capability of the unit. A unit so certified for position mooring will be designated by the symbol **POMS** placed after the classification symbol.

(a) Anchoring Systems

(i) General

Plans showing the arrangement and complete details of the anchoring system, including anchors, shackles, anchor lines consisting of chain, wire or rope, together with details of fairleads, windlasses, winches and any other components of the anchoring system and their foundations and attachments to the unit are to be submitted for review.

(ii) Design

(1) An analysis of the anchoring arrangements expected to be utilized in the unit’s operation is to be submitted. Among the items to be addressed are:

a) Design environmental conditions of waves, winds, currents, tides and ranges of water depth.

b) Air and sea temperature.

c) Description of analysis methodology.

(2) The anchoring system is to be designed to prevent a failure of any single component causing progressive failure of the remaining anchoring arrangements.

(3) Anchoring system components are to be designed utilizing adequate factors of safety (FOS)and a design methodology suitable to identify the most severe loading condition for each component. In particular, sufficient numbers of heading angles together with the most severe combination of wind, current and wave are to be considered, usually from the same direction, to determine the maximum tension in each mooring line.

(4) When a quasi-static analysis method is applied, the tension in each anchor line is to be calculated at the maximum excursion for each design condition defined in 13.4.3(a)(ii)(5), combining the following steady state and dynamic responses of the unit:

a) steady mean offset due to the defined wind, current and steady wave forces;

b) maximum surge/sway excursions of the unit due to first-order wave excitations in a storm sea-state of three hours’ duration. Significant values of surge/sway excursions due to first-order wave excitations may be used for evaluating transient conditions resulting from the sudden failure of any one anchor line. The effects of second order wave-induced motions are to be included for units when the magnitudes of such motions are considered to be significant.

(5) Factors of safety (FOS) are dependent on the design conditions of the system (intact, damaged, or transient), as well as the level of analyses (Quasi static or dynamic analysis). The minimum Quasi Static FOS, specified in the table below, at the maximum excursion of the unit for a range of headings is to be satisfied if the quasi static method outlined in 13.4.3.(a)(ii)(4) is applied. Otherwise, the minimum Dynamic Analysis FOS in the table below is to be satisfied, including the effects of line dynamics when these effects are considered significant.

Design Condition		Anchor Line FOS	
		Quasi Static	Dynamic Analysis
	-Intact	2.70	2.25
Operating	-Damaged	1.80	1.57
	-Transient	1.40	1.22
	-Intact	2.00	1.67
Servere Storm	-Damaged	1.43	1.25
	-Transient	1.18	1.05

where:

FOS = PB / T_{max}

PB = Maximum rated breaking load of the weakest component of the anchor line.

T_{max} = Maximum anchor line tension calculated in accordance with 13.4.3(a)(ii)(4) or Section 5.1.3.2 of API RP 2SK for each of the following design conditions.

a) Operating Intact.

T_{max} determined under the most severe design environmental conditions for normal operations specified by the Owner or designer with all anchor lines intact.

b) Operating Damaged.

T_{max}, under the operating environmental conditions specified above, but assuming the sudden failure of any one anchor line, after reaching a steady-state condition.

c) Operating Transient.

T_{max}, under the operating environmental conditions specified above, due to transient motions resulting from the sudden failure of any one anchor line.

d) Severe Storm Intact.

T_{max} determined under the most severe design environmental conditions for severe storm specified by the Owner or designer with all anchor lines intact.

e) Severe Storm Damaged.

T_{max}, under the severe storm environmental conditions specified above, but assuming the sudden failure of any one anchor line, after reaching a steady-state condition.

f) Severe Storm Transient.

T_{max}, under the severe storm environmental conditions specified above, due to transient motions resulting from the sudden failure of any one anchor line.

(6) Anchor lines are to be of adequate length to prevent uplift forces on the anchors (unless anchors are specifically designed to withstand such forces) under the design conditions specified in 13.4.3(a)(ii)(5). However, only steady wind, wave and current forces need be applied in evaluating anchor uplift forces in transient conditions.

(7) In general, the maximum surge/sway excursions of the unit due to wave excitation about the steady mean offset are to be obtained by means of model tests. Analytical calculations may be acceptable, provided that the proposed method is based on methodologies validated by model tests.

(8) Other analysis methodologies may be acceptable, provided that a level of safety equivalent to that required by 13.4.3(a)(ii)(4) and 13.4.3(a)(ii)(5) is attained.

(9) Special consideration will be given to arrangements where the anchoring systems are used in conjunction with thrusters to maintain the unit on station.

(b) Equipment

(i) Winches and Windlasses

(1) The design of mooring winches and windlasses is to provide for adequate dynamic braking capacity to control normal combinations of loads from the anchor, anchor line and anchor handling vessel during the deployment of the anchors at the maximum design payout speed of the winch or windlass. Winch and windlass foundations and adjacent hull structures are to be designed to withstand an anchor line load at the winch or windlass at least equal to the rated breaking load of the anchor line.

(2) Each winch or windlass is to be provided with two independent, power operated brakes and each brake is to be capable of holding a static load in the anchor line of at least 50 percent of the anchor line's rated breaking strength. One of the brakes may be replaced by a manually operated brake.

(3) On loss of power to the winches or windlasses, the power operated braking system is to be automatically applied and be capable of holding against 50 percent of the total static braking capacity of the windlass.

(ii) Fairleads and Sheaves

Fairleads and sheaves are to be designed to prevent excessive bending and wear of the anchor lines. The attachments to the hull or structure are to be such as to withstand the stresses imposed when an anchor line is loaded to its rated breaking strength.

(c) Anchor Lines

(i) Anchor lines are to be of a type that is compatible with the design conditions of the anchoring system. Details are to be submitted.

(ii) Means are to be provided to enable the anchor lines to be released from the unit after loss of main power.

(iii) Means are to be provided for measuring anchor line tensions and for initial and periodic calibration of line tension measuring instrumentation.

(d) Anchors

(i) The type and design of anchors are to be submitted for review, together with documentation estimating their holding power in various types of soil.

(ii) Suitable anchor stowage arrangements are to be provided to prevent movement of the anchors during transit.

(e) Quality Control

Details of the quality control of the manufacturing process of the individual anchoring system components are to be submitted. Components are to be designed, manufactured and tested in accordance with recognized standards insofar as possible and practical. Equipment so tested is to, insofar as practical, be legibly and permanently marked with the Surveyor's stamp and delivered with documentation which records the results of the tests.

(f) Control Stations

(i) A manned central control station is to be provided with means to indicate anchor line tensions and to indicate wind speed and direction.

(ii) Reliable means are to be provided to communicate between locations critical to the anchoring operation.

(iii) Each winch or windlass is to be capable of being controlled from a position which provides a good view of the operation. Means are to be provided at the individual winch or windlass control positions to monitor anchor line tension, winch or windlass power load and to indicate the amount of anchor line paid out.

13.5 Machinery, Equipment and Systems

13.5.1 General

(a) In general, the machinery, equipment and systems are to be in accordance with Part IV & V of the Rules.

(b) The propulsion plant is to be so designed, constructed and installed that any mode of vibrations will not induce excessive stresses within the normal speed range.

(c) In order to maintain sufficient maneuverability and secure control of the unit in all normal circumstances, there is to be sufficient reversing power. For the main propulsion systems with reversing gears, controllable pitch propellers or electric propeller drive, running astern is not to lead to the overload of propulsion machinery.

(d) The parts exposed to corrosive environment are to be made of corrosion resistant materials or provided with effective anti-corrosion means.

13.5.2 Failure protection

(a) In the event of failure, components and systems are to maintain the conditions with the minimum hazard to machinery, human and environment or in a fail- safe state.

(b) The probability of damage caused by component failure or failure to other components is to be reduced to an acceptable level.

(c) The failure of the redundant components in system is not to lead to damage or failure of standby or parallel components of the system.

13.5.3 Drawings and data

The following drawings and data are to be submitted for approval:

(a) General arrangement of pumps and piping

(b) Sanitary system

(c) Bilge and ballast systems

(d) Compressed air systems

(e) Essential control-air systems

(f) Vent, sounding and overflow pipes

(g) Fuel-oil filling, transfer and service systems

(h) Boiler-feed systems

(i) Steam and exhaust piping

(j) Lubricating-oil systems

(k) Hydraulic power piping systems

(l) Essential sea-water and fresh-water service systems

(m) Starting-air systems

(n) Fire-main and fire-extinguishing systems

(o) Steering-gear piping systems

(p) Exhaust piping for internal combustion engines and boilers

13.5.4 Jacking and fixation system

(a) General

This section applies to the design, manufacturing and installation of jacking gear machinery, fixation mechanism and associated systems for the hull of self-elevating units. It is mainly the relevant requirements for yoke and pin type and rack and pinion type jacking systems as well as fixation mechanism usually employed in self-elevating unit.

(b) Drawings and data

The following drawings and data, as appropriate for the type of jacking gear machinery and fixation systems, are to be submitted for approval:

(i) General arrangement of jacking system.
(ii) Schematic diagrams and specifications of jacking and control systems.
(iii) Diagrams and material specifications of principal parts of jacking system.
(iv) Calculations for jacking system (including rack strength, shutting pin and pin structure).
(v) Strength calculations for principal parts of jacking system.
(vi) Diagrams of control systems.
(vii) Construction and installation diagrams of main and auxiliary hydraulic cylinders;
(viii) Construction of shutting pins;
(ix) Arrangement of hydraulic piping system.
(x) Construction of gear transmission devices.
(xi) Jetting leg system.
(xii) Arrangement and specifications of fixation and control systems.
(xiii) Diagrams and material specifications of principal components of fixation system.
(xiv) Calculations for fixation system (including fixation racks, leg rack strength calculation).
(xv) Strength calculations for principal components of fixation system.
(xvi) Failure Mode and Effect Analysis (FMEA).

(xvii) Fatigue strength calculations, if necessary.

(c) Yoke and pin type hydraulic jacking systems and fixation system

(i) For each hydraulic jacking system, shutting pin system and control system, at least two independent power pumps are to be provided. Where any one pump is out of operation, the other pumps are to be operated to the required minimum design power of the system.

(ii) The hydraulic piping is not to be connected with any other piping outside the system. If safety and redundancy are fully considered, the hydraulic power source may be employed in other systems after special safety risk analysis is carried out.

(iii) Oil cylinders are to be provided with cushions or other means for limiting position and the jacking system of each leg is to be provided with a synchronous device.

(iv) At least two sets of positioning fixation mechanism are to be provided on each leg. The calculated load is to be not less than the maximum working load which the leg is capable of withstanding.

(v) The off actions of main and auxiliary shutting pins of legs are to be interlocked. Pilot lamps displaying whether main and auxiliary shutting pins are on or off are to be provided at the control station.

(vi) The bursting pressure of rubber hoses is to be not less than four times the maximum working pressure. Abrupt bends of the hoses are to be avoided, and the radius of curvature is in general to be not less than 10 times the external diameter of the hose. Bending is to be avoided in the connecting end of hoses, and the distance from the connecting end to bending point is to be not less than six times the external diameter of the hose;

(d) Rack and pinion type jacking systems and fixation system

(i) The hydraulic system in rack-and-pinion type jacking systems is to comply with the relevant requirements of 13.5.4(c).

(ii) An automatic fixation mechanism and a manual relief device are to be provided on each transmission shafting.

13.6 Pumps and Piping Systems

13.6.1 General of piping design

In general, the machinery, equipment and systems are to be in accordance with Part VI of the Rules. The use of steel, copper or other non-aluminum pipes, valves and fitting will require special attention to avoid galvanic corrosion with dissimilar metals.

13.6.2 Damage protection

(a) Piping are to be avoided to provide within the assumed damage zones and if not avoidable, analysis is to be carried out. If the piping within the damage zone is broken, it will not lead to further flooding of compartments other than the damaged zone via the broken piping, such piping may be provided within the assumed damage zone.

(b) Besides the requirements of damage stability, the piping serving generators and propulsion plant, ballast piping, bilge piping, bilge suctions and bilge wells are not to be arranged within the assumed damage zones so as to ensure the essential functions of units not impacted by the damage.

13.6.3 Bilge system

(a) The bilge system is to comply with the relevant requirements in Part VI/3.6~3.7 of the Rules.

(b) Flooding in any watertight space is not to cause flooding in other spaces through bilge piping.

(c) The arrangements of suction piping and suctions of main engine room, main generator room, propulsion room and pump rooms are of redundancy.

(d) The bilge water system of hazardous area is to be fully independent from the bilge water system of non-hazardous area.

(e) The slop system and bilge water system are mutually independent.

(f) All distribution valve chests and manual operating valves connected with bilge water pumping arrangements are generally fitted in easily accessible locations. If these valves are installed in the usually unattended spaces below the load line and with no bilge water high-level alarm, these valves are to be capable of being operated from outside the compartments where the valves are located.

13.6.4 Ballast system

(a) The ballast system is to comply with the relevant requirements in Part VI/3.15 of the Rules.

(b) The Self-elevating unit is to be provided with effective ballast systems to perform ballast and deballast services of each ballast tanks of the units.

(c) The Self-elevating unit is to be provided with at least two ballast pumps where the capacity of each ballast pump is to satisfy the demand of ballast and deballast services of the unit. If the submersible pump of the primary seawater system is independently arranged at the different location on board and with ballast functions, it may used as a substitute.

(d) The ballast pumps are to be self-priming unless it can be demonstrated that this requirement would be unnecessary.

(e) Where practicable, level gauges are to be positioned to minimize inaccuracy induced as a result of inclination of the unit.

(f) The equipment, components, piping and electrical circuits are not to be located in the assumed damage zones.

(g) The ballast arrangements of units intended for restricted or special services will be specially considered in each case.

13.6.5 Cooling water system

(a) The cooling water system is to comply with the relevant requirements in Part VI/4.3 of the Rules.

(b) Two or more independently power driven seawater cooling pumps are to be provided on the unit. These pumps are to be of sufficient capacity to supply the units with any one pump out of action..

(c) The two independent water sources are to be fed to seawater cooling pumps for the self-elevating unit in the elevated state.

(d) During the lifting or lowering operation for self-elevating unit, the supply of cooling seawater is not to be affected

(e) The self-elevating units are to be provided with at least two submersible pumps to supply water far from each other.

(f) The strength of the raw water tower and its components to withstand the maximum design environmental conditions for the unit in elevated condition is to be assessed and calculations in this regard are to be submitted for review.

(g) There are to be at least two hose reels provided. The hose reel units are to be adequately separated by either distance or primary structure such that a single incident (fire, blast, etc.) would not render both pumping systems inoperable.

(h) In order to isolate a damaged pump/hose from the rest of the sea water system, a suitable isolation valve is to be provided, capable of being operated during or immediately after the incident (fire, blast, etc.) in such a way that the water supply is not interrupted.

13.7 Electrical Installations

13.7.1 General requirement

(a) The electrical apparatus and the wiring system of a classed offshore service unit are to be constructed, installed, and tested under the supervision and to the satisfaction of the Surveyor in accordance with the following requirements. Considerations will be given, however, to the arrangements or details of the equipment and machinery which comply with other recognized standards provided they are not less effective than the requirements of this chapter.

(b) Plans and data required for submission to the Society for approval before work commences are to comply with Section 1.2 , Part VII of the" Rules of the construction and classification of steel ships".

(c) The general principle of design for electrical system is to comply with Section 1.3, 1.4, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10 ,1.11 ,2.1 , Part VII of the" Rules of the construction and classification of steel ships.

13.7.2 The protection of electrical system is to comply with Section 2.2, Part VII of the Rules.

13.7.3 Power and control circuits of steering gear installed in self-propelled offshore service units are to comply with Section 2.3, Part VII of the Rules.

13.7.4 Navigation light system is to comply with Section 2.4, Part VII of the Rules.

13.7.5 Internal communication system is to comply with Section 2.5, Part VII of the Rules.

(a) A voice communication system is to be provided between the central jacking control station and a location at each leg in self-elevating units.

13.7.6 Generators are to comply with Chapter 3, Part VII of the Rules.

13.7.7 Motors are to comply with Chapter 4, Part VII of the Rules.

13.7.8 Power and control circuits of jacking system

(a) Jacking gear motor installations are to comply with Chapter 4, Part VII of the Rules and the requirement below.
   (i) The capacity of the electric motor shall be sufficient for lifting requirements such as the following:
      (1) Lifting the platform with uneven load (but within approved tolerances) for a specific duration
      (2) Lifting in preload, if specified, with a specific duration.
   (ii) On each leg , two or more motors of any power may be connected to a single branch circuit
   (iii) The branch circuit is to be provided with short circuit protection set at not greater than ten times the sum of the full load currents of the motors.

(b) Control, monitoring and alarm system of jacking system is to comply with the requirement below:
   (i) Operation of the jacking system and holding mechanism is to be possible from a central jacking control station. However, operation of a fixation system is to be from a local control station near each leg chord.
   (ii) The central jack control station is to be provided with the following alarms and indications :
      (1) Audible and visual alarms for:
         a) Motor overload, over temperature, or overvoltage for each motor
         b) Unit out-of-level(elevated condition)
         c) Significant differences in the currents or torque in the motors on one rack
         d) Rack phase differential, where applicable to the design
         e) Brake fault or overheating
      (2) Indication of:
         a) Availability of power
         b) Current or torque in each motor (during raising and lowering operations)
         c) Brake release status
         d) Hydraulic pressure
         e) Air pressure
         f) Pin position
         g) Position of yoke
         h) Inclination of the unit, in two horizontal , perpendicular axes (elevated condition)
   (iii) Upon failure of the jacking system controls in the central control station, emergency controls to operate the jacking system are to be available. An emergency stop is to be provided at the central jacking control station at each jack house. Emergency stop circuits are to be independent from the jacking control circuits. A communication system as defined in 13.7.5.(a) is to be provided. Arrangements are to be provided for detecting and correcting rack phase differential, where applicable to the design
   (iv) When the jacking systems uses computer-based systems for control and monitoring of jacking operations , such systems are to comply with Section 2.7, Part VIII of the Rules

13.7.9 Switchboards and mounted equipments are to comply with Chapter 5, Part VII of the Rules.

13.7.10 Batteries are to comply with Chapter 6, Part VII of the Rules.

13.7.11 Transformers are to comply with Chapter 7, Part VII of the Rules.

13.7.12 Cables are to comply with Chapter 8, Part VII of the Rules.

13.7.13 Motor controllers are to comply with Chapter 9, Part VII of the Rules.

13.7.14 Accessories and lighting equipments are to comply with Chapter 10, Part VII of the Rules.

13.7.15 Main source and emergency source of electrical power are to comply with Section 11.1, 11.2, 11.4, 11.5, 11.6, 11.7, 11.8 and 11.9, Part VII of the Rules and the following requirement.

(a) The following services are to be comply with Section 11.4.5, Part VII of the Rules
  (i) For a period of 18 hours, emergency lighting:
    (1) At every muster and embarkation station and over the sides instead of 3 hours.
    (2) On helideck, to include perimeter and helideck status lights, wind direction indicators illumination , and related obstruction lights, if any.
    (3) At every location where an abandonment system is deployed or operated and onto the water where personnel leaving the abandonment system will reach the water level.
  (ii) For a period of four days, signaling lights and sound signals required for marking of offshore structures.
  (iii) For a period of 18 hours, permanently installed diving equipment necessary for safe conduct of diving operations, if dependent on the drilling unit's electrical power.
  (iv) For a period of 30 minutes,
    (1) Operation of watertight doors, including their controls and indicators, unless an independent temporary source of stored energy is provided.
    (2) Free-fall lifeboat secondary launching appliance, if the secondary launching appliance is not dependent on gravity, stored mechanical power or other manuals

13.7.16 Additional requirements for electric propulsion equipment are to comply with Chapter 13, Part VII of the Rules.

13.7.17 High voltage installations with voltages above 1kV up to 15kV are to comply with Chapter 14, Part VII of the Rules.

13.7.18 Semiconductor equipments are to comply with Chapter 15, Part VII of the Rules.

13.7.19 Tests after installation on board are to comply with Chapter 16, Part VII of the Rules.

13.7.20 Spare parts are to comply with Chapter 17, Part VII of the Rules.

13.7.21 Automatic or remote control and monitoring systems are to comply with Part VIII of the Rules.

13.8 Fire and Safety

13.8.1 For applicable requirements for Fire and Safety, refer to 1.1.2(d)(ii) of Part IX of the Rules.

Chapter 14

Additional Requirements for General Dry Cargo Ships

14.1 Application

General dry cargo ships intended to carry dry cargo in bulk are to be in compliance with the requirements given in Chapter XII of SOLAS 1974, as amended. If complying with the relevant requirements, the additional service notation **BC-XII** will be assigned, e.g. **"General Dry Cargo Ship, BC-XII..."**.

Chapter 15

Cable Laying Ships or Barges

15.1 General

15.1.1 Application

The requirements in this Chapter apply to ships or barges intended for unrestricted service that are primarily engaged in installation, maintenance and repair of underwater telecommunication cables and power transmission cables.

15.1.2 Classification

Ships or barges built in compliance with the requirements of this Chapter are to be assigned the service notation of Cable Laying, e.g. "CR 100✠ Cable Laying Ship..." or " CR 100 ✠ Cable Laying Barge...".

15.1.3 The requirements of hull constuction and equipment, machinery installations, piping systems and electrical installations are to be in accordance with Part II, Part IV to Part VIII of the Rules, if applicable. For barges, it is also to comply with requirements specified in Part III Chapter 9 of the Rules.

15.2 Submission of Plans and Data

In general, in addition to the plans listed in other Parts of the Rules, the following plans, calculations and particulars are to be submitted.

15.2.1 Hull plans

The following drawings are to be submitted together with the Trim and Stability Booklet for review.

(a) General arrangement plan, with outboard profile

(b) Capacity plan or table with centers of gravity and free surface values

(c) Lines plan

(d) Tank Sounding Tables, if not included in the Trim and Stability Booklet.

(e) Cross curves of stability, if not included in the Trim and Stability Booklet.

(f) List of down-flooding points, including their transverse, longitudinal and vertical locations, used in the calculation of the intact and damage stability criteria.

(g) Draft Marks Drawing showing the draft mark details, longitudinal locations of marks fore and aft referenced to the forward and after perpendiculars or to the nearest frames and vertical reference points. Navigational draft marks should be based on the ship's lowest vertical projection.

(h) Intact and damage stability calculations supporting the maximum KG or minimum GM curve.

15.2.2 Cable laying plans and data for approval

(a) Hull structural details related to cable laying

(b) Equipment and installations for cable laying

(c) Supporting structures for equipment engaged in the cable laying

(d) Equipment for station-keeping and maneuvering during cable laying

15.2.3 Design analysis

The following calculations are to be submitted and documented.

(a) Calculations demonstrating the adequacy of the sihp's or barge's stability during all cable laying operations. Also see 15.3.1.

(b) Calculations demonstrating adequacy of maneuvering power required for the ship or barge to maintain station during cable laying operations.

(c) Calculations for the supporting structure in way of all cable laying and cable storing equipment interfaces with the ship or barge structure.

(d) Design loads and allowable deflection at each foundation of the cable laying and cable storing equipment

15.2.4 Additional information

The following items are to be submitted:

(a) Arrangement plans showing the locations of all cable laying equipment and control stations.

(b) Support arrangement for equipment used in cable laying operations such as cable drum, cable reels; maximum forces are to be stated.

(c) Location and support details of the cranes; reaction forces are to be stated.

(d) Supporting structures for cable stowed on racks in holds and/or deck; maximum weights are to be stated.

(e) Supporting structures for cable drum and reels in holds and/or deck; maximum weights are to be stated.

(f) Descriptions of equipment for moving skid frames, substructures, including piping and electrical systems, details of mechanical components, including hold-down devices and applicable strength calculations.

15.2.5 Supporting systems

The following items are to be submitted:

(a) Electrical schematics, load analysis, short circuits analysis and coordination study for the ship's electrical systems supplying cable laying.

(b) Piping schematics and calculations for the ship's piping systems supplying cable laying systems.

(c) Arrangement and details of communication systems between the ship and cable laying systems.

15.2.6 Operation manual for ships or barges

For cable laying ships or barges, an operation manual is to be furnished to provide guidance on at least the following items.

(a) Means of identifying that the Manual is for the subject ship or barge, including principle particulars of the ship or barge.

(b) Loading conditions on which the design of the ship or barge has been based.

(c) There should also be evidence of approved loading and stability conditions on board. These should preferably be included in the operation manual. If they form a separate document, they should be referenced in the operation manual.

(d) Maximum approved lifting capacity and load charts of all cranes onboard.

(e) Service limitations, any scope of operations and/or operational limits, as applicable.

(f) Position and application of watertight and weathertight (doors, hatches etc.) closing appliances necessary to meet the Load Line assignment or watertight integrity.

(g) Identification of doors and hatches to be kept closed at sea.

(h) Location of lifesaving appliances

(i) Location of emergency escapes

(j) Anchoring and/or mooring procedures

(k) From the aspect of the Administration, depending on the Administration to which the ship or barge is flagged, there will also be a need for other items to be included such as a safety plan, firefighting procedures, means of escape, evacuation procedures, operation of life saving appliances, and requirements for safe operation of the ship or barge.

15.3 Seakeeping for Cable Laying

15.3.1 Stability

(a) Stability of cable laying ships or barges

(i) In evaluating the loading conditions for cable laying ships or barges, the following loads are to be included:

(1) The overturning moments due to environmental and operational loads on the cable laying devices are to be included. When the cable laying device is movable from stowage to operating condition, the full range of laying device positions is to be considered in order to investigate the most critical scenarios.

(2) The effect of the cable drum and reels in the stability analysis is to be assessed for each operating condition.

(3) If the ship is fitted with or carries open cargo bins on the deck that may accumulate water, either effective means to drain water from these spaces shall be provided or an appropriate free surface correction applied.

(4) Carriage of cable as deck cargo
Where cables are carried on deck, a quantity of trapped water equal to a certain percentage of the net volume of the deck cargo should be assumed in and around the cables. The net volume is to be taken as the internal volume of the cables, plus the volume between the cables. This percentage is to be 30% if the freeboard amidships is equal to or less than 0.015L and 10% if the free board amidships is equal to or greater than 0.03L. For intermediate values of the freeboard amidships, the percentage is to be obtained by linear interpolation. In assessing the quantity of trapped water, the positive or negative sheer aft, actual trim and area of operation may be taken into account.
Where cable is stored on decks located above the freeboard deck, the distance from the freeboard deck to the storage deck is to be added to the freeboard in the above calculation to determine the amount of trapped water.

(5) Where large and heavy equipment or structures are intended to be stowed on deck, the estimated weight and height of the center of gravity in the worst possible scenario are to be considered in the stability analysis.

(b) Cable laying ships equipped with lifting devices in addition to the cable laying device(s) are to comply with Appendix 2 of this Part.

15.3.2 Station keeping

Cable laying ships or barges are to be capable of maintaining their positions safely during cable laying operations. The means to maintain position may be a mooring system with anchors or a dynamic positioning system.

(a) Station keeping with anchors and cables

Position mooring with anchors, cables and mooring winches when used to maintain the ship's position during cable laying operations, are to comply with the requirements for the symbol **POME** or **POMS** (see 13.4 of this Part). Safety precautions are to be considered to prevent damaging seabed equipment and installations by anchor deployment, recovery and station keeping.

(b) Dynamic Positioning System

Dynamic positioning systems, when used to maintain the ship's position during cable laying operations, are to comply with the requirements of Part IV Chapter 10 of the Rules for the class notation **DPS-N**.

15.3.3 Loading conditions

Loading conditions covering departure and arrival in full load as well as ballast conditions, along with anticipated operational or intermediate conditions at site are to be included in the Trim and Stability Booklet of the ship.

15.4 Design and Arrangements of Ships or Barges

15.4.1 General

The weather conditions for cable laying operations are to be clearly defined prior to the beginning of the project. Design parameters of the intended operating and abandonment swell heights, together with associated wind, current speeds and cable pull, are to be used for calculation of the ship's or barge's motions and associated structural loads for the cable laying equipment and its interface with the ship structure.

The working deck is to be strengthened for the specified design loads and an allowance for corrosion, wear and tear is recommended. Uniform deck loadings are to be specified.

The working deck, as far as possible, is to be kept clear of engine room intakes and exhausts. Obstructions from tank vents are to be minimized.

15.4.2 Cranes

Cranes fitted on the ship are to be certified by the Society and are to comply with requirements in the Rules for the Construction and Classification of Cargo Gears (hereinafter referred to as the Cargo Gears Rules).

15.4.3 Supporting structure design loads

(a) Lifting loads

Maximum expected operational loads are to be applied for calculating scantlings of supporting structure of cable laying equipment and cranes. Crane working loads are to consider a dynamic factor according to the Cargo Gears Rules or one specified by the crane manufacturer, if that is greater.

(b) Other loads

Ship structures supporting heavy components of cable laying equipment such as cable drums, reels, and cranes are to be designed considering acceleration loads given below. Acceleration loads need not be combined with normal cable laying or lifting operation loads of cable laying equipment and deck cranes.

$$P_v = 0.102 \times \left(\frac{x - L}{70}\right) W$$
$$P_L = P_T = 0.5W$$

Where:

P_v = Vertical force, in kN.
P_L = Longitudinal force, in kN.
P_T = Transverse force, in kN.
L = Length as defined in 1.2.1 of Part II of the Rules, in m.
W = Supported weight, in kN.

The value of "x" is dependent on the location of the center of gravity of the specific equipment and is to be taken as that given in the table below. The value of "x" at intermediate locations is to be determined by interpolation. L is to be measured from AP to forward.

AP & aft of AP	0.1L	0.2L	0.3L~0.6L	0.7L	0.8L	0.9L	FP & forward
x=18	17	16	15	16	17	18	19

Alternatively, accelerations derived from other recognized standards or direct calculations, model tests considering the most severe environmental conditions the ship is expected to encounter may be considered. The hull structure supporting the stinger is to be strengthened for the maximum design load (also see 15.2.4).

(c) Allowable stresses

Scantlings of structure supporting cable laying equipment and cranes are to be based on the permissible stresses given below:

Normal Stress = 0.7Y
Shear Stress = 0.4Y
Equivalent stress = 0.8Y

Where Y is the specified minimum tensile yield strength or yield point.

Where finite element analysis is used for evaluating the response of supporting structure to design loads in this section, structures supporting cable laying equipment and cranes are to be accepted by the Society.

15.5 Cable Laying Equipment and Systems

15.5.1 General

Unless requested by the owner and exceptions specified in 15.5.3, equipment and systems used solely for cable laying operations are in general not subject to Classification by the Society, provided they are designed and constructed in compliance with an applicable recognized standard. The recognized standard used in design of cable laying equipment and systems is to be specified by designer and accepted by the Society. A manufacturer's affidavit or other acceptable documentation to verify compliance with applicable recognized standards is to be submitted to the Society. Their installations and onboard testing are to be supervised in the aspects of operational safety as to reduce to a minimum any danger to persons on board and marine pollution, due regard to be paid to moving parts, hot surfaces and other hazards. Considerations are to be given to the consequences of the failure of systems and equipment essential to the safety of the ship.

15.5.2 Cable laying systems arrangement

(a) Control system

A central control station is to be provided for controlling or coordinating the operations of the cable laying equipment. The central control station is to be located at a position that allows the operating personnel to have a clear view of the cable departure location and to provide an overview of all systems and activities associated with the cable laying operations.

(b) Communications

The cable laying central control station and the ship or barge station keeping control station are to be linked by a hard-wired communication system and a manually operated alarm system. Means of communications are to be provided between the central control station and the local control stations for the cable laying equipment.

15.5.3 Cable laying equipment and systems

(a) Cable drums, reels, deployment sheaves and support structure

Cable drums and reels are to be designed, constructed and installed in accordance with a recognized standard. Cable drum, reel and deployment sheave support structure including the reinforcements for the hull are to be designed to adequately resist the load effects of pipes, risers or reels imposed on the supports in the severe storm, normal operating and transit conditions with the allowable stresses defined in 15.4.3(c). Considerations should also be given to the unit in damaged conditions, where the cable reel support structure are to withstand the load effects caused by the trim and heel of the ship with the allowable stresses defined in 15.4.3(c).

15.5.4 Offshore Construction Supporting Equipment

(a) Dynamic tracking system

Where the dynamic tracking system for the laid cables interfaces with ship's or barge's data and control networks, provision is to be made to ensure that the operation or reliability of the ship's systems are not degraded.

15.6 Tests, Trials, and Surveys

15.6.1 General

Installation of the cable laying equipment and systems on cable laying ships or barges is to be to the satisfaction of the attending Surveyor. Upon installation, functional integration tests of the cable laying systems on board to the extent and as per the method agreed are to be carried out to the satisfaction of the attending Surveyor.

15.6 Tests, Trials, and Surveys

Position mooring equipment is to be tested in accordance with the specifications of the owner and in the presence of a Surveyor.

Dynamic positioning system is to be tested in accordance with Chapter 10 of Part IV of the Rules.

Chapter 16

Offshore Service Vessels

16.1 General

16.1.1 Introduction

(a) Introduction

This chapter applies to vessels supporting offshore installations including towing and anchor-handling operations and rescue and standby services.

(b) Scope

This chapter gives requirements to hull strength, systems and equipment, safety and availability, and stability including openings and closing appliances and the relevant procedural requirements applicable to offshore service vessels.

In addition, for vessels intended for specific operations, this Chapter gives additional requirements on strength, stability including openings and closing appliances and specific functions relevant for these operations.

(c) Application

The requirements in this Chapter are to be regarded as supplementary to those given in Parts II, IV, V, VI, VII, VIII, IX, XI, and XII.

16.1.2 Class notations

(a) Ship type notations

Assignment of class notations is to be based on compliance with the respective design requirements as stipulated in Table III 16-1 of this Chapter.

(b) Additional notations

The following notations, as specified in Table III 16-2 of this Chapter, are typically applied to offshore service vessels:

(b) Additional notations

The notations specified in Table III 16-2 of this Chapter are typically applied to offshore service vessels.

Table III 16-1
Ship Type Notations and Qualifiers

Ship Type Notation	Description	Qualifier	Additional description	Design requirements, Reference
OSV	Ship intended for supporting offshore installations	[none]		16.1 and 16.2 of this Chapter
		Harsh Weather	Designed for operations in harsh weather conditions	16.1 and 16.2.3 of this Chapter
		Anchor Handling	Equipped to handle subsurface deployment and lifting of anchoring equipment, including handling of floating objects on the surface or on the sea floor	16.1, 16.2 and 16.3 of this Chapter
		Towing	Equipped to handle towing of floating objects in open waters	16.1, 16.2 and 16.3 of this Chapter
		AHT	Multi-purpose offshore service vessels complying with notations **Anchor Handling** and **Towing**	16.1, 16.2 and 16.3 of this Chapter
		Windfarm Maintenance	Equipped for maintenance and service of offshore wind farms	16.1, 16.2 and 16.5 of this Chapter
Standby Vessel	Ship designed to carry out standby and rescue services to offshore installations	[none]		16.1 and 16.4 of this Chapter
		Harsh Weather	Designed specially to operate in harsh weather conditions	16.1 and 16.4.2(b) of this Chapter

Table III 16-2
Additional Notations

Class notation	Description	Application	Rule reference
NAV	Requirements to bridge design, instrumentation, location of equipment and bridge procedures for enhanced safety for maneuvering of the ship	All ships	Part XIII
DPS-N	Vessel equipped with dynamic positioning system This notation (**D**ynamic **P**ositioning **S**ystem),with N being **I**, **II** or **III**, will be assigned to ships provided with dynamic positioning system.	All ships	Part IV Chapter 10
NR	Comfort class covering requirements for noise and vibration and indoor climate	All ships	Part II Chapter 34
Fire-fighting Ship N	Ships intended for fire-fighting operation are to be assigned this class notation, with **N** being **1**, **2** or **3**.	All ships intended for fighting fires on board ships and on offshore and onshore installations	Part III Chapter 12
Damage Stability	Compliance with the damage stability requirements of IMO Res.MSC.235(82) (Guidelines for the Design and Construction of Offshore Supply Vessels, 2006), alternatively as amended by IMO Res. MSC.335(90) (Amendments to the Guidelines for the Design and Construction of Offshore Supply Vessels, 2006)	Offshore service vessels	16.2.5(e) of this Chapter
Helideck-N	This notation (**Heli**copter **deck**), with **N** being **I**, **II, III** or **IV**, will be assigned to ships provided with helicopter facilities in accordance with related requirements.	All ships	Part II Chapter 12A
HLA	Vessel with heavy lift appliance (**HLA**) onboard.	All ships	Rules for the Construction and Survey of Cargo Gear, and Part III Appendix 2
Walk-to-Work	Vessel with offshore gangway system.	All ships	16.5.4(b) of this Chapter

16.1.3 Definitions

(a) Anchor handling winch

Winch used for towing and anchor handling, as described in 16.3.3(c) of this Chapter. The towing and anchor handling functions may be fulfilled by dedicated drums on the winch.

(b) Bollard pull (BP)

The maximum continuous pull obtained from static pull test in sea trial.

(c) Primary supporting member (PSM)

Beam, girder or stringer type member which provides overall structural integrity of the hull envelope and tank boundaries, e.g. double bottom floors and girders, transverse side structure, deck transverses, bulkhead stringers and vertical webs on longitudinal bulkheads.

(d) Shark jaw

Equipment for temporary securement of towline or rig chains at inboard end.

(e) Stern roller

Roller, fairlead, or other equipment at the towline exit on the vessel (irrespective of onboard location), supporting the towline during lifting to avoid chafing and excessive bending, and arranged to facilitate the launch and recovery of rig anchors etc.

(f) Towing pins

Equipment for leading and maintaining the towline along the intended path.

(g) Towing winch

Winch used for towing, as described in 16.3.3(c) of this Chapter.

(h) Towline

Rope or wire used for towing.

16.1.4 Documentation

(a) Documentation requirements

(i) Offshore service vessel

Documentation is to be submitted as stipulated in Table III 16-3 of this Chapter.

(ii) Standby vessel

Documentation is to be submitted as required by Table III 16-4 of this Chapter.

16.1.5 Certification

(a) Certification requirements

Products using for anchor handling and towing, standby vessel and windfarm maintenance are to be certified as required by CR Guidelines for Survey of Products for Marine Use.

16.1.6 Testing

(a) Testing during newbuilding

Testing requirements for class notations **Anchor Handling** and **Towing** are given in 16.3.1(d) of this Chapter, and for **Windfarm Maintenance** in 16.5.2 of this Chapter.

16.2 Offshore Service Vessels

16.2.1 Introduction

(a) Introduction

These rules provide requirements for vessels intended for offshore services. This also includes operations in harsh weather conditions.

(b) Scope

These rules include requirements for hull strength, systems and equipment, and stability, including openings and closing appliances, applicable to offshore service vessels.

(c) Application

Vessels complying with the relevant requirements in 16.1 and 16.2 of this Chapter may be given the class notation **OSV**.

If, in addition, the vessel complies with the additional requirements given in 16.2.3 of this Chapter and relevant parts of 16.2.6 of this Chapter, the notation may be extended to **OSV–Harsh Weather**.

Note: The extended notation **OSV–Harsh Weather** is recommended for vessels primarily intended to operate in harsh weather conditions.

If the damage stability requirements in 16.2.5(e) of this Chapter are satisfied in addition to the general requirements in 16.2.5 of this Chapter, then the additional notation **Damage Stability** may be given.

16.2.2 Hull

(a) Loads

(i) Design still water bending moments and shear forces

The still water bending moment and shear force limits in seagoing and in harbour/sheltered water conditions are normally taken as the design still water bending moments and shear forces, as given in 3.2 and 3.3 of Part II. After special considerations, this may also be applicable for ships of length L ≤ 65 m.

(ii) The limits calculated in 16.2.2(a)(i) above may have to be calculated for extreme non-homogeneous loading conditions after special consideration of tank arrangement and cargo deck loading.

(iii) If the calculated bending moments and shear forces in 16.2.2(a)(ii) above exceed the design values given in 16.2.2(a)(i) above, the calculated values are to be applied in the hull girder scantling check.

(b) Hull local scantling

(i) Yield check of plating and stiffeners

General reference is given to Chapters 6A and 7 of Part II for prescriptive requirements to stiffeners and plating respectively. For wheel loading from cargo handling/transporting vehicles, reference is given to Chapter 6 of this Part.

Additional hull local scantling requirements for offshore service vessels are given in 16.2.2(c) to 16.2.2(f) as below.

(c) Ship's sides and stern

(i) Longitudinal steel fenders are to be fitted on the ship's sides at freeboard cargo deck and the second deck above. The fenders are not to extend less than 0.02L forward of the section where the deck has its full breadth.

Additional steel fenders are to be arranged aslope between the longitudinal steel fenders. The steel fenders may be omitted if the side shell scantlings are increased as specified in 16.2.2(c)(ii) as below.

(ii) The net thickness, in mm, of side plating, including bilge strake, up to the second deck above the freeboard deck, is not to to be less than:

$$t = \max\left((4.5 + 0.05L_{90})\frac{b}{s_s}\sqrt{K};\ 7.0\right)$$

where:

s_s	=	Standard frame spacing in m
	=	0.48 + 0.002 L
	=	Maximum 0.61 m forward of the collision bulkhead and aft of the after peak bulkhead
b	=	Width of face plate of stiffeners and primary supporting members
b / s_s	≥	1.0
L_{90}	=	Length of ship, L, as specified in 1.2.1 of Part II, but need not be taken greater than 90 m.
K	=	Material factor as specified in 1.5.2(a) of Part II.

Requirements given for side plating in Chapter 7 of Part II are to be complied with as applicable.

In way of fender area, as described in 16.2.2(c)(i) above, steel fenders can be omitted when the side plate thickness is at least twice that required above, for a breadth not less than 0.01L, along the level of the freeboard deck and at the second deck above.

(iii) The net section modulus, in cm^3, of transverse stiffeners or side longitudinals is not in any region to be less than:

$$Z_1 = 1.15Z$$

where Z is the required net section modulus, in cm^3, as given in Chapters 6A and 12 of Part II.

All stiffeners up to the second deck above the freeboard deck, and forward of 0.2L from the forward perpendicular up to the forecastle deck, are to have end connections with brackets.

(iv) Non-continuous welds are not to be used in connections between stiffeners and shell plating.

(d) Weather deck for cargo

(i) The deck is to have scantlings based on a minimum cargo load of 1.5 t/m^2, in combination with 80% of the design sea pressure, as specified for the classification. The design cargo load, in t/m^2, will be given in the appendix to the classification certificate. Cargo loads exceeding 4 t/m^2 need not be combined with sea pressure. For intermediate loads, the percentage of the design sea pressure to be added is to be varied linearly.

(ii) Net deck plating thickness is not to be less than 7.0 mm.

(iii) In deck areas for heavy cargo units, e.g. anchors, the deck structure is to be strengthened against the maximum expected anchor weight.

(iv) Protection of air pipes, valves, smaller hatches etc. is to be in accordance with 2.13.1(e)(i) of Part VI.

(v) Scantlings of flush hatch covers in the cargo deck areas are generally to be based on the same load as the adjacent deck. In the case that the flush hatch cover is designed for a different load, this is to be stated in the appendix to the classification certificate.

(e) Stow racks

(i) Stow racks for pipes as deck cargo are to be provided as required. The stow racks are to be efficiently attached and supported at deck.

The scantling of the stow racks is to be designed for a transverse load, taking into account a deck load, in kN, of not less than six times total deck area between the stow racks, evenly distributed on one side of the vessel. In addition, the stow racks are to withstand the deck load, at a heel angle of 30 degrees, assumed to be evenly distributed on one side of the vessel.

(ii) Allowable stresses

Acceptable stresses, in N/mm^2, for the stow rack scantlings and respective supporting structure resulting from bending moments and shearing forces for the load given above are to be calculated in accordance with acceptance criteria AC-SD, i.e. for static plus dynamic (S+D) design load combinations, in CSR-H Pt. 1 Ch. 6 Sec. 6 [3].

For direct strength calculations, the equivalent von Mises stress (σ_{vm}), in N/mm^2, is to satisfy:

$$\sigma_{vm} \leq 0.9R_{eH}$$

Where:

R_{eH} = Specified minimum yield stress specified in Table XI 3-9 or Table XI 3-10 of Part XI, in N/mm^2

(f) Primary supporting members (PSM)

(i) Direct strength analysis

The strength of primary structural members that form part of a grillage system, such as deck girders, side web frames, pillars, floors and girders in double bottom may be determined by using direct strength analysis, i.e. by use of beam analysis, as described in 16.2.2(f)(ii) as below.

PSM's are to be evaluated in accordance with CSR-H Pt. 1 Ch. 6 Sec. 6 [3].

(ii) Beam analysis

Beam analysis will, in general, be accepted to evaluate bending and shear stresses in webs and flanges of grillage structure under lateral loads, such as decks, double bottom and side structure under cargo or liquid pressure, e.g. sea and tank pressures. The effective plate breadth in bending of the primary strength members is to be calculated according to CSR-H Pt. 1 Ch. 3 Sec. 7 [1.3]

(iii) Design loads

The design loads as intended for direct analysis are to be provided by the ship owner, ship designer, or shipyard and accepted by the Society.

(iv) Allowable stresses

See CSR-H Pt.1 Ch.6 Sec.6 [3.3].

(v) Buckling check of plate panels based on beam analysis

The normal stresses and shear stresses taken from the strength assessment in 16.2.2(f)(ii) above are subject to buckling capacity calculation of plate panels as given in CSR-H Pt. 1 Ch. 8 Sec. 4, and the stresses are to be corrected as per CSR-H Pt.1 Ch. 8 Sec.5 [2.2.7].

(vi) Maximum flange area of primary supporting member

The effective flange area of primary supporting member is to satisfy the following:

$$b_f\, t_f \;\le\; b_{eff}\, t_p\, \frac{R_{eH,p}}{R_{eH,f}}$$

where:

b_f = Face plate/flange width of stiffener or PSM, in mm

t_f = Face plate/flange net thickness of stiffener or PSM, in mm

b_{eff} = Effective breadth of attached plating, as defined in Ch.3 Sec.7 [1.3.2], in m

t_p = Net thickness of the plating attached to a stiffener or a PSM, in mm

$R_{eH,p}$ = Minimum specified yield stress of the material of the plate, in N/mm^2.

$R_{eH,f}$ = Minimum specified yield stress of the material of the flange, in N/mm^2.

(vii) Yield and buckling criteria for finite element analysis

When finite element analysis is used for analysis of PSM then all significant stress components are to be considered, to a similar extent as for partial ship finite element models described in CSR-H Pt.1 Ch.7 Sec.3. The strength is to satisfy the yield criteria given in CSR-H Pt.1 Ch.7 Sec.3 and buckling criteria given in CSR-H Pt.1 Ch.8 Sec.4.

16.2.3 Hull local scantling for ships assigned class notation **OSV–Harsh Weather**.

(a) Ship's sides and stern

(i) Where subjected to heavy loads when handling anchors for offshore floating units, the stern is to be adequately strengthened. The net plate thickness, in mm, adjacent to the stern roller and shark jaw is not to be less than:

$$t = 8 + 0.2L$$

The deck adjacent to the stern is to be strengthened accordingly. The requirement may be modified if a substantial sheathing is fitted on the deck.

(ii) The net thickness of the side plating up to the forecastle deck is not to be less than that given in 16.2.2(c)(ii) of this Chapter.

(iii) The net section modulus, in m^3, of transverse stiffeners or side longitudinals up to the second deck above the freeboard deck is not to be less than:

$$Z_1 = 0.0014\ L_{90}\ l_e\ s\ K$$

or, if steel fenders are omitted:

$$Z_1 = 0.0023\ L_{90}\ l_e\ s\ K$$

The net section modulus, in cm^3, of transverse stiffeners or side longitudinals is to, however, not in any region be taken less than:

$$Z_{min} = 1.25Z$$

where:

Z	=	Required net section modulus, in cm^3, as given in Chapters 6A and 12 of Part II.
L_{90}	=	Length of ship as specified in 1.2.1 of Part II, but need not be taken greater than 90 m.
l_e	=	Effective bending span of stiffener, in m, as defined in CSR-H Pt.1 Ch.3 Sec.7 [1.1.2], where the notation l_{bdg} is employed
s	=	Stiffener spacing in mm, as defined in CSR-H Pt.1 Ch.3 Sec.7 [1.2.1]
K	=	Material factor as specified in 1.5.2(a) of Part II

The requirement for Z_1 given above refers to the ship's sides, which have an inclination to the vertical (along the ship's depth) less than 15°. For greater inclinations, the requirement given for Z_{min} is to be applied.

All stiffeners up to the second deck above the freeboard deck, and stiffeners forward of 0.2L from F.E. up to forecastle deck, are to have end connections with brackets.

(iv) Non-continuous welds are not to be used in connections between stiffeners and shell plating up to the second deck above the freeboard deck.

(v) In the ship sides up to the second deck above the freeboard deck, the net gross section modulus, in cm^3, of PSM's is not to be less than:

$$Z_2 = 1.4 L_{90}\ l_e\ K$$

or, if steel fenders are omitted:

$$Z_2 = 2.3 L_{90}\ l_e\ K$$

where L_{90}, l_e and K are as given in 16.2.3(iii) of this Chapter.

Additionally, the gross section modulus, in cm^3, of PSM's is not to be less than:

$$Z_{min} = 1.25\ Z$$

where *Z* is the required section modulus, as given in CSR-H Pt.1 Ch.6 Sec.6 [3].

The PSM's are assumed to have substantial connections at both ends.

(b) Bulwark

The bulwark gross plate thickness is not to be less than 7 mm. Bulwark stays are to have a depth not less than 350 mm at deck. Stays are to be fitted on every second frame. Open rails are to have ample scantlings and efficient supports.

(c) Support of heavy components

(i) General

PSM's supporting deck cargo and equipment, foundations for separate cargo tanks, as well as supports of other heavy components, are to have scantlings based on the supported mass, forces due to the ship motions, and reaction forces at supports of deck machinery.

(ii) Strength analysis of primary supporting members

Strength analysis of PSM's may follow the principles given in 16.2.2(f) of this Chapter.

(iii) Pressure due to distributed deck load

The total pressure P_{dl}, in kN/m^2, for the static plus dynamic (S+D) design load scenarios applied for strength analysis of PSM's are to be in accordance with CSR-H Pt.1 Ch.4 Sec.5 [2.3.1].

For vessels with L < 100 m, the total pressure P_{dl}, in kN/m^2, for the static plus dynamic (S+D) design load scenarios applied for strength analysis of PSM’s may be based on the simplified calculation as follows:

- aft of 0.2L from A.E. and forward of 0.2L from F.E:

  $P_{dl} = 20q$
- amidships within 0.4 L:

  $P_{dl} = 16q$
- between specified regions, P_{dl} is to be varied linearly.

  where q is the specified distributed deck load, in t/m^2.

(iv) Concentrated forces due to unit load

The force F_U, in kN, due to the loads described in 16.2.3(c)(i) of this Chapter for the static plus dynamic (S+D) design load scenarios, is to be in accordance with CSR-H Pt.1 Ch.4 Sec.5 [2.3.2].

(v) Allowable stresses

Acceptable stresses, in N/mm^2, for the supporting structure, resulting from bending moments and shearing forces calculated for the load given above, are to be in accordance with acceptance criteria AC-S given in CSR-H Pt. 1 Ch. 6 Sec. 6 [3.2] or [3.3], depending on the calculation method used.

For direct strength calculations, the equivalent von Mises stress (σ_{vm}), in N/mm^2, is to satisfy:

$$\sigma_{vm} \leq 0.9R_{eH}$$

Where:

R_{eH} = Specified minimum yield stress specified in Table XI 3-9 or Table XI 3-10 of Part XI, in N/mm^2

(d) Deckhouses and superstructures

(i) The net section modulus, in cm^3, of stiffeners and beams not contributing to longitudinal strength is not to be less than:

$$Z = \frac{f_u |P| s\, l_e^2}{f_e C_s R_{eH}}$$

where:

P = Design pressure in kN/m^2

= P_D for exposed decks

= $Max(P_{SI} ; P_W)$ for exposed superstructure side

= P_A for exposed end bulkheads and deckhouse boundaries

= Min. 10 kN/m^2 for weather decks

= Min. 5 kN/m^2 for top of the wheelhouse

= 8 kN/m^2 for accommodation decks, aft of 0.2L from A.E. and forward of 0.2L from F.E.

= 6.5 kN/m^2 elsewhere

P_D = Design sea pressure, in kN/m^2, as given in CSR-H Pt.1 Ch.4 Sec.5 [2] and Pt.1 Ch.4 Sec.5 [4.2], as applicable

P_{SI} = Design sea pressure, in kN/m^2, for superstructure side, as given in CSR-H Pt.1 Ch.4 Sec.5 [4.3]

P_W = Wave pressure, in kN/m^2, for superstructure side, as given in CSR-H Pt.1 Ch.4 Sec.5 [1.3]

P_A = Design sea pressure, in kN/m^2, for end bulkheads of superstructure and deckhouse boundaries, as given in CSR-H Pt.3 Ch.4 Sec.5 [4.4]

f_e = Bending moment factor as defined in CSR-H Pt.1 Ch.6 Sec.6 Table 2, where the notation f_{bdg} is employed. For stiffeners with end fixity deviating from the ones included in CSR-H Pt.1 Ch.6 Sec.6 Table 2, with complex load pattern, or being part of a grillage, the requirement in CSR-H Pt.1 Ch.6 Sec.5 [1.2] applies.

f_u = Factor for unsymmetrical profiles, to be taken as:

= 1.00 for flat bars and symmetrical profiles (T-profiles)

= 1.03 for bulb profiles

= 1.15 for unsymmetrical profiles (L-profiles)

C_S = permissible bending stress coefficient, taken as:

C_S = 0.75 for acceptance criteria set AC-SD.

R_{eH} = Specified minimum yield stress specified in Table XI 3-9 or Table XI 3-10 of Part XI, in N/mm^2

(ii) Stiffeners are to have effective end connections, i.e. with brackets or welded webs. Stiffeners on lower front bulkhead on weather deck forward are to have brackets at the lower ends.

(iii) The net plate thickness, in mm, in superstructures and deckhouses is not to be less than:

$$t = (t_0 + 0.02L)c\sqrt{K}$$

where:

t_0 = 4.5 mm for front bulkheads and weather deck forward of the lowest tier of the front bulkhead

= 3.5 mm for sides and aft end bulkheads and weather decks elsewhere

= 3.0 mm for superstructure and deckhouse decks (in way of accommodation).

c = Coefficient taken as:

$$c = \max(b/650;1.0)$$

K = Material factor as specified in 1.5.2(a) of Part II.

(e) Loading conditions

(i) The following loading conditions are to be presented:

- vessel in fully loaded departure condition with cargo distributed below deck and with deck cargo specified by position and weight, with full stores and fuel, corresponding to the worst service condition in which all stability criteria are met
- vessel in fully loaded arrival condition with cargo as specified, but with 10% stores and fuel

- vessel in ballast departure condition, without cargo but with full stores and fuel
- vessel in ballast arrival condition, without cargo but with 10% stores and fuel
- vessel in the worst anticipated operating condition
- if the vessel is equipped with towing gear, vessel in a typical condition ready for towing.

(ii) Assumptions for calculating loading conditions:

- if a vessel is fitted with cargo tanks, the fully loaded conditions, as described in 16.2.3(e)(i) above, are to be modified, assuming first the cargo tanks full and then the cargo tanks empty
- in all cases when deck cargo is carried, a realistic stowage weight is to be assumed and stated in the stability information, including the height of the cargo and its centre of gravity
- where pipes are carried on deck, a quantity of trapped water equal to a certain percentage of the net volume of the pipe deck cargo is to be assumed in and around the pipes. The net volume is to be taken as the internal volume of the pipes plus the volume between the pipes. This percentage is to be 30 if the freeboard amidships is equal to or less than 0.015 L_f and 10 if the freeboard amidships is equal to or greater than 0.03 L_f. For intermediate values of the freeboard amidships, the percentage may be obtained by linear interpolation.

16.2.4 Systems and equipment

(a) Steering gear

The steering gear is to be capable of bringing the rudder from 35° on one side to 30° on the other side in 20 s, when the vessel is running ahead at maximum service speed.

(b) Exhaust outlets

Exhaust outlets from diesel engines are to have spark arrestors.

(c) Anchoring equipment

For vessels without means for dynamic positioning, but intended for anchoring close to offshore installations, safety precautions are to be considered.

Note: Safety precautions may consist of increasing the diameter and length of the chain cables above the minimum requirements given in Table II 25-1. For operation in harsh weather conditions, it is recommended to have the diameter of chain cables based on an equipment letter at least two steps higher than the corresponding vessel's equipment number and length of the chain cables 85% greater than the table value corresponding to the increased diameter.

16.2.5 Stability

(a) Stability manual

(i) The requirements given in this sub-section are applicable to vessels with a freeboard length L_f of 24 m and above.

(ii) The stability manual is to contain the following information:

- report on inclining test and determination of light ship data
- capacities and centres of gravity of all tanks and spaces intended for cargo and consumables
- free surface particulars for all tanks
- information on types, weights, centres of gravity and distribution of deck cargoes that can be carried within the limits set out in Chapter 30 of Part II. Possible restrictions, such as plugging of pipes, are to be clearly stated
- where applicable, instructions related to the vessel when towing are to be included
- hydrostatic data
- cross curves of stability

- loading conditions, including righting lever curves and calculation of metacentric height GM including free surface corrections
- curves for limiting VCG (centre of gravity above keel) or GM values for intact conditions and a curve showing the permissible area of operation.
- stillwater bending moment and shear force limit curves.

(b) Loading conditions

For loading conditions see 16.2.3(e) of this Chapter.

(c) Icing

If the vessel is intended to operate in zones where icing is expected, this is to be included in the calculation of the stability. The vessel is, in any service condition, to satisfy the stability criteria set out in Chapters 30 and 30A of Part II, including the additional weight imposed by the ice. Weight distribution is to be taken as at least 30 kg/m^2 for exposed weather decks, passageways and fronts of superstructures and deckhouses, and at least 7.5 kg/m^2 for projected lateral planes on both sides of the vessel above the waterline. The weight distribution of ice on appurtenances such as railings, rigging, posts, and equipment is to be included by increasing the total area for the projected lateral plane of the vessel's sides by 5%. The static moment of this area is to be increased by 10%.

(d) Intact stability

(i) The freeboard at the stern in the upright condition is not to be less than 0.005 L_f in any loading condition.

(ii) In addition to the stability criteria for classification, the vessel is to comply with the requirements in 11.8 and 11A.4 of this Part for all towing conditions.

(e) Damage stability for ships assigned class notation **OSV–DS**

(i) The damage stability calculations are to contain GM or VCG limit curves for damage conditions showing the permissible area of operation

(ii) The vessel is to comply with the damage stability requirements of IMO Res. MSC.235(82) (Guidelines for the Design and Construction of Offshore Supply Vessels, 2006), alternatively as amended by IMO Res. MSC.335(90) (Amendments to the Guidelines for the Design and Construction of Offshore Supply Vessels, 2006).

16.2.6 Openings and closing appliances

(a) Weathertight doors

(i) Where necessary, an arrangement for protecting the doors against deck cargo is to be provided.

(ii) Scuttles or windows fitted in weathertight doors are to comply with 13.3 of Part II.

(iii) For ships assigned the class notation **OSV–Harsh Weather**, the arrangements and sill heights of weathertight doors are in general to comply with 17.4.2 of Part II. Unprotected doors in exposed positions on a weather deck for cargo are to be made of steel.

(iv) For ships assigned the class notation **OSV–Harsh Weather**, the requirements to sill heights of doors located in exposed positions in sides and front bulkheads apply one deck higher than given by 17.4.2 of Part II.

(v) For ships assigned the class notation **OSV–Harsh Weather**, doorways to the engine room and other compartments below the weather deck are, as far as is practicable, to be located at a deck above the weather deck. Alternatively, two weathertight doors in series may be accepted.

(vi) For ships assigned the class notation **OSV–Harsh Weather**, scuttles or windows fitted in weathertight doors are to comply with 16.2.6(c) as below.

(b) Freeing ports and scuppers

The area of the freeing ports in the side bulwarks on the cargo deck is at least to meet the requirements of 13.2 of Part II.

The disposition of the freeing ports is to be carefully considered to ensure the most effective drainage of water trapped in pipe deck cargoes and in recesses at the after end of the forecastle. In such recesses appropriate scuppers with discharge pipes led overboard may be required.

If an emergency exit is located in a recess, freeing ports should be located nearby.

(c) Windows and side scuttles for ships assigned class notation **OSV–Harsh Weather**

(i) Typical arrangements complying with the requirements given below are shown in Fig. III 16-1 and Fig. III 16-2 as below. Side scuttles will not be accepted in the ship's sides below third tier forward of 0.1 L_f from forward perpendicular unless upon special consideration with respect to strength and position.

(ii) In the after end bulkhead of deckhouses and superstructures, in sides of deckhouses and of superstructures that are not part of the shell plating, windows will be accepted in the second tier above the freeboard deck and higher. In the front bulkheads of deckhouses and superstructures, windows will be accepted in third tier above the freeboard deck and higher. In the first tier of the front bulkhead above the weather deck (forecastle deck), only side scuttles will be accepted.

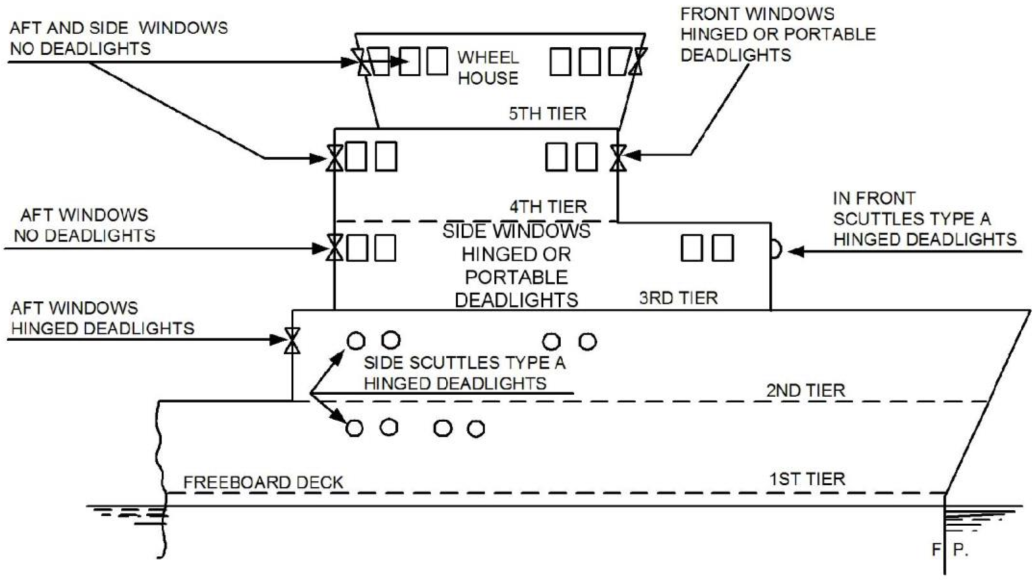

Fig. III 16-1
Side Scuttles and Windows in Offshore Service Vessel with Complete Superstructure and Uppermost Forecastle

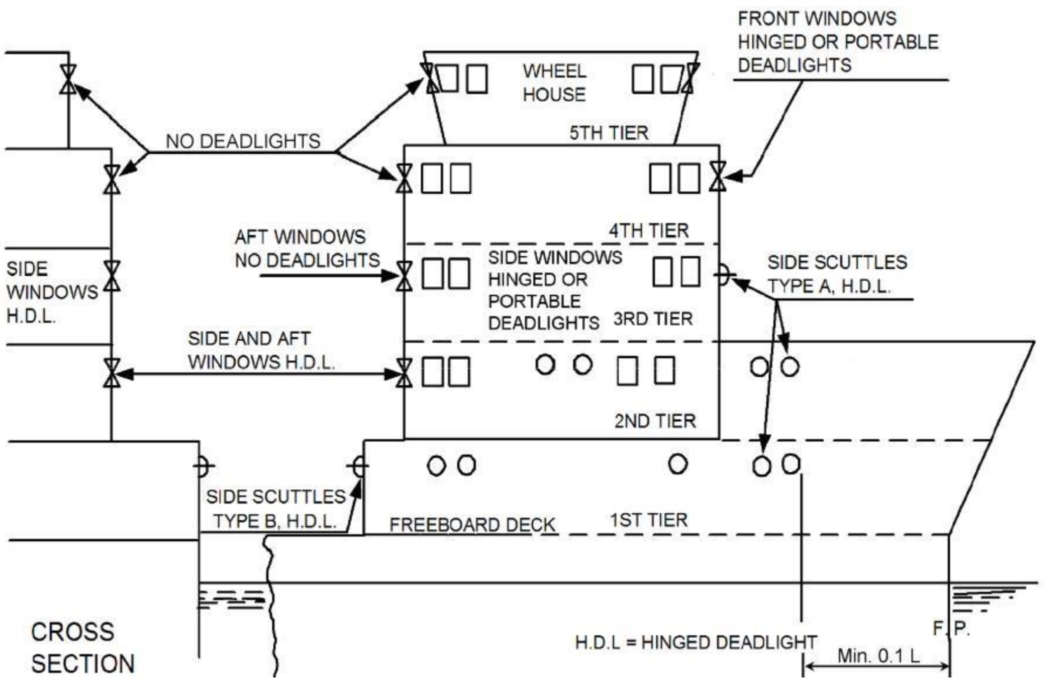

Fig. III 16-2
Side Scuttles and Windows in Offshore Service Vessel with Forecastle only

(iii) Hinged deadlights are to be fitted to:

- side scuttles in the vessel's hull, i.e. shell plating
- windows and side scuttles in the sides of deckhouses and superstructures up to and including the third tier above the freeboard deck
- all windows and side scuttles in front bulkheads of superstructures and deckhouses
- windows and side scuttles in the after end of bulkheads of superstructures and deckhouses, casings and companionways in the first and second tier above the freeboard deck
- windows and side scuttles in all bulkheads of the first tier on the weather deck.

(iv) Deadlights fitted in the side of the third tier may be portable if they are stored near by.

For the fourth tier and above, unless it is the first tier above the forward weather deck, the deadlights may be portable if they are stored nearby.

In the second tier above the freeboard deck and higher, deadlights on windows may be arranged externally, provided there is easy and safe access for closing.

Other deadlights are to be internally hinged.

(v) Deadlights are to be available for each type of window sited on the front of a wheelhouse that is located on the forward part of the vessel, unless the wheelhouse is located on the fifth tier (or higher) and is at least two decks above the forward weather deck. For externally fitted deadlights, an arrangement for easy and safe access is to be provided (e.g. gangway with railing). The deadlights of portable type are to be stowed adjacent to the window for quick mounting. For the wheelhouse front windows, at least two deadlights are to have means for providing a clear view.

(vi) The strength of side scuttles with internally hinged deadlights and toughened glass panes are to comply with International Standard ISO 1751 as follows:

Type A (heavy): In the hull, in the sides of superstructures, and in the front of superstructures and deckhouses (weather deck tier).

Type B (medium): In the after end of superstructures and in the sides and ends of deckhouses (except front in weather deck tier).

(vii) Windows are to have toughened safety glass panes of thickness, in mm, not less than:

$$t = \frac{b}{S}\sqrt{P\beta}$$

where:

b = Smaller dimension of the glass pane, in mm

S = Safety factor obtained from the Table III 16-5 of this Chapter

P = Local sea pressure, as given in 16.2.3(d)(i) of this Chapter, in kN/m^2.

β = Factor obtained from the Fig. III 16-3 of this Chapter

Furthermore, the thickness of windows should not be taken less than 10 mm.

When laminated glass panes are used, equivalent thickness according to formula given below is to be applied.

$$t_e = \sqrt{\frac{\sum_{i=1}^{n} t_i^3}{t_{max}}} \geq t_r$$

where:

n = Number of laminated layers

t_i = Thickness of each glass pane layer in the laminate in mm

t_{max} = The largest thickness of the n panes in mm

t_e = Equivalent thickness of laminated toughened safety glass in mm

The minimum thickness however for any glass pane layer is not to be less than 4 mm.

Table III 16-5
Safety Factor (S)

Window and tier	2nd	3rd	4th and above
Front or side	100	100	150
Aft	100	150	200

Fig. III 16-3
Curve for Factor β Based on Window Size Ratio

(viii) Windows of design not in accordance with recognised international standards are to be approved by the Society on a case-by-case basis. Drawings showing details of the frame design, its fixation, and material specification are to be submitted for approval.

(ix) For large windows with the lower edge positioned at or less than 900 mm above the deck, provision of handrails at a level approximately 1 m above the deck is to be considered when applicable.

16.3 Anchor-Handling and Towing Vessels

16.3.1 Introduction

(a) Introduction

The requirements in this section apply to vessels intended for anchor handling and towing operations offshore.

Anchor handling operations implies towing of floating objects in open waters and objects on sea bed in addition to subsurface deployment and lifting of anchoring equipment.

Towing operations implies towing of floating objects in open waters.

(b) Scope

The following is covered by this section:

- design and testing requirements to towing and anchor handling equipment
- hull arrangement and supporting structure
- stability and watertight integrity.

Basic requirements for anchor handling and towing vessels are given in 16.1 and 16.2 of this Chapter.

(c) Application

Vessels intended for anchor handling operations, and built in compliance with class notation **OSV** together with the requirements in this section, may be given the class notation qualifier **Anchor Handling**.

Vessels intended for towing operations, and built in compliance with class notation **OSV** together with the requirements in this section, may be given the class notation qualifier **Towing**.

(d) Testing requirements

(i) The winch and other equipment made mandatory in this section are to be function tested according to approved procedures in order to verify:

- the ability of the arrangement and equipment to operate within the limitations, towline paths, towline sectors etc. specified by the arrangement drawing
- the correct function of the normal operation modes
- the correct function of the emergency operation modes, including emergency release and dead ship operations.

(ii) The winch is to be load tested during hoisting, braking, and pay out. Design loads to be applied. However, a maximum load equal to BP may be accepted if the winch is not of novel design or complex structure.

(iii) The BP testing is to comply with applicable requirements in 11.9 of this Part.

16.3.2 Hull

(a) Deck structure

(i) Scantlings of foundations and supports of towing pins are to be based on 2 times the specified maximum static working load specified by the designer.

(ii) Scantlings of foundations and supports of winches intended for towing functions are to be based on minimum 2.2 times the maximum BP of the vessel.

(iii) Scantlings of foundations and supports of winches intended for anchor handling functions are to be based on 1.5 times the specified maximum hoisting capacity or the maximum brake holding capacity of the winch, whichever is greater.

(iv) Scantlings of foundations and supports of stern rollers are to be based on 2 times the maximum static working load as specified by the designer or 2 times the specified maximum hoisting capacity of the anchor handling winch, whichever is greater.

(v) Scantlings of foundations and supports of shark jaws are to be based on 2 times the maximum static working load as specified by the designer.

(vi) Acceptable stresses, in N/mm^2, for the scantlings of the supporting structure resulting from bending moment M, in kNm, and shear force Q, in kN, calculated for the load given above are:

σ_b = Bending stress, in N/mm^2, taken as:

$$\sigma_b = \frac{1000\,M}{Z}$$

$$\sigma_b \leq 0.9R_{eH}$$

τ = Average shear stress, in N/mm^2, taken as:

$$\tau = \frac{10Q}{A_{shr}}$$

$$\tau \leq 0.9\,R_{eH}/\sqrt{3}$$

where:

Z = Net section modulus, in cm^3

A_{shr} = Net shear area, in cm^2.

R_{eH} = Specified minimum yield stress specified in Table XI 3-9 or Table XI 3-10 of Part XI, in N/mm^2

For direct strength calculations, the equivalent von Mises stress, in N/mm^2, is to satisfy:

$\sigma_{vm} \leq 0.9R_{eH}$

(b) Ship's sides and stern

Where subjected to heavy loads when handling anchors, the stern and the flat part of the bottom in way of the stern are to be adequately strengthened. The net plate thickness is not to be less than twice the basic requirement given in 16.2.2(c)(ii) of this Chapter. The deck adjacent to the stern is to be strengthened accordingly. If a substantial sheathing is fitted on the deck, the requirement may be modified.

16.3.3 Systems and equipment

(a) General

(i) The equipment is to meet the requirements in this section. Alternatively, equipment complying with a recognized standard may be accepted upon special considerations, provided said standard gives a reasonable equivalence to the requirements of this section and fulfils the intention.

(ii) Arrangement drawing for anchor handling and towing, with the content listed under documentation requirement in this section, is to be posted on the bridge.

(iii) Structural elements, e.g. cargo rails, bulwarks, etc., that may support the towline during normal operation, are to have a radius of bend sufficient to avoid damage to the towline.

(iv) The arrangement is to be such that the heeling moment arising when the towline is running in the athwartship direction, will be as small as possible.

(v) Vessels with class notation qualifier **Anchor Handling** are to be fitted with the following items:

- anchor handling winch
- shark jaw
- towing pins
- stern roller.

(vi) Vessels with class notation qualifier **Towing** are to be fitted with the following items:

- towing winch or towing hook.

(vii) If a vessel with qualifier **Towing** is fitted with towing pins and/or shark jaws, these are to be certified as specified in CR Guidelines for Survey of Products for Marine Use.

(viii) The arrangement is to be such that the towline is led to the winch drum in a controlled manner under all foreseeable conditions (directions of the towline) and provides proper spooling on the drum.

(b) Materials for equipment

(i) Shark jaws and towing pins with attachments are to be made of rolled, forged or cast steel in accordance with Part XI.

(ii) For anchor handling and towing, winch materials are to comply with relevant specifications given in Part XI.

(iii) For forged and cast steel with minimum specified tensile strength R_m above 650 N/mm^2, specifications of chemical composition and mechanical properties are to be submitted for approval for the equipment in question.

(iv) Plate material in welded parts is to be of the grades as given in Table III 16-6 as below.

Table III 16-6
Plate Material Grades

Thickness in mm	Normal strength structural steel	High strength structural steel
$t \leq 20$	A	AH
$20 < t \leq 25$	B	AH
$25 < t \leq 40$	D	DH
$40 < t \leq 150$ (1)	E	EH

Note:
(1) For plates above 40 mm joined with fillet-/partly penetration welds, grade D and DH will normally be accepted

(v) When R_{eH} is greater than 80% of R_m, calculations for structural strength, as given in 16.3.3(c) as below, are to be based on the following value for R_{eH}:

$$R_{eH} = \min(R_{eH}\,;\,0.8R_m)$$

(vi) Fabrication of shark jaws and towing pins is to be in accordance with Part XI and Part XII, or a standard recognised by the Society.

(c) Anchor handling and towing winch

(i) Control system

The control stands are to provide a safe and logical interface for the operator with operating levers returning to stop position when released, and, in addition, providing a clear view to the drums.

The anchor handling winch is to be capable of controlled operation during lowering and hoisting of anchors, both submerged and over the stern roller.

(ii) Monitoring system

Devices for measuring tension in tow ropes should be fitted.

(iii) Emergency release

The winch is to be designed to allow drum release in an emergency, and in all operational modes.

The release capabilities are to be as specified on arrangement drawing as required in 16.3.3(a)(ii) of this Chapter.

The action to release the drum is to be from a position at the bridge with full view and control of the operation. Identical means of equipment for the release operation are to be used on all release stations.

After an emergency release, the winch brake is to be in normal function without delay.

It is to always be possible to carry out the emergency release sequence (emergency release and/or application of brake), even during a black-out.

Control handles, buttons etc. for emergency release are to be protected against unintentional operation.

(iv) Structural strength of winch for anchor handling function

The winch for anchor handling function is to be capable of withstanding the maximum forces from hoisting, rendering and braking, including dynamic effects, without exceeding the following stress levels:

- hoisting including dynamic effect at relevant layer: $0.67R_{eH}$
- braking at relevant layer as specified in 16.3.3(c)(x) as below: $0.67R_{eH}$
- rendering load/load in towline when drum starts to rotate in the opposite direction of the applied driving torque: $0.85\ R_{eH}$.

Buckling and fatigue are to be considered according to a recognized standard or code of practice.

(v) Structural strength for winch for towing function

The design and scantlings are to be capable of withstanding the winch holding capacity, taken as 80% of the minimum breaking load, as given in 11.7.4 of this Part, without permanent deformations at the relevant layer.

Buckling and fatigue are to be considered according to a recognized standard or code of practice.

(vi) Winches intended for both functions are to meet the requirements of both 16.3.3(c)(iv) and 16.3.3(c)(v) above.

(vii) Drums

The drum design is to be carried out with due consideration to the relevant operations.

The drum diameter for steel wire rope should not be less than 14 times the maximum intended diameter of the rope. However, for all rope types, the rope bending specified by the rope manufacturer should not be exceeded.

(viii) Towline attachment

The end attachment of the towline to the winch barrel is to be of limited strength making a weak link in case the towline has to be run out.

At least three dead turns of rope are assumed on the drum under normal operation to provide proper attachment.

(ix) Brake on drum intended for towing

The brake is to normally act directly on the drum and should be capable of holding the winch holding capacity, as given in 16.3.3(c)(v) above, at the inner layer. It is to be arranged for manual operation or other means for activation during a failure of the power supply.

(x) Brake on drum intended for anchor handling

The brake is generally to act directly on the drum. It is to be capable of holding at least 1.25 times the maximum torque created from towline pull including dynamic effect. In addition, the brake is to be capable of stopping the rotation of the drum from its maximum speed.

The holding load of the winch is not to be affected by failure of the power supply, and the brake is to be actuated at power failure if the load is not controlled by the winch motors or similar. Means are, however, to be provided for overriding such systems at any time.

(xi) Brakes on drums intended for both functions are to meet the requirements in 16.3.3(c)(ix) and 16.3.3(c)(x) above.

(d) Other equipment

(i) The shark jaw and towing pins are to be capable of sustaining the load defined on the arrangement drawing given in 16.3.3(a)(ii) of this Chapter without exceeding a stress level of $0.67R_{eH}$. Dynamic effects are to be included.

(ii) If an emergency release on shark jaw and towing pins is arranged, the capabilities are to be as specified on the arrangement drawing, given in 16.3.3(a)(ii) of this Chapter.

(iii) When the towing hook is fitted, applicable requirements in 11.7 of this Part are to be complied with.

(e) Marking

Equipment is to be marked to enable them to be readily related to their specifications and manufacturer. When the Society's product certificate is required, the equipment is to be clearly marked by the Society for identification.

16.3.4 Stability

(a) General requirements

For towing operations, stability is to comply with applicable requirements in 11.8 and 11A.4 of this Part.

16.4 Standby Vessels

16.4.1 Introduction

(a) Introduction

The requirements in this section apply to vessels especially designed to carry out rescue and standby services to offshore installations.

(b) Scope

This section contains requirements for hull arrangement, strength and equipment.

(c) Application

Vessels complying with the requirements in 16.4.1 to 16.4.6 of this Section, excluding 16.4.2(b), may be given the class notation **Standby Vessel**.

Note: The flag administration may have requirements for the same items found in these rules. The stricter one is expected to prevail.

If, in addition, the vessel complies with requirements for strengthening of the superstructure and deckhouses given in 16.4.2(b), the notation may be extended to **Standby Vessel– Harsh Weather**, which is recommended for vessels primarily operating in harsh weather conditions.

16.4.2 Hull

(a) Ship's sides

(i) The net section modulus of transverse stiffeners or side longitudinals, in cm^3, is not, in any region, to be less than:

$$Z_1 = 1.25Z$$

where Z is the net section modulus, as given in Chapters 6A and 12 of Part II.

All stiffeners up to the second deck above the freeboard deck, and forward of 0.2L from F.E. up to forecastle deck, are to have end connections with brackets.

(ii) Longitudinal steel fenders are to be fitted on the ship´s sides at freeboard cargo deck and the second deck above. The steel fenders are to extend not less than 0.02L forward of the section where the deck has its full breadth.

In way of steel fender area along the level of the freeboard cargo deck and the second deck above, the net thickness, in mm, for a breadth not less than 800 + 5 *L*, in mm, is not to be less than:

$$t = (4.5 + 0.05L)\frac{b}{s_s}$$

where:

s_s = Standard frame spacing in m
= 0.48 + 0.002 L
= Maximum 0.61 m forward of the collision bulkhead and aft of the after peak bulkhead

b = Width of face plate of stiffeners and primary supporting members

$b/s_s \geq$ 1.0

If steel fenders are omitted, as, for instance, within the rescue zone, the above minimum thickness is to be increased by 50%, for a breadth not less than 0.01L, in m, along the level of the freeboard cargo deck and the second deck above.

If the vessel is not assigned with class notation **OSV**, the net side plate thickness above the bilge, in mm, in way of the rescue zone, is not to be less than:

$$t = \max\left\{(4.5 + 0.05L)\frac{b}{s_s};\ 6.5\right\}$$

(iii) The net plate thickness of the exposed weather deck at the rescue zone, in mm, within at least 1.0 m from the ship's side, is not to be less than:

$$t = 6.0 + 0.02L$$

(iv) Bulwark gross plate thickness is not to be less than 7 mm. On the main weather deck the bulwark stays are to have a depth not less than 350 mm at deck, and positioned at every second frame. Open rails are to have ample scantlings and efficient supports.

(v) Scantlings of foundations and supports of towing winch and towing hook are to withstand a load $0.04P_S$ tonnes, where P_S is the total power of the propulsion engines in kW. Acceptable stresses, in N/mm^2, in the supporting structure resulting from bending moment M, in kN·m, and shear force Q, in kN, calculated for the load given above are:

σ_b = bending stress, in N/mm^2, taken as:

$$\sigma_b = \frac{1000\ M}{Z}$$

$$\sigma_b \leq 0.9R_{eH}$$

τ = Average shear stress, in N/mm^2, taken as:

$$\tau = \frac{10Q}{A_{shr}}$$

$$\tau \leq 0.9\ R_{eH}/\sqrt{3}$$

where:

Z = Net section modulus, in cm^3

A_{shr} = Net shear area, in cm^2.

R_{eH} = Specified minimum yield stress specified in Table XI 3-9 or Table XI 3-10 of Part XI, in N/mm^2

For direct strength calculations, the equivalent von Mises stress, in N/mm^2, is to satisfy:

$\sigma_{vm} \leq 0.9R_{eH}$

(b) Steel deckhouses and superstructures for ships assigned class notation **Standby Vessel – Harsh Weather**

(i) Scantling for superstructures and deckhouses

The net section modulus, in cm^3, of stiffeners and beams not contributing to longitudinal strength is not to be less than:

$$Z = \frac{f_u |P| s\, l_e^2}{f_e C_s R_{eH}}$$

where:

P	=	Design pressure in kN/m^2
	=	P_D for exposed decks
	=	Max(P_{SI} ; P_W) for exposed superstructure side
	=	P_A for exposed end bulkheads and deckhouse boundaries
	=	Minimum 10 kN/m^2 for weather decks
	=	Minimum 5 kN/m^2 for top of the wheelhouse
	=	8 kN/m^2 for accommodation decks, aft of 0.2L from A.E. and forward of 0.2L from F.E.
	=	6.5 kN/m^2 elsewhere
P_D	=	Design sea pressure, in kN/m^2, as given in CSR-H Pt.1 Ch.4 Sec.5 [2] and Pt.1 Ch.4 Sec.5 [4.2], as applicable
P_{SI}	=	Design sea pressure, in kN/m^2, for superstructure side, as given in CSR-H Pt.1 Ch.4 Sec.5 [4.3]
P_W	=	Wave pressure, in kN/m^2, for superstructure side, as given in CSR-H Pt.1 Ch.4 Sec.5 [1.3]
P_A	=	Design sea pressure, in kN/m^2, for end bulkheads of superstructure and deckhouse boundaries, as given in CSR-H Pt.3 Ch.4 Sec.5 [4.4.1]
f_e	=	Bending moment factor as defined in CSR-H Pt.1 Ch.6 Sec.6 Table 2, where the notation f_{bdg} is employed. For stiffeners with end fixity deviating from the ones included in CSR-H Pt.1 Ch.6 Sec.6 Table 2, with complex load pattern, or being part of a grillage, the requirement in CSR-H Pt.1 Ch.6 Sec.5 [1.2] applies.
f_u	=	Factor for unsymmetrical profiles, to be taken as:
	=	1.00 for flat bars and symmetrical profiles (T-profiles)
	=	1.03 for bulb profiles
	=	1.15 for unsymmetrical profiles (L-profiles)
C_S	=	Permissible bending stress coefficient, taken as: C_S= 0.75 for acceptance criteria set AC-SD.
R_{eH}	=	Specified minimum yield stress specified in Table XI 3-9 or Table XI 3-10 of Part XI, in N/mm^2

(ii) Stiffeners are to have effective end connections, i.e. with brackets or welded webs. Stiffeners on lower front bulkhead on weather deck forward are to have brackets at the lower ends.

(iii) The net plate thickness, in mm, in superstructures and deckhouses is not to be less than:

$$t = (t_0 + 0.02L)c\sqrt{K}$$

where:

t_0	=	4.5 mm for front bulkheads and weather deck forward of the lowest tier of the front bulkhead
	=	3.5 mm for sides and aft end bulkheads and weather decks elsewhere
	=	3.0 mm for superstructure and deckhouse decks (in way of accommodation).

c = Coefficient taken as: c = max(b/650 ; 1.0)

K = Material factor as specified in 1.5.2(a) of Part II.

16.4.3 Systems and equipment

(a) Towing arrangement

(i) When the vessel is fitted with means for emergency towing, the towing winch and/or towing hook is to satisfy the requirements given in 11.7 and 11.8 of this Part.

(ii) For ships which are not built according to the rules for **Tug**, **Towing**, **Anchor Handling** or **AHT** notation, the towing wire and all connected parts are to have a minimum breaking load of $0.04P_S$ tonnes, where P_S is the total power of the propulsion engines in kW.

(iii) All loose gear of the towing equipment, like shackles, rings, wire and ropes are to be delivered with a works certificate.

(b) Exhaust outlets

Exhaust outlets from diesel engines are to have spark arrestors.

(c) Propulsion

The vessel is to be fitted with two propulsion systems, or similar, capable of moving the vessel in the forward/aft direction.

16.4.4 Fire safety and lifesaving appliances

(a) Rescue zone arrangement, equipment and facilities

(i) The vessel is to be arranged with a rescue zone on each side with minimum 8 m length. The area is to be clearly marked on the ship's side. Its location is to be sufficiently far away from the propellers and clear of any ship side discharges up to 2 m below the loaded waterline.

(ii) Access routes from the rescue zones to survivors' accommodation and to helicopter winch zone, if provided, are to have slip-resistant deck coating or wooden lining with surface treatment giving equivalent properties.

(iii) The ship's side in way of the rescue zone is to be free of any obstructions, such as fenders, and clear of any discharge pipe connections.

(iv) Satisfactory lighting is to be available, capable of providing a minimum illumination level of 150 lux at the rescue zone and 50 lux at a distance of 20 m from the vessel.

(v) The deck area in way of the rescue zone should preferably be free from air pipes, valves, smaller hatches, etc. However, when this becomes impractical, proper arrangement is to be provided to protect against personal injury.

(vi) To enable direct boarding on the deck, a bulwark or railings in the rescue zone are to be easy to open or remove.

(vii) A searchlight is to be available on each side, and is to be operable from the navigation bridge. The searchlights should be able to provide an illumination level of 50 lux in clear air, within an area not less than 10 m diameter, up to a distance of 250 m.

(viii) Each rescue zone is to be provided with a scrambling net made of corrosion resistant and non-slip material.

(ix) The vessel is to be provided with power assisted means capable of ensuring careful recovery of disabled persons from the sea.

(x) A decontamination area equipped with a shower system is to be arranged for cleaning survivors and crew before entering the superstructure.

(b) Survivors spaces

(i) The vessel is to have a treatment room for casualties, a recovery room with berths, and enclosed space to accommodate survivors. These spaces are to be provided with lighting and means to control temperature and humidity suitable for the area of operation. The survivors may be accommodated in crew spaces, excluding sanitary rooms, treatment rooms, the galley, wheelhouse, radio room, and cabins for the captain and two crew members.

The designed capacity for survivors is to be determined considering 0.75 m^2 per person. This includes free floor space and floor space with loose furniture, fixed seating and/or fixed beds. Other fixed furniture, toilets and bathrooms are to be excluded.

Corridors and doors giving access to the treatment room for casualties and recovery room are to be dimensioned to allow adequate transport of survivors by stretchers.

(ii) Sanitary facilities are to be available exclusively for the survivors. At least one installation, comprising a toilet, a wash basin, and shower, is to be provided for each group of 50 survivors.

(c) Safety equipment

(i) The vessel is to be equipped with at least one fast rescue boat of type complying with IMO MSC/ Circ.809, arranged and maintained to be permanently ready for use under severe weather conditions. The launching arrangement is to be a SOLAS-approved type.

(ii) The following minimum safety equipment is to be provided when the vessel has a gross tonnage less than 500:

- one line-throwing appliance with not less than four projectiles and four lines
- one daylight signalling lamp
- six lifebuoys, four of which to be equipped with self-igniting lights and buoyant lines (SOLAS-approved type)
- one SOLAS-approved immersion suit for each crew member
- one SOLAS-approved lifejacket for each crew member plus 25% of the number of survivors that the vessel is intended to carry.

(d) Care of personnel

(i) The treatment room is to have adequate equipment and medical supplies.

(ii) Treatment room equipment and medical stores are to be arranged as required by local regulations or based on recognised standards.

Note: The vessel should be provided with blankets in sufficient quantity for the number of survivors that the vessel is intended to carry.

16.4.5 Stability

(a) Intact and damage stability

The vessel is to comply with intact stability requirements given in 16.2.5 of this Chapter and damage stability requirements given in 16.2.5(e) of this Chapter.

16.4.6 Openings and closing appliances

(a) Freeing ports

The area of the freeing ports in the side bulwarks on the cargo deck is to at least meet the requirements of 13.2 of Part II. The arrangement of the freeing ports is to be carefully considered to ensure the most effective drainage of water trapped on the weather deck.

(b) Weathertight doors

(i) The arrangement and sill heights of weathertight doors are to comply with 17.4.2 of Part II. Doors in exposed positions on the lowest weather deck and in the lowest unprotected fronts and sides are to be of steel.

(ii) For doors located in exposed positions in sides and front bulkheads, the requirements to sill heights apply one deck higher than specified in 17.4.2 of Part II.

(iii) Doorways to the engine room and other compartments below the weather deck are, as far as practicable, to be located at a deck above the weather deck. Alternatively, two weathertight doors in series may be accepted.

(c) Windows and side scuttles

Arrangement of windows and scuttles is to comply with the requirements given in 16.2.6(c) of this Chapter.

16.5 Windfarm Maintenance Vessels

16.5.1 Introduction

(a) Introduction

The requirements in this section apply to vessels intended for maintenance of offshore wind farms.

Wind farm maintenance may include:

- being a mother craft for smaller craft transferring technicians to and from offshore wind turbines
- transferring technicians directly to the wind turbine
- transferring supplies to the wind turbine
- performing smaller lifting operations onto the wind turbine.

(b) Scope

This section contains requirements for hull arrangement, strength, equipment, and dynamic positioning systems.

Note: Coastal state and/or statutory regulations may include requirements in excess of the provisions of these rules depending on the size, type, location and intended service of the unit/installation. These requirements are excluded from this section.

(c) Application

Vessels intended for for maintenance of offshore wind farms, and built in compliance with class notation **OSV** together with the requirements in this section, may be given the class notation qualifier **Windfarm Maintenance**.

16.5.2 Testing requirements

(a) Cranes

After completed installation on board, load- and functional testing of the crane are to be carried out as specified in Rules for the Construction and Survey of Cargo Gear.

(b) Work boat davits

Testing at factory and after installation on board is to be performed in line with IMO MSC. 81(70) part 2.

16.5.3 Hull

(a) Hull arrangement and strength

(i) The hull structural strength is to be as required for the classification taking into account necessary strengthening of supporting structures for equipment applied during the maintenance and service of offshore wind farms.

(ii) All load effects caused by deck cargo and heavy equipment are to be accounted for in the design calculations for all operational phases.

16.5.4 Systems and equipment

(a) Cranes

(i) Wind farm maintenance vessels equipped with cranes are to comply with Rules for the Construction and Survey of Cargo Gear.

(ii) The crane is to be delivered with the Society's product certificate to confirm compliance with Rules for the Construction and Survey of Cargo Gear.

(b) Offshore transfer systems

When requested by the Owner, the notation **Walk-to-Work** may be assigned for vessels equipped with offshore transfer systems for transferring technicians from ship to wind turbine, provided that the transfer system is designed according to a recognized standard acceptable to the Society.

(c) Work boat davits

(i) Where fitted, work boat davits and winches are to comply with SOLAS 1974 and the LSA Code.

(ii) Functional and operational requirements:

- no requirements to heel or trim unless specified by operator
- stored mechanical power not required, however lowering in dead ship condition is to be possible
- no requirements to hoisting or lowering speed unless specified by the flag administration
- if the estimated dynamic factor exceeds 1.5, shock damper arrangement is required.

(iii) In addition to the strength requirements given in the above regulations, fatigue checks are to be performed in accordance with a recognised standard acceptable to the Society.

(d) Work boats

(i) All work boats fitted onboard are to be contructed according to 1.1.16 in Part I.

(ii) The ship side in way of the work boats is to be equipped with fenders to reduce impact loads during launch and recovery of the craft.

16.5.5 Dynamic positioning

(a) Dynamic positioning system

The vessel is, as a minimum, to comply with the requirements for class notation **DPS-II**.

(b) Capability plots

(i) The position keeping ability of the vessel is to be calculated and presented in form of capability plots as outlined in these rules. The capability plots are to be kept onboard.

Note: It is recommended that a recognised standard, such as IMCA M 140 Rev. 1, be used as a guideline for making capability plots. The correlation between wind speed and waves height and period provided in this standard can also be used for current speeds other than those specified by the standard. Linear interpolation between points is acceptable.

(ii) The capability plots are to be produced in polar form, as a static analysis, with coincident forces of wind, waves, and current. In the analysis, the vessel is to maintain fixed position and heading, and is to be exposed to forces from a fixed current speed corresponding to the intended location of operation, but in any case not less than 1.5 m/s with correlating wind and waves. The fixed current speed applied is to be specified in the appendix to the classification certificate.

(iii) Therefore, there is to be, at the same time, a balance of forces and a balance of moments, including all moments generated by the thrusters, and those caused by environmental forces.

(iv) The limiting wind speeds, where the current, wind and wave forces are equal to the maximum available thruster forces, are to be plotted at least every 15° around the vessel. Linear interpolation between points is acceptable.

(v) The environmental forces caused by wind, waves, and current are to be calculated by recognised methods, or may be obtained by model testing.

(vi) The capability plots are to be based upon the available power and the thrust output that is under control, in the most efficient control mode.

(vii) A minimum of four plots is required:

- Case 1 is to represent optimal use of all thrusters
- Case 2 is to represent minimum effect of single-thruster failure
- Case 3 is to represent the maximum effect of single-thruster failure
- Case 4 is to represent the worst case failure modes. There is to be one plot for failure of each redundancy group, or an amalgamated plot is to be provided with the lowest result for each heading across all the redundancy groups.

All plots are to be produced at the same scale.

Note: It is recommended that the wind speed scale be taken as 15 mm: 10 m/s, with a range from 0 to 50 m/s.

Note: An amalgamated plot is to represent the vessel capability in all directions and can therefore, in many cases, represent several different failure conditions, as the worst case single failure (WCSF) typically will be heading-dependent.

Appendix 1

Direct Strength Assessment

A1.1 General

A1.1.1 This chapter provides requirements applicable to ships having rule length L of 150 m or above to assess the scantlings of the hull structure using finite element analysis.

A1.1.2 A design life of 25 years is assumed for selecting ship design parameters. The specified design life is the nominal period that the ship is assumed to be exposed to operating

A1.1.3 The analysis is to verify the following:

(a) Stress levels are within the acceptance criteria for yielding defined in CSR-H Pt1, Ch 7, Sec2 [5] and CSR-H Pt1, Ch 7, Sec3 [6].

(b) Buckling capability of plates and stiffened panels are within the acceptance criteria for bucking defined in CSR-H Pt1, Ch 8.

(c) Fatigue capacity of structural details is within the acceptance criteria defined in CSR-H Pt1, Ch 9.

A1.1.4 FE models for cargo hold FE analyses, full length FE analysis, local fine mesh FE analysis and very fine mesh FE analyses, are to be based on the net scantling approach in accordance with the Rules or other appropriate approach agreed by the Society.

A1.1.5 A flow diagram showing the minimum requirement of finite element analysis is shown in Fig. 1.

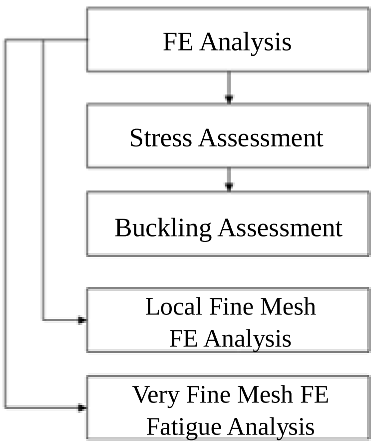

Fig. III A1-1
Flow Chart for FE Analysis

A1.1.6 Reference coordinate system

The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand coordinate system, see Fig. III A1-2:

Origin : At the intersection among the longitudinal plane of symmetry of ship, the aft end of L and the baseline.

X axis : Longitudinal axis, positive forwards.
Y axis : Transverse axis, positive towards portside.
Z axis : Vertical axis, positive upwards

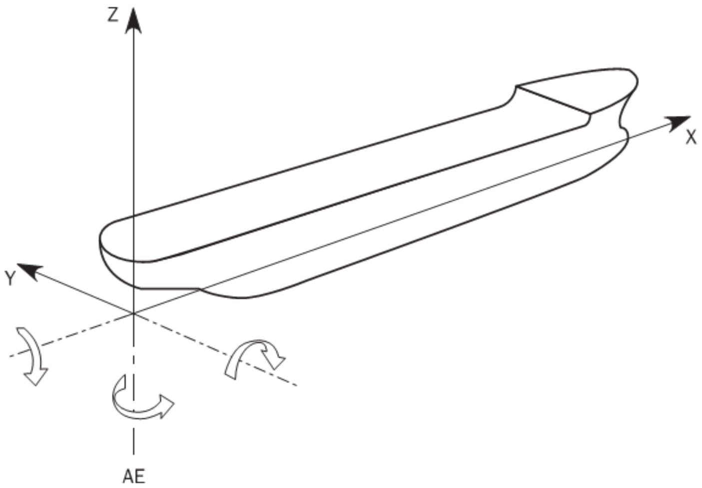

Fig. III A1-2
Reference Coordinate System

A1.2 Loads

A1.2.1 Loading conditions

All representative loading conditions (i.e. full homogenous, ballast, heavy ballast, ...) must be analyzed as specified by the relevant chapter of the rules for the considered ship type.

A1.2.2 North Atlantic wave environment

The rule requirements are based on a ship trading in the North Atlantic wave environment for its entire design life.

A1.2.3 Probability level for strength and fatigue assessments

In this appendix, the assessments are to be understood as follows:

(a) Strength assessment means the assessment for the strength criteria excluding fatigue, for the loads corresponding to the probability level of 10^{-8}, for the ballast water exchange, for harbour conditions and for flooded conditions.

(b) Fatigue assessment means the assessment for the fatigue criteria for the loads corresponding to the probability level of 10^{-2}.

A1.2.4 Loads for strength assessment

(a) The strength assessment is to be undertaken for all design load scenarios and the final assessment is to be made on the most onerous strength requirement.

(b) Each design load scenario for strength assessment is composed of a Static (S) load case or a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.

A1.2.5 Loads for fatigue assessment

Each design load scenario for fatigue assessment is composed of a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.

A1.2.6 All the static and dynamic hull girder load components, external loads and internal loads should be considered.

A1.3 FEM Modelling

A1.3.1 Model extent

For cargo hold FE analysis, the longitudinal extent of the cargo hold FE model is to cover three cargo hold lengths.

A1.3.2 Element types

Shell elements are to be used to represent plates. All stiffeners are to be modelled with beam elements having axial, torsional, bi-directional shear and bending stiffness. The eccentricity of the neutral axis is to be modelled. Face plates of primary supporting members and brackets are to be modelled using rod or beam elements.

A1.3.3 Meshing

(a) For the strength assessment

Coarse mesh should comply with CSR-H Pt1, Ch7, Sec2, [2.4].

Fine mesh should comply with CSR-H Pt1, Ch7, Sec3, [4].

(b) For the fatigue assessment

Very fine mesh should comply with CSR-H Pt1, Ch9, Sec5, [2.1].

A1.3.4 Boundary conditions for cargo hold models

The whole three dimensional model is assumed to be fixed at one end, while shear forces and bending moments are applied at the other end to ensure equilibrium. At the free end section, rigid constraint conditions are to be applied to all nodes located on longitudinal members, in such a way that the transverse section remains plane after deformation. When the hull structure is modelled over half the ship's breadth, in way of the ship's centerline longitudinal plane, symmetry or anti-symmetry boundary conditions as specified in Table III A1-1 are to be applied, depending on the loads applied to the model (symmetrical or anti-symmetrical, respectively).

Table III A1-1
Symmetry and Anti-Symmetry Conditions in way of the Ship's Centerline Longitudinal Plane

Boundary conditions	Displacements in directions			Rotation around axes		
	x	y	z	x	y	z
Symmetry	free	fixed	free	fixed	free	fixed
Anti-symmetry	fixed	free	fixed	free	fixed	free

A1.3.5 Boundary conditions for full length models

In order to prevent rigid body motions of the overall model, the constraints specified in Table III A1-2 are to be applied.

Table III A1-2
Boundary Conditions to Prevent Rigid Body Motion of the Model

Boundary conditions	Displacements in directions			Rotation around axes		
	x	y	z	x	y	z
One node on the fore end of the ship	free	fixed	fixed	free	free	free
One node on the port side shell at aft end of the ship (1)	fixed	free	fixed	free	free	free
One node on the starboard side shell at aft end of the ship (1)	free	fixed	fixed	free	free	free
Note: (1) The nodes on the port side shell and that on the starboard side shell are to be symmetrical with respect to the ship's longitudinal plane of symmetry						

When the hull structure is modelled over half the ship's breadth, in way of the ship's centerline longitudinal plane, symmetry or anti-symmetry boundary conditions as specified in Table III A1-1 are to be applied, depending on the loads applied to the model (respectively symmetrical or anti-symmetrical).

The loaded full length ship model should be balanced so that the reaction forces at the boundary conditions are negligible.

A1.4 Submission of Results

A1.4.1 Detailed report

A detailed report of the structural analysis is to be submitted by the designer/builder to demonstrate compliance with the specified structural design criteria. This report is to include the following information:

(a) List of plans used including dates and versions.

(b) Detailed description of structural modelling including all modelling assumptions and any deviations in geometry and arrangement of structure compared with plans.

(c) Plots to demonstrate correct structural modelling and assigned properties.

(d) Details of material properties, plate thickness, beam properties used in the model.

(e) Details of boundary conditions.

(f) Details of all loading conditions reviewed with calculated hull girder shear force, bending moment and torsional moment distributions.

(g) Details of applied loads and confirmation that individual and total applied loads are correct.

(h) Plots and results that demonstrate the correct behaviour of the structural model under the applied loads.

(i) Summaries and plots of global and local deflections.

(j) Summaries and sufficient plots of stresses to demonstrate that the design criteria are not exceeded in any member.

(k) Plate and stiffened panel buckling analysis and results.

(l) Tabulated results showing compliance, or otherwise, with the design criteria.

(m) Proposed amendments to structure where necessary, including revised assessment of stresses, buckling and fatigue properties showing compliance with design criteria.

(n) Reference of the finite element computer program, including its version and date.

A1.5 Computer Programs

A1.5.1 Use of computer programs

Any finite element computation program complying with this appendix may be employed to determine the stress and deflection of the hull structure, provided that the combined effects of bending, shear, axial and torsional deformations are considered.

A1.5.2 Calculation data and results

The responsibility for error free specification and input of program data and the subsequent correct transposal of output resides with the designer.

Appendix 2

Intact Stability Requirements for Ships Equipped with Heavy Lift Appliances

A2.1 Stability Information

A2.1.1 Application

This appendix applies to each ship equipped with heavy lift appliances for cargo or other objects and that has a maximum heeling moment due to hook load greater than or equal to the following.

$$\text{Heeling moment} \geq 0.67 \times \Delta \times \text{GM} \times \left(\frac{\text{F}}{\text{B}}\right)$$

Where:

Δ	=	displacement of the ship with the hook load included, in metric tons
GM	=	metacentric height with hook load included, in meters
F	=	freeboard to the deck edge amidships, in meters
B	=	beam, in meters

A2.1.2 Definition

(a) Hook load means the weight of the object lifted by the crane.

(b) Load radius means the distance illustrated in Fig. III A2-1

(c) Crane heeling moment is the maximum heeling moment developed by multiplying the weight of the hook load and boom by the horizontal distance from ship's centerline to the hook load and boom center of gravity, considering the full range of crane elevations and weights. The resulting heeling moment is to be converted to a heeling arm at zero degrees by dividing it by the ship displacement. The heeling arm is to be assumed constant for all heel angles.

(d) Equilibrium heel angle is the angle of heel under the combined effects of the hook load, counter-ballasting and a beam wind.

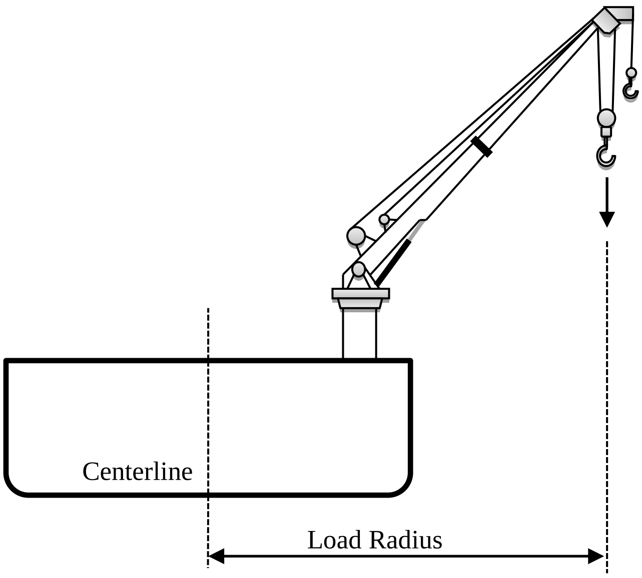

Fig. III A2-1
Load Radius

A2.2 Intact Stability Requirements for Ships Equipped to Lift

A2.2.1 Counter-ballasted and Non-counter-ballasted Ships

(a) Each ship that is equipped to lift is to comply, by design calculations, with this section under the following conditions:

(i) Either for each loading condition and pre-lift condition, or the range of conditions, including pre-lift conditions, delineated by the lifting operations guidelines contained in the trim and stability booklet;

(ii) Crane heeling moment, and

(iii) The effect of beam wind on the projected area of the ship (including deck cargo) should be evaluated for 25.7 m/s wind speed. Should a lesser wind speed be used, that wind speed shall be listed in the trim and stability booklet as an operational restriction during lifting operations.

The wind heeling moment shall be calculated as:

$P \times A \times H$ N-m

Where:

P = Wind pressure, calculated as per below.

A = Projected lateral area, in square meters, of all exposed surfaces (including deck cargo), in the upright condition.

H = Vertical distance, in meters, from the center of A to the center of the underwater lateral area or approximately to the one-half draft point.

This wind heeling moment is to remain constant for all heel angles.

$P = fV_k^2 C_h C_s$ N/m^2

Where:

f = 0.611

V_k = Wind velocity in m/s

C_s = 1.0, shape coefficient

C_h = height coefficient from Table III A2-1

Table III A2-1
Values of C_h

H (m)	C_h
0.0 ~ 15.3	1.00
15.3 ~ 30.5	1.10
30.5 ~ 46.0	1.20
46.0 ~ 61.0	1.30
61.0 ~ 76.0	1.37
76.0 ~ 91.5	1.43
91.5 and above	1.48

(b) Each ship is to have a righting arm curve with the following characteristics:

(i) The area under the righting arm curve from the equilibrium heel angle (based upon the wind heeling moment) up to the smallest of the following angles must be at least 0.080 meter-radians:

(1) The second intercept

(2) The downflooding angle

(3) 40 degrees

(ii) The lowest portion of the weather deck and downflooding point should not be submerged at the equilibrium heel angle.

(iii) The heeling angle based on the crane heeling moment and effect of the beam wind shall not exceed the maximum heel angle from the crane manufacturer.

The righting arm curve is to be corrected for the increase in the vertical center of gravity due to the lifting operation. (The increase in the VCG is due to the boom being in the elevated position, and the hook load acting at the elevated end of the boom.).

A2.2.2 Additional Intact Stability Standards – Counter-ballasted Ships

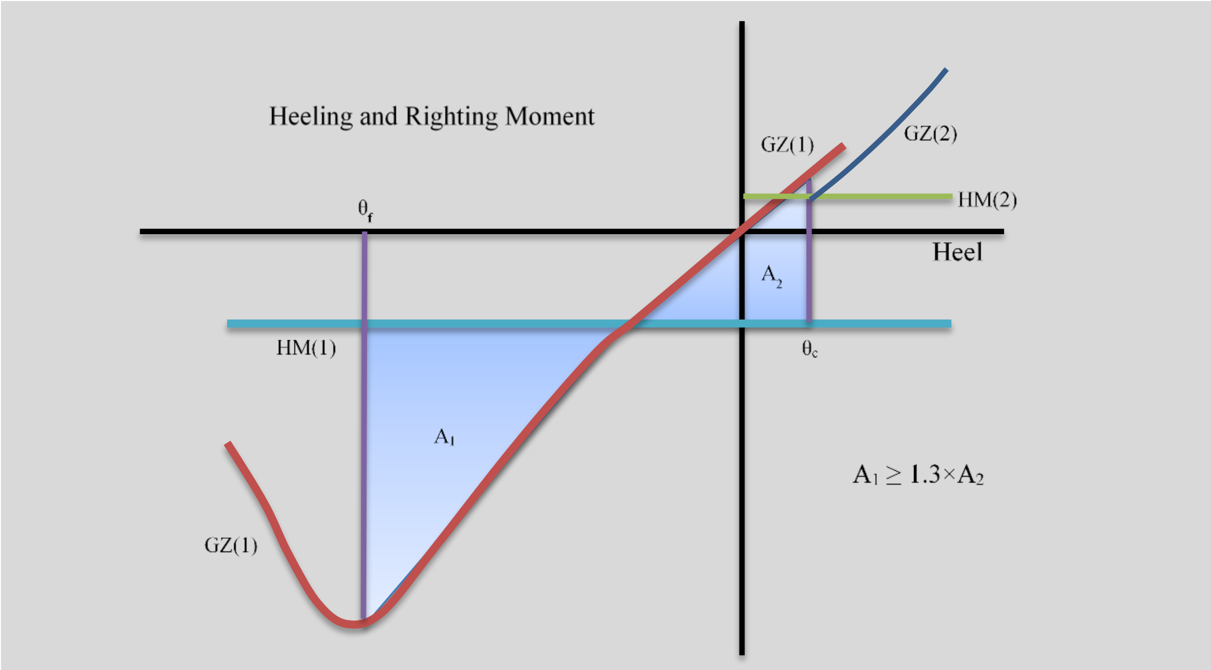
The following recommended criteria are based on crane operations taking place in favorable weather conditions. The analysis should be carried out for the counter-ballast case when the ship is floating with a heel and trim not exceeding the maximum cross angle. The maximum cross angle is the angle corresponding to the crane operational restrictions.

The righting arm curve is to be corrected for the increase in the vertical center of gravity due to the load. (The increase in the VCG is due to the boom being in the elevated position, and the hook load acting at the elevated end of the boom.).

(a) For any condition of loading and crane heeling moment, the first intercept of the heeling arm curve with the righting arm curve (equilibrium point) is to occur prior to submergence of the deck edge. The following requirements are also to be met, with the ship at the maximum allowable vertical center of gravity, to provide adequate stability in case of sudden loss of crane load.

(b) The residual area (area A_1 in Fig. III A2-2) between the first intercept and the angle of downflooding or the second intercept, whichever occurs first, is not to be less than 30% in excess of area A_2 in Fig. III A2-2.

(c) The angle of the first intercept between the righting lever curve after loss of crane load and the maximum permissible counter ballast lever curve is not to exceed 15° (angle of equilibrium after loss of crane load).



GZ(1)	=	Righting moment curve at the displacement corresponding to the vessel without hook load.
GZ(2)	=	Righting moment curve at the displacement corresponding to the vessel with hook load.
HM(1)	=	Heeling moment curve due to the heeling moment of the counter-ballast at the displacement without hook load.
HM(2)	=	Heeling moment curve due to the combined heeling moments of the hook load and the counter-ballast at the displacement with hook load.
θ_f	=	Limit of area integration to the downflooding angle or second intercept on the counter-ballasted side of the vessel.
θ_c	=	Limit of area integration to the angle of static equilibrium due to the combined hook load and counter-ballast heeling moment.

RULES FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS 2019

PART IV MACHINERY INSTALLATIONS –CONSTRUCTION AND SHAFTING

CONTENTS

Chapter 1

General

1.1 General

1.1.1 The requirements of this Part are applicable to the machinery intended for ships without special service limitations or restrictions. The Society may, however, modify the requirements in certain particular cases for their application to ships with service limitations or restrictions.

1.1.2 The Society will be prepared to give special consideration to the novel features of design in respect of the machinery based on the best information available at the time.

1.1.3 Passenger ships intended for classification are to be constructed in accordance with the requirements of the Society as well as those of Governmental and International Convention Regulations.

1.1.4 The formulae for scantlings of parts of the machinery given in the present Part do not take into consideration the possibility of additional stresses due to the presence of dangerous vibrations in the installation at speeds within the operating range, and the manufacturer of the machinery is required to take responsibility in the application of these formulae.

1.2 Units and Formulae

1.2.1 Units and formulae included in the Rules are shown in SI units.

1.2.2 Pressure gauges may be calibrated in bar.
where: 1 bar = 0.1 MPa

1.2.3 Ambient reference conditions

(a) The rating for classification purposes of main and essential service auxiliary machineries intended for installation in seagoing ships to be classed for unrestricted service is to be based on a total barometric pressure of 1,000 mbar, an engine room ambient temperature or suction air temperature of 0°C to 45°C, a relative humidity of 60% and a sea water temperature of 32°C or, where applicable, the temperature of the charge air coolant at the inlet of 32°C. In the case of open deck location, the temperature range is to be –25°C to 45°C. The engine manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

(b) In the case of ships to be classed for restricted service, the rating is to be suitable for the temperature conditions associated with the geographical limits of the restricted service.

1.2.4 Power rating
Where requirements to dimensions in the Rules are based on output and revolutions, the values to be applied are to be derived from the following:

(a) For main propelling machinery, the maximum continuous output and corresponding revolutions per minute give the maximum torque for which the machinery is to be classed.

(b) For essential auxiliary machinery, the maximum continuous output and corresponding revolutions per minute which will be used in services.

1.3 Essential Service Auxiliaries

1.3.1 When applying the requirements of the Rules, the so called essential service auxiliaries may generally be assumed as specified hereinafter.

1.3.2 Auxiliaries include their prime movers and controllers which are necessary for the propulsion of the ship:
Cooling pumps.
General service pumps.
Fuel pumps.
Lubricating oil pumps.
Purifiers.
Hydraulic pumps (for control use).
Air compressors (for starting and control use).
Scavenging pumps, blowers and exhaust gas turbochargers.
Condensate pumps.
Drain pumps.
Circulating cooling water pumps.
Condenser ejector pumps.
Gland exhaust fans.
Boiler feed water pumps.
Boiler water circulating pumps.
Boiler fans.
Electric Generators.
Evaporators (for main propelling machinery and boiler use).

1.3.3 Auxiliaries include their prime movers and controllers which are necessary for the safety of life and for the safety or operation of the ship at sea:
Bilge pumps (including pumps for oily bilge separator use).
Ballast pumps.
Fire pumps.
Steering gear.
Athwartship thrust units.
Windlasses.
Mooring winches or capstans.
Hydraulic appliances (for windlasses and mooring machineries).
Ventilating fans (for machinery spaces).
Electric generators (for emergency source of power).
Machineries and equipment of venting, purging, gas freeing and ventilation systems (for tankers).
Machinery and boiler control equipment.
Incinerator.

1.3.4 Other auxiliaries deemed as an essential by the Society.

1.4 Materials

1.4.1 The materials used for the construction of main parts of machinery are to comply with the requirements of Part XI, or such other appropriate material specifications as may be approved by the Society in connection with a particular design.

1.4.2 The materials for component parts of machinery are to be subjected to those test set out in the relevant Chapters of this Part. The society may, however, require material tests conducted on other important component parts and test methods not included in this Part.

1.4.3 The materials for component parts of machinery exposed to high temperature or chemical attack are to be of suitable quality.

1.4.4 Metal spraying and locking of cracks by special clamps etc. on shafting and other dynamically stressed parts of machinery are not permitted.

1.4.5 Steam reciprocating engines for main propelling and essential auxiliary services, where installed, are to comply with the applicable parts dealing with steam reciprocating engines in the 1976 edition of the Rules for Steel Ships.

1.5 Drawings and Data

1.5.1 For machineries built under special survey during construction, drawings showing the proposed arrangements of machinery compartments and such drawings of the machineries as stated in the subsequent Chapters of this Part are to be submitted for approval before proceeding with the work.

1.5.2 The proposed dimensions and quality of materials as well as all important arrangements and details are to be made clear in the drawings.

1.5.3 Drawings and descriptions of centralized and automatic control systems for the main propelling installation and essential service auxiliaries are to be submitted for consideration in accordance with the applicable requirements in Part VIII.

1.5.4 For any novel design of machinery, detailed drawings of parts and necessary data are to be submitted for consideration.

1.6 General Construction

1.6.1 Inclination of ships

The designs and constructions of machinery installations are to be in compliance with accepted marine engineering practices and the machineries are to be operable with complete reliability in all positions and motions with the ship under the conditions as shown in Table IV 1-1.

Table IV 1-1
Inclination of Ships

Type of machinery installations	Athwartships(1)		Bow-and-stern(1)	
	Static inclination (list)	Dynamic inclination (rolling)	Static inclination (trim)	Dynamic inclination (pitching)
Main propulsion machinery Main boilers and important auxiliary boilers Prime movers driving generators (excluding those for emergency) auxiliary machinery (excluding auxiliary machinery for specific use etc.) and their driving units	15°	22.5°	5°	7.5°
Emergency installations (emergency generators, emergency fire pumps and prime movers to drive them) Switch gears(2) (Circuit breakers, etc.) Equipment for automatic and remote controls	22.5°(3)	22.5°(3)	10°	10°

Notes:

(1) Athwartships and bow-and-stern inclinations may occur simultaneously.

(2) Up to an angle of inclination of 45°, undesired switching operations or operational changes are not to be caused.

(3) In ships carrying liquefied gases in bulk and ships carrying dangerous chemicals in bulk, the arrangement is to be such that the emergency power supply must also remain operable with the ship flooded to a final athwartships inclination up to a maximum of 30°.

1.6.2 Availability for operation

Ship's machinery is to be so arranged that it can be brought into operation from the "dead ship" condition using only the facilities available on board. "Dead ship" condition is understood to mean that the entire machinery installation, including the power supply, is out of operation and that auxiliary services such as compressed air, starting current from batteries, etc., for bringing the main propulsion into operation and for the restoration of the main power supply are not available. In order to restore operation from the "dead ship" condition, an emergency generator may be used provided that it is ensured that the emergency power supply from it is available at all times. It is assumed that means are available to start the emergency generator at all times.

1.6.3 Astern powers

The machinery built for propulsion purposes are to be of sufficient power for going astern in order to secure proper control of the ship in all normal circumstances. The astern power is to be of sufficient for maintaining in free route astern 70% of the ahead rated shaft revolutions for a period of at least 30 minutes. The output astern which may be developed in transient conditions is to be such as to enable the braking of the ship within a reasonable time. For main propulsion systems with reversing gear, controllable pitch propellers or electric propulsion equipment, the running astern is not to lead to the overload of the propulsion machinery.

1.6.4 Turning gear

Provision is to be made so that it is possible to turn the main propelling and auxiliary machineries. For the propelling turbine, the turning gear is to be power driven, and if electric, is to be continuously rated. An interlocking warning device is to be provided to ensure that the machinery cannot be started while the turning gear is engaged.

1.6.5 All component parts of machinery subject to stresses are to be made of approved sound materials, and have clearances and proper fits consistent with the best marine engineering practices.

1.6.6 Welded construction

The welded constructions are to be in compliance with the requirements specified in Part XII.

1.6.7 Safety devices on moving parts

(a) Efficient means are to be provided to prevent the loosening of nuts and screws of moving parts.

(b) The moving parts of machinery and shafting are to be efficiently protected by means of handrails, screens, etc.

1.6.8 Seating and fixing

(a) The machinery seating is to be of rigid construction and adequately attached to the hull. The effects of hull structure deformation on the machinery and excessive stressing due to shock and vibration as well as the thermal expansion of machinery are to be taken into account. Provision is to be made, as far as practicable, to ensure continuity between the longitudinal and transverse elements of the seating and the corresponding elements of the adjacent hull.

(b) The machinery is to be so securely bolted to the seating as to prevent any displacement due to the movements of the ship. The bedplate chock is to be of uniform fit before bolts are tightened.

(c) The accessories of machinery as well as spare parts of large dimensions are to be strongly secured so that they can not move or become loose under the movements of the ship.

1.6.9 Arrangements and ventilations

(a) The arrangement of machinery in the machinery compartment and tunnel is to be such that sufficient space is allowed for easy operation, maintenance and overhauling of machinery.

(b) Necessary instruments for a safe and speedy maneuvering and indicating the working condition of the machinery are to be clearly arranged at suitable positions.

(c) The machinery compartment is to be well ventilated and the ventilator is to be so arranged that any accumulation of inflammable gases is prevented as far as practicable.

(d) Flange joints and special joints (threaded pipe joints, compression fitting joints, etc.) in fuel oil, lubricating oil and other flammable oil pipings, and apparatuses contain fuel oil, lubricating oil or other flammable oil are not to be located right above hot surface on boilers, stream pipe lines, thermal oil pipe lines, exhaust gas pipe lines, silencers or exhaust gas driven turbochargers, etc. and to be arranged far apart therefrom, as far as practicable. An approved means to prevent oil from spraying is to be provided at these joints and apparatuses except where Society deems unnecessary to provide such means.

1.6.10 Communications

(a) The ship is to be fitted with 2 independent means of communicating orders between the bridge and engine room control station from which the engines are normally controlled. One of these means is to be an engine room telegraph which visually indicates the order and response, both at the engine room control station and on the bridge.

(b) At least one means of communication is to be provided between the bridge and any other control station from which the main propelling machinery may be controlled.

(c) An engineers' alarm is to be provided to be operated from the engine control room or at the maneuvering platform as appropriate, and to be clearly audible in the engineers' accommodation.

1.6.11 Protection against noise

Measures are to be taken to reduce machinery noise in machinery spaces to acceptable levels as determined by the National Regulations of the country in which the ship is registered. If this noise cannot be sufficiently reduced the source of excessive noise is to be suitably insulated or isolated or a refuge from noise is to be provided if the space is required to be manned. Ear protectors are to be provided for personnel required to enter such spaces, if necessary.

1.6.12 Control and safety

Main and auxiliary machinery essential for the propulsion, control and safety of the ship are to be provided with effective means for its operation and control. All control systems essential for the propulsion, control and safety of the ship are to be independent or designed such that failure of one system does not degrade the performance of another system.

1.6.13 Operating and maintenance instructions for ship machinery and equipment

Operating and maintenance instructions and engineering drawings for ship machinery and equipment essential to the safe operation of the ship are to be provided and written in a language understandable by her officers and crew members who are required to understand such information in the performance of their duties.

1.7 Tests and Inspections

1.7.1 For the machinery built under the special survey during construction, the extent of supervision by the Society is to be as follows:

(a) Approval of constructional drawings and their calculations.

(b) Approval of proper materials used and their testing.

(c) Supervising proper execution of work and safe installation of machinery.

(d) Trial testing of machinery.

1.7.2 The machinery for ships classed or intended to be classed is normally to be tested and inspected in the presence of the Surveyor at the following occasions in accordance with the requirements of the Rules and the approved drawings:

(a) Material tests for component parts of machinery set out in the relevant Chapters of this Part.

(b) Confirmations of materials and components of machinery delivered from other manufacturers.

(c) Workmanship for machining from the commencement of work until the finish inspections for component parts of machinery.

(d) Tightness, balancing and non-destructive tests etc. for component parts of machinery set out in the relevant chapters of this Part.

(e) Shop trials of machinery.

(f) Installations of main propelling machinery, shafting, gearing and essential service auxiliaries, etc. on-board.

(g) On-board trials of machinery and essential systems.
When, however, the shop trials have been carried out and the trial requirements are fulfilled, the on-board trial may be modified suitably at the discretion of the Surveyor.

1.7.3 The Society will be prepared on application to adopt the alternative methods of inspection for the production line machinery and component parts subject to approval of manufacturer's production procedure and quality control.

1.7.4 Other tests and inspections not included in this Part may be required if deemed necessary by the Society.

1.7.5 Where the machinery or component parts of machinery have appropriate certificates, the tests and inspections may be wholly or partially dispensed with subject to further considerations and special approval by the Society.

1.8 Certification on Basis of Approved Quality Assurance Scheme for Machinery

1.8.1 Application
For machinery intended to be used for essential auxiliary services having an output of less than 750 kW, consideration will be given on application to the acceptance of standardized, batch and line produced machinery without tests and inspections of individual units subject to approval of the proposed designs and the manufacturer's quality control program.

1.8.2 Approval of works
A certificate will issued to each approved works, indicating the products for which approval has been granted.

1.8.3 Maintenance of approval
The Surveyors are to visit the works at intervals determined by the nature of the product, rate of production and standard of quality control arrangements. Maintenance of approval is to be subject to carrying out survey by regular and systematic auditing for the continuance of those details of supplies, organization, procedures and methods which form the basis for granting approval.

1.8.4 Certification of products
Nominated personnel of the manufacturer will be authorized by the Society to dispatch the products with certificates signed on behalf of the manufacturer to certify that the products conform to their design specifications and to the requirements of the Society. These certificates are to be countersigned by the Surveyor to certify that the approved arrangements are being kept under review by regular and systematic auditing of the manufacturing and quality control procedures.

1.8.5 Suspension or withdrawal of approval
When attention to significant faults or deficiencies in the manufacturing or quality control procedures have been drawn by the Surveyors, and these have not been rectified within a reasonable time, approval of the works will be suspended

with notice in writing by the Society. When approval has been suspended and the manufacturer has proved unable or unwilling to take corrective action, approval will be withdrawn.

Chapter 2

Steam and Gas Turbines

2.1 General

2.1.1 Steam and gas turbines intended for main propelling and essential auxiliary service are to be constructed and installed in accordance with the following requirements under the supervision and to the satisfaction of the Surveyor.

2.1.2 These requirements are also to be complied with as far as they are applicable to exhaust gas turbine driving scavenge air blowers, turbo-compressors and turbo-chargers. Features of gas turbine machinery which are not included in this Chapter will be specially considered.

2.1.3 Steam and gas turbines driving electric propulsion generators are to be constructed and installed in accordance with the following requirements as well as the requirements stated in Chapter 13 of Part VII.

2.2 Drawings and Data

2.2.1 The turbine manufacturer is to submit the following drawings for approval:
Sectional assembly, casing, combustion chambers, gasifiers, regenerators or recuperators, turbine rotors together with compressor rotors including turbine discs and blading details, maneuvering and control arrangement, turbine installation details and main condensers as well as starting arrangement, fuel oil, lubricating, air inlet and exhaust systems for gas turbines.

2.2.2 The turbine manufacturer is to submit the following data together with drawings for approval: Shaft horsepower, revolutions, working pressure and working temperature corresponding to the maximum continuous output, mass and velocity of rotating element, critical speed of rotors, material specification, etc. for the purpose of checking calculated stresses, welding details and rotor stress calculations as well as calculations regarding the torsional vibration as stated in 6.8 of this Part.

2.3 Materials

2.3.1 Materials intended for the following component parts of turbines are to be tested and inspected in the presence of the Surveyor in accordance with the requirements of Part XI or to the requirements of the specifications approved in connection with the design: Rotors, discs, blades, diaphragms, casings and Group-I and group-II pipes as classified in Part VI.

2.3.2 Turbine rotors and discs are generally to be of forged steel. Rotors for small turbines, however, may be made by a special casting process or by welding. Rotors and discs for gas turbines are to be made from materials non-corrodible in exhaust gases.

2.3.3 Turbine blades, shroud rings and binding wires are to be of non-corrodible materials.

2.3.4 Turbine casings and other castings subject to high pressure and temperature are to be of materials suitable for the stress and heat to which they may be exposed and are to be properly heat treated to remove internal stresses. Grey cast iron may be used for working parts with temperature up to 220°C.

2.4 Main Turbine Arrangement

2.4.1 Astern power

(a) The main propelling turbine installation is to be provided with the astern turbine which is constructed to provide the sufficient power to secure proper control of the ship in all normal circumstances. Accordingly, in the multi-screw installation, at least 2 astern turbines are to be provided.

(b) Astern turbines are to be able to develop, when operating astern under transient conditions, 80% of the rated ahead torque at 50% of the ahead revolutions and to maintain in free route astern 70% of the ahead revolutions for a period of at least 30 minutes without undue heating of the ahead turbines and condensers.

2.4.2 Steam supply

The steam supply maneuvering system is to be so arranged that the change-over from ahead to astern running is immediately available. However, this does not prevent the use of a guarding valve in the system if it is operable from the throttle location.

2.4.3 Emergency operation

The installation is to be so arranged that navigation with reduced power is possible in case of emergency. In single-screw ships having several turbine casings, the arrangement is to be such that steam can be directly led to the lower pressure turbine, and the high pressure or intermediate pressure turbine is to exhaust directly to the condenser. The emergency steam to the low pressure turbine is to be saturated or desuperheated.

2.4.4 Extraction steam

Where steam is extracted from the turbine, an efficient means is to be provided to prevent steam or water entering the turbine by way of the bleeder connections.

2.5 Construction

2.5.1 Turbine casings

(a) Turbine casings are to be so designed that bearings are not adversely affected by heat flow from adjacent hot parts of the turbine steam or gases.

(b) Guide vanes, diaphragms, labyrinth seals, etc. are to be arranged into the casing in such a way that they can expand freely without changing the position of their axes.

(c) The flange mating surface of turbine casing halves is to be metallically jointed. A thin layer of heat resistant flange cement may, however, be applied to the flange mating surface.

(d) Turbine casings are to be fitted with drains in places where water may collect. An effective steam strainer is to be placed ahead of the steam inlet valve or ahead of the maneuvering valve.

2.5.2 Diaphragms

Diaphragms are to be preheated before guide vane connections are welded, and annealed subsequent to the welding.

2.5.3 Rotors, discs and blades

(a) Turbine and compressor rotors and discs are to be so designed that excessive vibration does not occur within the operating range of speeds. It is recommended that overhung rotors operating with variable speeds are of under-critical design. Over-critical rotors may, however, be approved if running and trial tests give satisfactory results.

(b) Blades are to be so designed as to avoid abrupt change in section and to provide an ample amount of stiffness to minimize deflection and vibration, and to have sufficiently large axial and radial clearances so that no interference with the static member can occur including creep in the material.

(c) Smooth and sufficiently large radius fillets are to be provided at abrupt changes of section of rotors, discs and blades. Edges of holes in turbine discs and blades are to be finely machined and preferably polished at the highly stressed areas.

2.5.4 Bearings and lubrication

(a) Steam turbines are normally to be fitted with plain bearings. Small auxiliary turbines and exhaust gas blowers may, however, be approved with anti-friction bearings.

(b) An effective means is to be provided to prevent steam or condensate from entering the bearings. The bearings are to be so designed that the lubricant does not mix with the steam.

(c) Turbines intended for main propelling and driving generators are to be fitted with emergency arrangement by which lubricating oil is supplied to maintain adequate lubrication when lubrication oil supply is stopped in the event of the failure of lubricating pumps. Gravity head tanks or equivalent means may be accepted for this purpose. For lubrication system, See 2.7.2 and 2.7.3 of this Part and Part VI.

2.5.5 Expansion indicators

Indicators for determining the axial position of rotors relative to their casings and for showing the longitudinal expansion of casings at the sliding feet, if fitted, are to be provided for main turbines. The latter indicators are to be fitted at both sides and be readily visible.

2.5.6 Salt removal

Gas turbines intended for operation in salt atmospheres are to be fitted with an arrangement for removing or preventing the accumulation of salt deposits in compressors and turbines.

2.6 Strength Calculations

2.6.1 The following strength requirements are applicable to rotors, discs and blades for steam turbines.

2.6.2 Steam turbine rotors and discs

(a) The following strength requirements do not take into consideration the phenomena of creep and relaxation, and their application does not relieve the manufacturer from the responsibility for excessive creep or relaxation at normal operating temperatures.

(b) Strength calculations.

(i) To calculate the elastic stresses and mean tangential stresses, assume:

R = 0 at the edge of the bore in solid rotors having inspection holes larger than 1/4 the basic diameter in way of the disc.

R = 0 at the bottom of the keyway in the bore for built-up disc.

R = T at the center for solid rotors having inspection holes smaller than 1/4 the basic diameter in way of the disc.

(ii) Assuming an adequate T at the starting point of each case as stated above, proceed step by step outward to the rim or bottom of the machined blade groove to calculate S and D at the step points for the determination of R and T at all points on the disc or drum section using the formula in (iii), and equalize R at the rim or bottom of machined blade groove to the total rim load. The rim load in this calculation is the total load due to blades, roots, and that portion of the rim which extends beyond the bottom of the groove, neglecting supporting effect in the rim.

(iii) Formula:

$$S_2 = (S_1 + \Delta S_1) + 52.0w(1+n)(V_1^2 - V_2^2)$$

$$D_2V_2^2 = (D_1 + \Delta D_1)V_2^2 + 26.0w(1-n)(V_2^4 - V_1^4)$$

$$R = \frac{S - D}{2}$$

$$T = \frac{S + D}{2}$$

$$\Delta S = (n+1)R\left(\frac{y_1}{y_2} - 1\right)$$

$$\Delta D = (n-1)R\left(\frac{y_1}{y_2} - 1\right)$$

$$T_m = \frac{114wN^2J}{A} + \frac{P}{2\pi A}$$

(iv) The stress at any point in the disc or drum section is not to exceed the allowable stress Y/F. If in the calculation it is found that R and T at any point so calculated have been exceeded, the calculation is to be repeated, assuming a value of T at the starting point sufficiently low to prevent the calculated stress from exceeding the allowable stress at any point.

(v) The notations used in 2.6.2(b)(i) to (iv) above are defined as follows:

R = Radial stress, in N/mm^2.
T = Tangential stress, in N/mm^2.
S = Sum of principal stresses, in N/mm^2.
D = Difference of principal stresses, in N/mm^2.
ΔS = Change in S caused by change in thickness.
ΔD = Change in D caused by change in thickness.
y_1 and y_2 = Successive thickness of turbine disc at step points, in cm.
V = Tangential velocity at maximum continuous revolutions, in m/sec.
n = Poisson's ratio of turbine disc or rotor material.
w = Mass density of turbine disc or rotor material, in kg/cm^3.
T_m = Mean tangential stress, in N/mm^2.
A = Area of wheel profile, including the rim, on one side of axis of rotation, in cm^2.
N = Number of maximum continuous revolutions per minute divided by 1,000.
J = Moment of inertia of area A about the axis of rotation, in cm^4.
P = $114WN^2r$, in N.
W = Mass of blades and roots, in kg.
r = Radial distance to center of gravity of W from center line of shaft, in cm.
Y = Yield stress of material, in N/mm^2.
F = Factor of safety as given in Table IV 2-1.

Table IV 2-1
Factor of Safety for Steam Turbine Rotor Elastic Stress

Type of Rotor	Built-up		Solid	
	Propulsion	Auxiliary	Propulsion	Auxiliary
Radial Stress	2.5	2.25	2.5	2.25
Tangential Stress	2.5	2.25	2	3
Mean Tangential Stress (See Note)	3	3	3	3

Note: The mean tangential stress is, in no case, to be higher than the value obtained by the use of a factor of safety of 4 on the tensile strength.

2.6.3 Steam turbine blades

(a) The following formula is based solely upon centrifugal stress considerations and its application does not relieve the manufacturer from responsibility for the presence of dangerous vibrations in the installation at speeds within the operating range.

(b) The sectional area at the root of the blade is not to be less than that obtained by the following formula:

$$A = \frac{4.395WN^2r}{U}$$

(c) The notations used in 2.6.3(b) above are defined as follows:

A = Minimum sectional area at root of blade, in cm^2.

W = Total mass of one blade, in kg.

r = Radial distance to center of gravity of blade from center line of shaft, in cm.

U = Minimum tensile strength of material or optionally 2 Y, in N/mm^2.

N and Y are as specified in 2.6.2 of this Part.

2.7 Safety Devices and Control Equipment of Steam Turbines

2.7.1 Governors and speed control

(a) All main and auxiliary turbines are to be provided with overspeed protective devices to prevent the design speed from being exceed by more than 15%. Where two or more turbines are coupled to the same gear wheel set, the Society may agree that only one overspeed protective device be provided for all the turbines.

(b) Arrangement is to be provided for shutting off the steam to the main turbines by suitable hand trip gear situated at the maneuvering stand and at the turbine itself. Hand tripping for auxiliary turbines is to be arranged in the vicinity of the turbine overspeed protective device.

(c) Where the main turbine installation incorporates a reverse gear, electric transmission, controllable pitch propeller or other free-coupling arrangement, a separate speed governor in addition to the overspeed protective device is to be fitted and is to be capable of controlling the speed of the unloaded turbine without bringing the overspeed protective device into action.

(d) Where exhaust steam from auxiliary systems is led to the main turbine it is to be cut off at activation of the overspeed protective device.

(e) Auxiliary turbines driving electric generators are to have both:

A speed governor which, with fixed setting, is to control the speed within the limit of 10% for momentary variation and 5% permanent variation when the full load is suddenly taken off, and an overspeed protective device which is to be independent of speed governor, and is to prevent the design speed from being exceeded by more than 15% when the full load is suddenly taken off.

2.7.2 Miscellaneous safety arrangements

(a) Main ahead turbines are to be provided with a quick acting device which will automatically shut off the steam or fuel supply in the case of dangerous lowering of oil pressure in the bearing lubricating system. This device is to be so arranged as not to prevent the admission of steam to the astern turbine for braking purposes. Where deemed necessary by the Society appropriate means are to be provided to protect the turbines in case of:

(i) abnormal axial rotor displacement,

(ii) excessive condenser pressure, and

(iii) high condensate level.

(b) Auxiliary turbines having governors operated other than hydraulically in which the lubricating oil is inherent in the system, are to be provided with an alarm device and a means of shutting off the steam supply in the case of lowering of oil pressure in the bearing lubricating oil system.

(c) Main turbines are to be provided with a satisfactory emergency supply of lubricating oil which will come into use automatically when the pressure drops below a predetermined value. The emergency supply may be obtained from a gravity tank containing sufficient oil to maintain adequate lubrication until the turbine is brought to rest or by equivalent means. If emergency pumps are used these are to be so arranged that their operation is not affected by failure of the power supply. Suitable arrangement for cooling the bearings after stopping may also be required.

(d) A sentinel valve or equivalent is to be provided at the exhaust end of all turbines. The valve discharge outlets are to be visible and suitably guarded if necessary. When, for auxiliary turbines, the inlet steam pressure exceeds the pressure for which the exhaust casing and associated piping up to exhaust valve are designed, means to relieve the excess pressure are to be provided.

(e) Non-return valves, or other approved means which will prevent steam and water returning to the turbines, are to be fitted in bled steam connections.

(f) Efficient steam strainers are to be provided close to the inlets to ahead and astern high pressure turbines or alternatively at the inlets to maneuvering valves.

2.7.3 Control equipment

(a) The main propelling turbine is to be provided with the necessary maneuvering and control equipment (See. 1.6.9 (b) of this Part.). At least the following equipment is to be provided:
  (i) Pressure gauges and thermometers for the steam condition:
    (1) before the maneuvering valve,
    (2) before entering the turbine,
    (3) inside the turbine casing,
    (4) after leaving the turbine,
    (5) before entering the condenser, and
    (6) at the extraction stage and intermediate steam supply stage.
  (ii) Tachometer and direction indicator
    Pressure gauges and thermometers for the lubricating and control oil.

(b) Auxiliary turbines are to be provided with the equipment in accordance with 2.7.3(a) above which is applicable.

(c) Alarm
  (i) The main propelling and auxiliary turbines are to be provided with audible and visible alarms for the following emergency conditions:
    (1) High pressure in condenser.
    (2) Failure in lubricating system.
  (ii) The alarms for the following emergency conditions are also recommended as far as practicable:
    (1) High condensate level.
    (2) Salinity of condensate.
    (3) Excessive axial displacement of rotor.
    (4) Turbine overspeed, if the unit is not fitted with speed regulator.
    (5) Turning gear engaged.

2.8 Safety Devices of Gas Turbines

2.8.1 Governors and overspeed protective devices

(a) All main and auxiliary gas turbines are to be provided with speed control governors (or overspeed governors) and separate overspeed protective devices. The overspeed protective devices are to be independent from the governors and so adjusted that the output shaft speed may not be exceeded by more than 15% of the maximum continuous speed, and are to have functions as specified in 2.8.2 (b).

(b) The governors of gas turbines to drive generators are to conform to the requirements in 3.2 of Part VII.

2.8.2 Emergency stopping devices

(a) Gas turbines are to be provided with emergency stopping devices operated by suitable hand trip gears installed at the control station.

(b) Gas turbines are to be provided with automatic fuel oil shut-off devices that operate in the following cases. In addition, means are to be provided so that alarms will be issued at the control station when the automatic fuel oil shut-off devices come into action.

(i) Overspeed.

(ii) Low lubricating oil pressure.

(iii) Failure in automatic starting.

(iv) Flame-out.

(v) Excessive vibrations.

2.8.3 Alarms

Gas turbines are to be provided with alarm devices that operate in the following cases:

(a) High temperature of turbine inlet or outlet gas.

(b) Low lubricating oil pressure (working before the function of the emergency stopping device specified in preceding 2.8.2).

(c) Low fuel oil supply pressure.

2.9 Tests and Inspections

2.9.1 Hydraulic pressure tests

Hydraulic pressure tests on turbine parts after machining are to be carried out in the presence of the Surveyor under the conditions specified in Table IV 2-2.

Table IV 2-2
Hydraulic Pressure Tests on Turbine Parts

Parts to be Tested	Test Pressure	Remarks
Turbine casings(1)	1.5 W	At least 0.2
H.P. turbine steam chests	1.5 W	
Steam receiver pipes	See Note (2)	
Steam, maneuvering and control valve chests, and steam strainers	2 W	
Cooling water spaces	1.5 W	At least 0.4
Condensers and heat exchangers	See Part V	
Group-I and -II pipes and fittings	See Part VI	
Where: W = Maximum working pressure for the respective parts, in MPa.		

Notes:

(1) Test pressure for exhaust gas turbine casings, see Table IV 3-3.

(2) Same test pressure as the casing which it is connected.

2.9.2 Balancing tests

Finished rotors, complete with balanced and all the rotating parts, are to be dynamically balanced in the presence of the Surveyor.

2.9.3 Thermal stability test

Forged or welded rotors for propulsion turbines, which are subjected to steam temperatures above 400°C, are to undergo a thermal stability test. This test may be carried out after rough machining and heat treatment, or at any subsequent stage in the production. The rotor temperature during the test is to be at least 30°C above maximum operating temperature of the rotor, but not above the tempering temperature for the rotor material.

2.9.4 Non-destructive tests

The following turbine parts are to be tested in the presence of the Surveyor by approved non-destructive testing methods:

(a) Turbine casing – at abrupt changes of sections and at points liable to casting faults.

(b) Diaphragm – guide vanes and welded connections.

(c) Turbine rotor, disc, blading, welded connections and shrink surfaces – over the complete surfaces and fillets.

2.9.5 Shop trials

(a) For steam turbines, operational trials are to be satisfactorily carried out at the manufacturer's workshop with their most suitable facilities available in the present of the Surveyor.

(b) The warm running tests on the bladed exhaust gas turbine are to extend over a period of 20 minutes at the working speed and 10 minutes at a speed 10% above the maximum working speed.

(c) The overspeed protective device is to be set not more than 15% above the maximum design speed.

(d) On completion of the above shop trials, turbines are to be overhauled and inspected for fineness, wear, clearances on major working parts, securities of locking devices, etc. in the presence of the Surveyor.

2.9.6 On-board trials

(a) After installation on-board, the main propelling and essential auxiliary turbines are to be trial tested under working conditions in the presence of the Surveyor to demonstrate that the entire installation is working satisfactorily without undue vibrations of hull or turbines within the service range. For this purpose, the following trials on-board are normally to be carried out as far as practicable.

(b) For main propelling turbines, rated maximum continuous revolutions for at least 2 hours, corresponding revolutions of partial loads of the turbine rated output in ahead running and astern running for suitable durations, minimum speed and safety device tests are normally to be carried out.

(c) For turbines intended for auxiliary purposes, they are to be run at the maximum continuous output for at least 3 hours, and partial and overloads for suitable durations if deemed necessary by the Surveyor. These load tests may be based on the power of driven auxiliary.

(d) On completion of the above on-board trials, the turbine, to the discretion of the Surveyor, may be opened up for inspection to a certain extent as deemed necessary.

Chapter 3

Diesel Engines

3.1 General

3.1.1 The construction and installation of diesel engines for main propelling and essential service are to be carried out in accordance with the following requirements under the supervision and to the satisfaction of the Surveyor.

3.1.2 Diesel engines which drive electric propulsion generators are to be constructed and installed in accordance with the following requirements as well as the requirements stated in 3.2 of Part VII.

3.1.3 The diesel engine intended for emergency electric source is also to comply with the requirements stated in Chapter 11 of Part VII.

3.1.4 Each marine diesel engine with a power output of more than 130 kW installed on a ship is to comply with the requirements of Reg. 13 of MARPOL Annex VI and NOx Technical Code 2008, as amended.

3.2 Drawings and Data

3.2.1 The drawings and documents of diesel engine listed in Table IV 3-1 as below are to be submitted for approval, as applicable.

3.2.2 The drawings and documents of diesel engine listed in the Table IV 3-2 as below are to be submitted for information, as applicable.

3.3 Materials

3.3.1 Materials intended for the component parts of diesel engines are to be tested and inspected in the presence of the Surveyor in accordance with the requirements of Part XI or with the requirements of the specification approved in connection with the design as listed in 3.10.2 of this Chapter.

3.3.2 Engine parts subject to stress are to be made of sound materials, and cylinders, cylinder liners, cylinder covers, pistons, etc. under high temperature or pressure are to be made of materials suitable for the stress and temperature to which they are exposed.

3.4 Construction

3.4.1 General

(a) Frames and bedplates are to be of rigid and oil-tight construction. Crank cases are to be strongly built and doors or covers securely fastened and made air and oiltight so that they can withstand a considerable excessive pressure within the crank cases without any risk of damage.

(b) Passages for cooling water and lubricating oil are to be carefully cleaned of sand and scale.

(c) Clutches or reversing gear built in engines are to be in accordance with the requirements stated in Chapter 5 of this Part.

Table IV 3-1
Drawings and Documents to be Submitted for Approval

No.	Item
1	Bedplate and crankcase of welded design, with welding details and welding instructions[(1)(2)]
2	Thrust bearing bedplate of welded design, with welding details and welding instructions[(1)]
3	Bedplate/oil sump welding drawings[(1)]
4	Frame/framebox/gearbox of welded design, with welding details and instructions[(1)(2)]
5	Engine frames, welding drawings[(1)(2)]
6	Crankshaft, details, each cylinder No.
7	Crankshaft, assembly, each cylinder No.
8	Crankshaft calculations (for each cylinder configuration)
9	Thrust shaft or intermediate shaft (if integral with engine)
10	Shaft coupling bolts
11	Material specifications of main parts with information on non-destructive material tests and pressure tests[(3)]
12	Schematic layout or other equivalent documents on the engine of Starting air system, Fuel oil system, Lubricating oil system, Cooling water system, Hydraulic system, Hydraulic system (for valve lift), Engine control and safety system
13	Shielding of high pressure fuel pipes, assembly[(4)]
14	Construction of accumulators (for electronically controlled engine)
15	Construction of common accumulators (for electronically controlled engine)
16	Arrangement and details of the crankcase explosion relief valve[(5)]
17	Calculation results for crankcase explosion relief valves
18	Details of the type test program and the type test report[(7)]
19	High pressure parts for fuel oil injection system[(6)]
20	Oil mist detection and/or alternative alarm arrangements
21	Details of mechanical joints of piping systems
22	Documentation verifying compliance with inclination limits
23	Documents as required in IACS UR E22, as applicable

Notes:

(1) For approval of materials and weld procedure specifications. The weld procedure specification is to include details of pre and post weld heat treatment, weld consumables and fit-up conditions.

(2) For each cylinder for which dimensions and details differ.

(3) For comparison with Society requirements for material, NDT and pressure testing as applicable.

(4) All engines.

(5) Only for engines of a cylinder diameter of 200 mm or more or a crankcase volume of 0.6 m^3 or more.

(6) The documentation to contain specifications for pressures, pipe dimensions and materials.

(7) The type test report may be submitted shortly after the conclusion of the type test.

Table IV 3-2
Drawings and Documents to be Submitted for Information

No.	Item
1	Engine particulars (e.g. Data sheet with general engine information, Project Guide, Marine Installation Manual)
2	Engine cross section
3	Engine longitudinal section
4	Bedplate and crankcase of cast design
5	Thrust bearing assembly(1)
6	Frame/framebox/gearbox of cast design(2)
7	Tie rod
8	Connecting rod
9	Connecting rod, assembly(3)
10	Crosshead, assembly(3)
11	Piston rod, assembly(3)
12	Piston, assembly(3)
13	Cylinder jacket/ block of cast design(2)
14	Cylinder cover, assembly(3)
15	Cylinder liner
16	Counterweights (if not integral with crankshaft), including fastening
17	Camshaft drive, assembly(3)
18	Flywheel
19	Fuel oil injection pump
20	Shielding and insulation of exhaust pipes and other parts of high temperature which may be impinged as a result of a fuel system failure, assembly
21	For electronically controlled engines, construction and arrangement of Control valves, High-pressure pumps, Drive for high pressure pumps
22	Operation and service manuals(4)
23	FMEA (for engine control system)(5)
24	Production specifications for castings and welding (sequence)
25	Evidence of quality control system for engine design and in service maintenance
26	Quality requirements for engine production
27	Type approval certification for environmental tests, control components(6)

Notes:

(1) If integral with engine and not integrated in the bedplate.

(2) Only for one cylinder or one cylinder configuration.

(3) Including identification (e.g. drawing number) of components.

(4) Operation and service manuals are to contain maintenance requirements (servicing and repair) including details of any special tools and gauges that are to be used with their fitting/settings together with any test requirements on completion of maintenance.

(5) Where engines rely on hydraulic, pneumatic or electronic control of fuel injection and/or valves, a failure mode and effects analysis (FMEA) is to be submitted to demonstrate that failure of the control system will not result in the operation of the engine being degraded beyond acceptable performance criteria for the engine. The FMEA reports required will not be explicitly approved by the Society.

(6) Tests are to demonstrate the ability of the control, protection and safety equipment to function as intended under the specified testing conditions per IACS UR E10.

3.4.2 Cylinder relief valves

A relief valve set to relieve at not more than 140% of the designed maximum firing pressure is to be fitted on each cylinder when the cylinder bore exceeds 230 mm. For auxiliary engines, an approved device capable of giving warning of excessive cylinder pressure will be specially considered as an alternative. Outlet ports of cylinder relief valves are to be so placed as to avoid endangering personnel.

3.4.3 Crankcase explosion relief valves

(a) Crankcases are to be provided with lightweight spring loaded relief valves or other quick-acting and self-closing devices able to lift rapidly in order to prevent any considerable excessive pressure within the crankcase in the event of internal explosion and to close automatically after the passage of the explosion wave in order to prevent any inrush of external air. Relief valves are to be so designed that the discharge from valves is shielded by flame trap to minimize the possibility of danger and damage arising from the emission of flame, and the operation of the valves is to be actuated by an excessive pressure as low as possible with 0.02 MPa to be the maximum.

(b) Generally, in large engines at least one relief valve is to be fitted to each cylinder crankcase and separate gear or chain case for camshaft or similar drive, when the gross volume of such space is 0.6 m^3 and above. In small engines where there is free communication between all cylinder crankcases, relief valves are to be provided in numbers not less than those given in Table IV 3-3. Where only 2 relief valves are required, they are to be located at or near each end of the crankcase. In V-type cylinder arrangement engines, half the number of cylinders may generally be taken in using this table. In engines having a cylinder of less than 200 mm bore or having a crankcase volume of less than 0.6 m^3, relief valves may be omitted.

Table IV 3-3
Crankcase Explosion Relief Valves

Cylinder Bore D (mm)	No. of Cylinders per Engine	Min. Number of Explosion Relief Valves per Engine
$200 \le D < 250$	≤ 8	2
	> 8	3
$250 \le D < 300$	Any number	One for each alternate cylinder, See Note
$300 \le D$	Any number	One per cylinder

Note: For engines having 3, 5, 7, 9 etc. cylinders, the number of explosion relief valves is not to be less than 2, 3, 4, 5 etc. respectively.

(c) The minimum free area of crankcase explosion relief valves is to be determined as follows:

$$A = \frac{CV}{Z}$$

where:

A = Minimum free area of each explosion relief valve, in cm^2, but not less than 45 cm^2.

V = Total gross volume of crankcase compartment, in m^3. The volume of stationary parts within the crankcase may be deducted.

Z = Number of explosion relief valves fitted to each engine, which is to be not less than given in Table IV 3-3.

C = 115 for engines with a free communication crankcase, and
50 for crosshead type engines with a diaphragm fitted between the cylinder and a crankcase.

3.4.4 Protection against scavenging spaces

(a) Crosshead type engine scavenging spaces in open connection to the cylinders are to be provided with explosion relief valves. These devices are to be so arranged to discharge that no damage for operators can occur.

(b) Crosshead type engine scavenging spaces in open connection to the cylinders are to be connected to an approved fire extinguishing system, which is to be entirely separate from the fire extinguishing system of the engine room.

3.4.5 Crankcase Oil Mist Detection Arrangements

(a) Crankcase oil mist detection arrangements are required for diesel engines of 2250 kW maximum continuous power and above or having cylinders of more than 300mm bore, and in cases of engine failure, the following means are automatically employed. However, in cases where alternative devices (e.g. engine bearing temperature monitors or equivalent devices) deemed appropriate by the Society are provided, such devices may be used instead of crankcase oil mist detection arrangements.

(i) In the case of low speed (crosshead) engines, alarms are to activate, and speed be reduced automatically or manually.

(ii) In the case of medium/high speed (trunk piston) engines, alarms are to activate and diesel engines are to be stopped or have their fuel supply shut off automatically.

Note: For the purpose of this requirement, the following definitions apply:

(1) Low speed engines means diesel engines having a rated speed of less than 300 rpm.

(2) Medium speed engines means diesel engines having a rated speed of 300 rpm and above, but less than 1400 rpm.

(3) High speed engines means diesel engines having a rated speed of 1400 rpm and above.

(b) The crankcase oil mist detection arrangements required in 3.4.5(a) above are to be of an approved type and in accordance with the following requirements:

(i) The oil mist detection arrangements are to provide an alarm indication in the event of a foreseeable functional failure in the equipment and installation arrangements.

(ii) The oil mist detection arrangements are to provide an indication that any lenses fitted in the equipment and used in determination of the oil mist level have been partially obscured to a degree that will affect the reliability of the information and alarm indication.

(iii) The oil mist detection arrangements are to be capable of being tested on the test bed and board under engine at standstill and running at normal operating conditions.

(iv) Oil mist detection and alarm information is to be capable of being read from a safe location away from engine.

(v) In the case of ships which apply the rules for automatic or remote control and monitoring system, the density of crankcase oil mist is also to be capable of being monitored, as specified in Table VIII 4-5A, VIII 4-5B and VIII 4-7 of Part VIII.

(vi) Each engine is to be provided with its own independent oil mist detection arrangement and a dedicated alarm.

(vii) The layout of the arrangements, pipes and cables, pipe dimensions, the location of engine crankcase sample points, sample extraction rate and the way of maintenance and test are to be in accordance with the engine designer's and oil mist manufacturer's instructions.

(viii) Where sequential oil mist detection arrangements are provided, the sampling frequency and time is to be as short as reasonably practicable.

(ix) A copy of the maintenance and test manual is to be provided on board ship.

3.4.6 Crankcase ventilation

(a) If provisions are made for ventilation of enclosed crankcases by means of breathers or mechanical suctions, the corresponding suction pressure is not to exceed 25 mm of water. Crankcases are not to be ventilated by a blast of air.

(b) Where a breather is provided connecting any part of the crankcase, this breather is to have a dimension as small as practicable to minimize the inrush of air after an explosion and is to be led to a safe position on deck or other approved position.

(c) Crankcase lubricating oil pipes from engine sumps to their respective drain tanks are to be submerged at their outlet ends. Where 2 or more engines are installed, the pipes leading to crankcases as well as breathers and lubricating oil pipes are to be laid independently of one another to avoid intercommunication between the crank-cases.

3.4.7 Warning notice

A notice of warning is always to be fitted either on the control stand or, preferably, on a discernible place near the crankcase door on both sides of the engine specifying that the crankcase doors or sight holes are not to be opened within a reasonable period which is normally not less than 10 minutes after stopping the engine in case overheat is suspected within the crankcase.

3.4.8 Speed governor and overspeed protective device of main diesel engines

(a) Each main engine is to be fitted with a speed governor so adjusted that the engine speed cannot exceed the rated speed by more than 15%.

(b) In addition to this speed governor each main engine having a rated power of 220 kW and above, and which can be declutched or which drives a controllable pitch propeller, is to be fitted with a separate overspeed protective device, which including its driving mechanism, has to be independent from the governor required in 3.4.8 (a) above, and so adjusted that the engine speed cannot exceed by more than 20% of the maximum continuous revolutions. Equivalent arrangements may be accepted upon special consideration.

(c) When electronic speed governors of main diesel engines form part of a remote control system, they are to comply with the following condition:

(i) if lack of power to the governor may cause major and sudden changes in the present speed and direction of thrust of the propeller, back-up power supply is to be provided;

(ii) local control of the engines is always to be possible, and, to this purpose, from the local control position it is to be possible to disconnect the remote signal, bearing in mind that the speed control, is not available unless an additional separate governor is provided for such local mode of control.

(d) In addition, electronic speed governors and their actuators are to be type tested.

3.4.9 Speed governor, overspeed protective and governing characteristics of generator prime movers

(a) For overspeed protective device, see 3.4.8(b) above, and so adjusted that the speed may not be exceeded by more than 15% of the maximum continuous revolutions.

(b) For speed governor characteristics of generator prime movers, see Chapter 3 of Part VII.

3.5 Crankshafts

3.5.1 General

(a) Scope

These Rules for the scantling of crankshafts are to be applied to diesel engines for main propulsion and auxiliary purposes, where the engines are being so designed as to be capable of continuous operation at their rated power when running at rated speed.

(b) Field of application

These Rules apply only to solid-forged and semi-built crankshafts of forged or cast steel, with one crank throw between main bearings.

(c) Principles of calculation

The scantlings of crankshafts are based on an evaluation of safety against fatigue in the highly stressed areas.

The calculation is also based on the assumption that the fillet transitions between the crankpin and web as well as between the journal and web are the areas exposed to the highest stresses. The outlets of oil bores into crankpins and journals are to be formed in such a way that the safety margin against fatigue at the oil bores is not less than that acceptable in the fillets. The engine manufacturer, if requested by the Society, is to submit a documentation supporting his oil bore design. Calculation of crankshaft strength consists initially in determining the nominal alternating bending and nominal alternating torsional stresses which, multiplied by the appropriate stress concentration factors using the theory of constant energy of distortion (von Mises' Criterion), result in an equivalent alternating stress (uni-axial stress). This equivalent alternating stress is then compared with the fatigue strength of the selected crankshaft material. This comparison will then show whether or not the crankshaft concerned is dimensioned adequately.

(d) Drawings and particulars to be submitted

For the calculation of crankshafts, the documents and particulars listed in the following are to be submitted:

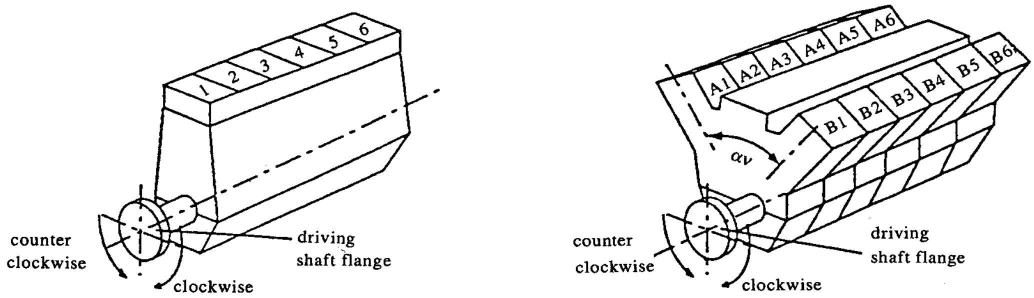

Fig. IV 3-1
Designation of the Cylinders

(i) crankshaft drawing which must contain all data in respect of the geometrical configuration of the crankshaft.

(ii) type designation and kind of engine (in-line engine or V-type engine with adjacent connecting rods, forked connecting rod or articulated-type connecting rod).

(iii) operating and combustion method (2-stroke or 4-stroke cycle/direct injection, pre combustion chamber, etc.).

(iv) number of cylinders.

(v) rated power (kW).

(vi) rated engine speed (1/min).

(vii) sense of rotation (see Fig. IV 3-1).

(viii) firing order with the respective ignition intervals and, where necessary, V-angle α_v (see Fig. IV 3-1).

(ix) cylinder diameter (mm).

(x) stroke (mm).

(xi) maximum cylinder pressure P_{max} (bar).

(xii) charge air pressure (bar) (before inlet valves or scavenge ports, whichever applies).

(xiii) nominal compression ratio.

(xiv) connecting rod length L_H (mm).

(xv) oscillating weight of one crank gear (kg) (in case of V-type engines, where necessary, also for the cylinder unit with master and articulated-type connecting rod or forked and inner connecting rod.).

(xvi) digitalized gas pressure curve presented at equidistant intervals (bar versus crank angle) intervals equidistant and integrally divisible by the V-angle, but not more than 5° CA.

(xvii) for engines with articulated-type connecting rod (see Fig. IV 3-2)

(1) distance to link point L_A (mm).

(2) link angle α_N(°).

(3) connecting rod length L_N (mm).

(xviii) for the cylinder with articulated-type connecting rod

(1) maximum cylinder pressure P_{max} (bar).

(2) charge air pressure (bar) (before inlet valves or scavenge ports, whichever applies.).
(3) nominal compression ratio.
(4) digitalized gas pressure curve presented at equidistant intervals (bar versus crank angle);

(xix) details of crankshaft material;

(xx) material designation;

(xxi) mechanical properties of material;

The minimum requirements of Rule's materials must have been complied with:

(1) tensile strength (N/mm^2);
(2) yield strength (N/mm^2);
(3) reduction in area at break (%);
(4) elongation A_5 (%);
(5) impact energy – KV (J);

(xxii) method of material melting process(open-hearth furnace, electric furnace, etc.);

(xxiii) type of forging (free form forged, continuous grain flow forged, drop-forged, etc.; with description of the forging process);

(xxiv) heat treatment;

(xxv) surface treatment of fillets, journals and pins (induction hardened, flame hardened, nitrided, rolled, shot peened, etc. with full details concerning hardening);

(1) hardness at surface (HV);
(2) hardness as a function of depth (mm);
(3) extension of surface hardening;

(xxvi) particulars for alternating torsional stresses, see item 3.5.2(b).

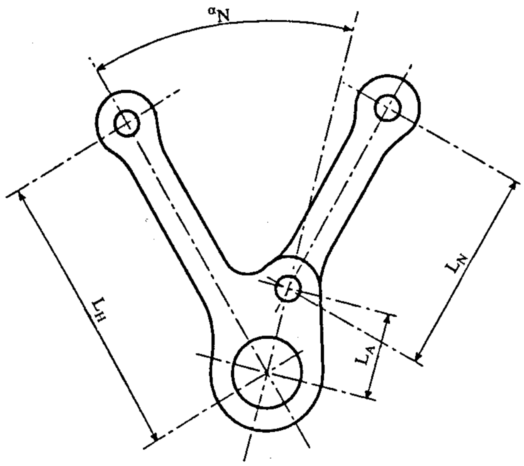

Fig. IV 3-2
Articulated-Type Connecting Rod

3.5.2 Calculation of stresses

(a) Calculation of alternating stresses due to bending moments and shearing forces

(i) Assumptions

The calculation is based on a statically determined system, so that only one single crank throw is considered of which the journals are supported in the center of adjacent bearings and which is subject to gas and inertia forces. The bending length is taken as the length between the two main bearings (distance L_3), see Figures IV 3-3 and IV 3-4.The nominal bending moment is taken as the bending moment in the crank web cross-section in the center of the solid web (distance L_1) basing on a triangular bending moment load due to the radial components of the connecting rod force. For crank throws with two connecting rods acting upon one crankpin the nominal bending moment is taken as a bending moment obtained by superposition of the two triangular bending moment loads according to phase. The nominal alternating stresses due to bending moments and shearing forces are to be related to the cross-sectional area of the crank web. This reference area of cross-section results from the web thickness W and the web width B in the center of the overlap of the pins or, if appropriate, at the center of the adjacent generating lines of the two pins if they do not overlap, see Fig. IV 3-5. Nominal mean bending stresses are neglected.

(ii) Calculation of nominal alternating bending and shearing stresses

As a rule the calculation is carried out in such a way that the individual radial forces acting upon the crank pin owing to gas and inertia forces will be calculated for all crank positions within one working cycle. A simplified calculation of the radial forces may be used as the discretion of the Society. By means of these radial forces variable in time within one working cycle and taking into account the distance of acting position on the pin, the time curve of the bending moment M_B in the web center as defined in 3.5.2(a)(i) will then be calculated.
The decisive nominal alternating bending moment will then be calculated

$$M_{BN} = \pm\frac{1}{2}\left(M_{B,max} - M_{B,min}\right)$$

and, from the latter, the nominal alternating bending stress which will be modified by the empirical factor K_e which considers to some extent the influence of adjacent cranks and bearing restraint.

$$\sigma_{BN} = \pm\frac{M_{BN}}{W_{eq}} \cdot 10^3 \cdot K_e$$

$$W_{eq} = \frac{B \cdot W^2}{6}$$

K_e = 8 for 2-stroke engines

= 1.0 for 4-stroke engines

In case of V-type engines, the bending moments, progressively calculated from the gas and inertia forces, of the two cylinders acting on one crank throw are superposed according to phase, the differing designs (forked connecting rod, articulated-type connecting rod or adjacent connecting rods) being taken into account. Where there are cranks of different geometrical configuration (e.g., asymmetric cranks) in one crankshaft, the calculation is to cover all crank variants.

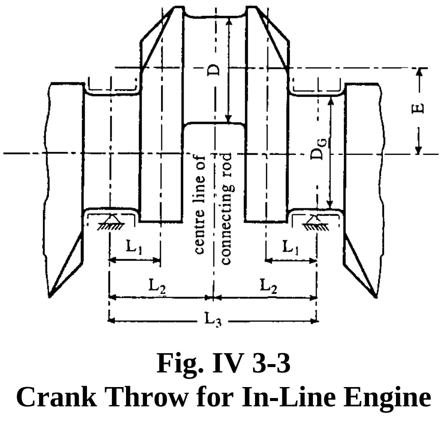

Fig. IV 3-3
Crank Throw for In-Line Engine

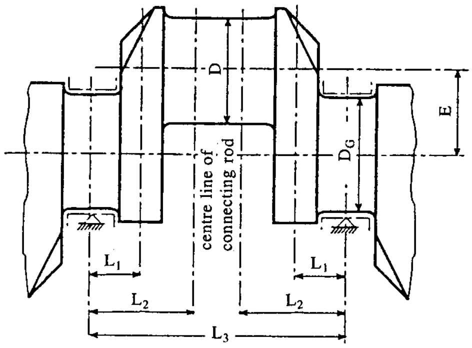

Fig. IV 3-4
Crank Throw for Engine with 2 Adjacent Connecting Rods

The calculation of the nominal alternating shearing stress is as follows:

$$\sigma_{QN} = \pm \frac{Q_N}{F} \cdot K_e$$
$$Q_N = \pm \frac{1}{2}(Q_{max} - Q_{min})$$
$$F = B \cdot W$$

where:

M_{BN}	=	Nominal alternating bending moment (Nm);
σ_{BN}	=	Nominal alternating bending stress (N/mm^2);
W_{eq}	=	Equatorial moment of resistance related to cross-sectional area of web (mm^3);
Q_N	=	Nominal alternating shearing force (N);
σ_{QN}	=	Nominal alternating stress due to shearing force (N/mm^2);
F	=	Area related to cross-section of web (mm^2).

(iii) Calculation of alternating bending stresses in fillets

The calculation of stresses is to be carried out for the crankpin fillet as well as for the journal fillet.

(1) For the crankpin fillet

σ_{BH} = $\pm(\alpha_B \bullet \sigma_{BN})$

where:

σ_{BH} = Alternating bending stress in crankpin fillet (N/mm^2);

α_B = Stress concentration factor for bending in crankpin fillet (determination see 3.5.3).

(2) For the journal fillet

σ_{BG} = $\pm(\beta_B \bullet \sigma_{BN} + \beta_Q \bullet \sigma_{QN})$

where:

σ_{BG} = Alternating stresses in journal fillet (N/mm^2);

β_B = Stress concentration factor for bending in journal fillet (determination – see 3.5.3);

β_Q = Stress concentration factor for shearing (determination – see 3.5.3).

(b) Calculation of alternating torsional stresses

(i) General

The calculation for nominal alternating torsional stresses is to be undertaken by the engine manufacturer according to the information contained in 3.5.2(b)(ii).The maximum value obtained from such calculations will be used by the Society when determining the equivalent alternating stress, according to 3.5.5. In the absence of such a maximum value it will be necessary for Society to incorporate a fixed value in the calculation for the crankshaft dimensions on the basis of an estimation.

(ii) Calculation of nominal alternating torsional stresses

The max. and min. alternating torques are to be ascertained for every mass point of the system and for the entire speed range by means of a harmonic synthesis of the forced vibration from the 1st order up to and including the 15th order for 2-stroke cycle engines and from the 0.5th order up to and including the 12th order for 4-stroke cycle engines. Whilst doing so, allowance must be made for the dampings that exist in the system and for unfavorable conditions (misfiring in one of the cylinders). The speed stages are to be selected in such a way that the transient response can be recorded with sufficient accuracy. The values received for such calculations are to be submitted. The nominal alternating torsional stress in every mass point, which is essential to the assessment, results from the following equation:

$$\tau_N = \pm \frac{M_T}{W_P} \cdot 10^3$$

$$M_T = \pm \frac{1}{2}(M_{Tmax} - M_{Tmin})$$

$$W_P = \frac{\pi}{16}\left(\frac{D^4 - D_{BH}^4}{D}\right)$$

or

$$W_P = \frac{\pi}{16}\left(\frac{D_G^4 - D_{BG}^4}{D_G}\right)$$

Where:

τ_N	=	Nominal alternating torsional stress referred to crankpin or journal (N/mm^2);
M_T	=	Nominal alternating torque (Nm);
W_P	=	Polar moment of resistance related to cross-sectional area of bored crankpin or bored journal (mm^3);
M_{Tmax}, M_{Tmin}	=	Extreme values of the torque with consideration of the mean torque.

The assessment of the crankshaft is based on the torsional stress which in conjunction with the associated bending stress, results in the lowest acceptability factor. Where barred speed ranges are necessary, the torsional stresses within these ranges are to be neglected in the calculation of the acceptability factor. Barred speed ranges are to be so arranged that satisfactory operation is possible despite of their existence. These are to be no barred speed ranges above a speed ration of $\lambda \geq 0.8$ of the rated speed. The approval of crankshafts is to be based on the installation having the lowest acceptability factor. Thus, for each installation, it is to be ensured by suitable calculation that the approved nominal alternating torsional stress is not exceeded. This calculation is to be submitted for assessment.

(iii) Calculation of alternating torsional stresses in fillets

The calculation of stresses is to be carried out for both the crankpin and the journal fillet.

(1) For the crankpin fillet:

$$\tau_H = \pm (\alpha_T \bullet \tau_N)$$

where:

τ_H = Alternating torsional stress in crankpin fillet (N/mm^2);

α_T = Stress concentration factor for torsion in crankpin fillet (determination see 3.5.3).

(2) For the journal fillet:

$$\tau_G = \pm (\beta_T \bullet \tau_N)$$

Where:

τ_G = Alternating torsional stress in journal fillet (N/mm^2).

β_T = Stress concentration factor for torsion in journal fillet (determination see 3.5.3).

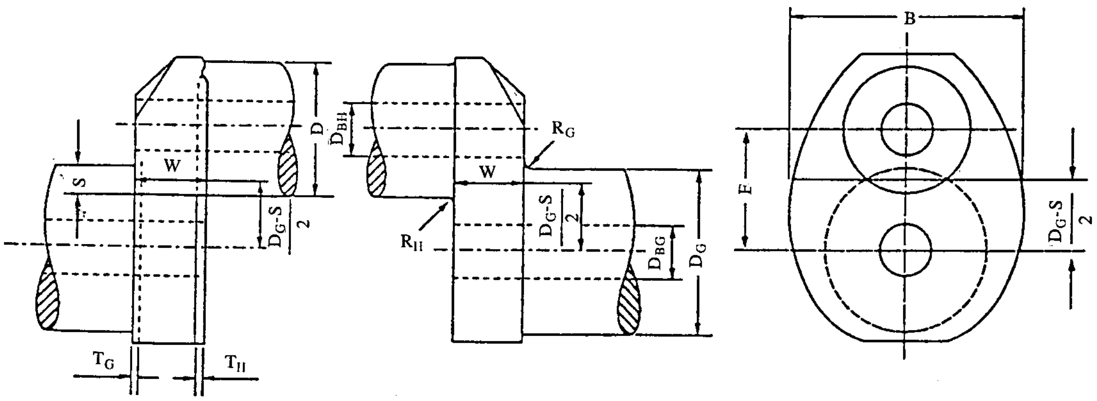
3.5.3 Calculation of stress concentration factors

(a) General

The stress concentration factors for bending (α_B, β_B) is defined as the ratio of the maximum bending stress-occurring in the fillets under bending load acting in the central cross-section of a crank-to the nominal stress related to the web cross-section. The nominal stress has to be determined under the bending moment in the middle of the solid web.

The stress concentration factor for torsion (α_T, β_T) is defined as the ratio of the maximum torsional stress-occurring under torsional load in the fillets-to the nominal stress related to the bored crankpin or journal cross-section. The stress concentration factor for shearing (β_Q) is defined as the ratio of the maximum shear stress-occurring in the journal fillet under bending load-to the nominal shear stress related to the web cross-section. Where the stress concentration factors cannot be furnished by reliable measurements the values may be evaluated by means of the formulae according to 3.5.3(b) and 3.5.3(c), applicable to the fillets of solid-forged web-type crankshafts and to the crankpin fillets of semi-built crankshafts only. All crank dimensions necessary for the calculation of stress concentration factors are shown in Fig. IV 3-5.The following related dimensions will be applied for the calculation of stress concentration factors.

crankpin fillets	journal fillets
$r = R_H / D$	$r = R_G / D$
$s = S/D$	
$w = W/D$	
$b = B/D$	
$d_G = D_{BG}/D$	
$d_H = D_{BH}/D$	
$t_H = T_H/D$	
$t_G = T_G/D$	



Actual dimensions:

D	=	Crankpin diameter (mm);
D_{BH}	=	Diameter of bore in crankpin (mm);
R_H	=	Fillet radius of crankpin (mm);
T_H	=	Recess of crankpin (mm);
D_G	=	Journal diameter (mm);
D_{BG}	=	Diameter of bore in journal (mm);
R_G	=	Fillet radius of journal (mm);
T_G	=	Recess of journal (mm);
E	=	Pin eccentricity (mm);
S	=	Pin overlap (mm);

$$S = \frac{D + D_G}{2} - E$$

W	=	Web thickness (mm).
B	=	Web width (mm).

Fig. IV 3-5
Crank Dimensions Necessary for the Calculation of Stress Concentration Factors

Stress concentration factors are valid for the ranges of related dimensions for which the investigations have been carried out. Ranges are as follows:

$$-0.5 \leq s \leq 0.7$$
$$0.2 \leq w \leq 0.8$$
$$1.2 \leq b \leq 2.2$$
$$0.03 \leq r \leq 0.13$$
$$0 \leq d_G \leq 0.8$$
$$0 \leq d_H \leq 0.8$$

The factor f (recess) which accounts for the influence of a recess in the fillets is valid if

$t_H \leq R_H/D$

$t_G \leq R_G/D$

and is to be applied within the range

$-0.3 \leq s \leq 0.5$

(b) Crankpin fillet

The stress concentration factor for bending (α_B) is:

$$\alpha_B = 2.6914 \cdot f(s,w) \cdot f(w) \cdot f(b) \cdot f(r) \cdot f(d_G) \cdot f(d_H) \cdot f(recess)$$

where:

$f(s,w) = -4.1883 + 29.2004 \cdot w - 77.5925 \cdot w^2 + 91.9454 \cdot w^3 - 40.0416 \cdot w^4$
$+ (1-s) \cdot (9.5440 - 58.3480 \cdot w + 159.3415 \cdot w^2 - 192.5846 \cdot w^3 + 85.2916 \cdot w^4)$
$+ (1-s)^2 \cdot (-3.8399 + 25.0444 \cdot w - 70.5571 \cdot w^2 + 87.0328 \cdot w^3 - 39.1832 \cdot w^4)$

$f(w) = 2.1790 \cdot w^{0.7171}$

$f(b) = 0.6840 - 0.0077 \cdot b + 0.1473 \cdot b^2$

$f(r) = 0.2081 \cdot r^{(-0.5231)}$

$f(d_G) = 0.9993 + 0.27 \cdot d_G - 1.0211 \cdot d_G^2 + 0.5306 \cdot d_G^3$

$f(d_H) = 0.9978 + 0.3145 \cdot d_H - 1.5241\ d_H^2 + 2.4147 \cdot d_H^3$

$f(recess) = 1 + (t_H + t_G) \cdot (1.8 + 3.2 \cdot s)$

The stress concentration factor for torsion (α_T) is:

$$\alpha_T = 0.8 \cdot f(r,s) \cdot f(b) \cdot f(w)$$

where:

$f(r,s) = r^{[-0.322+0.1015 \cdot (1-s)]}$

$f(b) = 7.8955 - 10.654 \cdot b + 5.3482 \cdot b^2 - 0.857 \cdot b^3$

$f(w) = w^{(-0.145)}$

(c) Journal fillet

The stress concentration factor for bending (β_B) is:

$$\beta_B = 2.7146 \cdot f_B(s,w) \cdot f_B(w) \cdot f_B(b) \cdot f_B(r) \cdot f_B(d_G) \cdot f_B(d_H) \cdot f(recess)$$

where:

$f_B(s,w) = -1.7625 + 2.9821 \cdot w - 1.5276\ w^2 + (1-s) \cdot (5.1169 - 5.8089 \cdot w + 3.1391 \cdot w^2)$
$+ (1-s)^2 \cdot (-2.1567 + 2.3297 \cdot w - 1.2952 \cdot w^2)$

$f_B(w) = 2.2422 \cdot w^{0.7548}$

$f_B(b) = 0.5616 + 0.1197 \cdot b + 0.1176 \cdot b^2$

$f_B(r) = 0.1908 \cdot r^{(-0.5568)}$

$f_B(d_G) = 1.0012 - 0.6441 \cdot d_G + 1.2265 \cdot d_G^2$

$f_B(d_H) = 1.0022 - 0.1903 \cdot d_H + 0.0073 \cdot d_H^2$

$f(recess) = 1 + (t_h + t_G) \cdot (1.8 + 3.2 \cdot s)$

The stress concentration factor for shearing (β_Q) is:

$$\beta_Q = 3{,}0128 \cdot f_Q(s) \cdot f_Q(w) \cdot f_Q(b) \cdot f_Q(r) \cdot f_Q(d_H) \cdot f(recess)$$

where:

$f_Q(s) = 0.4368 + 2.1630 \cdot (1-s) - 1.5212 \cdot (1-s)^2$

$f_Q(w) = \dfrac{w}{0.0637 + 0.9369 \cdot w}$

$f_Q(b) = -0.5 + b$

$f_Q(r) = 0.5331 \cdot r^{(-0.2038)}$

$f_Q(d_H) = 0.9937 - 1.1949 \cdot d_H + 1.7373 \cdot d_H^2$

$f(recess) = 1 + (t_H+t_G) \cdot (1.8+3.2 \cdot s)$

The stress concentration factor for torsion (β_T) is:

$\beta T = \alpha T$ if the diameters and fillet radii of crankpin and journal are the same.

$\beta T = 0.8 \cdot f(r,s) \cdot f(b) \cdot f(w)$ if crankpin and journal diameters and/or radii are of different sizes.

where:

f(r,s), f(b) and f(w) are to be determined in accordance with 3.5.3(b) (see calculation of α_T), however, the radius of the journal fillet is to be related to the journal diameter:

3.5.4 Additional bending stresses

In addition to the alternating bending stresses in fillets (see 3.5.2(a)(iii)) further bending stresses due to misalignment and bedplate deformation as well as due to axial and bending vibrations are to be considered by applying σ_{add} as given by table:

Type of engine	σ_{add} (N/mm^2)
crosshead engines	± 30
trunk piston engines	± 10

3.5.5 Calculation of equivalent alternating stress

(a) General

The equivalent alternating stress is to be calculated for the crankpin fillet as well as for the journal fillet. For this calculation the theory of constant energy of distortion (von Mises' Criterion) is to be used. In this it is assumed that the maximum alternating bending stresses and maximum alternating torsional stresses within a crankshaft occur simultaneously and at the same point.

(b) Equivalent alternating stress

(i) For the crankpin fillet:

$$\sigma_v = \pm\sqrt{(\sigma_{BH} + \sigma_{add})^2 + 3 \cdot \tau_H^2}$$

(ii) For the journal fillet:

$$\sigma_v = \pm\sqrt{(\sigma_{BG} + \sigma_{add})^2 + 3 \cdot \tau_G^2}$$

where:

σ_v = Equivalent alternating stress (N/mm^2);

for other parameters see 3.5.2(a)(iii), 3.5.2(b)(iii) and 3.5.4.

3.5.6 Calculation of fatigue strength

The fatigue strength is to be understood as that value of alternating bending stress which a crankshaft can permanently withstand at the most highly stressed points of the fillets. Where the fatigue strength for a crankshaft cannot be furnished by reliable measurements, the fatigue strength may be evaluated by means of the following formulae:

(a) Related to the crankpin diameter:

$$\sigma_{DW} = \pm K \cdot (0.42 \cdot \sigma_B + 39.3) \cdot \left(0.264 + 1.073 \cdot D^{-0.2} + \frac{785 - \sigma_B}{4900} + \frac{196}{\sigma_B} \cdot \sqrt{\frac{1}{R_H}}\right)$$

(b) Related to the journal diameter:

$$\sigma_{DW} = \pm K \cdot (0.42 \cdot \sigma_B + 39.3) \cdot \left(0.264 + 1.073 \cdot D^{-0.2} + \frac{785 - \sigma_B}{4900} + \frac{196}{\sigma_B} \cdot \sqrt{\frac{1}{R_G}}\right)$$

where:

σ_{DW} = Allowable fatigue strength of crankshaft (N/mm^2);

K = Factor for different types of forged and cast crankshafts without surface treatment;

= 1.05 for continuous grain flow forged or drop- forged crankshafts;

= 1.0 for free form forged crankshafts;

= 0.93 for cast steel crankshafts;

σ_B = Minimum tensile strength of crankshaft material (N/mm^2).

It is to be considered that for calculation purposes R_H and R_G are not to be taken less than 2 mm. Where no results of the fatigue tests conducted on full size crank throws or crankshafts which have been subjected to surface treatment are available, the K-factors for crankshafts without surface treatment are to be used. In each case the experimental values of fatigue strength carried out with full size crank throws or crankshafts are subject to special consideration of the Society. The survival probability for fatigue strength values derived from testing is to be to the satisfaction of the Society and in principle not less than 80%.

3.5.7 Calculation of shrink-fits of semi-built crankshafts

(a) General

All crank dimensions necessary for the calculation of the shrink-fit are shown in Fig. IV 3-6.

where:

D_S = Shrink diameter (mm).

L_S = Length of shrink-fit (mm).

D_A = Outside diameter of web (mm), or twice the minimum distance x between center-line of journals and outer contour of web, whichever is less.

y = Distance between the adjacent generating lines of journal and pin (mm).

$y \geq 0.05 \cdot D_S$

Where y is less than $0.1 \cdot D_S$ special consideration is to be given to the effect of the stress due to the shrink on the fatigue strength at the crankpin fillet.

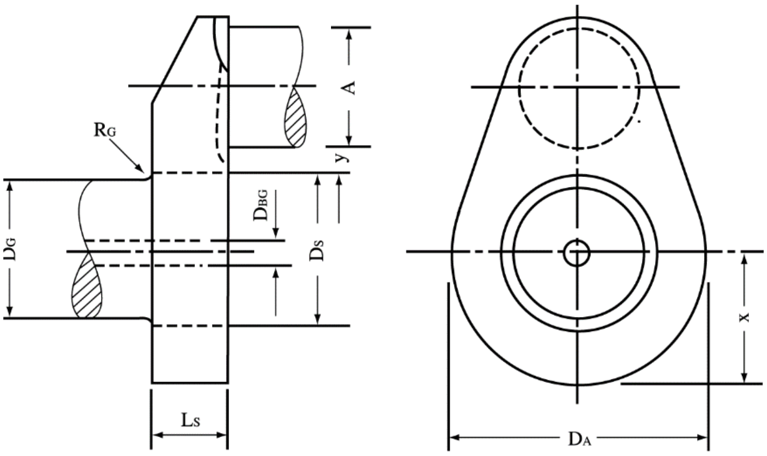


Fig. IV 3-6
Crank Throw of Semi-Built Crankshaft

Respecting the radius of the transition from the journal to the shrink diameter, the following is to be complied with:

$R_G \geq 0.015\ D_G$ and $R_G \geq 0.5\ (D_S - D_G)$, where the greater value is to be considered.

The actual oversize Z of the shrink-fit must be within the limits Z_{min} and Z_{max} calculated in accordance with 3.5.7(b) and 3.5.7(c).

(b) Necessary minimum oversize of shrink-fit

The necessary minimum oversize is determined by the greater value calculated in accordance with items (i) and (ii) stated bellows:

(i) The calculation of the minimum oversize is to be carried out for the crank throw with the absolute maximum torque M_{max}. The torque M_{max} corresponds to the maximum value of the torque M_{Tmax} ascertained as per item 3.5.2(b) for the various mass points of the crankshaft.

$$Z_{min} \geq \frac{4 \cdot 10^3}{\pi\mu} \cdot \frac{S_R M_{max}}{E_m D_S L_S} \cdot \frac{1 - Q_A^2 \cdot Q_S^2}{(1 - Q_A^2) \cdot (1 - Q_S^2)}$$

with

$$Q_A = \frac{D_S}{D_A}$$

$$Q_S = \frac{D_{BG}}{D_S}, \mu = 0.20$$

$$\text{for} \frac{L_S}{D_S} \geq 0.40$$

where:

Z_{min}	=	Minimum oversize (mm);
S_R	=	Safety factor against slipping, however a value not less than 2 is to be taken;
$Q_{A,}\ Q_S$	=	Ratio of different diameters;
μ	=	Coefficient for static friction;
E_m	=	Young's modulus (N/mm^2).

(ii) In addition to item (i) the minimum oversize is also to be calculated according to the following formula:

$$Z_{min} \geq \frac{\sigma_S \cdot D_S}{E_m}$$

where:

σ_S =Minimum yield strength of material for crank web (N/mm^2).

(c) Maximum permissible oversize of shrink-fit

The maximum permissible oversize is calculated in accordance with the following formula:

$$Z_{max} \leq \frac{\sigma_S \cdot D_S}{E_m} + \frac{0.8 \cdot D_S}{1000}$$

where:

Z_{max} = Maximum oversize (mm).

This condition serves to restrict the shrinkage in the fillet.

3.5.8 Acceptability criteria

The sufficient dimensioning of a crankshaft is confirmed by a comparison of the equivalent alternating stress and the fatigue strength. This comparison has to be carried out both for the crankpin fillet and the journal fillet and is based on the formula:

$$Q = \frac{\sigma_{DW}}{\sigma_V}$$

where:

Q = Acceptability factor.

Adequate dimensioning of the crankshaft is ensured if the smaller of both acceptability factors satisfies the criteria:

$Q \geq 1.15$

3.5.9 Fillets and oil holes

(a) Fillets at the junctions of crank webs with crank journals or pins, where they are formed as solid forgings or castings, are to be machined to a radius not less than 5% of the actual diameter of the journal or the pin and are to have a smooth finish.

(b) Oil holes at the surfaces of crank journals and pins are to be rounded to an even contour with a smooth finish.

3.5.10 Reference marks are to be provided on the outer junction of the crank webs with the crank pins and journals.

3.5.11 The part of the journal outside the end bearing may be gradually tapered to the same diameter as the adjacent shaft.

3.5.12 The diameter in way of flywheel or eccentric sheave for pump fitted on the crankshaft or additional shaft between the aftermost journal bearing and the thrust shaft is not to be less than that required for the crankshaft.

3.5.13 Coupling flanges

(a) The thickness of coupling flanges at the pitch circle of bolt holes is not to be less than the required diameter of the coupling bolts.

(b) The fillet between coupling flange and crankshaft is to have a radius not less than 8% of the diameter of the corresponding crankshaft provided that recesses are to be avoided in way of bolt heads and nuts.

(c) Where a coupling flange is separate from the crankshaft, the arrangement is to be submitted for consideration and provision is to be made for the coupling to resist any twisting force and astern pull.

3.6 Starting Arrangements

3.6.1 Air starting

Compressed air starting arrangements are to be in compliance with the requirements specified in 4.6 of Part VI.

3.6.2 Electric starting

(a) Where main propelling and auxiliary engines are fitted with electric starters, at least 2 starting batteries are to be installed sufficient in their combined capacity without recharging to provide the consecutive starts, as required in 4.6.2 of Part VI for air starting, within 30 minutes.

(b) The connections to the starting batteries are to be such that the batteries can be used alternately. Two charging facilities are required for the starting batteries, one automatic device supplied from a charging dynamo on the engine, and another device, may be of manually, supplied from the ship's electric system. Each of the charging devices is to be able to recharge one battery completely within 6 hours.

(c) The starting battery is not to be used for any purpose other than starting and running the engine. If it is also used for other purposes, the battery capacity is to be increased accordingly and the circuits are to be completely separated from the starting system.

3.6.3 Starting for emergency generator sets (as the emergency source of power)

(a) Where emergency generator sets are fitted, they are to be capable of being started readily when cold.

(b) A hand starting is acceptable if it is demonstrated to be practicable. Where other means are provided for starting, they are, in general, to provide for not less than 3 consecutive starts in a period of 30 minutes without recourse to other source of power within the machinery space.

(c) Starting for emergency generator sets, see 11.5 of Part VII.

3.7 Air Intake and Exhaust Arrangements

3.7.1 Scavenging air arrangements

(a) The 2-stroke cycle engine is to be provided with at least one scavenging blower, either of the reciprocating or the rotary type.

(b) Where one independent scavenging blower is arranged for a 2-stroke cycle engine, 2 prime movers driving alternately or 2 prime movers of same power arranging duplicately are to be provided. Each of the prime movers of the duplicate means is to have a sufficient capacity to operate the main propelling engine at the revolutions developing more than 1/2 of the maximum continuous output without trouble in case of failure of one of the prime movers.

3.7.2 Exhaust gas turbochargers

(a) For main propulsion engine equipped with exhaust driven turbochargers, means are to be provided to ensure that the engine can be operated with sufficient power to give the ship a navigable speed in case of failure of one of the turbochargers.

(b) Where the main propulsion engine can not be operated only with the exhaust driven turbochargers in case of starting or low speed range, an auxiliary scavenging air system is to be provided.

3.7.3 Exhaust arrangements

(a) Exhaust lines and silencers are to be effectively lagged or cooled where the surface temperature may exceed 220°C. Where the exhaust line or silencer is water cooled and the cooling water outlet can be closed, special arrangements are to be provided to prevent an excessive rise in pressure occurring within the cooling spaces.

(b) Silencers are to be fitted with easily accessible cleaning openings and with means to drain water.

(c) If several engine exhaust lines are conducted to a common silencer, special arrangement is to be made to prevent exhaust gas from entering the engine which is not being used.

(d) Where the engine exhaust line is conducted near the water line, efficient means are to be provided to prevent the water from entering the engine.

(e) Where necessary, the exhaust line is to be fitted with suitable draining arrangement and means to allow for expansion.

(f) The engine exhaust line and the boiler uptake are not to be connected except where the boiler is arranged to utilize waste heat from the engine. Where the engine exhaust gases pass through the oil-fired boiler, the exhaust line leading to the boiler is to be so arranged that boiler un-burnt oil cannot enter the engine exhaust line. For this purpose, the changeover valve in the exhaust line is to be interlocked with the burner so that oil cannot be supplied to the burner while the valve is open.

(g) Oil carriers are to be provided with silencers or special spark arresters which will prevent soot particles from being discharged to the atmosphere as sparks.

(h) In 2-stroke cycle main engines fitted with exhaust gas turbo-chargers which operate on the impulse systems, provision is to be made to prevent broken piston rings entering the turbine casing and causing damage to blades and nozzle rings.

(i) Exhaust arrangements for reducing NOx and SOx emission from diesel engines are to be in accordance with Guidelines for Selective Catalytic Reduction Systems, Guidelines for SOx Scrubber Systems and Guidelines for Exhaust Gas Recirculation Systems.

3.8 Fuel, Lubrication and Cooling Arrangements

3.8.1 Fuel oil arrangements

(a) For the arrangement of fuel oil, see 4.4 of Part VI.

(b) All external high pressure fuel delivery lines between the high pressure fuel pumps and fuel injectors are to be protected with a jacketed piping system capable of containing fuel from a high pressure line failure. A jacketed pipe incorporates an outer pipe into which the high pressure fuel pipe is placed forming a permanent assembly. Metallic hose of approved design may be accepted as the outer pipe. The jacketed piping system is to include a means for collection of leakages and arrangements are to be provided for an alarm to be given of a fuel line failure. For existing ships the keel of which were laid on or before June 30, 1998 are to comply with the above requirements by 1st July 2003, except that a suitable enclosure recognized by the Society on engines having an maximum continuous output of 375 kW or less having fuel injection pumps serving more than one injector may be used as alternative to the jacketed piping system.

(c) All surfaces with temperatures above 220°C which may be impinged as a result of a fuel system failure are to be properly insulated.

(d) Oil fuel lines are to be screened or otherwise suitably protected to avoid as far as practicable oil spray or oil leakages onto hot surfaces, into machinery air intakes, or other sources of ignition. The number of joints in such piping systems is to be kept to a minimum.

(e) Suitable arrangements are to be made for draining any oil fuel leakage and for preventing contamination of lubricating oil by fuel oil. If flexible hoses are used for shielding purpose, these are to be of an approved type.

(f) On engines intended for service in unattended machinery spaces, the high pressure oil fuel injection piping is to be shielded irrespective of the bore of the cylinders.

(g) When in return piping the pulsation of pressure with peak to peak values exceed 2 N/mm^2, shielding of this piping is also required.

3.8.2 Lubricating oil arrangements

(a) Lubricating oil arrangements are to be in accordance with the requirements of 4.5 of Part VI in addition to the following.

(b) If enclosed crankcases are used as lubricating oil sumps, they are to be so arranged that the contained oil can be drained at any time and that purifiers or suitable filters for lubricating oil are provided.

(c) Lubricating oil lines are to be provided with pressure gauges or other adequate means at suitable positions to indicate that proper circulation is being maintained.

(d) Precautions are to be taken to ensure satisfactory lubrication of the scavenging blower and turbocharger when starting and when running at reduced speeds. Lubricating oil from the drive and the bearing is not to be allowed to mix with the scavenging and turbo-charging air.

(e) Main engines and auxiliary engines with maximum continuous output exceeding 375 kW are to be provided with alarm devices which give visible and audible alarming in the event of failure of supply of lubricating oil or appreciable reduction in lubricating oil pressure, and also with devices to stop the operation of the engine automatically by lower pressure after the function of alarms.

(f) Generators driven by diesel engines of 37 kW and over with forced lubrication are to be provided with a means to shut down the engine automatically in case of failure of the lubricating system.

3.8.3 Cooling arrangements

(a) Cooling arrangements are to be in accordance with the requirements of 4.3 of Part VI in addition to the following.

(b) Discharge pipes for cooling water or cooling oil are to be provided with thermometers and preferably be fitted with adequate means to indicate the proper circulation.

(c) In engines having 2 or more cylinders, adequate means are to be provided to adjust the quantity of cooling water or cooling oil to make cooling uniformly for each cylinder and piston.

(d) Drain arrangements are to be provided on water jackets and cooling water lines at their lowest positions. Relief valves are to be fitted in the main lines to the jackets to release excessive pressure.

(e) Cooling water or cooling oil is to be discharged from the cooling spaces, where practicable, at its highest position.

3.9 Type Tests of Mass Produced Diesel Engines

Each type of diesel engine mass produced under the accepted quality assurance scheme is to be type tested in accordance with this section. A type test carried out for a type of engine at a place of manufacture will be accepted for all engines of the same type built by licensees and licensers. A type test carried out on one engine having a given number of cylinders will qualify all engines of the same type having a different number of cylinders. The type test is to be conducted in the presence of the Surveyor.

Consideration will be given to modification of the type test requirements for existing engine designs which have proven reliability in service.

Mass produced diesel engines may be eligible for certification under quality assurance scheme*.

*: A system, by which the Society evaluates a manufacturer's quality assurance and quality control arrangements for compliance with the requirements, then authorizes a manufacturer to undertake and witness testing normally required to be done in the presence of a Surveyor.

3.9.1 Definition

(a) Mass produced engines, for main and auxiliary purposes, are defined as those which are produced under the following criteria:
 (i) In quantity under strict quality control of material and parts, according to a quality assurance scheme acceptable to the Society.
 (ii) By the use of jigs and automatic machine tools designed to machine parts to specified tolerances for interchangeability, and which are verified on a regular inspection basis.
 (iii) By assembly with parts taken from stock and requiring little or no fitting.
 (iv) With bench tests carried out on individual assembled engines according to a specified programme.
 (v) With appraisal by final examination of engines selected at random after workshop testing.

(b) Castings, forgings and other parts for use in mass produced engines are also to be produced by methods similar to those given in 3.9.1(a)(i), (ii) and (iii) above, with appropriate inspection.

(c) Hydraulic testing of components is to comply with Table IV 3-4.

(d) The specification of a mass produced engine is to define the limits of manufacture of all component parts. The total production output is to be certified by the manufacturer and verified as may be required, by the Society in accordance with the agreed manufacturer's quality assurance scheme, see 3.9.1(a)(i) above.

3.9.2 Procedure for approval of mass produced engines

(a) The procedure outlined in 3.9.2(b) to 3.9.2(e) applies to the inspection and certification of mass produced oil engines having a bore not exceeding 300 mm.

(b) For the approval of a mass produced engine type, the manufacturer is to submit a list of subcontractors for main parts.

(c) The manufacturer is to supply full information regarding the manufacturing processes and quality control procedures applied in the workshops. The information is to address the following:
 (i) Organization of quality control systems.
 (ii) Recording of quality control operations.
 (iii) Qualification and independence of personnel in charge of quality control.

(d) A running type test of at least 100 hours duration is to be carried out on an engine chosen from the production line. The type testing is to comply with 3.9.5 of this Chapter.

(e) Reserves the right to limit the duration of validity of approval of a mass produced engine. The Society is to be informed, without delay, of any change in the design of the engine, in the manufacturing or control processes, in the selection of materials or in the list of subcontractors for main parts.

3.9.3 Continuous review of production

(a) The Society's Surveyors are to be provided free access to the manufacturer's workshops and to the quality control files.

(b) The control of production, which is subject to survey, is to include the following:
 (i) Inspection and testing records are to be maintained to the satisfaction of the Surveyor.
 (ii) The system for identification of parts is to be in accordance with recognized practice, and acceptable to the Society.

(iii) The manufacturer is to provide full information about the quality control of the parts supplied by subcontractors for which certification may be required. The Society reserves the right to apply direct and individual inspection procedures for parts supplied by subcontractors when deemed necessary.

(iv) At the request of an attending Surveyor, a workshop test may be required for an individual engine.

3.9.4 Compliance and inspection certificate

(a) Each engine which is to be installed on a ship classed by the Society is to be supplied with a statement certifying that the engine is identical to the one which underwent the tests specified in 3.9.2(d), and state the test and inspection results. The statement is to be made on a form agreed with the Society. Each statement is to include the identification number which appears on the engine. A copy of this statement is to be submitted to the Society.

3.9.5 Type test conditions

(a) The requirements in this section are applicable to the type testing of mass produced internal combustion engines where the manufacturer has requested approval. Omission or simplification of the type test requirements will be considered by the Society for engines of an established type on application by the manufacturer.

(b) The engine to be tested is to be selected from the production line and agreed by the Society.

(c) The duration and programme of type tests is to include the following:

(i) 80 h at rated output.

(ii) 8 h at 110% overload.

(iii) 10 h at varying partial loads (25%, 50%, 75% and 90% of rated output).

(iv) 2 h at maximum intermittent loads.

(v) Starting tests.

(vi) Reverse running of direct reversing engines.

(vii) Testing of speed governor.

(viii) Testing of over-speed device.

(ix) Testing of lubricating oil system failure alarm device.

(x) Testing of the engine with turbocharger out of action, when applicable.

(xi) Testing of minimum speed for main propulsion engines and the idling speed for auxiliary engines.

(d) The type tests in 3.9.5(c) above at the required outputs are to be combined together in working cycles for the whole duration within the limits indicated. See also 3.9.5(j) and 3.9.5(k) as below.

(e) The overload testing required by 3.9.5(c) above is to be carried out with the following conditions:

(i) 110% of rated power at 103 per cent revolutions per minute for engines directly driving propellers.

(ii) 110% of rated power at 100 per cent revolutions per minute for engines driving electrical generators or for other auxiliary purposes.

(f) For prototype engines, the duration and programme of tests are to be specially agreed between the manufacturer and the Society.

(g) As far as practicable during type testing the following particulars are to be continuously recorded:

(i) Ambient air temperature.

(ii) Ambient air pressure.

(iii) Atmospheric humidity.

(iv) External cooling water temperature.

(v) Fuel and lubrication oil characteristics.

(h) In addition to the particulars stated in 3.9.5(g) above and as far as practicable, the following are also to be continuously measured and recorded:
   (i) Engine revolutions per minute.
   (ii) Brake power.
   (iii) Torque.
   (iv) Maximum combustion pressure.
   (v) Indicator pressure diagrams where practicable.
   (vi) Exhaust smoke (with an approved smoke meter).
   (vii) Lubricating oil pressure and temperature.
   (viii) Exhaust gas temperature in exhaust manifold, and, where facilities are available, from each cylinder.
   (ix) For turbocharged engines:
      (1) Turbocharger revolutions per minute.
      (2) Air temperature and pressures before and after turbo-blower and charge cooler.
      (3) Exhaust gas temperature and pressures before and after the turbine.
      (4) The cooling water inlet temperature to the charge air cooler.

(i) After the type test, the main parts and especially those subject to wear are to be dismantled for examination by the Society's Surveyors.

(j) For engines that are required to be approved for different purposes (multi-purpose engines), and that have different performances for each purpose, the programme and duration of test is to be modified to cover the whole range of the engine performance, taking into account the most severe conditions and intended purpose(s).

(k) The rated output for which the engine is to be tested is the output corresponding to that declared by the manufacturer and agreed by the Society, i.e. actual maximum power which the engine is capable of delivering continuously between the normal maintenance intervals stated by the manufacturer at the rated speed and under the stated ambient conditions.

3.10 Tests, Inspections and Certification of Diesel Engine Component

3.10.1 General

(a) The engine manufacturer is to have a quality control system that is suitable for the actual engine types to be certified by the Society. The quality control system is also to apply to any sub-suppliers. The Society reserves the right to review the system or parts thereof.

(b) Materials and components are to be produced in compliance with all the applicable production and quality instructions specified by the engine manufacturer.

(c) The Society requires that certain parts are verified and documented by means of marine product certificate (C) , test report (TR) or manufacturer's document (W). Refer to 1.5 of "Guidelines for Survey of Products for Marine Use" for the definitions of marine product certificate or manufacturer's document.

(d) The documents above are used for product documentation as well as for documentation of single inspections such as crack detection, dimensional check, etc. If agreed to by the Society, the documentation of single tests and inspections may also be arranged by filling in results on a control sheet following the component through the production.

(e) The Surveyor is to review W for compliance with the agreed or approved specifications. C means that the Surveyor also witnesses the testing, batch or individual, unless an quality assurance scheme provides other arrangements.

(f) The manufacturer is not exempted from responsibility for any relevant tests and inspections of those parts for which documentation is not explicitly requested by the Society. Manufacturing works is to be equipped in such a way that all materials and components can be consistently produced to the required standard. This includes production and assembly lines, machining units, special tools and devices, assembly and testing rigs as well as all lifting and transportation devices.

(g) The extent of parts to be documented depends on the type of engine, engine size and criticality of the part.

(h) Symbols used in Table IV 3-4 are listed below. A summary of the required documentation for the engine components is listed in Table IV 3-4 of this Chapter.

Symbol	Description
CC	Chemical composition
CH	Crosshead engines
D	Cylinder bore diameter (mm)
M	Mechanical properties
MT	Magnetic particle testing
PT	Dye penetration testing
UT	Ultrasonic testing
VT	Visual examination of accessible surfaces by the Surveyor

(i) For components and materials not specified in Table IV 3-4 of this Chapter, consideration will be given by the Society upon full details being submitted and reviewed.

3.10.2 Material and non-destructive tests required on diesel engine parts.

(a) Materials intended for the principal components of diesel engines and their non-destructive test are to conform to the requirements given in Table IV 3-4.

(b) All required material tests are to be witnessed in the presence of the Society's Surveyor.

(c) For important structural parts of engines, examination of welded seams by approved methods of inspection may be required.

(d) In addition to tests mentioned above, where there is evidence to doubt the soundness of any engine component, non-destructive test by approved detecting methods may be required.

3.10.3 Engine alignment

The crankshaft alignment is to be checked each time the engine is lined up. This is at least to include measurement of the crank web deflections at each crank.

Table IV 3-4
Summary of Inspection, Test and Certification of Diesel Engine Part

Parts	Material properties[1]	Non-destructive Examination[2]	Hydraulic Testing[3][6]	Dimensional Inspection[6] (including surface condition)	Visual Inspection[6] (Surveyor)	Application to Engine	Component Certificate
Welded bedplate	W (CC+M)	W (UT+MT/PT)			fit-up + post-welding	All	C
Bearing transverse girders (cast steel)	W (CC+M)	W (UT+MT/PT)			X	All	C
Welded frame box	W (CC+M)	W (UT+MT/PT)			fit-up + post-welding	All	C
Cylinder block (grey cast iron)			W[5]			CH	
Cylinder block (spheroidal graphite cast iron)			W[5]			CH	
Welded cylinder frames	W (CC+M)	W (UT+MT/PT)			fit-up + post-welding	CH	C
Engine block (grey cast iron)			W[5]			> 400 kW/cyl	
Engine block (spheroidal graphite cast iron)	W (M)		W[5]			> 400 kW/cyl	
Cylinder liner	W (CC+M)		W[5]			D > 300 mm	
Cylinder head (grey cast iron)			W			D > 300 mm	
Cylinder head (spheroidal graphite cast iron)			W			D > 300 mm	
Cylinder head (cast steel)	W (CC+M)	W (UT+MT/PT)	W		X	D > 300 mm	C
Forged cylinder head	W (CC+M)	W (UT+MT/PT)	W		X	D > 300 mm	C
Piston crown (cast steel)	W (CC+M)	W (UT+MT/PT)			X	D > 400 mm	C
Forged piston crown	W (CC+M)	W (UT+MT/PT)			X	D > 400 mm	C
Crankshaft: made in one piece	C (CC+M)	W (UT+MT/PT)		X	Random, of fillets and oil bores	All	C

Parts	Material properties[1]	Non-destructive Examination[2]	Hydraulic Testing[3][6]	Dimensional Inspection[6] (including surface condition)	Visual Inspection[6] (Surveyor)	Application to Engine	Component Certificate
Semi-built crankshaft	See below	See below		See below	See below	All	C
Crank throw	C (CC+M)	W (UT+MT/PT)		X	Random, of fillets and shrink fittings	All	
Forged main journal and journals with flange	C (CC+M)	W (UT+MT/PT)		X	Random, of shrink fittings	All	
Exhaust gas valve cage			W			CH	
Piston rod, if applicable	C (CC+M)	W (UT+MT/PT) (MT/PT again after final machining (grinding))			Random	D > 400 mm	C
Cross head	C (CC+M)	W (UT+MT/PT) (MT/PT again after final machining (grinding))			Random	CH	C
Connecting rod with cap	C (CC+M)	W (UT+MT/PT)		X	Random, of all surfaces, in particular those shot peened	All	C
Coupling bolts for crankshaft	C (CC+M)	W (UT+MT/PT)		X	Random, of interference fit	All	C
Bolts and studs for main bearings	W (CC+M)	W (UT+MT/PT)				D > 300 mm	
Bolts and studs for cylinder heads	W (CC+M)	W (UT+MT/PT)				D > 300 mm	
Bolts and studs for connecting rods	W (CC+M)	W (UT+MT/PT)		TR[7] (thread marking)		D > 300 mm	
Tie rod	W (CC+M)	W (UT+MT/PT)		TR[7] (thread marking)	Random	CH	C
High pressure fuel injection pump body			W			D > 300 mm	
			TR[7]			D ≤ 300 mm	

Parts	Material properties[(1)]	Non-destructive Examination[(2)]	Hydraulic Testing[(3)(6)]	Dimensional Inspection[(6)] (including surface condition)	Visual Inspection[(6)] (Surveyor)	Application to Engine	Component Certificate
High pressure fuel injection valves (only for those not autofretted)			W			D > 300 mm	
			TR[(7)]			D ≤ 300 mm	
High pressure fuel injection pipes including common fuel rail	W (CC+M)		W for those that are not autofretted			D > 300 mm	
			TR for those that are not autofretted			D ≤ 300 mm	
High pressure common servo oil system	W (CC+M)		W			D > 300 mm	
			TR[(7)]			D ≤ 300 mm	
Cooler, both sides[(4)]	W (CC+M)		W			D > 300 mm	
Accumulator of common rail fuel or servo oil system	W (CC+M)		W			All engines with accumulators with a capacity of > 0.5 *l*	
Piping, pumps, actuators, etc. for hydraulic drive of valves, if applicable			W			> 800 kW/cyl	
Engine driven pumps (oil, water, fuel, bilge)			W			> 800 kW/cyl	
Bearings for main, crosshead, and crankpin	TR[(7)] (CC)	TR[(7)] (UT for full contact between basic material and bearing metal)		W		> 800 kW/cyl	

Notes:

(1) Material properties include chemical composition and mechanical properties, and also surface treatment such as surface hardening (hardness, depth and extent), peening and rolling (extent and applied force).

(2) Non-destructive examination means e.g. ultrasonic testing, crack detection by magnetic particle testing or dye penetration testing.

(3) Hydraulic testing is applied on the water/oil side of the component. Items are to be tested by hydraulic pressure at the pressure equal to 1.5 times the maximum working pressure. High pressure parts of the fuel injection system are to be tested by hydraulic pressure at the pressure equal to 1.5 maximum working pressure or

maximum working pressure plus 300 bar, whichever is the less. Where design or testing features may require modification of these test requirements, special consideration may be given.

(4) Charge air coolers need only be tested on the water side.

(5) Hydraulic testing is also required for those parts filled with cooling water and having the function of containing the water which is in contact with the cylinder or cylinder liner.

(6) Testing or inspection required for parts is marked with an "X".

(7) "TR" is a document signed by the manufacturer stating:

- conformity with requirements.
- that the tests and inspections have been carried out on samples from the current production.

3.11 Factory Acceptance Test and Shipboard Trials

3.11.1 Safety precautions

(a) Before any test run is carried out, all relevant equipment for the safety of attending personnel is to be made available by the manufacturer / shipyard and is to be operational.

(b) This applies especially to crankcase explosive conditions protection, but also to overspeed protection and any other shut down function.

(c) The overspeed protective device is to be set to a value, which is not higher than the overspeed value that was demonstrated during the type test for that engine. This set point shall be verified by the surveyor.

3.11.2 General

(a) Before any official testing, the engines shall be run-in as prescribed by the engine manufacturer.

(b) Adequate test bed facilities for loads as required in 3.11.3 as below shall be provided. All fluids used for testing purposes such as fuel, lubrication oil and cooling water are to be suitable for the purpose intended, e.g. they are to be clean, preheated if necessary and cause no harm to engine parts. This applies to all fluids used temporarily or repeatedly for testing purposes only.

(c) The testing consists of workshop and shipboard (quay and sea trial) testing.

(d) Engines are to be inspected for:

(i) Jacketing of high-pressure fuel oil lines including the system used for the detection of leakage.

(ii) Screening of pipe connections in piping containing flammable liquids.

(iii) Insulation of hot surfaces by taking random temperature readings that are to be compared with corresponding readings obtained during the type test. This shall be done while running at the rated power of engine. Use of contact thermometers may be accepted at the discretion of the attending Surveyor. If the insulation is modified subsequently to the type approval test, the Society may request temperature measurements.

(e) These inspections are normally to be made during the works trials by the manufacturer and the attending surveyor, but at the discretion of the Society parts of these inspections may be postponed to the shipboard testing.

3.11.3 Works trials (Factory Acceptance Test)

(a) Objectives

The purpose of the works trials is to verify design premises such as power, safety against fire, adherence to approved limits (e.g. maximum pressure), and functionality and to establish reference values or base lines for later reference in the operational phase.

(b) Records

(i) The following environmental test conditions are to be recorded:

(1) Ambient air temperature

(2) Ambient air pressure

(3) Atmospheric humidity

(ii) For each required load point, the following parameters are normally to be recorded:

(1) Power and speed

(2) Fuel index (or equivalent reading)

(3) Maximum combustion pressures (only when the cylinder heads installed are designed for such measurement).

(4) Exhaust gas temperature before turbine and from each cylinder (to the extent that monitoring is required in 3.13 of this Chapter)

(5) Charge air temperature

(6) Charge air pressure

(7) Turbocharger speed (to the extent that monitoring is required in 3.13 of this Chapter)

(iii) Calibration records for the instrumentation are, upon request, to be presented to the attending Surveyor

(iv) For all stages at which the engine is to be tested, the pertaining operational values are to be measured and recorded by the engine manufacturer. All results are to be compiled in an acceptance protocol to be issued by the engine manufacturer. This also includes crankshaft deflections if considered necessary by the engine designer

(v) In each case, all measurements conducted at the various load points are to be carried out at steady state operating conditions. However, for all load points provision should be made for time needed by the Surveyor to carry out visual inspections. The readings for MCR, i.e. 100% power (rated maximum continuous power at corresponding rpm) are to be taken at least twice at an interval of normally 30 minutes.

(c) Test loads

Test loads for various engine applications are given below. In addition, the scope of the trials may be expanded depending on the engine application, service experience, or other relevant reasons. Alternatives to the detailed tests may be agreed between the manufacturer and the Society when the overall scope of tests is found to be equivalent.

(i) Propulsion engines driving propeller or impeller only.

(1) 100% power (rated power) at rated engine speed (n_o):	at least 60 min after having reached steady conditions.
(2) 110% power at engine speed n = 1.032 n_o: (Only required once for each different Engine/turbocharger confirguration)	Records to be taken after 15 minutes or after steady conditions have been reached, whichever is shorter.
(3) Approved intermittent overload (if applicable):	testing for duration as agreed with the manufacturer.

(4) 90% (or normal continuous cruise power), 75%, 50% and 25% power in accordance with the nominal propeller curve, , the sequence to be selected by the engine manufacturer..

(5) Reversing maneuvers(if applicable).

(6) Testing of governor and independent overspeed protective device.

(7) Shut down device.

Note: After running on the test bed, the fuel delivery system is to be so adjusted that overload power cannot be given in service, unless intermittent overload power is approved by the Society. In that case, the fuel delivery system is to be blocked to that power.

(ii) Engines driving generators for electric propulsion

The test is to be performed at rated speed with a constant governor setting under conditions of:

(1) 100% power (rated power) at rated engine speed:	at least 60 min after having reached steady conditions.
(2) 110% power:	15 min after having reached steady conditions.

(3) 75%, 50% and 25% power and idle, the sequence to be selected by the engine manufacturer.

(4) Start-up tests.

(5) Testing of governor and independent overspeed protective device.

(6) Shut-down device.

Note: After running on the test bed, the fuel delivery system is to be adjusted so that full power plus a 10% margin for transient regulation can be given in service after installation onboard. The transient overload capability is required so that the required transient governing characteristics are achieved also at 100% loading of the engine, and also so that the protection system utilised in the electric distribution system can be activated before the engine stalls.

(iii) Engines driving generators for auxiliary purposes

Test to be performed in accordance with 3.11.3(c)(ii) above.

(iv) Propulsion engines also driving power take off (PTO) generator

(1) 100% power (rated power) at rated engine speed: at least 60 min after having reached steady conditions.

(2) 110% power at rated engine speed: 15 min after having reached steady conditions.

(3) Approved intermittent overload (if applicable): testing for duration as agreed with the manufacturer.

(4) 90% (or normal continuous cruise power), 75%, 50% and 25% power in accordance with the nominal propeller curve, , the sequence to be selected by the engine manufacturer..

(5) Reversing maneuvers(if applicable).

(6) Testing of governor and independent overspeed protective device.

(7) Shut down device.

Note:

After running on the test bed, the fuel delivery system is to be adjusted so that full power plus a margin for transient regulation can be given in service after installation onboard. The transient overload capability is required so that the electrical protection of downstream system components is activated before the engine stalls. This margin may be 10% of the engine power but at least 10% of the PTO power.

(v) Engines driving auxiliaries

(1) 100% power (rated power) at rated engine speed: at least 30 min after having reached steady conditions.

(2) 110% power at rated engine speed: 15 min after having reached steady conditions.

(3) Approved intermittent overload (if applicable): testing for duration as agreed with the manufacturer.

(4) For variable speed engines, 75%, 50% and 25% power in accordance with the nominal propeller curve, , the sequence to be selected by the engine manufacturer..

(5) Reversing maneuvers(if applicable).

(6) Testing of governor and independent overspeed protective device.

(7) Shut down device.

Note: After running on the test bed, the fuel delivery system is normally to be so adjusted that overload power cannot be delivered in service, unless intermittent overload power is approved. In that case, the fuel delivery system is to be blocked to that power.

(d) Turbocharger matching with engine

(i) Compressor chart

(1) Turbochargers shall have a compressor characteristic that allows the engine, for which it is intended, to operate without surging during all operating conditions and also after extended periods in operation.

(2) For abnormal, but permissible, operation conditions, such as misfiring and sudden load reduction, no continuous surging shall occur.

(3) In this section, surging and continuous surging are defined as follows:
Surging means the phenomenon, which results in a high pitch vibration of an audible level or explosion-like noise from the scavenger area of the engine.

(4) Continuous surging means that surging happens repeatedly and not only once.

(ii) Surge margin verification

Category C turbochargers (as defined in 3.13 of this Chapter) used on propulsion engines are to be checked for surge margins during the engine workshop testing as specified below. These tests may be waived if successfully tested earlier on an identical configuration of engine and turbocharger (including same nozzle rings).

(1) For 4-stroke engines
The following shall be performed without indication of surging:

a) With maximum continuous power and speed (=100%), the speed shall be reduced with constant torque (fuel index) down to 90% power.

b) With 50% power at 80% speed (= propeller characteristic for fixed pitch), the speed shall be reduced to 72% while keeping constant torque (fuel index).

(2) For 2-stroke engines
The surge margin shall be demonstrated by at least one of the following methods:

a) The engine working characteristic established at workshop testing of the engine shall be plotted into the compressor chart of the turbocharger (established in a test rig). There shall be at least 10% surge margin in the full load range, i.e. working flow shall be 10% above the theoretical (mass) flow at surge limit (at no pressure fluctuations).

b) Sudden fuel cut-off to at least one cylinder shall not result in continuous surging and the turbocharger shall be stabilised at the new load within 20 seconds. For applications with more than one turbocharger the fuel shall be cut-off to the cylinders closest upstream to each turbocharger.

This test shall be performed at two different engine loads:

i) The maximum power permitted for one cylinder misfiring.

ii) The engine load corresponding to a charge air pressure of about 0.6 bar (but without auxiliary blowers running).

c) No continuous surging and the turbocharger shall be stabilised at the new load within 20 seconds when the power is abruptly reduced from 100% to 50% of the maximum continuous power.

(e) Integration tests

For electronically controlled engines, integration tests are to be made to verify that the response of the complete mechanical, hydraulic and electronic system is as predicted for all intended operational modes and the tests considered as a system are to be carried out at the works. If such tests are technically unfeasible at the works, however, these tests may be conducted during sea trial. The scope of these tests is to be agreed with the Society for selected cases based on the FMEA.

(f) Component inspections

Random checks of components to be presented for inspection after works trials are left to the discretion of the Society.

3.11.4 Shipboard trials

(a) Objectives

The purpose of the shipboard testing is to verify compatibility with power transmission and driven machinery in the system, control systems and auxiliary systems necessary for the engine and integration of engine / shipboard control systems, as well as other items that had not been dealt with in the FAT (Factory Acceptance Testing).

(b) Starting capacity

Starting manoeuvres are to be carried out in order to verify that the capacity of the starting media satisfies the required number of start attempts.

(c) Monitoring and alarm system

The monitoring and alarm systems are to be checked to the full extent for all engines, except items already verified during the works trials.

(d) Test loads

(i) Test loads for various engine applications are given below. In addition, the scope of the trials may be expanded depending on the engine application, service experience, or other relevant reasons.

(ii) The suitability of the engine to operate on fuels intended for use is to be demonstrated.

Note:

Tests other than those listed below may be required by statutory instruments (e.g. EEDI verification).

(iii) Propulsion engines driving fixed propeller or impeller

(1) At rated engine speed n_o: at least 4 hours.

(2) At engine speed $n = 1.032 \bullet n_o$: 30 minutes.
(if engine adjustment permits)

(3) At approved intermittent overload (if applicable): testing for duration as agreed with the manufacturer

(4) Minimum engine speed to be determined.

(5) The ability of reversible engines to be operated in reverse direction is to be demonstrated.

Note:

During stopping tests according to Resolution MSC.137 (76), see 3.11.5 as below for additional requirements in the case of a barred speed range.

(iv) Propulsion engines driving controllable pitch propellers

(1) At rated engine speed n_0 with a propeller pitch leading to rated engine power (or to the maximum achievable power if 100% cannot be reached): at least 4 hours.

(2) At approved intermittent overload (if applicable): testing for duration as agreed with the manufacturer.

(3) With reverse pitch suitable for manoeuvring, see 3.11.5 for additional requirements in the case of a barred speed range.

(v) Engine(s) driving generator(s) for electrical propulsion and/or main power supply

(1) At 100% power (rated electrical power of generator): at least 60 min.

(2) At 110% power (rated electrical power of generator): at least 10 min.

Note: Each engine is to be tested 100% electrical power for at least 60 min and 110% of rated electrical power of the generator for at least 10 min. This may, if possible, be done during the electrical propulsion plant test, which is required to be tested with 100% propulsion power (i.e. total electric motor capacity for propulsion) by distributing the power on as few generators as possible. The duration of this test is to be sufficient to reach stable operating temperatures of all rotating machines or for at least 4 hours. When some of the gen. set(s) cannot be tested due to insufficient time during the propulsion system test mentioned above, those required tests are to be carried out separately.

(3) Demonstration of the generator prime movers' and governors' ability to handle load steps as described in 3.2.1 of Part VII.

(vi) Propulsion engines also driving power take off (PTO) generator

(1) 100% engine power (MCR) at rated engine speed n_0: at least 4 hours.

(2) 100% propeller branch power at engine speed n_0
(unless already covered in (1)): 2 hours.

(3) 100% PTO branch power at engine speed n_0: at least 1 hour.

(vii) Engines driving auxiliaries.

(1)	100% power (rated power) at rated engine speed:	at least 30 min.
(2)	Approved intermittent overload:	testing for duration as approved.

3.11.5 Torsional vibrations

(a) Barred speed range

(i) Where a barred speed range (bsr) is required, passages through this bsr, both accelerating and decelerating, are to be demonstrated. The times taken are to be recorded and are to be equal to or below those times stipulated in the approved documentation, if any. This also includes when passing through the bsr in reverse rotational direction, especially during the stopping test.

Note:

Applies both for manual and automatic passing-through systems.

(ii) The ship's draft and speed during all these demonstrations is to be recorded. In the case of a controllable pitch propeller, the pitch is also to be recorded.

(iii) The engine is to be checked for stable running (steady fuel index) at both upper and lower borders of the bsr. Steady fuel index means an oscillation range less than 5% of the effective stroke (idle to full index).

3.12 Type Testing of Diesel Engines

3.12.1 General

(a) Type approval of diesel engine types consists of drawing approval, specification approval, conformity of production, approval of type testing programme, type testing of engines, review of the obtained results, and the issuance of the type approval certificate. The maximum period of validity of a type approval certificate is 5 years.

(b) For the purpose of this section, the following definitions apply:

(i) Low-speed engines means diesel engines having a rated speed of less than 300 rpm.

(ii) Medium-speed engines means diesel engines having a rated speed of 300 rpm and above, but less than 1400 rpm.

(iii) High-speed engines means diesel engines having a rated speed of 1400 rpm or above.

3.12.2 Objectives

(a) the type testing, documented in this section, is to be arranged to represent typical foreseen service load profiles, as specified by the engine builder, as well as to cover for required margins due to fatigue scatter and reasonably foreseen in-service deterioration.

(b) This applies to:

(i) Parts subjected to high cycle fatigue (HCF) such as connecting rods, cams, rollers and spring tuned dampers where higher stresses may be provided by means of elevated injection pressure, cylinder maximum pressure, etc.

(ii) Parts subjected to low cycle fatigue (LCF) such as “hot” parts when load profiles such as idle - full load - idle (with steep ramps) are frequently used.

(iii) Operation of the engine at limits as defined by its specified alarm system, such as running at maximum permissible power with the lowest permissible oil pressure and/or highest permissible oil inlet temperature.

3.12.3 Validity

(a) Type testing is required for every new engine type intended for installation onboard ships subject to classification.

(b) A type test carried out for a particular type of engine at any place of manufacture will be accepted for all engines of the same type built by licensees or the licensor, subject to each place of manufacture being found to be acceptable to the Society.

(c) A type of engine is defined by:

(i) bore and stroke

(ii) injection method (direct or indirect)

(iii) valve and injection operation (by cams or electronically controlled)

(iv) kind of fuel (liquid, dual-fuel, gaseous)

(v) working cycle (4-stroke, 2-stroke)

(vi) turbo-charging system (pulsating or constant pressure)

(vii) the charging air cooling system (e.g. with or without intercooler)

(viii) cylinder arrangement (in-line or V) (1)

(ix) cylinder power, speed and cylinder pressures (2)

Notes:

(1) One type test will be considered adequate to cover a range of different numbers of cylinders. However, a type test of an in-line engine may not always cover the V-version. Subject to the individual Societies' discretion, separate type tests may be required for the V-version. On the other hand, a type test of a V-engine covers the in-line engines, unless the bmep is higher.

Items such as axial crankshaft vibration, torsional vibration in camshaft drives, and crankshafts, etc. may vary considerably with the number of cylinders and may influence the choice of engine to be selected for type testing.

(2) The engine is type approved up to the tested ratings and pressures (100% corresponding to MCR).

Provided documentary evidence of successful service experience with the classified rating of 100% is submitted, an increase (if design approved*) may be permitted without a new type test if the increase from the type tested engine is within:

- 5% of the maximum combustion pressure, or
- 5% of the mean effective pressure, or
- 5% of the rpm

Providing maximum power is not increased by more than 10%, an increase of maximum approved power may be permitted without a new type test provided engineering analysis and evidence of successful service experience in similar field applications (even if the application is not classified) or documentation of internal testing are submitted if the increase from the type tested engine is within:

- 10% of the maximum combustion pressure, or
- 10% of the mean effective pressure, or
- 10% of the rpm

* Only crankshaft calculation and crankshaft drawings, if modified.

(d) De-rated engine

If an engine has been design approved, and internal testing per Stage A is documented to a rating higher than the one type tested, the Type Approval may be extended to the increased power/mep/rpm upon submission of an Extended Delivery Test Report at:

(i) Test at over speed (only if nominal speed has increased)

(ii) Rated power, i.e. 100% output at 100% torque and 100% speed corresponding to load point 1., 2 measurements with one running hour in between

(iii) Maximum permissible torque (normally 110%) at 100% speed corresponding to load point 3 or maximum permissible power (normally 110%) and speed according to nominal propeller curve corresponding to load point 3a., 0.5 hour

(iv) 100% power at maximum permissible speed corresponding to load point 2, 0.5 hour

(e) Integration test

An integration test demonstrating that the response of the complete mechanical, hydraulic and electronic system is as predicted maybe carried out for acceptance of sub-systems (Turbo Charger, Engine Control System, Dual Fuel, Exhaust Gas treatment, etc.) separately approved. The scope of these tests shall be proposed by thedesigner/licensor taking into account of impact on engine.

3.12.4 Safety precautions

(a) Before any test run is carried out, all relevant equipment for the safety of attending personnel is to be made available by the manufacturer/shipyard and is to be operational, and its correct functioning is to be verified.

(b) This applies especially to crankcase explosive conditions protection, but also overspeed protection and any other shut down function.

(c) The inspection for jacketing of high-pressure fuel oil lines and proper screening of pipe connections (as required in 3.12.8(i) of this Chapter) is also to be carried out before the test runs.

(d) Interlock test of turning gear is to be performed when installed.

3.12.5 Test programme

(a) The type testing is divided into 3 stages:

(i) Stage A - internal tests.

This includes some of the testing made during the engine development, function testing, and collection of measured parameters and records of testing hours. The results of testing required by the Society or stipulated by the designer are to be presented to the Society before starting stage B.

(ii) Stage B - witnessed tests.

This is the testing made in the presence of the Surveyor.

(iii) Stage C - component inspection.

This is the inspection of engine parts to the extent as required by the Society.

(b) The complete type testing program is subject to approval by the Society. The extent the Surveyor's attendance is to be agreed in each case, but at least during stage B and C.

(c) Testing prior to the witnessed type testing (stage B and C), is also considered as a part of the complete type testing program.

(d) Upon completion of complete type testing (stage A through C), a type test report is to be submitted to the Society for review. The type test report is to contain:

(i) overall description of tests performed during stage A. Records are to be kept by the builders QA management for presentation to the Society.

(ii) detailed description of the load and functional tests conducted during stage B.

(iii) inspection results from stage C.

(e) As required in 3.12.2 of this Chapter the type testing is to substantiate the capability of the design and its suitability for the intended operation. Special testing such as LCF and endurance testing will normally be conducted during stage A.

(f) High speed engines for marine use are normally to be subjected to an endurance test of 100 hours at full load. Omission or simplification of the type test may be considered for the type approval of engines with long service experience from non-marine fields or for the extension of type approval of engines of a well-known type, in excess of the limits given in 3.12.3 of this Chapter.
Propulsion engines for high speed vessels that may be used for frequent load changes from idle to full are normally to be tested with at least 500 cycles (idle - full load - idle) using the steepest load ramp that the control system (or operation manual if not automatically controlled) permits. The duration at each end is to be sufficient for reaching stable temperatures of the hot parts.

3.12.6 Measurements and recordings

(a) During all testing the ambient conditions (air temperature, air pressure and humidity) are to be recorded.

(b) As a minimum, the following engine data are to be measured and recorded:

(i) Engine r.p.m.

(ii) Torque

(iii) Maximum combustion pressure for each cylinder [(1)]

(iv) Mean indicated pressure for each cylinder [(1)]

(v) Charging air pressure and temperature

(vi) Exhaust gas temperature

(vii) Fuel rack position or similar parameter related to engine load

(viii) Turbocharger speed

(ix) All engine parameters that are required for control and monitoring for the intended use (propulsion, auxiliary, emergency).

Notes:

(1) For engines where the standard production cylinder heads are not designed for such measurements, a special cylinder head made for this purpose may be used. In such a case, the measurements may be carried out as part of Stage A and are to be properly documented. Where deemed necessary e.g. for dual fuel engines, the measurement of maximum combustion pressure and mean indicated pressure may be carried out by indirect means, provided the reliability of the method is documented.

(c) Calibration records for the instrumentation used to collect data as listed above are to be presented to - and reviewed by the attending Surveyor.

(d) Additional measurements may be required in connection with the design assessment

3.12.7 Stage A - internal tests

(a) During the internal tests, the engine is to be operated at the load points important for the engine designer and the pertaining operating values are to be recorded. The load conditions to be tested are also to include the testing specified in the applicable type approval programme.

(b) At least the following conditions are to be tested:

(i) Normal case:

The load points 25%, 50%, 75%, 100% and 110% of the maximum rated power for continuous operation, to be made along the normal (theoretical) propeller curve and at constant speed for propulsion engines (if applicable mode of operation i.e. driving controllable pitch propellers), and at constant speed for engines intended for generator sets including a test at no load and rated speed.

(ii) The limit points of the permissible operating range. These limit points are to be defined by the engine manufacturer.

(iii) For high speed engines, the 100 hr full load test and the low cycle fatigue test apply as required in connection with the design assessment.

(iv) Specific tests of parts of the engine, required by the Society or stipulated by the designer.

3.12.8 Stage B - witnessed tests

(a) The tests listed below are to be carried out in the presence of a Surveyor. The achieved results are to be recorded and signed by the attending Surveyor after the type test is completed.

(b) The over-speed test is to be carried out and is to demonstrate that the engine is not damaged by an actual engine overspeed within the overspeed shutdown system set-point. This test may be carried out at the manufacturer's choice either with or without load during the speed overshoot.

(c) Load points

The engine is to be operated according to the power and speed diagram (see Figure IV 3-7 of this Chapter). The data to be measured and recorded when testing the engine at the various load points have to include all engine parameters listed in 3.12.6 above. The operating time per load point depends on the engine size (achievement of steady state condition) and on the time for collection of the operating values. Normally, an operating time of 0.5 hour can be assumed per load point, however sufficient time should be allowed for visual inspection by the Surveyor.

(d) The load points are:

(i) Rated power (MCR), i.e. 100% output at 100% torque and 100% speed corresponding to load point 1, normally for 2 hours with data collection with an interval of 1 hour. If operation of the engine at limits as defined by its specified alarm system (e.g. at alarm levels of lub oil pressure and inlet temperature) is required, the test should be made here.

(ii) 100% power at maximum permissible speed corresponding to load point 2.

(iii) Maximum permissible torque (at least and normally 110%) at 100% speed corresponding to load at point 3, or maximum permissible power (at least and normally 110%) and 103.2% speed according to the nominal propeller curve corresponding to load point 3a. Load point 3a applies to engines only driving fixed pitch propellers or water jets. Load point 3 applies to all other purposes. Load point 3 (or 3a as applicable) is to be replaced with a load that corresponds to the specified overload and duration approved for intermittent use. This applies where such overload rating exceeds 110% of MCR. Where the approved intermittent overload rating is less than 110% of MCR, subject overload rating has to replace the load point at 100% of MCR. In such case the load point at 110% of MCR remains.

(iv) Minimum permissible speed at 100% torque, corresponding to load point 4.

(v) Minimum permissible speed at 90% torque corresponding to load point 5. (Applicable to propulsion engines only).

(vi) Part loads e.g. 75%, 50% and 25% of rated power and speed according to nominal propeller curve (i.e. 90.8%, 79.3% and 62.9% speed) corresponding to points 6, 7 and 8 or at constant rated speed setting corresponding to points 9, 10 and 11, depending on the intended application of the engine.

(vii) Crosshead engines not restricted for use with C.P. propellers are to be tested with no load at the associated maximum permissible engine speed

(e) During all these load points, engine parameters are to be within the specified and approved values.

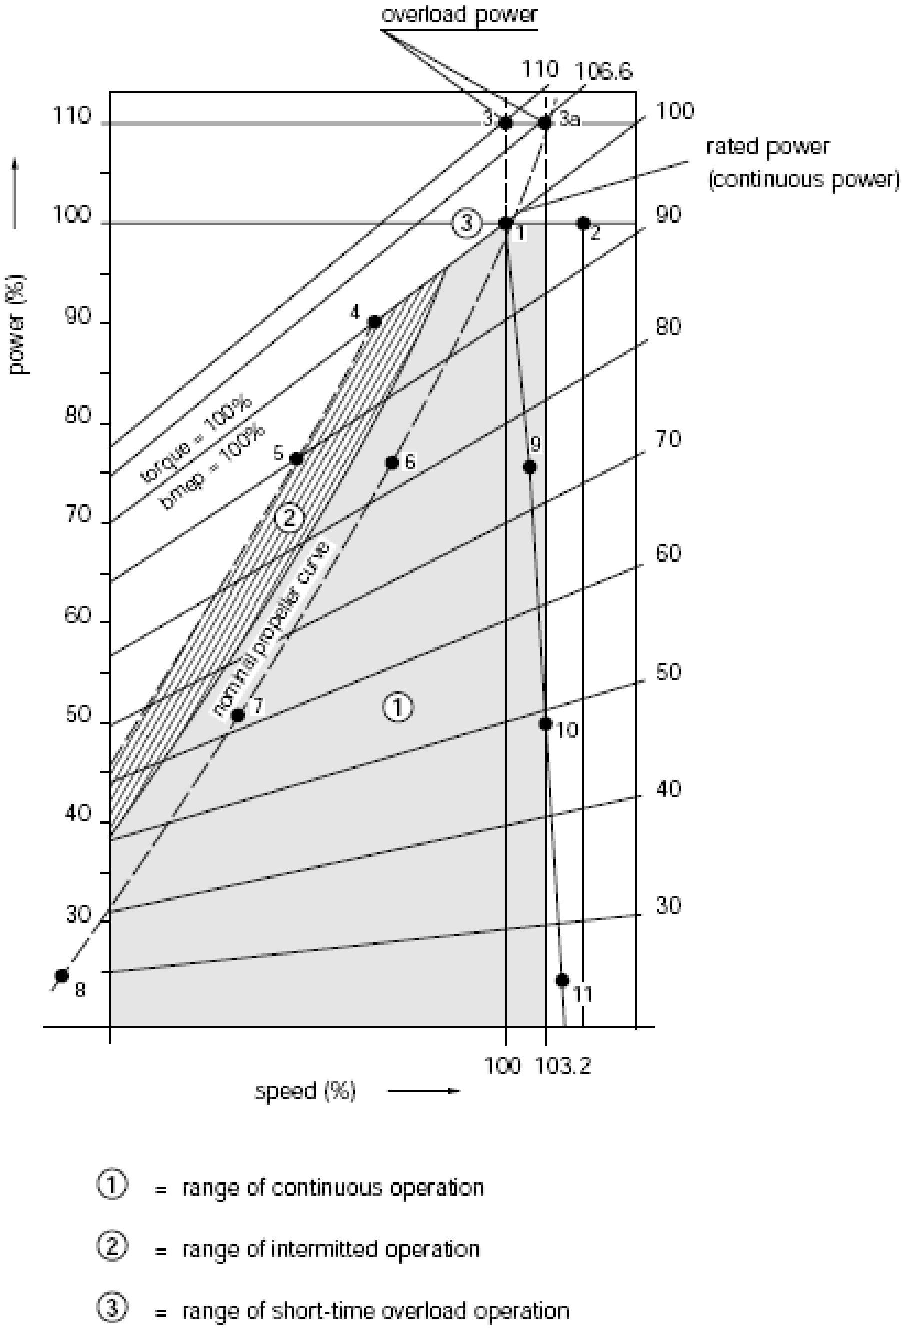

Fig. IV 3-7
Load Points

(f) Operation with damaged turbocharger

(i) For 2-stroke propulsion engines, the achievable continuous output is to be determined in the case of turbocharger damage.

(ii) Engines intended for single propulsion with a fixed pitch propeller are to be able to run continuously at a speed (r.p.m.) of 40% of full speed along the theoretical propeller curve when one turbocharger is out of operation. (The test can be performed by either by-passing the turbocharger, fixing the turbocharger rotor shaft or removing the rotor.)

(g) Functional tests

(i) Verification of the lowest specified propulsion engine speed according to the nominal propeller curve as specified by the engine designer (even though it works on a waterbrake). During this operation, no alarm shall occur.

(ii) Starting tests, for non-reversible engines and/or starting and reversing tests, for reversible engines, for the purpose of determining the minimum air pressure and the consumption for a start.

(iii) Governor tests: tests for compliance with IACS UR M3.1 and IACS UR M3.2 are to be carried out.

(h) Integration test

For electronically controlled diesel engines, integration tests are to verify that the response of the complete mechanical, hydraulic and electronic system is as predicted for all intended operational modes. The scope of these tests is to be agreed with the Society for selected cases based on the FMEA.

(i) Fire protection measures

Verification of compliance with requirements for jacketing of high-pressure fuel oil lines, screening of pipe connections in piping containing flammable liquids and insulation of hot surfaces:

(i) The engine is to be inspected for jacketing of high-pressure fuel oil lines, including the system for the detection of leakage, and proper screening of pipe connections in piping containing flammable liquids.

(ii) Proper insulation of hot surfaces is to be verified while running the engine at 100% load, alternatively at the overload approved for intermittent use. Readings of surface temperatures are to be done by use of Infrared Thermoscanning Equipment. Equivalent measurement equipment may be used when so approved by the Society. Readings obtained are to be randomly verified by use of contact thermometers

3.12.9 Stage C - Opening up for Inspections

(a) The crankshaft deflections are to be measured in the specified (by designer) condition (except for engines where no specification exists).

(b) High speed engines for marine use are normally to be stripped down for a complete inspection after the type test.

(c) For all the other engines, after the test run the components of one cylinder for in-line engines and two cylinders for V-engines are to be presented for inspection as follows (engines with long service experience from non-marine fields can have a reduced extent of opening):

(i) piston removed and dismantled

(ii) crosshead bearing dismantled

(iii) guide planes

(iv) connecting rod bearings (big and small end) dismantled (special attention to serrations and fretting on contact surfaces with the bearing backsides)

(v) main bearing dismantled

(vi) cylinder liner in the installed condition

(vii) cylinder head, valves disassembled

(viii) cam drive gear or chain, camshaft and crankcase with opened covers. (The engine must be turnable by turning gear for this inspection.)

(d) For V-engines, the cylinder units are to be selected from both cylinder banks and different crank throws.

(e) If deemed necessary by the surveyor, further dismantling of the engine may be required.

3.13 Turbochargers

3.13.1 Scope

(a) These requirements are applicable for turbochargers with regard to design approval, type testing and certification and their matching on engines. Turbochargers are to be type approved, either separately or as a part of an engine. The requirements are written for exhaust gas driven turbochargers, but apply in principle also for engine driven chargers.

(b) The requirements escalate with the size of the turbochargers. The parameter for size is the engine power (at MCR) supplied by a group of cylinders served by the actual turbocharger, (e.g. for a V-engine with one turbocharger for each bank the size is half of the total engine power).

(c) Turbochargers are categorised in three groups depending on served power by cylinder groups with:

(i) Category A: ≤ 1000 kW

(ii) Category B: > 1000 kW and ≤ 2500 kW

(iii) Category C: > 2500 kW

3.13.2 Documentation to be submitted

(a) Category A:

On request

(i) Containment test report.

(ii) Cross sectional drawing with principal dimensions and names of components.

(iii) Test program.

(b) Category B and C:

(i) Cross sectional drawing with principal dimensions and materials of housing components for containment evaluation.

(ii) Documentation of containment in the event of disc fracture, see IACS UR M73, 3.2.

(iii) Operational data and limitations as:

(iv) Maximum permissible operating speed (rpm)

(v) Alarm level for over-speed

(vi) Maximum permissible exhaust gas temperature before turbine

(vii) Alarm level for exhaust gas temperature before turbine

(viii) Minimum lubrication oil inlet pressure

(ix) Lubrication oil inlet pressure low alarm set point

(x) Maximum lubrication oil outlet temperature

(xi) Lubrication oil outlet temperature high alarm set point

(xii) Maximum permissible vibration levels, i.e. self- and externally generated vibration (Alarm levels may be equal to permissible limits but shall not be reached when operating the engine at 110% power or at any approved intermittent overload beyond the 110%.)

(xiii) Arrangement of lubrication system, all variants within a range.

(xiv) Type test reports.

(xv) Test program.

(c) Category C:

(i) Drawings of the housing and rotating parts including details of blade fixing.

(ii) Material specifications (chemical composition and mechanical properties) of all parts mentioned above.

(iii) Welding details and welding procedure of above mentioned parts, if applicable.

(iv) Documentation* of safe torque transmission when the disc is connected to the shaft by an interference fit, see 3.13.3 as below.

(v) Information on expected lifespan, considering creep, low cycle fatigue and high cycle fatigue.

(vi) Operation and maintenance manuals*.

*: Applicable to two sizes in a generic range of turbochargers.

3.13.3 Design requirements and corresponding type testing

(a) General

(i) The turbochargers shall be designed to operate under conditions given in chapter 1. The component lifetime and the alarm level for speed shall be based on 45°C air inlet temperature.

(ii) The air inlet of turbochargers shall be fitted with a filter.

(b) Containment

(i) Turbochargers shall fulfil containment in the event of a rotor burst. This means that at a rotor burst no part may penetrate the casing of the turbocharger or escape through the air intake. For documentation purposes (test/calculation), it shall be assumed that the discs disintegrate in the worst possible way.

(ii) For category B and C, containment shall be documented by testing. Fulfilment of this requirement can be awarded to a generic range** of turbochargers based on testing of one specific unit. Testing of a large unit is preferred as this is considered conservative for all smaller units in the generic range. In any case, it must be documented (e.g. by calculation) that the selected test unit really is representative for the whole generic range.

(iii) The minimum test speeds, relative to the maximum permissible operating speed, are:

(1) For the compressor: 120%.

(2) For the turbine: 140% or the natural burst speed, whichever is lower.

(iv) Containment tests shall be performed at working temperature.

(v) A numerical analysis (simulation) of sufficient containment integrity of the casing based on calculations by means of a simulation model may be accepted in lieu of the practical containment test, provided that:

(1) The numerical simulation model has been tested and its suitability/accuracy has been proven by direct comparison between calculation results and the practical containment test for a reference application (reference containment test). This test shall be performed at least once by the manufacturer for acceptance of the numerical simulation method in lieu of tests.

(2) The corresponding numerical simulation for the containment is performed for the same speeds as specified for the containment test.

(3) Material properties for high-speed deformations are to be applied in the numeric simulation. The correlation between normal properties and the properties at the pertinent deformation speed are to be substantiated.

(4) The design of the turbocharger regarding geometry and kinematics is similar to the turbocharger that was used for the reference containment test. In general, totally new designs will call for a new reference containment test.

**: A generic range means a series of turbocharger which are of the same design, but scaled to each other.

(c) Disc-shaft shrinkage fit

(i) Applicable to Category C

(ii) In cases where the disc is connected to the shaft with interference fit, calculations shall substantiate safe torque transmission during all relevant operating conditions such as maximum speed, maximum torque and maximum temperature gradient combined with minimum shrinkage amount.

(d) Type testing

(i) Applicable to Categories B and C

(ii) The type test for a generic range of turbochargers may be carried out either on an engine (for which the turbocharger is foreseen) or in a test rig.

(iii) Turbochargers are to be subjected to at least 500 load cycles at the limits of operation. This test may be waived if the turbocharger together with the engine is subjected to this kind of low cycle testing, see 3.12.

(iv) The suitability of the turbocharger for such kind of operation is to be preliminarily stated by the manufacturer.

(v) The rotor vibration characteristics shall be measured and recorded in order to identify possible sub-synchronous vibrations and resonances.

(vi) The type test shall be completed by a hot running test at maximum permissible speed combined with maximum permissible temperature for at least one hour. After this test, the turbocharger shall be opened for examination, with focus on possible rubbing and the bearing conditions.

(vii) The extent of the surveyor's presence during the various parts of the type tests is left to the discretion of each Society.

3.13.4 Certification

(a) The manufacturer shall adhere to a quality system designed to ensure that the designer's specifications are met, and that manufacturing is in accordance with the approved drawings.

(b) For category C, this shall be verified by means of periodic product audits of the quality assurance scheme by the Society.

(c) These audits shall focus on:

(i) Chemical composition of material for the rotating parts.

(ii) Mechanical properties of the material of a representative specimen for the rotating parts and the casing.

(iii) UT and crack detection of rotating parts.

(iv) Dimensional inspection of rotating parts.

(v) Rotor balancing.

(vi) Hydraulic testing of cooling spaces to 4 bars or 1.5 times maximum working pressure, whichever is higher.

(vii) Overspeed test of all compressor wheels for a duration of 3 minutes at either 20% above alarm level speed at room temperature or 10% above alarm level speed at 45°C inlet temperature when tested in the actual housing with the corresponding pressure ratio. The overspeed test may be waived for forged wheels that are individually controlled by an approved non-destructive method.

(d) Turbochargers shall be delivered with:

(i) For category C, a marine product certificate, which at a minimum cites the applicable type approval and the quality assurance scheme, when quality assurance scheme applies.

(ii) For category B, a work's certificate, which at a minimum cites the applicable type approval, which includes production assessment.

(e) The same applies to replacement of rotating parts and casing.

(f) Alternatively to the above periodic product audits, individual certification of a turbocharger and its parts may be made at the discretion of the Society. However, such individual certification of category C turbocharger and its parts shall also be based on test requirements specified in the above mentioned bullet points.

3.13.5 Alarms & monitoring

(a) For all turbochargers of Categories B and C, indications and alarms as listed in Table IV 3-5 are required.

(b) Indications may be provided at either local or remote locations.

Table IV 3-5
Alarm Lists

Pos.	Monitored Parameters	Category of Turbocharger				Notes
		B		C		
		Alarm	Indication	Alarm	Indication	
1	Speed	High(4)	X(4)	High(4)	X(4)	
2	Exaust gas each turbocharger inlet, temperature	High(1)	X	High(1)	X	High temp. alarms for each cylinder at engine is acceptable(2)
3	Lub. oil at turbocharger outlet, temperature				X	If not forced system, oil temperature near bearings
4	Lub. oil at turbocharger outlet, pressure	Low	X	Low	X	Only for forced lubrication systems(3)

Notes:

(1) For Category B turbochargers, the exhaust gas temperature may be alternatively monitored at the turbocharger outlet, provided that the alarm level is set to a safe level for the turbine and that correlation between inlet and outlet temperatures is substantiated.

(2) Alarm and indication of the exhaust gas temperature at turbocharger inlet may be waived if alarm and indication for individual exhaust gas temperature is provided for each cylinder and the alarm level is set to a value safe for the turbocharger

(3) Separate sensors are to be provided if the lubrication oil system of the turbocharger is not integrated with the lubrication oil system of the diesel engine or if it is separated by a throttle or pressure reduction valve from the diesel engine lubrication oil system.

(4) On turbocharging systems where turbochargers are activated sequentially, speed monitoring is not required for the turbocharger(s) being activated last in the sequence, provided all turbochargers share the same intake air filter and they are not fitted with waste gates.

Chapter 4

Deck Machinery and Essential Auxiliaries

4.1 General

4.1.1 The requirements of this chapter are applicable to the steering gear, athwartship thruster, windlass, mooring winch, capstan, reciprocating compressor and essential service pumps, etc.

4.1.2 Athwartship thrust units, not including azimuth thrusters intended for main propulsion, are regarded as part of the steering function. The requirements dealing with steering gear, shafting, gearing and couplings, propeller, remote control systems as well as electric installations in the relevant parts of the Rules, as far as they are applicable, are to be complied with for the athwartship thrust units.

4.1.3 The requirements in 4.3 of this Part are to be complied with, as far as they are applicable, for the mooring winch and capstan.

4.1.4 Drawings and data
The manufacturers are to submit the following drawings together with data for approval:

(a) For steering gear:
  (i) Drawings
    (1) General arrangements of steering gear
    (2) Details of tiller, etc.
    (3) Assembly and details of power units
    (4) Assembly and details of rudder actuators
    (5) Piping diagram of hydraulic pipes; Arrangements of control systems
    (6) Diagram of hydraulic and electrical systems
    (including alarm devices and automatic steering gear)
    (7) Arrangements and diagram of an alternative source of power
    (8) Diagram of a rudder angle indicator
    (9) Other drawing considered necessary by the Society
  (ii) Data
    (1) Particulars
    (2) Operating instructions (including drawing showing the change-over procedure for power units and control systems, drawings showing the sequence of automatic supply of power from an alternative source of power, data showing the kind, particulars and an assembly of the power source in the case that the alternative source of power is an independent source of power and information about hydraulic fluid quality)
    (3) Manuals for countermeasures to be taken at the time of a single failure of the power actuating system;
    (4) Calculation sheet of the strength of essential parts.
    (5) Other data considered necessary by the society.

(b) For windlass, mooring winch and capstan
General arrangement, detail drawings of the shaft, cable lifting wildcat for windlass and brake, necessary particulars for capacity, speed, driving power, and material specifications, etc.

(c) For reciprocating compressor
  (i) The compressor manufacturers are to submit the following drawings for approval:
  Sectional assembly and crank shafts.
  (ii) The compressor manufacturers are to submit the following data together with drawings for approval:

Design pressures and temperatures of air in different stages, capacity, revolutions, particulars, power required and material specifications, etc.

(d) For pumps

General arrangement including capacity, head, revolutions and driving power, description of pump including overload protection and other safety devices, and material specifications, etc.

4.1.5 Materials

(a) For steering gear

(i) All the steering gear components and the rudder stock are to be of sound reliable construction to the Surveyor's satisfaction.

(ii) All components transmitting mechanical forces to the rudder stock are to be tested according to the requirements of Part XI.

(iii) Ram cylinders, pressure housings of rotary vane type actuators, hydraulic power piping, valves, flanges and fittings; and all steering gear components transmitting mechanical forces to the rudder stock (such as tillers, quadrants, or similar components) are to be of steel or other approved ductile material, duly tested in accordance with the requirements of Part XI. In general, such material is to have an elongation of not less than 12 per cent nor a tensile strength in excess of 650 N/mm^2. Special consideration will be given to the acceptance of grey cast iron for valve bodies and redundant parts with low stress levels.

(b) For windlasses, mooring winches and capstans, the material used is generally to comply with 4.1.5(a) above. The cable lifting wildcats generally to be of cast steel.

(c) For reciprocating compressor

(i) Crankshaft and connecting rods are normally to be of forged steel, cast steel or approved spheroidal or nodular graphite cast iron. The use of other material is to be specially approved in each case by the Society.

(ii) Materials intended for crankshafts and the spheroidal or nodular graphite cast iron connecting rods are to be tested and inspected in the presence of the Surveyor in accordance with the requirements of Part XI or to the requirements of the specifications approved in connection with the design.

(d) For pumps which handle corrosive fluids, noncorrodible materials are to be used. Cast iron pump bodies are not to be used for circulating pumps of forced circulation boilers for which the design pressure exceeds 1.0 MPa.

(e) Materials intended for the following component parts are to be tested and inspected in the presence of the Surveyor in accordance with the requirements of Part XI or to the requirements of the specifications approved in connection with the design.

(i) For athwartship thrusters, windlass, mooring winches, capstans and pumps requiring a driving power of 375 kW and more: shafts.

(ii) For piping: group-I and -II pipes and valves as classified in Part VI.

4.2 Steering Gears

4.2.1 General

(a) Each ship is to be provided with a main steering gear and an auxiliary steering gear in accordance with the requirements of the Rules. The main steering gear and the auxiliary steering gear are to be so arranged that the failure of one of them will not render the other one inoperative.

(b) Whilst the requirements satisfy the relevant regulations of the International Convention for the Safety of Life at Sea 1974 (SOLAS 1974) as amended, attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship is registered.

(c) Consideration will be given to other cases, or to arrangements which are equivalent to those required by the Rules.

(d) Where the steering gear is so arranged that more than one system (either power or control) can be simultaneously operated, the risk of hydraulic locking caused by single failure is to be considered.

(e) Definitions relating to steering gear

(i) Steering gear control system means the equipment by which orders are transmitted from the navigating bridge to the steering gear power units. Steering gear control systems comprise transmitters, receivers, hydraulic control pumps and their associated motors, motor controllers, piping and cables.

(ii) Main steering gear means the machinery, rudder actuator(s), the steering gear power units, if any, and ancillary equipment and the means of applying torque to the rudder stock (e.g. tiller or quadrant) necessary for effecting movement of the rudder for the purpose of steering the ship under normal service conditions.

(iii) Steering gear power unit means:

(1) in the case of electric steering gear, an electric motor and its associated electrical equipment,

(2) in the case of electrohydraulic steering gear, an electric motor and its associated electrical equipment and connected pump,

(3) in the case of other hydraulic steering gear, a driving engine and connected pump.

(iv) Auxiliary steering gear means the equipment other than any part of the main steering gear necessary to steer the ship in the event of failure of the main steering gear but not including the tiller, quadrant of components serving the same purpose.

(v) Power actuating system means the hydraulic equipment provided for supplying power to turn the rudder stock, comprising a steering gear power unit or units, together with the associated pipes and fittings, and a rudder actuator. The power actuating systems may share common mechanical components, i.e. tiller, quadrant and rudder stock, or components serving the same purpose.

(vi) Maximum ahead service speed means the greatest speed which the ship is designed to maintain in service at sea at her deepest sea going draught at maximum propeller RPM and corresponding engine MCR.

(vii) Rudder actuator means the component which converts directly hydraulic pressure into mechanical action to move the rudder.

(viii) Maximum working pressure means the maximum expected pressure in the system when the steering gear is operated to comply with 4.2.2(b).

4.2.2 Main steering gear

(a) The main steering gear and rudder stock are to be of adequate strength and capable of steering the ship at maximum ahead service speed, and are also to be designed that they will not be damaged at maximum astern speed. However, this design requirement need not be proved by trials at maximum astern speed and maximum rudder angle.

(b) The main steering gear is to be capable of putting the rudder over from 35° on one side to 35° on the other side with the ship at its deepest seagoing draught and running ahead at maximum ahead service speed and, under the same conditions, from 35° on either side to 30° on the other side in not more than 28 seconds. Where it is impractical to demonstrate compliance with this requirement during sea trials with the ship at its deepest seagoing draught and running ahead at the speed corresponding to the number of maximum continuous revolutions of the main engine and maximum design pitch, ships regardless of date of construction may demonstrate compliance with this requirement by one of the following methods:

(i) during sea trials the ship is at even keel and the rudder fully submerged whilst running ahead at the speed corresponding to the number of maximum continuous revolutions of the main engine and maximum design pitch; or

(ii) where full rudder immersion during sea trials cannot be achieved, an appropriate ahead speed shall be calculated using the submerged rudder blade area in the proposed sea trial loading condition. The calculated ahead speed shall result in a force and torque applied to the main steering gear which is at least as great as if it was being tested with the ship at its deepest seagoing draught and running ahead at the speed corresponding to the number of maximum continuous revolutions of the main engine and maximum design pitch; or

(iii) the rudder force and torque at the sea trial loading condition have been reliably predicted and extrapolated to the full load condition. The speed of the ship shall correspond to the number of maximum continuous revolutions of the main engine and maximum design pitch of the propeller.

(c) The main steering gear is to be operated by power where necessary to meet the requirements of 4.2.2(b) above and in any case when the Rules required a rudder stock over 120 mm in diameter in way of the tiller, excluding strengthening for navigation in ice.

(d) Regarding the propulsion and steering systems other than traditional arrangements for a vessel's directional control, the main steering arrangements are to be capable of changing direction of the vessel's directional control system from one side to the other at declared steering angle limits at an average rotational speed of not less than 2.3°/s with the vessel running ahead at the maximum ahead service speed.

4.2.3 Auxiliary steering gear

(a) The auxiliary steering gear is to be of adequate strength and capable of steering the ship at navigable speed and of being brought speedily into action in an emergency.

(b) The auxiliary steering gear is to be capable of putting the rudder over from 15° on one side to 15° on the other side in not more than 60 seconds with the ship at its deepest seagoing draught and running ahead at 1/2 of the maximum ahead service speed or 7 knots, whichever is the greater. Where it is impractical to demonstrate compliance with this requirement during sea trials with the ship at its deepest seagoing draught and running ahead at one half of the speed corresponding to the number of maximum continuous revolutions of the main engine and maximum design pitch or 7 knots, whichever is greater, ships regardless of date of construction, may demonstrate compliance with this requirement by one of the following methods:

(i) during sea trials the ship is at even keel and the rudder fully submerged whilst running ahead at one half of the speed corresponding to the number of maximum continuous revolutions of the main engine and maximum design pitch or 7 knots, whichever is greater; or

(ii) where full rudder immersion during sea trials cannot be achieved, an appropriate ahead speed shall be calculated using the submerged rudder blade area in the proposed sea trial loading condition. The calculated ahead speed shall result in a force and torque applied to the auxiliary steering gear which is at least as great as if it was being tested with the ship at its deepest seagoing draught and running ahead at one half of the speed corresponding to the number of maximum continuous revolutions of the main engine and maximum design pitch or 7 knots, whichever is greater; or

(iii) the rudder force and torque at the sea trial loading condition have been reliably predicted and extrapolated to the full load condition.

(c) The auxiliary steering gear is to be operated by power where necessary to meet the requirements of 4.2.3(b) above and in any case when the Rules require a rudder stock of over 230 mm in diameter in way of the tiller, excluding strengthening for navigation in ice.

(d) Regarding the propulsion and steering systems other than traditional arrangements for a vessel's directional control, the auxiliary steering arrangements are to be capable of changing direction of the vessel's directional control system from one side to the other at declared steering angle limits at an average rotational speed of not less than 0.5°/s with the vessel running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater.

4.2.4 Where the main steering gear comprises 2 or more identical power units, an auxiliary steering gear need not be fitted, provided that:

(a) In a passenger ship, the main steering gear is capable of operating the rudder as required by 4.2.2(b) of this Part while any one of the power units is out of operation.

(b) In a cargo ship, the main steering gear is capable of operating the rudder as required by 4.2.2(b) of this Part while operating with all power units.

(c) The main steering gear is so arranged that after a single failure in its piping system or in one of the power units the defect can be isolated so that steering capability can be maintained or speedily regained.

4.2.5 Power units

Main and auxiliary steering gear power units are to be arranged to re-start automatically when power is restored after a power failure and capable of being brought into operation from a position on the navigating bridge. In the event of a power failure to any one of the steering gear power units, an audible and visual alarm is to be given on the navigating bridge. These power units are also to be arranged so that transfer between units can be readily effected.

4.2.6 Hand steering gear

Hand steering gears are only acceptable when the force required to operate the gear does not exceed 155N under normal condition, and are to be so designed that the rudder can be moved from hardover to hardover with a maximum of 25 turns of the hand steering wheel.

4.2.7 Rudder stoppers

The steering gear is to be arranged with the adequate stoppers within the gear itself to limit the movement of the rudder in normal service, otherwise the movements of quadrants and tillers are to be limited by structural stoppers arranged on the deck. Power operated steering gears are to be provided with positive arrangements for stopping the gear before the rudder stops are reached. These arrangements are to be synchronized with the gear itself and not with the steering gear control.

4.2.8 Steering gear control systems

(a) A steering gear control system is to be provided:
   (i) for main steering gear, both on the navigating bridge and in the steering gear compartment;
   (ii) where the main steering gear is arranged in accordance with 4.2.4 of this Part, by 2 independent control systems, both operable from the navigating bridge. This does not require duplication of the steering wheel or steering lever. Where the control system consists of a hydraulic telemotor, a second independent system need not be fitted, except in a tanker, chemical tanker or gas carrier of 10,000 gross tonnage and upwards, and
   (iii) for the auxiliary steering gear, in the steering gear compartment and, if power operated, it is also to be operable from the navigating bridge and is to be independent of the control system for the main steering gear.

(b) Any main and auxiliary steering gear control system operable from the navigating bridge is to comply with the following requirements:
   (i) if electric, it is to be served by its own separate circuit supplied from the associated steering gear power circuit from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected;
   (ii) means are to be provided in the steering compartment for disconnecting any control system operable from the navigating bridge from the steering gear it serves;
   (iii) the system is to be capable of being brought into operation from a position on the navigating bridge;
   (iv) in the event of a failure of electrical power supply to the steering gear control system, an audible and visible alarm is to be given on the navigating bridge; and
   (v) each separate supply circuit of steering gear control is to be provided with short circuit protection only.

(c) Where the arrangement is such that a single failure may cause hydraulic lock and loss of steering, an audible and visual alarm which identifies the failed system or component is to be provided on the navigating bridge. The alarm is to be activated upon steering gear failure if:
   (i) position of the variable displacement pump control system does not correspond to the given order, or

(ii) incorrect position of 3-way full follow valve or similar in constant delivery pump system is detected.

4.2.9 Rudder angle indicators

The angular position of the rudder is to be indicated in the navigating bridge, if the main steering gear is power operated. The rudder angle indication is to be independent of the steering gear control system, and readily visible from the control position. In addition, the angular position of the rudder is to be recognizable in the steering gear compartment.

4.2.10 Electrical equipment

(a) Electric power circuits and protective devices for steering gear is to comply with the requirements in 2.3 of Part VII.

(b) Indicators for running indication of each main and auxiliary motor of steering gear power units are to be installed on the navigating bridge and at a suitable main machinery control position.

(c) Electric control systems are to be independent and separated as far as is practicable throughout their length.

4.2.11 Components and piping

(a) Special consideration is to be given to the suitability of any essential component which is not duplicated. Where appropriate, any such essential component is to utilize anti-friction bearings which are permanently lubricated or provided with lubrication fittings.

(b) All steering gear components transmitting mechanical forces to the rudder stock, which are not protected against overload by structural rudder stoppers or mechanical buffers, are to have a strength at least equivalent to that of the rudder stock in way of the tiller.

(c) Piping, joints, valves, flanges and other fittings are to comply with the requirements of Part VI. The design pressure for calculations to determine the scantlings of piping and other steering gear components subjected to internal hydraulic pressure is to be at least 1.25 times the maximum working pressure to be expected under the operational condition specified in 4.2.2(b) of this Part, taking into account any pressure which may exist in the low pressure side of the system. Fatigue criteria may be applied for the design of piping and components, taking into account pulsating pressures due to dynamic loads.

(d) Relief valves are to be fitted to any part of the hydraulic system which can be isolated and in which pressure can be generated from the power source of external forces. The setting of the relief valves is not to exceed the design pressure. The valves are to be of adequate size and so arranged as to avoid an undue rise in pressure above the design pressure.

(e) Relief valves for protecting any part of the hydraulic system which can be isolated, as required by 4.2.11(d) above are to comply with the following:

(i) The setting pressure is not to be less than 1.25 times the maximum working pressure.

(ii) The minimum discharge capacity of the relief valves(s) is not to be less than 110% of the total capacity of the pumps which can deliver through it (them). Under such conditions the rise in pressure is not to exceed 10% of the setting pressure. In this regard, due consideration is to be given to extreme foreseen ambient conditions in respect of oil viscosity.

(f) Flexible hoses

Hose assemblies approved by the Society may be installed between 2 points where flexibility is required but are not to be subjected to torsional deflection (twisting) under normal operating conditions. In general, the hose is to be limited to the length necessary to provide for flexibility and for proper operation of machinery.

(g) Hydraulic power operated steering gear are to be provided with:

(i) arrangement to maintain the cleanliness of the hydraulic fluid taking into consideration the type and design of the hydraulic system;

(ii) a low level alarm for each hydraulic fluid tank to give the earliest practicable indication of hydraulic fluid leakage. Audible and visual alarm are to be given on the navigating bridge and in the machinery space where they can be readily observed, and

(iii) a fixed storage tank having sufficient capacity to recharge at least one power actuating system including the hydraulic fluid tank, where the main steering gear is required to be power operated. The storage tank is to be permanently connected by piping in such a manner that the hydraulic system can be readily recharged from a position within the steering gear compartment and provided with a contents gauge.

(h) For the steering gears which are so arranged that more than one system (either power or control) can be simultaneously operated, where hydraulic locking, caused by a single failure, may lead to loss of steering, an audible and visual alarm, which identifies the failed system, is to be provided on navigation bridge.

4.2.12 Display of operating instructions

Appropriate operating instructions with a block diagram showing the change-over procedures for steering gear control systems and steering gear acting systems are to be permanently displayed in the navigating bridge and in the steering gear compartment.

4.2.13 Additional requirements for tankers, chemical tankers or gas carriers of 10,000 gross tonnage and upwards and every other ship of 70,000 gross tonnage and upwards are as follows:

The main steering gear is to comprise 2 or more identical power units complying with the requirements in 4.2.4 of this Part.

4.2.14 Additional requirements for tankers, chemical tankers or gas carriers of 10,000 gross tonnage and upwards are as follows:

Subject to the requirements in 4.2.15 of this Part the following are to be complied with:

(a) The main steering gear is to be so arranged that in the event of loss of steering capability due to a single failure in any part of one of the power actuating systems of the main steering gear, excluding the tiller, quadrant or components serving the same purpose, or seizure of the rudder actuators, steering capability is to be regained in not more than 45 seconds after the loss of one power actuating system.

(b) The main steering gear is to comprise either:

(i) 2 independent and separate power actuating systems, each capable of meeting the requirements in 4.2.2(b) of this Part, or

(ii) at least 2 identical power actuating systems which, acting simultaneously in normal operation, are capable of meeting the requirements in 4.2.2(b) of this Part. Where necessary to comply with these requirements, inter-connection of hydraulic power actuating systems is to be provided. Loss of hydraulic fluid from one system is to be capable of being detected and the defective system automatically isolated so that the other actuating system or systems remain fully operational.

(c) Steering gears other than of the hydraulic type are to achieve equivalent standards.

4.2.15 Additional requirements for tankers, chemical tankers or gas carriers of 10,000 gross tonnage and upwards but of less than 100,000 tons deadweight are as follows:

(a) Solutions other than those set out in 4.2.14 of this Part which need not apply the single failure criterion to the rudder actuator or actuators, may be permitted provided that an equivalent safety standard is achieved and that:

(i) following loss of steering capability due to a single failure of any part of the piping system or in one for the power units, steering capability is regained within 45 seconds, and

(ii) where the steering gear includes only a single rudder actuator, special consideration is given to stress analysis for the design including fatigue analysis and fracture mechanics analysis, as appropriate, the material used, the installation of sealing arrangements and the testing and inspection and provision of effective maintenance.

4.3 Windlass

4.3.1 General

A windlass of sufficient power and suitable for the size of chain cable is to be fitted to the ship to operate the anchors.

4.3.2 Definitions

(a) "Working Load": The working load, derived from the nominal diameter and the grade of anchor chain cables, is the tensile force exerted upon the cable lifter in the tangential direction when the anchor and anchor chain cables are being hoisted.

(b) "Overload Pull": The necessary temporary overload capacity of the windlass.

(c) "Holding Load": The maximum static load on the anchor chain cables which the cable lifter brake is to withstand.

(d) "Nominal Speed": The average speed of recovery of 55 m (two lengths) of anchor chain cables when 82.5m (three lengths) of the cables are submerged and freely suspended at commencement of lifting.

4.3.3 Performance

The windlass is to have the following performance:

(a) The windlass is to be capable of continuous operation for a period of 30 minute under the working load and also be capable of operating under the overload for a period of 2 minutes at reduced speed.

(b) The working load of the windlass is to be based on the following values:

(i) Grade E1 anchor chain cable: $37.5\ d^2$ (N).

(ii) Grade E2 anchor chain cable: $42.5\ d^2$ (N).

(iii) Grade E3 anchor chain cable: $47.5\ d^2$ (N).

where

d = Nominal diameter of anchor chain cable(mm).

(c) The overload is to be 150% of the working load.

(d) The holding load is to be as follows:

(i) with cable stopper: $0.45 \times$ breaking test load of cable;

(ii) without cable stopper: $0.8 \times$ breaking test load of cable.

(e) The holding load of control brake is to be 130% of the working load when equipped with the control brake.

(f) The rated hoisting speed is to be 0.15 m/s or more. The conditions in this case are such that the anchor and the anchor chain cables are used where the efficiency of the hawse pipe is 70%.

4.3.4 Construction

(a) The windlass is to be so designed as to endure impact of waves and to ensure smooth operation of the components. The closed portions of the windlass installed on exposed decks are to have suitable watertight construction.

(b) The cable lifters for ordinary and couple type windlasses are to be so constructed that they can be driven independently and simultaneously.

(c) The cable lifter is to be as follows:

(i) The cable lifter is to be provided with five teeth at minimum, and the angle of contact of the anchor chain cable to the cable lifter is to be at least 110°.

(ii) The cable lifter is to be de-clutchable from the drive. Power operated clutches are also to be de-clutchable by hand.

(d) The cable lifter brake gear is to be as follows:

(i) Electric windlass is to be provided with an automatic control brake system which operates when the control handle is in the "off" position or when the power supply is cut off. The automatic control brake system is to be capable of sustaining the holding load of control brake.

(ii) Each cable lifter is to be fitted with a hand-brake which may be remotely controlled, capable of sustaining the holding load.

(e) Each remotely controlled windlass is to be fitted with a quick acting local emergency stop mechanism, which, when came into action, cuts off power for the windlass and applies the control brake system.

(f) Prime movers and gearing are to be provided with protective devices and safety devices against excessive torque and shock, as follows:

(i) Overpressure preventive device for hydraulic equipment.

(ii) Slipping clutch between electric motor and reduction gear.

(iii) Protective device for the electric motor against overload.

(iv) Covers for open gears.

(v) Cover for preventing the operator from burning by touching the steam cylinder at excessively high temperature.

(vi) Cover for crank disc.

(g) The speed of the rotation of the cable lifter is to be controllable.

4.3.5 Strength

(a) The parts for the windlass such as the bedplate, cable lifter, cable lifter shaft, bearing frame, brake gear, holding-down bolt, etc. are to have such strength that the stress on these parts is below the yield points of the materials when sustaining the holding load on the cable lifter.

(b) The driving section is to have such strength that the stress on each part is below 40% of the yield points of the materials used when the working load is applied.

4.3.6 Tests and Inspection

The windlass and cable lifter unit are to be inspected during fabrication at the manufacturers' facilities by a Surveyor for conformance with the approved plans. Acceptance tests, as specified in the specified standard of compliance, are to be witnessed by the Surveyor and include the following tests, as a minimum. The test results are to be recorded.

(a) "No-load Test": The windlass is to be run without load once in normal and once in reverse directions, for a sum of 30 minutes, under the rated voltage at the speed of rotation equivalent to the rated speed. When the windlass is provided with a gear change, an additional 5 min similar test is to be carried out for each additional gear change.

During the test, the following items are to be checked or measured:

(i) tightness against oil leakage;

(ii) temperature of bearings;

(iii) pressure of abnormal noise.

(b) "Load Test": The windlass is to, as a rule, be checked to verify that the working load, rated speed and overload pull are attainable as specified in 4.3.3 above.

(c) "Cable Lifter Brake Test": The holding power of the cable lifter brake is to be verified. The cable lifter brake is also to be tested with the anchor dropping, operated onboard with the holding load controlled and sustained by applying the brake at each half length of the chain.

(d) Performance Tests
   (i) When provided with the remote control or other special device, their performances are to be verified.
   (ii) The function of the automatic control brake system for electric windlass is to be tested at the manufacturer's shop of the electric motor.
   (iii) The clutch and slipping clutch (for electric windlass) are to be tested to verify their performance.

4.4 Reciprocating Compressors

4.4.1 General

The following requirements apply to the compressors for supplying starting air of main propelling and auxiliary engines and the compressors for cargo refrigerating machinery. They apply mainly to reciprocating compressors of the types normally used aboard ships. For the capacity required for starting air compressors, see 4.6 of Part VI and the refrigerant compressors are also to comply with Part X.

4.4.2 Construction

(a) The temperature of compressed air at the discharge of each stage is not to exceed 160°C for multistage compressors or 200°C for single-stage compressors; and for discharge pressure of less than 1.0 MPa, an increase of 20°C may be permitted. The cooling of air compressors is to be so designed that the temperature of the air discharged to the starting air vessel is substantially not to exceed 95°C in service. The design of the cooler for compressors is to be based on a sea water temperature of not less than 32°C for water cooling and an air temperature of not less than 45°C for air cooling.

(b) Safety devices
   (i) Each stage of the air compressor is to be fitted with a suitable relief valve which cannot be isolated and which is so dimensioned and adjusted that in the event of the discharge line being shut-off, the accumulation will not exceed 10% of the approved working pressure, which are not to be greater than the approved design pressure in each stage of the air compressor. The casings of the cooling water spaces are to be fitted with a relief valve or safety disc so that sample relief will be provided in the vent of the bursting of an air cooler tube.
   (ii) The refrigerant compressor is to be protected against over-pressure in such a manner that an equalizing of the pressure difference between the discharge and suction sides is possible by a relief valve and/or safety disc. Where one compressor stage consists of several cylinders, each capable of being isolated, each cylinder is to be provided with a relief valve. The relief valve and safety disc are to be set at a pressure not greater than the design pressure as specified in Table X 2-2 of Part X.

(c) Every compressor stage and the refrigerant suction line are to be fitted with a suitable pressure gauge. In the intermediate stage of the air compressor requiring a driving power of less than 18 kW, the above pressure gauge may be omitted. It is recommended that the pressure gauge marked with the corresponding refrigerant temperatures be provided for the refrigerant compressor.

(d) The air compressor is to be provided with a separator in the final stage. It may also be advisable to fit a cooler. The separator or the cooler which serves as a separator is to be fitted at its lowest point with a drain where condensate may be observed as it runs off.

4.5 Pumps

4.5.1 Reciprocating pumps and other displacement pumps are to be fitted with sufficient large relief valves which cannot be isolated and which protect the pump casing from excessive pressure when the delivery valve is shut. For pumps handling inflammable fluids, the discharge from the relief valves is to be fed back to the suction side of the pumps.

4.5.2 Rotary pumps are to be so designed that they can be operated without damage occurring when the delivery valves are shut.

4.5.3 The size, capacity and numbers required for the pump are to be in accordance with the requirements in relevant Parts.

4.6 Tests and Inspections

4.6.1 Hydraulic pressure tests

Hydraulic pressure tests on deck machinery and pump parts after machining are to be carried out in the presence of the Surveyor under the conditions specified in Table IV 4-1.

Table IV 4-1
Hydraulic Test Pressure on Deck Machinery and Pump Parts

Parts to be Tested	Test Pressure, MPa
Steering gear:	
Steam reciprocating steering engine.	See 2.9.1 of this Part.
Hydraulic steering gear, pump case, cylinder etc.	1.5 W or W + 7, whichever is smaller.
Windlass:	
Steam reciprocating windlass engine.	See 2.9.1 of this Part.
Diesel windlass engine.	See 3.10.1 of this Part.
Hydraulic pump and motor.	1.5 W or W + 7, whichever is smaller.
Reciprocating compressors:	
Air Compressor:	
Cylinder, liner, cover, inter- and fter-coolers.	
Compressed air side.	1.5 W
Cooling water space.	0.4 but not less than 1.5 W
Refriagerant compressor.	See Part X
Pump:	
Pump prime mover, steam or diesel engine.	See 2.9.1 and 3.10.1 of this Part.
Pump casing.	0.4 but not less than 1.5 W.
Piping:	
Group-I and -II pipes and fittings.	See Part VI.
Where: W = Design pressure and/or maximum working pressure for the respective parts, in MPa.	

4.6.2 Shop trials

(a) The following operational tests are to be carried out at the manufacturer's workshop in the presence of the Surveyor:

(i) For the steering gear: Characteristic tests of hydraulic pump units, if used. Running tests of steering gear. Adjustments and tests of safety devices and brake arrangements. Each new design power unit pump for steering gear is to be type tested before come into the market. The type test is to be for a duration of not less than

100 hours, the test arrangements are to be such that the pump may run in idling conditions, and at maximum delivery capacity at maximum working pressure. During the test, idling periods are to be alternated with periods at maximum delivery capacity at maximum working pressure. The passage from one condition to another is to occur at least as quickly as on board. During the whole test no abnormal heating, excessive vibration or other irregularities are permitted. After the test, the pump is to be disassembled and inspected. Type tests may be waived for a power unit which has been proven to be reliable in marine service.

(ii) For the athwartship thruster: Running tests of thruster. Adjustment and tests of the control and monitoring systems.

(iii) For the windlass, see 4.3.6 of this Part.

(iv) For the reciprocating compressor:

Running test for 2 hours and safety device test. Charging test for air compressor. Performance test for refrigerant compressor if deemed necessary by the Surveyor.

(v) For the pump: Characteristic tests with the pump running at designed condition.

(b) The overhaul inspection after shop trial is to be carried out in the presence of the Surveyor. The range and extent of inspection are subject to the discretion of the Surveyor.

4.6.3 On-board trials

(a) For the steering gear: The steering gear is to be tried out on the trial trip in order to demonstrate to the Surveyor's satisfaction that the requirements of the Rules have been met. The trial is to include the operation of the following:

(i) The steering gear, including demonstration of the performances required by 4.2.2(b) and 4.2.3 (b). For the main steering gear trial, the propeller pitch of controllable pitch propellers is to be at the maximum continuous ahead RPM. If the vessel cannot be tested at the deepest draught, alternative trial conditions may be specially considered. In this case, for the main steering gear trial, the speed of the ship corresponding to the maximum continuous revolutions of the main engine is to apply;

(ii) The steering gear power units, including transfer between steering gear power units;

(iii) The isolation of one power actuating system, checking the time for regaining steering capability;

(iv) The hydraulic fluid recharging system;

(v) The emergency power supply required by 2.3.10 of Part VII;

(vi) The steering gear controls, including transfer of control and local control;

(vii) The means of communication between the steering gear compartment and the wheelhouse, also the engine room, if applicable;

(viii) The alarms and indicators;

(ix) Where the steering gear is designed to avoid hydraulic locking this feature is to be demonstrated.

Test items (iv), (vii), (viii) & (ix) may be effected at the dockside.

(b) For the windlass, an anchoring test is to be carried out in the presence of the Surveyor to demonstrate that the windlass with brakes, etc., functions satisfactorily and that the lifting power specified by the Rules can be developed. See 4.3.6 of this Part.

(c) For the athwartship thruster, mooring winch and capstan, an on-board running under working condition, if available, is to be carried out in the presence of the Surveyor.

(d) For reciprocating compressor, the following on-board trials are normally to be carried out in the presence of the Surveyor:

(i) Running and charging.

(ii) Safety device adjusting and setting.

(e) For pumps, an on-board running under working condition is to be carried out in the presence of the Surveyor.

4.6.4 Alternative proposals will be specially considered where any of the tests required by 4.6.2 and 4.6.3 above are considered impracticable.

Chapter 5

Gearing and Couplings

5.1 General

5.1.1 The requirements of this Chapter are applicable to reduction gearing and couplings for main propelling purpose and for driving essential service auxiliaries.

5.1.2 Drawings and data

(a) The manufacturer of gearing or coupling is to submit the following drawings for approval:

Assembly and section drawings, detail of pinion, pinion shaft, gear wheel, gear wheel shaft, flexible coupling, quill shaft and gear casing etc.

(b) The following data are to be submitted together with drawings for approval:

Material specifications, maximum power transmitted by each pinion in continuous running and corresponding revolutions, number of teeth and modules of teeth in each pinion and gear wheel, pitch circle diameters, pressure angle and helix angle, addendum and dedendum, face width tooth profiles together with base and pitch circle diameters and fillet radii, minimum backlash, addendum modifications and tooth bearing corrections to the teeth, finishing operations for the teeth, final accuracy foreseen of the teeth and their meshing, data for rim shrunk on gear wheel and/or hub shrunk on shaft with the shrinkage allowances, and welding details including sequences and stress relieving where the casing and/or the gear wheel are of welded construction.

(c) For flexible coupling

(i) Main technical parameters of flexible coupling: type, model, rated torque, instantaneous maximum torque, allowable vibratory(variable) torque, allowable revolution speed, allowable power loss (overheating), Allowable misalignment for continuous operation, static torsional angle(rated, maximum), static torsional stiffness, dynamic stiffness(if applicable), damper factor(if applicable).

(ii) Strength calculations(keys, connecting bolts, etc.)

(iii) Technical specification(design basis, enterprise standard, etc.)

(iv) Routine test program

(v) Assembly drawing

(vi) Drawing of main part(input/output flange/discs, elastic parts/components, etc.)

(vii) Operation instruction

(viii) Other drawings and data deemed necessary by the Society.

5.1.3 Materials

(a) All components of gearing and couplings which transmit part of the turning moment for the main propelling purpose and for driving the essential service auxiliaries are to be tested and inspected in the presence of the Surveyor to comply with the requirements of Part XI or to the requirements of the specifications approved in connection with the design.

(b) The components described above are normally to be made of forged or cast steel. The flangeless plain gear shaft may also be made of hot rolled carbon steel bars.

(c) The use of cast iron for gearing and coupling is to be approved by the Society in each particular case.

(d) In the selection of materials for pinion and gear wheel teeth, consideration is to be given to their combined ability to resist wear, pitting and scuffing. In general, for gears of through-hardened steel, except in the case of low reduction ratios, provision is also to be made for a hardness differential between pinion teeth and gear wheel teeth for which purposes the specified minimum tensile strength of the gear wheel rim material is not to be more than 85% of that of the pinion. For unhardened gears, the tensile strength of the material of pinion teeth is generally to be at least 100 N/mm^2 above that of the gear wheel teeth.

5.2 Construction

5.2.1 Gear wheels and pinions

(a) In the case of gear wheels with shrunk-fitted rim, the rim is to be of sufficient thickness to ensure a good shrinkfit without undue distortion and the shrinkage is to be sufficient for transmitting the load with adequate safety. The shrinking is preferably to be completed prior to cutting the teeth and is to be carried out to the satisfaction of the Surveyor.

(b) In the case of welded construction, the full details of welding procedure are to be approved in the first instance by the Surveyor before work is commenced. The welded gear wheel is to be stress relieved prior to cutting the teeth and particulars of which are to be submitted. All welds in the completed gear wheel are to have satisfactory smooth appearance and even contour, and are to be proved by means of radiographic or magnetic particle detection.

(c) In general, arrangements are to be made so that the interior structure of the gear wheel may be examined. An alternative proposal will be specially considered in each case.

5.2.2 Gear casings

(a) The gear casing is to be of rigid construction in order that it is free from distortion when chocked and secured to its seating to maintain the alignment of gear elements at sea. For this purpose the casing is to be constructed with heavy ribbing with adequate flanges on both end walls and side walls.

(b) Inspection openings are to be provided at the peripheries of the gear casing to enable the teeth of pinions and gear wheels to be readily examined. Where the construction of the gear casing is such that sections of structure cannot readily be moved for inspection purposes, access openings of adequate size are also to be provided at the ends of the gear casing to permit examination of the structure of gear wheels. Their attachment to the shafts is to be capable of being examined by removal of bearing caps or by equivalent means.

(c) The gear casing of welded construction is to be stress relieved on completion and particulars of which are to be submitted.

5.2.3 Couplings

(a) The coupling is to be so constructed that it has sufficient strength to transmit the load and is capable of being operating safely and efficiently.

(b) When hydraulic or compressed air is employed in the operation of the clutch for main propelling purpose, an hydraulic pump or an air compressor of reserve use, or other suitable means are to be provided to ensure that the ship can proceed the safe voyage in case of failure of the hydraulic or compressed air main supply system. The Society may, however, modify the above mentioned requirements for small ships.

5.2.4 Flexible Couplings

(a) Design.

Flexible couplings intended for use in propulsion shafting are to be of approved designs. Couplings are to be designed for the rated torque, fatigue and avoidance of overheating. Where elastomeric material is used as a torque-transmitting component, it is to withstand environmental and service conditions over the design life of the coupling, taking into consideration the full range of maximum to minimum vibratory torque. Flexible coupling design will be evaluated, based on submitted engineering analyses.

(b) Torsional displacement limiter

Flexible couplings with elastomer or spring type flexible members, whose failure will lead to total loss of propulsion capability of the vessel, such as that used in the line shaft of a single propeller vessel, are to be provided with a torsional displacement limiter. The device is to lock the coupling or prevent excessive torsional displacement when a pre-determined torsional displacement limit is exceeded. Operation of the vessel under such circumstances may be at reduced power. Warning notices for such reduced power are to be posted at all propulsion control stations.

(c) Barred range

Conditions where the allowable vibratory torque or the allowable dissipated power may be exceeded under the normal operating range of the engine are to be identified and are to be marked as a barred range in order to avoid continuous operation within this range.

(d) Impact torque

Flexible couplings for generator sets or motors are to be capable of absorbing short time impact torque due to electrical short-circuit conditions up to 6 times the nominal torque, or the couplings are to be evaluated for capability to absorb the torque generated by transient torsional vibration stresses.

5.3 Design – Load Capacity of Involute Parallel Axis Spur and Helical Gears

5.3.1 General influence factors

(a) Symbols and units

a = Centre distance, in mm;
b = Common facewidth, in mm;
$b_{1,2}$ = Facewidth of pinion, wheel, in mm;
d = Reference diameter, in mm;
$d_{1,2}$ = Reference diameter of pinion, wheel, in mm;
$d_{a1,a2}$ = Tip diameter of pinion, wheel, in mm;
$d_{b1,b2}$ = Based diameter of pinion, wheel, in mm;
$d_{f1,f2}$ = Root diameter of pinion, wheel, in mm;
$d_{w1,w2}$ = Working diameter of pinion, wheel, in mm;
F_t = Nominal tangential load, in N;
F_{bt} = Nominal tangential load on base cylinder in the transverse section, in N;
h = Tooth depth, in mm;
m_n = Normal module, in mm;
m_t = Transverse module, in mm;
$n_{1,2}$ = Rotational speed of pinion, wheel in revs/min;
P = Maximum continuous power transmitted by the gear set, in kW;
$T_{1,2}$ = Torque in way of pinion, wheel, in Nm;
U = Gear ratio;
v = Linear speed at pitch diameter, in m/s;
